CORONA BORËA'LIS, a small and bright constellation near Hercules.

COR'ONACH, a dirge, or wailing for the dead, long common among the Gaels of Scotland and Ireland in early times. The practice seems to have been in vogue in Greece and Rome, and is still, to some extent, in use at Irish wakes.

CORONA'TION. The use of crowns in antiquity, as a mark either of honor or of rejoicing will be explained under CROWN. It was, no doubt, as an adaptation of this general custom to a special use that the practice of placing a crown on the head of a monarch at the commencement of his reign was introduced. The practice is very ancient, as we may learn from the fact that Solomon and Ahaziah were crowned; and there is probably scarcely any country in which it has not been followed in one form or another. Generally it has been accompanied by what was regarded as the still more solemn rite of anointing with oil, a ceremony which, from the time of the ancient Hebrews to our own, has been peculiarly significant of consecration or devotion to the service of God. The term employed for C. in the Saxon chronicle, "gehalgod," is hallowed or consecrated; and it would seem that the ceremony as then performed at Kingston-on-Thames or Winchester, was in all essentials the same as that which now takes place in Westminster abbey. A copy of the Gospels is still in existence amongst the Cottonian MSS. in the British museum, which is believed to be the identical copy on which the Saxon kings were sworn. Detailed accounts of many English coronations, from Richard I. downwards, have been preserved. They will be found enumerated, along with those of the German emperors, the kings of France, emperors of Russia, etc., in Bohn's *Cyclopædia of Political Knowledge;* and much more fully, along with much interesting information on the subject generally, in *Chapters on Coronations* (Lond. 1838).

CORONATION GULF, an inlet of the Arctic ocean, forms the s.e. part of the land locked and isle-studded bay that receives the Coppermine. Lat. 66° 30′ to 68° 30′ n., long. 109° to 110° west.

CORONATION OATH. The form in which the limitations imposed on the monarch were defined by the nation and accepted by him, was probably from the first something equivalent to a coronation oath. Up to the period of the revolution, however, the C.O., like all the other guarantees for popular liberty, admitted of being tampered with; and there is in existence (Cottonian MS., Tib. E. viii.) a copy of the oath sworn by Henry VIII., interlined and altered with his own hand.

To obviate the possibility of such proceedings for the future, the existing C.O., altered only in consequence of the subsequent unions between England and Scotland, and Great Britain and Ireland, was fixed by stat. 1 Will. and Mary, st. 1, c. 6. It is to the following effect, and thus administered. The archbishop of Canterbury demands of the king (or queen): "Sir, (or madam), is your majesty willing to take the oath?" and on the king answering, "I am willing," the archbishop ministereth these questions: and the king, having a copy of the printed form and order of the coronation service in his hands, answers each question severally, as follows:

Archb. Will you solemnly promise and swear to govern the people of this United Kingdom of Great Britain and Ireland, and the dominions thereto belonging, according to the statutes in parliament agreed on, and the respective laws and customs of the same?

King. I solemnly promise so to do.

Archb. Will you, to your power, cause law and justice, in mercy, to be executed in all your judgments?

King. I will.

Archb. Will you, to the utmost of your power, maintain the laws of God, the true profession of the Gospel, and the Protestant reformed religion, established by law? And will you maintain and preserve inviolably the settlement of the united church of England and Ireland, and the doctrine, worship, discipline, and government thereof, as by

law established within England and Ireland, and the territories thereunto belonging? And will you preserve to the bishops and clergy of England and Ireland, and to the churches there committed to their charge, all such rights and privileges as do, or shall appertain unto them, or any of them?

King. All this I promise to do.

The sovereign then goes to the altar, and laying his hand upon the Gospels, takes the following oath: "The things which I have heretofore promised, I will perform and keep, so help me God."

The sovereign then kisses the book, and signs the oath.

The passage in the oath in which the sovereign guarantees the privileges of the church of England, is framed in conformity with the "act for securing the church of England as by law established," which is declared to be a fundamental and essential part of the treaty of union, and which was inserted accordingly in the act by which the treaty of union was finally ratified. The passage in the act which provides for the security of the church of Scotland was framed in conformity with an "overture for an act for security of the church"—of which a copy will be found in the appendix to Defoe's *History of the Union*, p. 617. It is to the effect that, "after the decease of her present majesty (whom God long preserve), the sovereign succeeding to her in the royal government of this kingdom shall, in all time coming (not at the coronation) *at his or her accession to the crown, swear and subscribe* that they shall maintain and preserve the aforesaid settlement of the true Protestant religion, with the government, worship and discipline of this church, as above (that is, by the previously recited act, 1 Will. and Mary, c. 5) established inviolably." The security of the church of Scotland is thus provided for, by what may be called an accession oath, even during the period which must intervene between the accession of the sovereign and his coronation, when he is not bound, by oath at least, to the maintenance of the other branches of the constitution.

CORONEL'LA, a genus of non-venomous serpents of the family *colubridæ*, of a small size, having a somewhat compressed and generally pentagonal body, and rather long conical tail. They inhabit the warm and temperate parts of the world. One species, *C. lævis*, is found in the center and s. of Europe.

CORONER (Lat. *coronator*, *corona*, a crown), a very ancient officer in England, at the common law. He is mentioned in a charter of king Athelstan, 905 A.D; and the office, like much of the common law, is acknowledged to be of Saxon origin. The name is derived from the fact, that the C. has chiefly to do with pleas of the crown. In this light, the lord chief-justice of the queen's bench is the principal C. in the kingdom, and may exercise jurisdiction in that capacity in any part of England. There are, however, particular coroners for every place in England, and in some counties, three or four, or even more. They were formerly paid by fees on each inquest, but now (23 and 24 Vict. c. 116) by salary paid out of the county rate. The C. is chosen for life, and the election rests with the freeholders of the county or district. A C. may, however, be dismissed by the lord chancellor for inability or misbehavior in his office. By the statute of Westminster the first (3 Edw. I. c. 10), it was enacted that none should be chosen but lawful and discreet knights; and in the time of Edward III., there is an instance of a man being removed from the office because he was merely a merchant. Subsequently, it was thought sufficient if a man had lands enough to entitle him to be made a knight; and Blackstone complains that in his time it had come to be sought for the perquisites, and not for the honor of serving the country. This motive has now ceased. The C. is now usually a professional man, frequently an attorney or a medical man.

The office of C. is to some extent the only one in England charged with the investigation of crime. Where the C. cannot act, there is no authority to examine witnesses until a suspected person has been actually charged or accused before a magistrate. But even the C.'s duties are very limited, and little is added to the statute 3 Edw. I. The C. can inquire only into the causes of violent or sudden death, and into these only when the body has been found. When such a death happens, it is the duty of the constable to give notice of it to the C., who then summons a jury from the body of the county for the purpose of making an inquisition into the matter. The C. presides over the inquisition, and the court thus constituted is a court of record. The jury consists of twelve men at least, who are sworn and charged by the C.; and the verdict must be of twelve. By 6 and 7 Vict. c. 12, it has been enacted that the inquest shall be held before the C. in whose district the body shall be "lying dead." If any be found guilty by such inquisition of murder or other homicide, the C. is to commit them to prison for further trial, and is also to make inquiry concerning their lands, goods, and chattels (which are forfeited thereby), if not otherwise known; and he must, moreover, certify the whole of this inquisition under his own seal and the seals of the jurors, together with the evidence thereon, to the court of queen's bench or the next assizes. The accused may thereupon be put on his trial without other indictment. By 6 and 7 Will. IV. c. 89, the C. is empowered to summon, and by 1 Vict. c. 68, to pay, medical witnesses, in place of referring them for payment to the church-wardens. The sums allowed are one guinea for a simple examination, and two guineas if a *post-mortem* examination of the body has been made. By 6 and 7 Vict. c. 83, coroners are empowered to appoint deputies in case of absence from illness or other reasonable cause. 9 and 10 Vict. c. 37, regulates the duties

of the C. and the expenses of inquests in Ireland. Another branch of the C.'s office is to inquire concerning shipwrecks and treasure-trove; but this has been nearly superseded by the provisions of the merchant shipping act, 1854. He is a conservator of the king's peace, in which capacity he is mentioned in one of the oldest treatises on the common law (*Mirror*, c. 1, s. 3). As such, he may cause felons to be apprehended, whether an inquisition has found them guilty or not. The C. has likewise ministerial functions as the sheriff's substitute, in executing process in suits in which the sheriff is related either to the plaintiff or defendant. Latterly, the office of C. has been the subject of consideration, with a view to certain reforms of administration. In many cases, it is alleged that the C. makes a job of his office, trumps up cases, and acts vexatiously at variance with the warrants of magistrates. Coroners or crowners, as they were also called in England, are mentioned in many old Scottish statutes; and there is no doubt that the office, as well as that of alderman and mayor, existed in those parts of the country that were peopled by persons of Teutonic race. But it was abolished or fell into desuetude, probably in consequence of the secession war and the French connection; and in Scotland the duties are now chiefly performed by an officer appointed by the crown, styled the procurator-fiscal (q.v).

CORONER (*ante*), in the United States, elected or appointed, usually one or more in each county or city. The functions of a coroner are almost exclusively confined to holding inquests upon persons who have died by violence or accident, or in a sudden or mysterious manner. He summons a jury, and if need be a physician, and inquires into the facts, after which a verdict is returned. Neither the coroner nor the jury have any defined responsibility; they can only recommend, except in cases of crime, where the coroner has power to cause arrests and to commit to prison.

CORONET. See CROWN.

COROT, JEAN BAPTISTE CAMILLE, 1796–1875; a French landscape painter. He labored many years without special recognition, but triumphed at last, and received the cross of the legion of honor and many other marks of distinction. Among his works are "View in Italy," "Souvenir of the Environs of Florence," "Dance of the Nymphs," "Sunset in the Tyrol," "Hagar in the Desert," "Dante and Virgil," "Repose," "Solitude, etc.

CORPORAL (more properly *caporal*, from the Italian *capo di escadra*) is, so far as concerns the British army at the present day, the grade next below non-commissioned officers. When the regiment is formed as a corps, he has no function different from the private soldier. In barracks or camp, however, he exercises certain disciplinary control over the privates. At present, in the British army, there are 32 corporals to each regiment of cavalry, and 40 for each infantry battalion. They receive pay varying from 1*s.* 3*d.* to 2*s.* 5*d.* per day. The lance C. is an assistant C., who remains, however, on private's pay; he wears one *chevron* (q.v.) on his arm, and two when he rises to the rank of corporal.

On shipboard, there is a ship's corporal, a petty-officer under the master-at-arms; to aid in teaching the seamen the use of small-arms, to guard against the smuggling of spirits on board, to extinguish the fires and lights at a given signal, and to keep order below at night.

CORPORAL (*ante*), in the United States, does not differ from the same officer in England. He is the lowest officer in a company, standing between a private and sergeant, and does duty in the ranks as a private, except that he places and relieves sentinels, and at drill has charge of a squad.

CORPORAL (Lat. *corpus*, a body, because of the belief that the bread and wine are the body and blood of our Saviour), a name given to the cloth with which the minister covers what is left of the consecrated elements in the Lord's supper until the service is concluded. It is also called the *pall*, and its use is of the highest antiquity.

CORPORAL PUNISHMENTS. See FLOGGING.

CORPORA'TION. This, in England, is either aggregate or sole. A C. aggregate is a society of persons authorized by law to act as one person, and to perpetuate its existence by the admission of new members. Without such legal authority, the acts of the society would be regarded only as the acts of the individuals, and the property of the society would descend to the heirs of the individual members. A C. sole consists of one person, and his successors, who are by law invested with the same capacities as a C. aggregate. The sovereign is a C. sole, and so is a bishop and the vicar of a parish, for these in the eye of the law never die, and each successive holder of the office takes the property belonging to it, neither by conveyance nor by ordinary succession, but is vested in it by his mere holding of the office.

A C. could formerly be established only by charter from the crown or act of parliament, unless, indeed, it existed by immemorial prescription; but of late years the exigencies of commerce have led to the passing of various enactments, by compliance with which any society of persons may acquire for themselves the character of a corporation. The particulars of these will be considered under the title JOINT-STOCK COMPANIES. A C. always receives a corporate name, by which it sues and is sued, and must possess a common seal, the affixing of which is the only competent way of affixing

the signature of the corporation. The majority of the members of a C. are entitled to act in its name, and may, by a by-law, even delegate—except in the case of municipal corporations—the power of acting in its name to a certain number of its members. For the acts of the C. none of its members are personally liable. A C. may hold lands—subject to the statutes of mortmain (q.v.)—and may be possessed, if a C. aggregate, of chattels; but a C. sole has not this privilege, unless it be the representative of a number of persons for whose benefit the chattels are held. But no C. can be either a trustee-proper or an executor.

Corporations, whether aggregate or sole, are divided into ecclesiastical and lay, and the lay are subdivided into civil and eleemosynary. The ecclesiastical are such as are composed wholly of clergymen, in their ecclesiastical capacity, and are chiefly for the purpose of holding ecclesiastical property. Civil corporations include municipal corporations, the universities, the colleges of physicians and surgeons, learned societies, and many trading companies incorporated. Eleemosynary corporations are for the administration of funds for charitable and pious purposes, such as hospitals, the colleges in universities, etc. An important consequence of these distinctions is the effect it has on the right of *visiting* a C. or exercising a legal superintendence over its proceedings. The crown is the visitor of the archbishops, each archbishop is the visitor of his suffragan bishops, and each bishop is the visitor of all the ecclesiastical corporations in his diocese. Civil corporations have no visitor, but the court of queen's bench is the authority entitled to restrain and direct them. Eleemosynary corporations are visited by the founder and his heirs, or such persons as the founder appointed to be visitors; and in default of such persons, or of the founder's heirs, the court of chancery acts as visitor. Hospitals, if of ecclesiastical nature, are, however, subject to the visitation of the bishop.

A C. may be dissolved by the death of all its members, or of such number as leaves not enough to make new elections in the way the charter requires; by forfeiture of the charter, through breach of its conditions; by surrender of the charter; or by act of parliament. In all such cases, the lands of the C. revert to their several donors, and the debts due by or to the C. are extinguished.

Municipal corporations, formerly dependent on special charter alone, are now made uniform, and regulated by the 5 and 6 Will. IV. c. 76, and some subsequent acts. See MUNICIPAL CORPORATION.

As to public corporations in Scotland, see BURGH, TOWN COUNCIL, FRIENDLY SOCIETIES; and as to private corporations for trading purposes, see BANK, LIABILITY (limited), PARTNERSHIP.

CORPORATION (*ante*). There are, strictly speaking, no ecclesiastical corporations in the United States. In addition to the explanation given respecting English corporations which serves equally to define the position of our own, it may be said, that corporations are public and private. A public corporation (as a village) is a governmental instrument, and may be dissolved at the will of the creating power; but a private corporation, as a college, cannot be dissolved at will, as no state has the power to deny obligation of contracts. Therefore it is that in many instances the right of repeal is reserved by the state in the charter of the corporation. But a private corporation may be dissolved for the non-fulfillment of contract, for misdirection of funds, and for other causes. The law respecting the power of corporations to inherit money or estate is differently construed in different states; in some they are entirely deprived of right of inheritance, while in others they have the right under various restrictions, such as the limitation of the value of the bequest, or an expiration of a certain time between the making of the will and the death of the testator. A corporation may, through an agent, act outside of the limits of its own state, unless prohibited from so doing by a special enactment. The direction of corporations is never placed in the hands of one person, as in England, but is generally vested in a board of trustees. The property of a corporation is subject to the control of the U. S. court of bankruptcy, and the corporation may be sued as an individual.

CORPS D'ARMÉE, in the military system of the greater continental European states, is an organization of the forces in the time of peace. The whole military strength is divided into several corps, each complete in itself as an army, with everything needful for service, staff and artillery park included. The English army is now distributed into eight army corps, stationed in eight territorial centers. The French army, had in 1879, nineteen *corps d'armée;* which have been increased in strength by the recent military reorganization. Germany had in the same year eighteen *corps d'armée.* In the Austrian service, the normal number of *corps d'armée* is thirteen. The military strength of Russia, as finally settled in 1876, is distributed over fourteen military districts.

CORPS D'ARMÉE (*ante*), a title not used in the United States. At present the army is in three great divisions: the Atlantic, the Pacific, and the Missouri. During the late war, sections of the army were known by location, such as the army of the Potomac, or of the Cumberland.

CORPSE-CANDLE. See CANDLE.

CORPS LÉGISLATIF, the name of the lower house of the French national legislature under Napoleon III. from 1857 to 1870. Members were elected for six-year terms.

CORPULENCE. See OBESITY, *ante.*

CORPUS CATHOLICO'RUM, a name given in Germany after the peace of Westphalia to the Roman Catholic division of the empire. The elector of Mayence was at the head or president of the corpus catholicorum, which generally held its meetings in a convent of that city in which the diet happened to meet. The corpus catholicorum was extinguished by the abolition of the German empire in 1806.

CORPUS CHRISTI, the seat of justice of Nueces co., Texas, 178 m. s.e. of Austin; pop. '70, 2,140—288 colored. There is a good harbor, with steamboat communication with New Orleans, and considerable trade.

CORPUS CHRISTI, Oxford. This college was founded in 1516 by Richard Fox, bishop of Winchester, under a license from king Henry VIII. The statutes were issued in 1517. The foundation consisted of 20 fellows and 20 scholars; of whom the fellows were to be elected from the scholars, while the scholars were to be elected from certain specified counties. Two peculiarities marked this foundation. First, the usual rules of life and discipline were enforced with peculiar severity; and, second, the object of the college was expressly connected with the studies of the age. Classical literature was for the first time distinctly mentioned. The subjects of the lectures were enjoined to be, not the old routine of divinity and the two philosophies, but divinity, humanity, and Greek. Incessant industry in these pursuits was inculcated by the founder, and the fellows were even forbidden to accept the proctorship, lest the avocations of that office should interfere with their proper duties. The object and the stringency of these regulations called forth the celebrated encomium of Erasmus, that what Colossus was to Rhodes, what the Mausoleum was to Caria, that C. C. college would be to the kingdom of Great Britain. This prediction has hardly been fulfilled. The rules of the founder have been gradually set aside by acts of parliament, by custom, and by injunctions of the visitor. Of the three university lectureships contemplated by the founder, one was never founded at all, and the other two were merged in the college fellowships and tutorships. And, lastly, the college has suffered greatly from the severe restrictions imposed by statute upon the elections to fellowships. In virtue of the powers conferred by 17 and 18 Vict. c. 81, important changes have been effected by the college working in harmony with the commissioners. Both fellows and scholars are now elected without any restrictions as to place of birth. The fellowships are still 20 in number, value rather more than £300 a year. The college is now one of considerable eminence. Two of the fellowships are permanently attached to the two professorships of Latin and Jurisprudence, the professors being admitted honorary fellows of Corpus, and each receiving from its revenues a sum of £600 a year. The scholarships are 24 in number, tenable for five years, and of the annual value of £80, with rooms rent free; besides seven exhibitions recently instituted to be competed for annually by the commoners of the college. There are 22 benefices in the gift of this college; and in the year 1873, there were about 240 names on the college books.

COR'PUS CHRIS'TI, or BE'NET COLLEGE, Cambridge, was founded by two guilds or fraternities of townspeople—the guild of C. C., who had their prayers at St. Benedict church; and the guild of the Blessed Virgin, who prayed at St. Mary's. These were united in 1352, and a small college erected by them. Archbishop Parker added largely to the endowments of this college, and bequeathed to it his valuable manuscripts, amongst which are the only authentic manuscript copies of the 39 articles of the church of England. Of the 12 fellows, all except 4 must take holy orders. There are 31 scholarships, some of considerable value, given to the students who most distinguish themselves at the annual examinations. Among the eminent men of this college were Hugh Latimer, archbishops Parker and Tennison, Fletcher the dramatist, and Gough the antiquary.

CORPUS CHRISTI FESTIVAL, the most splendid festival of the Roman Catholic church. It was instituted in 1264, in honor of the consecrated host, and with a view to its adoration, by pope Urban IV., who appointed for its celebration the Thursday after the festival of the Trinity, and promised to all the penitent who took part in it indulgence for a period of from 40 to 100 days. The festival is chiefly distinguished by magnificent processions. In France, it is known as the *Fête Dieu.*

COR'PUSCLES, BLOOD. See BLOOD.

CORPUS'CULAR ACTION, and CORPUSCULAR PHILOSOPHY. See ATOM, *ante.*

CORPUS DELIC'TI, a criminal law term used in Scotland to signify the body or substance of the charge. Before a conviction can take place the fact libeled must be proved—e.g., before a man can be convicted of murder, it must be clearly made out that there was a murder; and it is this fact that is called the corpus delicti. See CRIMINAL LAW.

CORPUS DOCTRI'NÆ, collections of writings which were intended to have authority in the Protestant churches of Germany. The chief collection was *Corpus Philippicum,* containing the Apostolic, the Nicean, and the Athanasian creeds, the Augsburg confession, and Melanchthon's *Loci Communes.* This, and similar collections were superseded by the *Formula Concordiæ.*

CORPUS JURIS. See LAW, *ante.*

CORPUS JURIS CANON'ICI. See CANON LAW, *ante.*

CORRE'A DA SERRA, José Francisco, 1750–1823; a Portuguese politician and scientist, who was educated and took orders in Rome. With the assistance of the duke of Alafoès, he founded the Portuguese academy of science, in Lisbon, and was made perpetual secretary with the privilege of publishing its transactions without reference to censorship. He soon came in conflict with the church, through the inquisition, and fled to France, and afterwards went to England, where he became secretary to the Portuguese legation. In 1813, he came to New York; and in 1816, he was made Portuguese minister at Washington; in 1820, he was called home and made a member of the financial council, with a seat in the cortes. He ranked high as a botanist.

CORRECTION, House of, a prison for the reformation of petty offenders. See Prison, Reformatory.

CORRECTION of the PRESS. This is one of the most important of the many operations that every piece of printed matter must undergo before it is put into the hands of the reading public; and in every considerable printing establishment, it forms a special department executed by one or more functionaries, technically called "readers." The

'To rule the nations with imperial swdy, to impose terms of peace, to spare the humbled, and to rcush the proud, resigning itto others to describe the courses of theheavens, and explain the rising stars; this, to use the words of the poet of the Æneid in the apostrophe of Anchises to Fabius in the Shades was regarded as the proper province of a Roman. The genius of the people was even more adverse to the cultivtion of the physical sciences than that the European Greeks and seen we have that the latter left experimental philosophy chiefly in the hands of the Asian and African colonists. The elegant literature and metaphysical specutlations of Athens, her histories, dramas, epics, and orations, had a numerous host of admirers in Italy, but a *feeling* of indifference was displayed to the practical science of Alexandria. [This repugnance of the Roman mind at home to mathematics and physics, extending from the Atlantic to the IndianO cean, from Northern Britain to the cataracts of the Nile, annihilated in a measure all pure sciences in the conquered districts where they had had been pursued, and prohibited attention to them in the mother country.

Long, indeed, after the age of Ptolemy, the school in connection with which he flourished, remained in existence; &c.

1. A wrong letter. A line is drawn through the wrong letter, and the proper one written in the margin. After every mark of correction a line / should be drawn, to prevent its being confounded with any other in the same line. 2. A word or letter to be transposed. Where letters only are to be transposed, it is better to strike them out, and write them in their proper sequence in the margin, like a correction. 3. A *space* wanted. This mark is also used when the spacing is insufficient. 4. A space or quadrat *sticking up*. 5. Alteration of type. One line is drawn under the word for *italics*, two for SMALL CAPITALS, three for CAPITALS. 6. Correction or insertion of stops (*points*). 7. A word struck out, and afterwards approved of (Lat. *stet*, let it stand). 8. A turned letter. 9. An omission. 10. A letter of a wrong fount. 11. A word or letter to be deleted. 12. Alteration of type. 13. A new paragraph. This should be avoided as much as possible, as it causes great trouble and expense. 14. Insertion of a sentence. 15. A *space* to be removed or diminished. 16. A wrong word. This is struck out, and the proper one written in the margin. 17. When letters or lines do not stand even. 18. Mark for a hyphen or rule. 19. No new paragraph. This is also troublesome and expensive. 20. The manner in which the apostrophe, inverted commas, the star, and other references, and superior letters and figures, are marked.

immediate object of a corrector of the press, or "reader," is to observe and mark every error and oversight of the compositor, with a view to make the printed sheet a perfect copy of the author's manuscript. This is on the supposition that the manuscript itself is quite correct, which is seldom the case; and therefore the duty of a good reader extends to seeing that there are no inconsistencies in orthography, punctuation, abbreviations, etc., and in many cases to the verification of quotations, dates, and proper names. The duty of securing consistency in spelling and punctuation is especially important in the case of works on which several writers are employed, such as newspapers and cyclopædias. The corrector has also to direct his attention to the numbering of the pages; to the arrangement of chapters, paragraphs, and notes; to running titles, etc. It is part of his business to observe the mechanical defects of the work—defective types, turned letters, inequalities of spacing between words, sentences, and lines, crooked lines, and to secure symmetry in verses, tables, mathematical operations, and such like. In almost all cases, two proofs are taken, and in difficult works, such as those in foreign languages, tables, etc., even more. Lastly follows the revision, in which little more is done than seeing that the compositor has made all the corrections marked on the last proof. It is usual for the writer or author to reserve the correction of the second proof for himself.

In printing regular volumes, one sheet is usually corrected at a time; but where extensive alterations, omissions, or additions are likely to be made by writer or editor, it is more convenient to take the proofs in long slips, before division into pages. The corrections to be made are marked on the margin; and for this purpose an established set of signs or short-hand is used, understood by all printers, and which it is often useful to know. The specimen of a proof on the preceding page exhibits the application of most of these signs.

The thankless and monotonous business of a corrector or reader is more difficult than the uninitiated would believe. It requires extensive and varied knowledge, accurate acquaintance with the art of typography, and above all, a peculiar sharpness of eye, which, without losing the sense and connection of the whole, takes in at the same time each separate word and letter. After the invention of printing, the C. of the P. was executed by the publisher himself, or at least was intrusted to men of ability and learning, and often men of name. Robert Stephen (1526–59), and Plantin (1555–89), had recourse to publicity, hung out the successive sheets of their publications, and promised a reward to any one who would point out a typographical error. Some editions of particular works are held in high estimation from the care with which the press had been corrected. Among the most famous are those that issued from the press of Aldus Manutius in Venice, of which we may mention the works of Petrarch (1514), corrected by Pietro Bembo; Aristotle (1551–53, 6 vols.), corrected by the famous Greek scholar, J. B. Camotius; Lactantius (1515), and Suetonius (1516), corrected by J. B. Egnatius; Plato (1513), Athenæus (1514), and Gregory Nazianzene (1516), corrected by Marcus Massurus. The first edition of Homer was printed by Nerlius in Florence (1484, 2 vols.), corrected by Demetr. Chalkondylas. Robert Stephen of Paris himself corrected the numerous works that issued from his press; and Erasmus had a great name as a corrector.

CORREG'GIO, a t. of northern Italy, province of Reggio nell' Emilia, midway on the railway between Parma and Modena; pop. 2,700. It is very handsome, regularly built, and has a castle, a cathedral, and a theater. It was a barony of the lords of Correggio, who were great patrons of letters. It is the birthplace of the painter Antonio Allegri surnamed Correggio; and of the engraver Jesi, etc.

CORREG'GIO, ANTONIO ALLEGRI, a celebrated Italian painter, called C. from the place of his birth, a small town near Modena, now called Reggio. He was born in the year 1493–94, and his father, a tradesman of some property, had him carefully educated, and instructed in the rudiments of art, by an uncle, Lorenzo Allegri, a painter of small merit. How much he owed to his teacher is uncertain. He was the first among the moderns who displayed that grace and general beauty and softness of effect, the combined excellences of design and color with taste and expression, for which he is still unrivaled. His chiar-oscuro is perfect. Almost before he had seen the great masters, he became a master in a style all his own; and was the founder, or rather his imitators for him, of what is called by some the Lombard, by others the Parma school of painting. On first beholding, at Bologna, Raphael's glorious picture of St. Cecilia, he is said to have exclaimed: "Anch'io sono pittore" (I, too, am a painter). But this story is doubted.

There was long a tradition that C. lived in indigence, unaided but by his own genius; and it is remarkable that Vasari, who lived at the same time, in his *Lives of the Painters*, records only vague rumors regarding C.'s life; and that Annibale Caracci, fifty years after his death, writes: "I rage and weep to think of the fate of this poor Antonio: so great a man—if, indeed, he were not rather an angel in the flesh." This belief, so prevalent in his own day, now refuted by recent researches, proves how retired and simple must have been his life. That he was in high estimation in his later days, is proved by his signature being found affixed to the deed of marriage of the lord of Correggio, celebrated in 1533. C. died the following year, Mar. 5, 1534, in his 41st year, and is buried in the Franciscan convent of Correggio.

At the age of 18, C. painted an altar-piece, the "Madonna di San Francesco," now

in the Dresden gallery, which is rich in pictures by C.; the most famous of which are the "Notte" (Night), lighted only by the celestial splendor beaming from the head of the infant Saviour—Vasari calls it "quite wonderful"—and the famous "Magdalen," one of the most admired pictures in the world. For the cupola of the church San Giovanni at Parma, he painted an "Ascension" in fresco, and over the high-altar a "Coronation of the Virgin," now only known through copies and engravings. He also decorated elaborately in fresco the cathedral there, for which he received 1000 ducats, worth about £3,500. In the Louvre are two pictures—the "Marriage of St. Catharine," and the "Antiope;" in the Florence gallery, three—one the "Madonna on her knees adoring the Infant;" in the Naples gallery, three—one a lovely Madonna, called, from its oriental character, "La Zingarella" (the Gypsy), said to be a likeness of C.'s wife; at Vienna, two; at Berlin, three; at Parma, five—the most celebrated is the "St. Jerome;" and in the British national gallery, a Madonna, known as the "Vierge au Panier," the "Education of Cupid," and the famous "Ecce Homo," purchased by the British government for £11,500.

CORREG'IDOR is the name given in Spain to the principal magistrate of a town. He is appointed by the king. The C. is also a Portuguese functionary, but, unlike his Spanish brother, does not possess the double power of governing and administering justice, but only the latter.

CORRELA'TION OF PHYSICAL FORCES. See FORCE.

CORREZE, a department of France, formed out of part of the old province of Limousin, and taking its name from an affluent of the Vezère, the Corrèze, which traverses the department from n.e. to s.w. C. extends between lat. 44° 55' and 45° 40' n., and long. 1° 13' and 2° 22' e.; its total area is nearly 2,300 sq.m., and its pop., in 1876, 311,525. The chief rivers of C. are the Dordogne, the Vezère, and the Corrèze. The surface of the department is mountainous, especially in the n. and e., where it is broken in upon by offsets from the Auvergne mountains, which, in some parts, attain a height of 4,000 ft. above the sea. The lower slopes are clad with forests, but the district is in general sterile. In the s. and s.w., however, the soil yields wheat, oats, barley, rye, maize, etc. Wine is also produced, but of poor quality. The rural population are poor, badly housed and fed; their food consisting, to a great extent, of chestnuts, which are very abundant. Minerals, particularly coal, iron, lead, alabaster, and granite of various colors, are found in considerable quantities. The department is divided into the three arrondissements of Tulle, Brive, and Ussel. Tulle is the chief town.

COR'RIB, LOUGH, a lake, the third in size in Ireland, in the n. of Galway. It is of very irregular shape, 27 m. long from n.w. to s.e., and 1 to 6 broad, with an area of 68 sq.miles. It is between 28 and 31 ft. above the sea-level. From its s. end, 4 m. n. of Galway, it discharges its surplus waters by Galway river into Galway bay. It receives the waters of Lough Mask, at its n. end, through the Pigeon Hole and other caves, as well as those of the Clare and other smaller rivers. On its sides are metamorphic rocks, carboniferous limestone, and marble. Near it are many monumental heaps and so-called Druid circles. It contains many islets, and to the w. are mountains 3,000 ft. high.

COR'RIDOR is a gallery or passage running (It. *correre*, Sp. *correr*, to run) or leading to several rooms, each of which has a door opening into it. Spacious corridors are necessary in all public buildings, such as hospitals, prisons, etc.

CORRIE, DANIEL, 1777–1837; a native of England, who was appointed archdeacon of Calcutta in 1823, and bishop of Madras in 1835. He was a laborer in missions with Buchanan, Martyn, Heber, and Turner. He translated prayers, homilies, and other religious works into Hindustanee, and made an ancient history in English for schools in India.

CORRIEN'TES (in English, *currents*) is a name of various application in Spanish America. Besides indicating several capes in Cuba, Mexico, and New Granada, it is more conspicuously connected with one of the states of the Argentine Confederation and with the capital of the same. 1. C., the city, stands in lat. 27° 27' s., and long. 58° 46' w., near the confluence of the Parana and the Paraguay. It takes its name from the rapids, which are said to be as decidedly a turning-point in the climate of the country as in the navigation of the river. Pop. 11,000. 2. C., the province, lies between Entre Rios on the s., and the republic of Paraguay on the n., having the Parana on the n. and west. Lat. 27° to 30° s., and long. 57° to 59° west. Area about 60,000 sq.m.; pop. '69, 129,023. The north is undulating and fertile; and the south, besides being generally swampy, is partly covered by lake Thara. The products are maize, cotton, sugar, indigo, tobacco, and a species of silk.

CORRIEVREK'IN, or CORRYBRECH'TAN, or gulf of Brechan, a whirlpool or dangerous passage a mile broad, off the w. coast of Argyleshire, in the strait between Scarba and Jura isles. It is occasioned by the meeting of tides (often running 12 or 14 m. an hour) from the n. and w., in the narrow passage into the sound of Jura, round a pyramidal rock, which rises with rapid slope from a considerable depth to some fathoms from the surface. This rock forces the water in various directions. In stormy weather,

at flow-tide, vast openings foam in the water, immense bodies of water tumble headlong as over a precipice, then rebounding from the abyss, dash together and rise in spray to a great height. The noise is heard over the isles around. The water is smooth for half an hour in slack-water.

COREO'SIVE SUBLIMATE, the popular name of bichloride of mercury (q.v.).

COR'RUGATED IRON (Lat. *ruga*, a wrinkle). Common sheet-iron, and what is improperly called "galvanized iron" (i.e., sheet-iron coated with zinc by immersion in a bath of the fused metal), have of late been made available for many useful purposes, by virtue of the great additional strength imparted to the sheets by corrugation, which is merely an application to metallic substances of the old contrivance of "goffering or crimping," by means of which the frills of the olden time were made to keep their shape.

The sheets of metal are passed between rollers, the surfaces of which are formed into rounded grooves and ridges, the ridges of one roller filling the grooves of the other. The metal in passing between these is compressed into a waving form, or corrugated. It will be easily understood that a piece of sheet-metal, of given size and thickness, if rolled up to form a tube, will resist a much greater bending strain than when flat. Now the curves of the corrugation may be regarded as a series of half-tubes, and the additional strength is due to the application of the same principle. See STRENGTH OF MATERIALS. Walls and roofs of temporary buildings are now extensively made of this material. Railway sheds, emigrants' houses, temporary churches, store-rooms, and sheds for dock-yards, etc., are among the common applications. Mr. Francis, of New York, has applied the principle to the construction of light boats, the strength of which, and their power of resisting violent blows, such as boats are subject to on landing through a surge, is said to be remarkably great. On this account, they are proposed to be used for life-boats, ships' boats, etc. They are made by stamping the metal in enormous dies, of the shape and size of the boat, and grooved for the required corrugations. Small boats thus constructed require no internal bracings, the requisite rigidity and strength being given entirely by the corrugations.

CORRUPTION OF BLOOD. See TREASON.

CORRUPTION OF JUDGES. See JUDGE.

CORRUPT PERJURY. See PERJURY.

CORRUPT PRACTICES ACT. The laws relating to bribery, treating, and undue influence at elections of members of parliament, were consolidated and amended by 17 and 18 Vict. c. 102 (10th Aug., 1854), which was continued and amended by 21 and 22 Vict. c. 87 (2d Aug., 1858). Both of these statutes were further continued till 10th Aug., 1860, by 22 and 23 Vict. c. 48 (13th Aug., 1859); and till 10th Aug., 1861, by 23 and 24 Vict. c. 99.

Additional legislation on this very troublesome subject has been attempted in almost every session of parliament. See PARLIAMENT.

CORRY, a city in Erie co., Penn., an outgrowth of the great petroleum speculation, situated at the crossing of the Atlantic and Great Western, and Philadelphia and Erie railroads, and at the terminus of other roads in the oil region; pop. '70, 6,809. There are manufactories, and general business; but its establishment and prosperity are due to the discovery of oil, or petroleum. It was chartered as a city in 1866.

COR'SAC, *Canis* or *Cynalopex corsac*, an animal of the dog family (*canidæ*), found in the deserts of Tartary and in India. In size, it resembles a small fox, but is more slender in body and limbs; it has long and pointed ears, a bushy tail, and is of a reddish or yellowish color; the form of the head resembles that of the fox. It lives in large communities, burrows, prowls during the day, and not during the night like foxes, and is believed to feed chiefly on birds and their eggs, but not to object even to insect food. There are several Asiatic species closely allied to this.

COR'SAIR (Ital. *corso*, a race), a pirate or sea-robber, but generally limited in its application to the pirates who in former times sailed from Algiers, Tunis, Tripoli, and the ports of Morocco, and were the terror of merchantmen in the Mediterranean and the neighboring parts of the Atlantic ocean.

CORSE'LET was the body-covering of pikemen. The C. was made chiefly of leather, and was pistol-proof.

COR'SICA, an island in the Mediterranean, separated from the island of Sardinia by the strait of Bonifacio on the s., and situated in lat. 41° 20′ to 43° n., and long. 8° 30′ to 9° 30′ east. It forms the French department of Corse, and has an area of 3,350 sq.m., with a pop., in 1876, of 262,701. The greater portion of the island is occupied by ranges of rugged mountains, the highest being Monte Rotondo (ancient *Mons Aureus*), 9,068 ft. high, and covered with perpetual snow. There are several rivers in the island, the largest of which, having their source in Monte Rotondo, are the Tavignano (ancient *Rhotanus*) and the Golo (ancient *Tavola*). They flow into the sea on the e. coast; the Golo is navigable for boats. Several small rivers, most of which are dry in summer, flow westward into the sea. The soil is generally fertile in the valleys, yielding all kinds of cereals, and much wine is produced. Olive, orange, fig, almond, and other

fruit-trees flourish; fruit forming a considerable item in the exports. But C. is chiefly celebrated on account of its magnificent forests of oak, pine, chestnut, beech, larch, cork, etc. Many of the pines are upwards of 120 ft. high, and are much used for masts in the French navy. The chestnut forests are particularly fine, and the fruit serves as an important article of food for the inhabitants. Prickly-pear, arbutus, myrtle, etc., abound. Iron, lead, black manganese, antimony, marble, and granite of beautiful quality, are found on the island, but these sources of wealth are not developed. Sheep of a peculiar black breed, with four and occasionally six horns, goats, and pigs are numerous, and the rearing of cattle is carried on to a great extent. Tunny, pilchard, and anchovy abound along the coast. C. is divided into the five arrondissements of Ajaccio, Bastia, Calvi, Corte, and Sartene. Ajaccio is the capital. The language spoken in C. is a corrupt Italian. The Corsicans are great *improvisatori;* valor, love of freedom, and desire of revenge are their principal characteristics.

In early times C. was known as *Cyrnos*, although its native name is said by some historians to have been the same as that it now bears. As early as 564 B.C., a colony of Phocæans had founded a city on its e. coast. After successive changes of Carthaginian, Roman, Vandal, Greek, and Gothic rulers, it came in the 8th c. into the hands of the Saracens, who held it until the beginning of the 11th c., when it fell under the dominion of Pisa. It afterwards passed to the Genoese, who held it until 1755, when the Corsicans under gen. Paoli made themselves in great part independent. The French, to whom the Genoese surrendered the claims they themselves could not maintain, captured it in 1768; since which time, with slight intermission, it has remained in the possession of France.

CORS'NED, or morsel of execration, was a piece of cheese or bread made use of in early times with a view to ascertain whether persons suspected of any crime were guilty or innocent. The C., according to Blackstone, "was consecrated with a form of exorcism, desiring of the Almighty that it might cause convulsions and paleness, and find no passage, if the man was really guilty, but might turn to health and nourishment if he was innocent." In this mode of divination, barley-bread appears to have had the preference. It was one of the many forms of ordeal (q.v.).

COR'SO (literally, course or running) is an Italian word used to express not only the racing of horses (without riders), but also the slow driving in procession of handsome equipages through the principal streets of a town, such as almost always takes place in Italy on festivals. This custom has given a name to many streets in almost all the larger towns of Italy. The best known of these is the C. in Rome, which is the scene of the celebrated diversions of the carnival.

CORSSEN, WILHELM PAUL, 1820–75; a German philologist, a native of Bremen, educated in the university of Berlin, and professor in the Stettin gymnasium. He published *The Pronunciation, Vocalization, and Accentuation of the Latin Language*, which is considered to be the best work thus far published on the subject. At the time of his death he was engaged on the second volume of an elaborate work on the Etruscan speech.

CORT, CORNELIS, a famous Dutch engraver, was b. at Hoorn, in 1536. In 1572, he went to Venice, and was hospitably received there by Titian. Being less of a painter than of an engraver, he seems very soon to have been employed by the great Venetian colorist for the reproduction in copper-plate of some of his master-pieces, and it appears he did it so well, that he afterwards engraved for Tintoretto and other Venetian masters. C. next settled at Rome, where he erected an engraving school, and had among his pupils Agostino Caracci, and from this school sprang the most excellent Italian and Venetian engravers. C.'s works had a favorable influence on the graver's art in the Netherlands. He died at Rome in 1578. His engravings, considering his short life of 42 years, are very numerous, amounting to more than 150.

COR'TE, a t. in Corsica, on the Tavignano, 35 m. n.e. of Ajaccio; pop. '66, 6,094. Paoli, a native of the place, established and endowed here in 1836 an important school. There is also a communal college.

CORTE-REAL', the name of a noble Portuguese family. In 1500, Gaspard Corte-Real landed on the Labrador coast and stole some of the natives, whom he took to Portugal and sold for slaves. He went the next year for another cargo, but never returned. Then his brother Miguel set out to find him, and he never returned. Then the king of Portugal sent two ships to find them, but nothing could be learned of their fate. A third brother, Vasco, intended to make a search, but was prevented by the king. The family produced one poet, Jeronymo, who also was a sailor.

COR'TÉS is the name given in Spain and Portugal to the assembly of representatives of the nation. As one district of Spain after another was recovered by the Christian princes from the Moors, there arose in each a corporation composed of the different "states" or orders of the population, limiting the power of the princes. From the union of several of these territories were formed the two leading kingdoms of Castile and Aragon, having each its C., representing the clergy, the nobility, and the cities. In Aragon, the C. appointed a judge, *el justicia*, who decided disputes between the king and his subjects, and confined the royal power within constitutional limits. In Castile the

rights of the burghers were less extensive than in Aragon, but in both states the king was dependent on the Cortes. After the union of Castile and Aragon under Ferdinand and Isabella, the crown succeeded in making itself less dependent on the C., whose power and privileges were gradually encroached upon, until at last they were seldom assembled except to do homage or to sanction an arrangement as to the succession to the throne. After 1713, they did not meet till 1789, on the accession of Charles IV. In 1809, the C., as composed in 1789, was assembled by the Junta, and framed a new constitution, called the constitution of 1812, which, however, was set aside at the restoration. Endless attempts at restoration and modification of the Spanish C. have since been made, without any happy result. See SPAIN.

The history of the Portuguese C. is very similar to that of the Spanish. In 1826, Dom Pedro promulgated a new constitution after the model of the French, calling the C. again into life, and abdicating at the same time in favor of his daughter, Maria da Gloria. This constitution was set aside during the usurpation of Dom Miguel, but was finally restored in 1842.

COR'TÉS, HERNAN, the daring conqueror of Mexico, was b. in 1485, at Medellin, a village of Estremadura, Spain. He was educated for the law, but afterwards adopted the profession of arms; and in 1511, distinguished himself under Diego-Velasquez in the expedition against Cuba. In 1518, the conquest of Mexico was intrusted to him by Velasquez, who was then governor of Cuba; but the latter had no sooner granted him the commission than he wished to revoke it, fearful that his dashing and sagacious lieut. would deprive him of all the glory of the enterprise. C., however, maintained his command in defiance of the governor. Never, perhaps, was an enterprise so great undertaken with so little regard for its difficulties and dangers. A force of between 600 and 700 men, only 13 of whom were musketeers, with only 10 field-pieces and two or three smaller pieces of cannon, were all the means at C.'s disposal to effect the conquest of the then extensive empire of Mexico, when, early in 1519, he landed on its shores. Sailing up the river Tabasco, C. captured the town of that name, the prowess of the Spaniards occasioning great terror to the Tabascans, who made liberal presents to the white men, and volunteered all the information about Mexico in their power. Arriving off the coast of San Juan de Ulloa, C. was here visited by some Mexican chiefs, with whom he entered into negotiation regarding a visit to Montezuma, who then ruled with nearly absolute sway over Mexico. Montezuma sent C. rich presents, but objected to his visiting the capital. But C. had resolved upon seeing the emperor in his palace, and was not to be daunted by opposition. Having founded the town of Vera Cruz, and burnt his ships, so that his troops could not return, and must, therefore, conquer or perish, C., with a force reduced to 400 Spaniards on foot and 15 horse, but with a considerable number of Indian followers, lent him by dissatisfied chiefs dependent on Montezuma, marched upon the capital. Overcoming the Tlascalans, a brave people, on the way, who after became his firm allies, and taking fearful vengeance on the city of Cholula, where, by Montezuma's orders, a treacherous attempt was made to massacre his troops, C. on the 8th Nov., 1519, reached the city of Mexico with his little band, and was received with great pomp by the emperor in person. The Spaniards were regarded as those descendants of the sun who, according to a current prophecy, were to come from the east and subvert the Aztec empire—a tradition that was worth a good many soldiers to Cortes. An attack on C.'s colony at Vera Cruz by one of Montezuma's generals, however, proved the mortality of the Spaniards, and would have been the ruin of them but for the decisiveness of C., who immediately seized the emperor, and carrying him to the Spanish quarter, forced him to surrender the offending general and three other chiefs, whom he caused to be burnt in front of the palace, and ere long compelled him formally to cede his empire to Spain. One has nothing but astonishment for this man, whose daring acts in the capital city of the empire, containing, it is calculated, 300,000 inhabitants, had nothing but 400 Spaniards, and a few thousand Indians, whom he had recently conquered, to support them. Meanwhile Velasquez, enraged at C.'s success, sent an army of about 1000 men, well provided with artillery, to compel his surrender. C. unexpectedly met and overpowered this force, and secured its allegiance. But in his absence the Mexicans had risen in the capital, and C. was finally driven out with much loss. During the disturbance, Montezuma, who was still kept a prisoner, appeared on a terrace with the view of pacifying his people; but he was wounded by a stone, an indignity against his kingly person which he took so much to heart that he died in a few days. C. now retired to Tlascala, to recruit his fatigued and wounded men; and receiving reinforcements, he speedily subjugated all Anahuac to the e. of the Mexican valley, and soon marched again on the city of Mexico, which he succeeded in capturing (Aug. 16, 1521) after a siege of four months, ended by a murderous assault of two days. Famine had assisted the Spanish arms, so that of the vast population only about 40,000 remained when the Spaniards entered the city, which lay in ruins, "like some huge churchyard with the corpses disinterred and the tombstones scattered about." Mexico was now completely subjugated, for though some attempts at revolt were afterwards made, they were soon crushed by C., who had been nominated governor and capt. gen. of the country by Charles V. In 1528, C. returned to Spain, to meet some calumnies against him, and was received with great distinction. On his return to Mexico in

1530, however, he was divested of his civil rank. At his own expense he fitted out several expeditions, one of which discovered California. In 1540, he came again to Spain, but was coldly received at court, from which he soon retired, and died at Seville, Dec., 1547.

CORTLAND, a co. in central New York, intersected by the Syracuse and Binghamton and the Southern Central railroad; 480 sq.m.; pop. '75, 24,454. There is iron ore in some places, but agriculture is the chief business, the production of cheese, butter, and maple sugar being prominent. Co. seat, Cortland.

CORTLAND, a village and seat of justice of Cortland co., N. Y., on the Syracuse and Binghamton railroad, 36 m. s. of Syracuse; pop. of township, '75, 6,184.

CORTO'NA, a t. of central Italy, about 50 m. s.e. of Florence. It is beautifully situated amid vineyards on a hill rising from the fertile valley of the Chiana, and commanding a view of the lake of Perugia (anc. *lacus Trasimenus*). The city is of fabulous antiquity, older, it is said, than Troy; and the Cyclopean walls, erected by the Pelasgians—which in many parts remain unchanged—prove, if not a history quite as old as tradition affirms, at all events one second in remoteness to few places in Italy. It was one of the most powerful of the twelve cities forming the Etruscan league. By the Romans, who settled a colony here about the time of Sulla, it was called *Corythus*. After many vicissitudes during the middle ages, the town became subject to Florence in the 15th century. Besides the walls, there are several objects of Etruscan antiquity at Cortona. The modern town contains above 3,900 inhabitants. Among the principal buildings are the cathedral, dating from the 10th or 11th c., with some fine paintings and monuments, the churches of Jesus, St. Francesco, and others. The Etruscan academy has its seat here, the museum connected with which contains a multitude of Etruscan sarcophagi, vases, etc. C. has a trade in wine and olives, and fine marble is found in the vicinity.

CORTONA, PIETRO BERRETTINI DA, 1596–1669; an Italian architect and painter employed by Urban VIII. to decorate a chapel and to execute the frescoes on the ceiling of the grand salon of the Barberini palace, which, with others from his hand, are among the most remarkable specimens of decorative art of the period. The church of Santa Maria del Pace in Rome was his best architectural work.

CORU'NA (English, *Corunna*), a fortified seaport of Spain, situated on a small headland in the Atlantic, formed by the three bays of Betanzos, Coruña, and El Ferrol, about midway between capes Finisterre and Ortegal, in lat. 43° 22′ n., long. 8° 22′ west. C., which is a thriving place, is built partly on the slope and partly at the foot of a hill, and is divided into the upper and lower towns, the former being the most ancient. The lower town, which was formerly inhabited chiefly by fishermen, is now more important than the upper. It is well built, chiefly of granite, and some of its streets are broad and well paved. There are few public buildings of any note in Coruña. A citadel defends the town, and the harbor, protected by forts, is safe and commodious. In 1871, 356 vessels, with an aggregate tonnage of 34,927 tons, entered, and the same number and tonnage cleared the port. During the same year, the value of cargoes amounted to £119,260. Pop. 23,500. C. dates its origin from the Phœnicians, from whom it was taken by the Romans in the 1st c. B.C. For Englishmen, great historical interest attaches to Coruña. Here, in 1386, John of Gaunt landed to claim the crown of Castile in right of his wife, daughter of Pedro the cruel; in 1554, Philip II. embarked here for England to marry queen Mary; and in 1588, the great Spanish armada, which had been refitted at this port, set sail for the conquest of England. But C. is best known in connection with the death of sir John Moore, who, as a fitting conclusion to his memorable retreat, with about 14,000 men defeated (Jan. 16, 1809) on the heights of Elvina, behind C., 20,000 French under Soult. Moore, who was mortally wounded in the action, was buried on the ramparts in his military cloak. A monument, erected by the British government, marks the place of his burial.

CORUN'DUM, a mineral consisting essentially of mere alumina, yet of great specific gravity—about four times that of water—and of remarkable hardness, being inferior in this respect only to the diamond. Mineralogists regard the sapphire as a variety of C., and along with it the gems popularly known as oriental ruby, oriental topaz, oriental emerald, and oriental amethyst; but the name C. is more usually limited to the coarser varieties, to which it is applied by the natives of India. These, instead of exhibiting the brilliancy of gems, are in general of a dull and muddy appearance, and the crystals—which are usually six-sided prisms, and six-sided pyramids—are externally dull and rough. The color is various, often green, blue, or red, inclining to gray. The variety called *adamantine spar* is of a hair-brown color and adamantine luster. Some corundums—known as *asteria sapphires* or *star sapphires*—when cut in a particular manner, exhibit an opalescent star of six rays. C. is found in many parts of the world, and has long been used in India for polishing all gems except the diamond, which is too hard for it, and also for polishing the stones used in temples and other buildings. Emery (q.v.), so well known as a polishing substance, is a variety of corundum.

CORUNNA, a province of Spain, in Galicia, forming the extreme n.w. corner of the kingdom, bordering on the bay of Biscay and the Atlantic ocean; about 3,000 sq.m.; pop. '70, 630,504. It has a sinuous and rugged coast, and is traversed by mountain

ridges, between which run a number of small rivers. Much of the province is still woodland, and wild boars infest the original forests. Iron, silver, copper, and coal are found. There is a moderate degree of agriculture. The chief town is Corunna.

CORVEI (*Corbeia Nova*), a Benedictine abbey on the Weser, near Höxter, the oldest and most famous in early Saxony, founded in the beginning of the 9th century. It was a colony from the monastery of the same name in Picardy, then part of the country of the West Franks. It received rich endowments; was the center of great agricultural improvement and prosperity during the earlier part of the middle ages; and the seat of a school, founded by Ansgar, the apostle of the north, which flourished greatly in the 9th and 10th centuries, and was next in reputation to Fulda. Its abbots were numbered amongst the spiritual princes of the German empire. In 1794, it was made a bishopric by Pius VI. Its territory then extended to about 22 sq.m., with 10,000 inhabitants. In 1803, it was annexed to Nassau, from which it was transferred in 1807 to Westphalia, and in 1815 to Prussia. In 1822, the lands belonging to the ancient abbey passed into the hands of count Victor Amadeus von Hessen-Rheinfels-Rothenburg, which were formed into a mediate principality of the Germanic empire. The church of the abbey is built in the Gothic style, very magnificently adorned in the interior, and contains a multitude of monuments of successive dynasties. The library and archives of the cloister, which contained most valuable records of the early ages of German history, have all been destroyed—the authenticity of the *Chronicon Corbejense*, an alleged record of this abbey from its foundation to the end of the 12th c., being doubtful.

CORVETTE', is a flush-decked vessel, ship-rigged, but without a quarter-deck, and having only one tier of guns.

COR'VIDÆ, a family of birds of the order *insessores*, tribe *conirostres*, having a strong bill, compressed towards the point, and covered at the base with stiff, bristly feathers, which advance so far as to conceal the nostrils. The plumage is dense, soft, and lustrous, very generally dark, but sometimes of gay colors, more particularly in the tropical species. The birds of this family are widely diffused over the world. They are generally birds of strong and rapid flight; some of them are solitary, some gregarious in their habits; some reside in woods, some in moors and wastes, some on sea-coasts, etc. They are very omnivorous. They are also remarkable for their intelligence, their prying curiosity, and their disposition to pilfer and secrete glittering articles. Besides the crows, raven, rook, and jackdaw, which belong to the genus *corvus*, the magpie, jay, chough, and nut-cracker are included among the C. of Britain.

CORVINUS, MATTHIAS. See MATTHIAS CORVINUS, *ante*.

COR'VO, the most northerly of the Azores, is the smallest among the inhabited islands of the group. It measures only 6 m. by 3, the latitude of its southern point being 39° 42' north. It is of volcanic origin, and has, in an exhausted crater, a small lake 1277 ft. above the sea. With a fertile soil and a delicious climate, C. contains barely 1000 inhabitants, and these generally poor.

CORVUS, M. VALERIUS, a general of the early Roman republic, b. about 370 B.C. He was twice dictator and six times consul, and occupied the curule chair 21 times. He defeated the Gauls, the Volsci, the Samnites, the Etruscans, and the Marsi. He lived to be 100 years old.

COR'WEN, a t. in North Wales, in the n.e. of Merionethshire, situated on the right bank of the Dee, 10 m. w. of Llangollen. It is sheltered by a rock at the foot of the Berwyn mountains. Pop. of parish '71, 2,464. Here the Welsh under Owen Gwynedd defeated Henry II., and afterwards under Owen Glyndwr defeated Henry IV.

CORWIN, THOMAS, 1794–1865; b. Ky.; a lawyer, practicing in Ohio, where his eloquence soon made him politically prominent. He was a leading member of the whig party, and a member of congress in 1830. In 1840, he was chosen governor of his state; in 1845, elected to the U. S. senate, where he made a powerful speech against the proposed war with Mexico. In 1850, he was secretary of the treasury; in 1858, again a member of congress; and in 1861, minister to Mexico. He was a man of great force of character.

CORYBAN'TES, priests of Cybele, in Phrygia, who celebrated her worship by dressing in full armor and performing loose dances to the music of flutes and cymbals. It is said that under the influence of the music and the dance they became insane, and were supposed to be possessed by spirits. In Rome the priests of Cybele were called Galli.

CORYDAL'IS. See FUMARIACEÆ.

CORYELL, a co. in central Texas on Leon river; 960 sq.m.; pop. '70, 4,124—279 colored. The surface is rolling or hilly, with timber-land and prairie. Stock-raising is the principal business. Co. seat, Gatesville.

CORYGAUM', an insignificant village in the presidency of Bombay, is historically interesting in connection with the final subjugation of the Peishwa of the Mahrattas. On 1st Jan., 1818, it was defended for nine hours by a mere handful of men under capt. Staunton against a native force numbering at least 3,000 infantry and about 20,000

cavalry, the struggle terminating in the repulse of the assailants after terrible slaughter. C. stands 16 m. to the n.e. of Poona, in lat. 18° 39′ n., and long. 74° 8′ east.

CORYLA'CEÆ. See CUPULIFERÆ.

COR'YLUS. See HAZEL.

COR'YMB, in botany, a form of *indefinite* and *centripetal* inflorescence, in which the flowers are arranged as in a raceme (q.v), but the lower flower-stalks are elongated so as to bring the flowers almost to the level of those of the upper. The C. is a very common form of inflorescence.

CORYMBIF'ERÆ. See COMPOSITÆ.

CORYM'BUS (Gr. *korumbus*), the particular mode of dressing the hair among the Greeks, with which the statues of Venice have rendered us familiar. The hair was often covered with a sort of open ornamental work.

COR'YPHA. See FAN PALM, GEBANG PALM, and TALIPAT PALM.

CORYPHÆ'US (from Gr. *koruphe*, a summit), the leader of the chorus in ancient Greece. The name is now used to signify those of the highest distinction in any art or science. In the Italian opera the choir-leader is called the *corifèo;* in French, *coryphée.*

COR'YPHENE, *Coryphæna*, a genus of fishes of the family *scomberidæ*, to which the name DOLPHIN, properly belonging to a genus of *cetacea*, has by some mistake been popularly transferred. The coryphenes are remarkable for the beauty and metallic brilliancy of their colors, which delight the spectator as they are seen gliding with extreme rapidity near the surface of the water, gleaming in the light of the sun; and the changes of which, as they lie dying on the shore or on the deck of a vessel, have acquired a peculiar poetic celebrity. They have an elongated compressed body, covered with small scales, the head rising in a sharp crest, the mouth large. They are natives of the seas of warm climates, and some species are found in the Mediterranean, among which is the *C. hippuris*, the largest known, attaining a length of 5 feet. This and some of the other species are often seen playing around ships; and great interest is occasionally awakened by their pursuit of shoals of flying-fish. In this chase, a C. may be seen to dart completely out of the water, making a leap of 10 yards or more. Capt. Basil Hall likens the velocity to that of a cannon-ball. The C. is often caught by sailors, with a glittering bit of metal instead of a bait.

COS (more anciently Meropis), an island of the Grecian archipelago belonging to Asiatic Turkey. Its modern name is Stanko or Stanchio. C. has a length of 23 m., with a breadth of 5, and a pop. of from 20,000 to 30,000, the half of whom are Greeks; the other half being Turks and Jews, who congregate in the towns. On the eastern side of the island a range of hills extends along the coast, from cape Fonka on the n., to point Korkilo on the s.; but with this exception, C. consists mostly of delightful and fertile plains, which are well cultivated. S. of these plains, on which stands the principal town, of the same name as the island, rises a high mountain range, which, from its jagged summit, is called mount Prion—the "sawing" mount, or sierra. There are many mineral springs on the island. The exports consist principally of raisins, lemons, salt, and grain. They amount annually to about £50,000. The chief imports are oil, soap, butter, butcher-meat, and English manufactures. The climate in general is pretty healthy. Many ancient Greek remains are scattered over the island. The chief town, Comopolis or Cos, is situated on the n.e. coast. It is built on the ruins of the ancient city of the same name; and in the center of the chief street is a gigantic palm-tree, said to have stood there before the Christian era. To the n.w. is an old fortress of the knights of St. John. The harbor is small, with only about 6 ft. of water in it. The inhabitants are employed chiefly in agriculture. Modern Greek is the language spoken. In early times C. was sacred to the worship of Æsculapius. It was the birthplace of Ptolemy Philadelphus, of the painter Apelles, and the physician Hippocrates.

COSCIN'OMANCY, a species of divination practiced from the earliest times by means of a sieve (Gr. *koskinon*) and a pair of shears or forceps. It appears to have been chiefly employed for the discovery of thieves. The sieve was supported or suspended by means of the shears, in some way not easily understood; a certain mystical form of words was then used, and the names of the suspected persons being mentioned in succession, at the name of the thief the sieve moved or turned round.

COSEN'ZA, a province in Calabria, s. Italy, between the gulf of Tarento and the Mediterranean; 2,841 sq.m.; pop. 440,468. The region is mountainous, being traversed by the Apennines down to the sea. The vine, the olive, silk, and fruits are cultivated.

COSEN'ZA, a t. of Italy, capital of the province of the same name, about lat. 39° 20′ n., long. 16° 15′ east. It is situated 12 m. e. of the Mediterranean, in a mountain-inclosed valley at the confluence of the Crati and the Busento, the waters dividing the town into two parts. The lower town is much affected by malaria arising from the river marshes, but the upper town is tolerably healthy. It is the residence of the principal families, and contains some handsome buildings, including a cathedral, and an unusually fine court-house. The streets generally are narrow and crooked. C. has considerable industry, the principal articles of manufacture being silk, earthenware, and cutlery. Pop. about 15,000. Anciently, C., called *Consentia*, was a city of the Brutii. It was

captured by the Carthaginian general Himilco, and was forced to surrender (204 B.C.) to the Romans, who afterwards colonized it. Alaric the Goth died here 410 A.D., and is buried in the bed of the Busento. Area of province (formerly called Calabria Citra), 3,000 sq.m.; pop. '71, 440,468.

COSHOC'TON, a co. in central Ohio, on the Muskingum river and its tributaries, traversed by the Ohio canal, and the Pittsburg, Cincinnati and St. Louis railroad; 516 sq.m.; pop. '70, 23,600. The surface is hilly, and the soil is generally productive; wheat, corn, oats, butter, and wool are the chief productions. Co. seat, Coshocton.

CO-SINE, CO-TANGENT, etc. See TRIGONOMETRY.

COS'MAS, surnamed *Indicopleustes*, a merchant of Alexandria, who lived in the middle of the 6th c., and after having traveled much, returned to Egypt, where he spent the evening of his days in monastic retirement, and wrote a *Christian Topography* in 12 vols., in the Greek language, containing much information about many countries, and particularly about India. An attempt to reconcile everything to his notions of the meaning of the Bible has led him into many errors. The work (which, among other things, gives the first account of the *Monumentum Adulitanum*, see ADULE) has been edited by Montfaucon in the *Nova Collectio Patrum Græcorum*, vol. ii. (Par. 1707). C. wrote also a description of the plants and animals of India, which was published by Thevenot in his *Relations de Divers Voyages Curieux*, vol. i. (Par. 1663).

COSMETICS (Gr. *kosmeo*, I adorn) are chemical preparations employed for improving the appearance of the skin and hair. Several of the C. in use are comparatively harmless, such as perfumed starch and chalk; whilst others, such as *pearl white* (the subnitrate of bismuth), are more or less poisonous, and dangerous to use. At all times, the employment of C. is not to be commended, as the minute particles tend to fill up and clog the pores of the skin, and prevent the free passage of gases and vapors, which is so essential to the preservation of any animal organ in a thorough state of health.

COSMO DE' MEDICI. See MEDICI.

COSMOG'ONY (Gr. *kosmos*, the universe; *gonè*, generation) is the (so-called) science of the formation of the universe. It is thus distinguished from cosmography, which is the science of the parts of the universe as we behold it (a science embodied in the work of Humboldt, entitled *Cosmos*), and from cosmology, which reasons on the actual and permanent state of the world as it is. Geogony, which confines itself to the formation of the earth, and speculative geology, are but subdivisions of cosmogony.

Cosmogonists proper may be divided into two classes—the theistical, and the pantheistical. According to theistic C., the world of matter and order sprang at once into existence at the Omnific fiat. The chief speculations from this point of view, have of late been regarding the *date*, if the expression may be used, of the world's formation, and, looking to the facts of geology and astronomy, the precise condition of the cosmos when evoked; how much, in short, of the evolution, since the date, is attributable to the operation of secondary causes. The pantheists hold the universe, on the other hand, to be the very body and being of Deity, and as such to have been from all eternity. God is all things, and all things are God—a conclusion reached from pure *à priori* reasoning, and that seems to exclude all further inquiry.

Men of science, in modern times, stopping short of an actual C. or genesis of the world, have pushed their inquiries into the order of development of its present state, which they, or at least some of them, aver to have taken place from the first by the divine power exercised in the manner of natural law. They assume the existence of matter; and with them there is no proper beginning of things, but an eternal round, under fixed laws of growth and decay.

In cosmogonical speculations, heat, air, atoms with rotatory motions, numbers—all in turn have had the honor of being recognized as the fountain and causes of things. Latterly, there has been a tendency to dynamical hypotheses, not only of the formation of our own rotating globe, but of our system, and of all similar systems in space. Of these, the chief is that of Laplace, founded on observation of the mutual relations of the planets, their common direction in rotation and revolution, their general conformity to one plane, etc.; taken in connection with such facts as the rings of Saturn and the fundamental unity of the asteroids. Thus arose the Nebular Theory (q.v.), which at one time had a support from sir William Herschel's observations on the *nebulæ;* of which, however, the discoveries by lord Rosse's telescope in a great measure deprived it. Following up this view of a formation of the globes by natural causes, there have been speculations as to the commencement and progress of organic life upon them by similar means: these are to be found in the *Philosophie Zoologique* of Lamarck; the *Vestiges of the Natural History of Creation;* and in the work of Charles Darwin on the *Origin of Species by a Principle of Natural Selection;* all of which involve great differences of view among themselves, though all meeting in one point—an assimilation of the processes of creation to the ordinary natural course of things presumed to be arranged and conducted by the Deity.

COSMOG'ONY (*ante*), properly denotes the science of the world's formation, but, in the absence of knowledge, is applied to theories on the subject and even to mythical accounts. The views of the ancients in regard to it may be comprised in three classes.

1. That the world is eternal both in matter and form. Aristotle taught that heaven and earth, inanimate substances and living beings, had no beginning, but were the eternal effect of an eternal cause. Yet he believed that that cause was a spiritual substance; that God is an intelligent spirit, incorporeal, indivisible, immovable, the mover of all things; and that the world is an emanation from him rather than a creation by him. 2. That the matter of the world is eternal, but not its form. Asserting that from nothing nothing could come, many felt compelled to maintain that the world has always existed in some form. Yet the many evident changes equally compelled them to deny that any one form was eternal. The first forms, as they said, had a succession of variable movements which became regular by chance. The Greek poets, following the old mythological views, represent the universe as coming forth from chaos and darkness, without the action of God. Some philosophers ascribed all things to an infinity of atoms or indivisible particles, having form, size, and weight, existing from eternity, moving by chance, combining into a variety of substances, and changed in the progress of time into the present organization of things. The Stoics attributed the origin of all things to two principles which they called God and matter, yet regarded them both as corporeal, as they did not admit the existence of spiritual beings. 3. The third theory ascribes the origin of the world to a great spiritual creator. There are traces of it among the Etruscans, Magi, Druids, and Brahmans, who probably derived it by tradition from a primitive revelation. It was, to some extent, received among the Greeks and Romans. It is especially the doctrine of the Scriptures, which teach it with the supreme design of exhibiting the wisdom and power of God rather than of setting forth, with what we call scientific exactness, the modes and processes by which the worlds were formed. They employ common language as that which the most scientific and the most uncultured alike understand and use. And although their main design is not to teach physical science, yet, considered as the word of God, whenever they do speak concerning his works, they must speak the truth. That the harmony between the word and the works may appear, it is necessary that both should be fully understood. If either or both be incorrectly interpreted, contradictions necessarily appear. In the past, the interpretations of both have been either absolutely false or only imperfectly true. But as biblical and physical science, each in its own line, advance towards perfection, the harmony between them is seen to be great and wonderful.

The account at the opening of the Bible, as at present understood, sets forth the following points. 1. That the matter of the world had its origin "in the beginning" by the action of God. The word *bara*, translated "create," is used three times in the narrative, at its great transition points, with reference to the original *matter*, of *animal life*, and of man endowed with *spiritual life;* in all other instances, where processes of formation only are implied, another word, *asah*, translated "made," is used; and at the close both are joined together: "God *created to make*." 2. Matter in its primitive state is said to have been "without form and void;" both words have substantially the same meaning—*empty*, and by the repetition signify *very empty;* thus they supply the fit description of gaseous matter. 3. It is said that darkness prevailed unbroken. 4. That motion was imparted to the mass. The root of the word *te-hōm* signifies, revolving or circular motion, and the form of it denotes that to which such motion has been imparted. 5. The action of God's power on the mass. 6. Light diffused through the mass as one of the first results of motion. 7. Separation of light from darkness. Light, wherever existing, is called "day," and darkness, wherever remaining, is called night. This marked off the *first* period. 8. The *second* period was distinguished by the formation, not of a "firmament" (as the English translation has it, from the Latin *firmamentum*, and that from the Greek στερεωμα, all describing the heaven as a solid sphere), but of *an expanse*, as Moses says, giving a good expression for the atmosphere expanded around the world. The great idea of the second period's work is division or separation. This follows from motion as certainly as light. "The vast primitive nebula of the first period breaks up into masses, and these are concentrated into stars." 9. To the *third* period two works are assigned: (a) The formation of the material globe of the earth. The main fact expressed is the condensation of matter into the solid globe and its liquid covering. The result is given without any statement of the process. (b) The introduction of vegetable life as the connecting link between inert matter and animal life. An outline of the system is given once for all at the origin of it. 10. At the *fourth* period, the sun, moon, and stars appeared as within the earth's atmosphere, to give light to the earth; to divide its day from its night; and to govern its seasons, days, and years. These were not *formed* in the fourth period, but then *appeared*, the original light of the earth having declined sufficiently to make them visible within its atmosphere. 11. The *fifth* and *sixth* periods unfold the successive creation of the various tribes of animals which people the water, the air, and the land, "in the precise order indicated by geology." In the *fifth* the water-animals were created, marine monsters and birds; the *sixth* (the third period in the era of life) was distinguished (as the third in the era of matter had been) by two works: (a) the formation of the higher animals that live on the land, and (b) the creation of man. For the former, the word employed is "God *made*." The word "create" having been used to describe the beginning of animal life, all the modifications of it are described only as "made." But the second work of the sixth period was the introduction of a higher order of life, consequently it is said, God "*created*" man in his image.

12. The creative and formative works of the six periods are followed by the seventh, the period of God's resting from them both. That this is still in progress is indicated in the *record* by no evening being assigned to it, as had been to all of the six, and in the *universe* by its being simply upheld in existence without the creation of any new worlds or new orders of creatures. And as the Scriptures, at the beginning, declare the fact of God's resting from the work of formation, so, at the close, they announce that the work is to be resumed. He that sitteth on the throne said—"Behold, I make all things new." These six periods of work the account calls "days." For a long time it was assumed, without reflection, that they were only 24 hours long. Consequently when, by examination of the rocks and strata of the earth, scientific inquirers were brought to believe that its formation had been continued through a very long period, there was an apparent and startling contradiction between the new science and the Bible. But the account in Genesis nowhere limits the length of the periods. It uses the Hebrew word *yôm* (to which the English word "day" corresponds) in six different applications. 1. As meaning *light*, in opposition to darkness or night, without reference to duration. 2. The day of 24 hours—the period of the rotation of the earth, indicated by the apparent rising and setting of the sun and stars. 3. The illuminated portion of these 24 hours, as distinguished from the dark, making the earth's day and night. 4. The cosmogonic day, the length of which is the question to be determined. 5. The sum of the whole six of these periods—"in the day that the Lord God made the heavens and the earth." 6. The seventh day, without being yet ended, has already been as long as the whole number of years since the earth and heaven were made ready for man—that is, according to the lowest computation, nearly 6,000 solar years. Moreover, the account does not determine how long the interval was between "the beginning" and the origin of light, or that between the successive periods of work. If, therefore, the strata of the earth certainly show that they have been formed during a very long period of time, what is there in the Mosaic account that is inconsistent with them? The views on the scientific side of the subject presented in this article have been either taken from the published writings of prof. Arnold H. Guyot or confirmed by comparison with them.

COS'MOS. See COSMOGONY.

COSNE, a t. of France, in the department of Nièvre, and on the right bank of the Loire, here crossed by a suspension bridge. It has iron manufactures. Pop. '76, 5,711.

COS'SACKS (Russ. *Kasak*), a race whose origin is hardly less disputed than that of their name. The latter has been variously derived from words meaning, in radically distinct languages, "an armed man, a saber, a rover, a goat, a promontory, a coat, a cassock, and a district in Circassia." The C. are by some held to be Tartars, by more to be of nearly pure Russian stock. The most probable view is that they are a people of very mixed origin. Slavonic settlers seem to have mingled with Tartar and Circassian tribes in the regions to the s. of Poland and Muscovy, in the Ukraine and on the lower Don; and to have given to the new race, first heard of as Cossacks in the 10th c., a predominantly Russian character. On the conquest of Red Russia by Poland, numerous Russian refugees fled to the Cossack country; and more on the Tartar conquest of Muscovy. The numbers of the C. were also recruited from time to time by adventurers or fugitives from Poland, Hungary, Wallachia, and elsewhere; but in physique, as in language and religion, the C. have always been mainly Russian. They distinguished themselves in war against Turks and Tartars, and were known as a powerful military confederacy in the 15th century. The kings of Poland and the czars of Muscovy employed them largely to defend their frontiers, especially against nomadic neighbors; but the connection between the C. and their lords paramount was always very elastic, and was frequently repudiated to suit the convenience of either party. The C. are still the outposts of Russian authority towards Siberia, Central Asia, and the Caucasus. Living near, or as "free Cossacks" amongst, hostile peoples, the C. developed their peculiar military organization—either forming a cordon of military settlements along the confines of occupied territory, or as isolated camps in the nomad country beyond. Agriculture they eschewed: self-reliance and readiness at all times for defense or assault were their chief characteristics; though such of them as inhabited the banks of the Don and Dnieper, and their islands, became and still are skillful boatmen and fishers. Their political constitution was completely democratical; all offices were elective for one year only; and every Cossack might be chosen to any post, including the supreme one of Attaman or Hetman. This organization they have in great measure retained, though the office of Hetman was abolished by the emperor Nicholas, except as a title hereditary in the imperial family. There have been two main branches of the C.—the Malo-Russian and the Don Cossacks. To the first belonged the Zaporogian C., those dwelling near the *Porogi* or falls of the Dnieper. From them again are descended the Tschernomerian C., those of the Kuban valley and of Azov. From the Don C. spring those of the Volga or of Astrakhan, of the Terek valley, of Orenburg, of the Ural, and of Siberia. They furnish a large and valuable contingent of light cavalry to the Russian army, and are very patient of fatigue, hunger, thirst, and cold. The Don C. give name to a province with an area of nearly 60,000 sq.m., and a population of over a million inhabitants (of whom 20,000 are

Kalmucks). Though the C. have generally been represented in the w. of Europe as little better than fierce savages, they have left a very favorable impression on those who have dwelt among them. Jonas Hanway found them in 1743 "a civilized, and a very gallant as well as sober people;" and many more recent travelers agree in asserting that the C. are in intelligence, cleanliness, refinement, and enterprise greatly the superiors of the average Russians. See Springer, *Die Kosacken* (1877), Wallace Mackenzie's *Russia* (1877), and an article in the *Geographical Magazine* for 1878.

COSSIMBAZAR' (*Cossim's market*), stands on the Bhagirathi, which is the first or most westerly offset of the Ganges, and is the river port of Moorshedabad. It was once famous for its silk manufactures. Pop. about 4,000.

COS'SUS. See GOAT MOTH.

COSTA, ISAAC DA, an eminent poet and religious writer, was b. at Amsterdam, Jan. 14, 1798. His parents were Portuguese Jews, who had settled in Holland. The first aspiration of his poetical genius having been shown by his Hebrew teacher to Bilderdijk, the latter expressed himself favorably regarding it, and a warm and lasting friendship sprang up between him and Costa. In his twentieth year, C. acquired the degree of doctor at law; and shortly after, having embraced Christianity, was baptized. This subjected him to considerable persecution, which, however, subsided as his genius gradually gained recognition. The most interesting of his writings to the British public are probably his translation of Byron's *Cain;* his *Israel and the Gentiles;* and *Harmony of the Gospels,* the last two of which have been translated into English. As a public lecturer, C. specially excelled. His *Battle of Nieuwpoort,* the last of his poems, is one of his masterpieces. He died April 28, 1860.

COSTA, Sir MICHAEL, a very popular musician and composer, was b. at Naples, Feb., 1810. As he early showed a decided talent for music, he was sent to the conservatoire in his native city for education, where he greatly distinguished himself. In 1828, his fame, though he was then but 18, having reached England, he was invited to take part in the Birmingham musical festival, an invitation he complied with; and he was so well received in this country that he resolved to settle in it. In 1830, he was appointed conductor of the music in the Italian opera, London, an office which, in 1847, he resigned for a similar one in the royal Italian opera, Covent Garden. His great work, the oratorio *Eli,* produced at the Birmingham festival of 1855, raised him to a high rank as a composer. *Naaman,* first sung in Birmingham in 1864, was a great success. He was knighted by queen Victoria in 1869; and, in the same year, received the royal order of Frederick from the king of Würtemberg, in token of his majesty's admiration of *Eli,* performed under the composer's direction at Stuttgart the previous November. C. is the author of several ballets, and of some operas, the most successful of which was *Don Carlos.*

COSTA-CABRAL', ANTONIO BERNARDO DA, Count de Thomar, b. 1803; a Portuguese statesman, educated at Coimbra; judge of the supreme court in Oporto and in Lisbon; a representative in 1835, and prime minister in 1838, and again in 1841. In the next year he fomented insurrection in Oporto, assumed control of the army, established a censorship of the public schools, suppressed the universities, and so oppressed the people with taxes that he was driven from power in 1846. In 1849, he was once more appointed prime minister, and again played the dictator; but was compelled to resign. The queen refused to accept his resignation, and a revolution was started against him, which overthrew his administration in April, 1851. He fled to England, but returned the next year, and became a member of the council of state. From 1859 to 1861, he was minister to Brazil.

COSTA RI'CA, the most s. easterly state of Central America. It occupies the entire breadth from sea to sea between Nicaragua on the one side and New Granada on the other, stretching in n. lat. from 8° to 10° 40', and in w. long. from 83° to 85°. With an area of 26,000 sq.m., it is estimated to contain (1870) 165,000 inhabitants. The country is generally mountainous—more so on the n.e. than on the s.w.—with many volcanoes, the temperature becoming mild and salubrious in proportion to the elevation. It yields gold and silver, tobacco, sarsaparilla, indigo, sugar, cocoa, and dye-woods. The principal staples, however, of foreign trade are coffee, hides, and cedar. These are exported chiefly from Punta Arenas, on the gulf of Nicoya, an inlet of the Pacific ocean. The other places of any note are San José, the capital, and the cities of Cantago, Alajuela, Eredia, Estrella, and Esparsa. The government is republican, the president being elected every four years. A notorious filibuster, William Walker, put Costa Rica, some years ago, to much trouble commercially and politically. Estimated revenue in 1876–77, £476,000. In 1875, the imports amounted to £570,000, the exports to £851,866. The exports consist chiefly of coffee, of which upwards of 24,000,000 lbs. were exported in 1877. A railway from the Atlantic to the Pacific, by way of San José, is being constructed.

COSTA RICA (*ante*). This republic has been an independent state since 1821, from 1824 to 1839 forming a part of the confederation of Central America, and subsequently separate; now governed under the constitution of Dec. 22, 1871. The legislative power is vested in a congress of one chamber, chosen in electoral assemblies, the members of

which are returned by universal suffrage. The congressmen are elected for four years, one half retiring every two years. The executive authority is in the hands of a president, elected in the same manner as the congress for four-year terms. He is assisted by two vice-presidents, elected annually by the congress. In recent years, there have been constant changes by revolutions and wars, so that few presidents have served their full terms. The administration is carried on by the ministers of justice and the interior, of public instruction and foreign affairs, of finance and commerce, and of public works. The latest estimate of the area of the republic is 26,040 sq. miles. There exist only vague estimates of the population, which is supposed to number from 180,000 to 190,000, but stated at twice as much in government returns. The exports of the country consist almost entirely of coffee. In 1874, there was in process of construction a line of railway from Alajuela to Limon, 114 m., destined to connect the Atlantic and Pacific oceans. At the close of June, 1877, there were in all the country 200 m. of telegraph lines. The old weights and measures of Spain are in use, but the French metric system will probably soon be introduced.

Costa Rica is exceedingly fertile, its forests being filled with an immense variety of timber and useful dye-woods, such as mahogany, ebony, india-rubber, Brazil wood, and oak. Nearly all the fruits of the tropical and temperate zones thrive well, and flowering plants are in great profusion. Coffee, rice, maize, barley, potatoes, beans, and bananas are cultivated in the interior; cocoa, vanilla, sugar cane, tobacco, cotton, and indigo on the warmer coast lands. In the forests are the jaguar, tapir, ocelot, puma, deer, and wild pig. Birds of all kinds, including the splendid quetzal or trogen, fill the woods. Among reptiles are the alligator, the iguana, and many other lizards, the bobo, the black-snake, and the rattlesnake. Among domestic animals, oxen and mules are the most valuable. There are no manufacturing industries worth noticing; but the country is rich in gold, silver, copper, iron, nickel, zinc, lead, and marble, of which only gold, silver, and copper have been worked. The country is divided into the six provinces of San José, Cartago, Hérédia, Alajuela, Guanacaste, and Punta Arenas.

Costa Rica was one of the earliest discovered parts of America; Columbus touched its shores on his third voyage. In 1821, when all the provinces which formed the kingdom of Guatemala declared their independence of Spain, two parties—one desiring union with Mexico under the dynasty of Iturbide, the other seeking to form a separate republic—divided opinions in the revolted provinces. In Costa Rica, the town of Cartago chose the former, and San José the latter. The opposing factions met, and the republicans were victorious, whereupon the seat of government was transferred from Cartago to San José. In 1824, Costa Rica joined the Central American confederation; but that union was dissolved in 1839. In 1856, fearing for her own safety, the republic declared war against the filibuster William Walker, who had taken possession of Nicaragua. The Costa Rican forces, led by the president, Don Juan Mora, met Walker's troops under col. Schlesinger near Santa Rosa, routed them, followed them into Nicaragua, and, in conjunction with the forces of the other states, surrounded Walker in the city of Rivas, forcing his surrender to the commander of the United States sloop *St. Mary's*, under whose protection he left the country. On the 17th of Feb., 1872, the ministers plenipotentiary of Costa Rica, Guatemala, Honduras, and San Salvador formed another Central American union, consisting of the independent republics named. The main objects of this union are to preserve the autonomy and integrity of Central American territory, to maintain the peace of the several states, to insure to each a republican form of government, to guarantee to every citizen full political liberty, and to promote progress, moral, intellectual, and material. Slavery was denounced, confiscation abolished, and the extradition of political offenders prohibited.

COSTE, Jean Jacques, Marie Cyprien Victor, b. 1807; a French naturalist noted for researches in embryology, and for efforts toward the cultivation of fishes in his country. Mainly through Coste's influence, 600,000 salmon and trout were placed in the Rhone within two years. In 1862, he was appointed inspector-general of the river and coast fisheries. He has long been a member of the academy, and has published dissertations on pisciculture and embryology.

COSTELLO, Louisa Stuart, a voluminous English authoress, was b. in 1815. Her first production, at least of any note, was *Specimens of the Early Poetry of France* (1835), but it was as a tourist she gained the greatest popularity. The works in which she describes her traveling trips are *A Summer amongst the Bocages and the Vines* (1840); *A Pilgrimage to Auvergne*, etc. (1842); *Béarn and the Pyrenees* (1844); *The Falls, Lakes and Mountains of North Wales* (1845); and *A Tour to and from Venice by the Vaudois and the Tyrol* (1846). Miss C. also wrote several novels, the principal of which are *The Queen-Mother* (1841), and *Jacques Cœur, the French Argonaut* (1848). In 1853, she published a work of a professedly historical character, entitled *Memoirs of Mary, the Young Duchess of Burgundy;* and in 1855, another of the same kind, *Anne of Brittany.* Miss C. wrote in a very pleasant and picturesque style. She died in 1870.

COSTER, Laurens Janszoon, according to the Dutch, the inventor of printing, was b. at Haarlem, about the year 1370. The time of the invention ascribed to him must have fallen between the years 1420 and 1426. C., at first for his own amusement and the instruction of his grandchildren, cut letters out of the bark of the beech-tree, which

he inverted, and employed to print short sentences. Afterwards, he discovered a more glutinous kind of ink, which did not spread in using, and succeeded in printing with it entire pages, with cuts and characters. He also replaced his wooden types by types cast out of metal, at first using lead for this purpose, but afterwards pewter, which he found harder and more suitable. C., for a time, worked in secret, because, he being a sacristan, his art, if known, would have brought him into unpleasant collision with the manuscript-writing clergy, whose productions he tried to imitate, even to the abbreviations; thus his name did not appear on the productions of his press. As custom increased, C. had to take apprentices; and one of them, a German, Johann, making use of the confusion occasioned by C.'s death in 1439, is said have purloined the greater part of his master's types and matrices, and to have fled to Mainz, where he brought the hidden art to light. This Johann was probably Johann Gänsfleisch, a member of the Gutenberg family. Such, at least, is the history of the invention of printing as given by the Dutch, and which they support by the testimony of Hadrianus Junius, the historian of the states of Holland, who, in his account of the discovery, states that, at the time he wrote, C.'s descendants were in possession of drinking-cups made out of the remains of the types which C. had used. Moreover, a celebrated printer of Cologne, Ulrich Zell, deceased about the year 1500, is said to have declared "that Gutenberg, *his master*, had derived his art from Holland, after the model of a *Donatus* printed there." Now, a Donatus of C.'s time still exists; it was produced in 1740, by Johannes Enschedé, also a celebrated printer of Haarlem; and no sooner had his discovery been made known in Meerman's *Origines Typographicæ*, than fragments of the same work appeared in such quantities, that no one could any more aver that this early monument of imperfect typography, mostly printed from indisputably Dutch types, had been struck off from Gutenberg's press. Gutenberg's works, even now, are models of impression; those ascribed to C., *at first printed on one side only*, are the first proofs of a beginner. Then, all the characters of the oldest Dutch printed books resemble the Dutch handwriting of the first half of the 15th c., a proof of the independent nature of the attempts towards imitating manuscripts for sale. Other evidences are given by the Dutch that C. was the true inventor of printing; the most eminent advocates of his claims being Meerman, Koning, Scheltema, Van Westtreenen van Tiellandt, De Vries, Schinkel, Noordziek, Ebert, Leon de Laborde, Paul Lacroix, and Bernard. Yet the most thoroughgoing assault on the claims of C. and of Haarlem, as being founded on local legends, was made in 1870 by a Netherlander, A. von der Linde. In the town-house of Haarlem, the typographical remnants of the productions ascribed to C. are preserved. See PRINTING; and for the German account of the invention, GUTENBERG. As for C., his memory still is held in due honor by the town of his birth; the site of his house is still pointed out with pride; and monuments to his memory have been erected.

COSTILLA, a co. in s. central Colorado, w. of the Rocky mountains, and bordering on New Mexico, bounded on the w. by the Rio Grande del Norte; 2,000 sq.m.; pop. '80, 2,879, mostly Mexicans and Roman Catholics in religion, still dwelling in adobe houses. Stock-raising is the main business. Co. seat, Costilla.

COST MARY (i.e., *cost*, or aromatic plant, of the Virgin Mary), or ALE-COST, *Balsamita vulgaris*, a perennial plant of the natural order *compositæ*, sub-order *corymbiferæ*, a native of the s. of Europe, which has long been cultivated in gardens in Britain for the agreeable fragrance of the leaves. The root-leaves are ovate, of a grayish color, on long footstalks; the stem is 2 to 3 ft. high; the stem-leaves have no footstalk; the small heads of flowers are in loose corymbs, deep yellow. The leaves were formerly put into ale and negus, and are still used by the French in salads.

COSTRO'MA. See KOSTROMA.

COSTS, the technical name in English law for the expenses incurred in legal proceedings. As a general rule, the C. of the successful party are paid by the loser, but the rule is subject to important exceptions. 1. A party suing or defending *in formâ pauperis* (to entitle him to which privilege he must swear that he is not worth £5), does not pay C., though he is entitled to receive them if successful. 2. In actions in which the plaintiff recovers damages under 40s., he is, in certain cases, not entitled to C., unless the presiding judge certifies that he ought to have them; and in all other cases, he is not entitled to them, if the presiding judge certifies that he ought not to have them. 3. A plaintiff who might have brought his action in the county court, is not entitled to C. if he sues in the higher courts, and recovers not more than £5 in certain actions, or £20 in others, unless the judge who tries the case certifies that it was proper the action should have been brought in the higher court. 4. A party who is successful in the main, and therefore entitled to the "general costs," may be unsuccessful upon some minor point, and therefore bound to pay the C. which belong properly to it. 5. A party who has tendered the amount recovered, and who pays the sum into court, and pleads the tender, is not bound to pay costs. 6. The payment of money into court in the course of an action relieves the party paying from C. of subsequent proceedings, if no greater amount be ultimately recovered.

C. formerly used to be given neither to nor against the crown, either in its fiscal, public, or private capacity; but by 18 and 19 Vict. c. 90, and 23 and 24 Vict. c. 34, the crown is now entitled to C., and bound to pay C. in the same way as a private suitor.

C. are taxed (i.e., the items allowed or disallowed) by the officer of the court appointed for the purpose under the name of the master. When so ascertained, they are, if in favor of the plaintiff, included in the amount for which judgment is given, if it be in his favor, and recovered as part of it. If they are in favor of the defendant, they are recovered as a judgment in his favor; and any party may have, if he chooses, his own attorney's or solicitor's bill taxed by the same officer before paying it, or even after payment in certain cases.

In criminal cases, the prosecutor's C. may be allowed by the judge, and in that case are paid out of the county rates, the county being reimbursed by the treasury.

In chancery suits, C. are, in the discretion of the court, given as a general rule to the successful party; but when the suit was properly instituted, and was of the nature of an administrative suit, C. are often given out of the estate.

C., in Scotland, are called expenses (q.v.). See also AUDITOR OF THE COURT OF SESSION.

COSTS (*ante*), in legal practice in the United States, are very much as in England, nearly all the states of the union having adopted substantially the statute of Gloucester, 6 Edw. I. c. 1. Statutes which give costs are not to be extended beyond the letter, but must be strictly construed. They do not extend to the government, and therefore when the United States is a party they neither pay nor receive costs unless by express provision of a statute. In equity, the giving of costs is entirely discretionary, as well with respect to the period at which the court decides upon them, as with respect to the parties to whom they are given. In the exercise of their discretion, courts of equity are generally governed by certain fixed principles.

COSTUME (Ital. *costume;* Fr. *coustume, coutume,* from Lat. *consuetudo,* use and wont) is another form of the word custom, and, in its wider sense, signifies the external appearance which the life of a people presents at a particular epoch of its history. In its narrower and more usual sense, C. signified the customary modes of clothing and adorning the person, in any particular age or country. In this sense, it includes the prevailing fashion in jewelry, weapons, and other personal equipments. In both senses, C. plays an important part in art. The poet, more especially the narrative or epic poet, is compelled to resort to it as a means of carrying his reader back into the age which he describes. Homer has it constantly in view in narrating the exploits of his heroes. Amongst modern romance writers, sir Walter Scott has introduced the fashion of perhaps an excessive attention to mere external costume. But it is in art as presented to the eye, that C. becomes indispensable, and the loose and general treatment of it which is permitted to the novelist or the poet, is forbidden to the painter, the sculptor, and the player. How sorely the sculptor has been tried by the wings and breeches of former generations, and by the trousers, straps, hats, and other monstrosities of our own, no one who has seen a statue of Frederick the great, or of the late sir Robert Peel, can require to be told. Two means, not of solving but of escaping from the difficulty, have been largely resorted to: the one consists in departing from the modern dress altogether, and reverting to the ancient toga; the other, in wrapping up the figure, as far as possible, in a cloak. The first of these devices is neither more nor less than a deliberate violation of what artists regard as the laws of C., by which they conceive themselves bound to represent every object with its appropriate accessories; the second, besides being very often open in a lesser degree to the same objection, has the further disadvantage of accomplishing its object very imperfectly. The wisest course for the artist is boldly to face the difficulty. That he may do so successfully, many of the works of Rauch, Tieck, Thorwaldsen, Schadow, and others abundantly testify. In the earlier stages of art, an excessive attention to C. may generally be remarked, which though useless, and sometimes hurtful to artistic effect, has proved of the greatest value for historical purposes. The tendency of the earlier schools of art to exhibit C. with an almost painful accuracy and minuteness, is exhibited in the works of the older masters, both of the Italian and German schools. Even during the period of the highest bloom of Italian art, the mediæval custom of representing historical, sacred, and ideal characters in the C. peculiar to the time and country of the artist, was in a great measure adhered to. From Paul Veronese, Tintoretto, and others, we may learn the aspect which a marriage-feast in the palace of a Venetian or Florentine grandee presented, but can form little conception of the C. of that simpler festivity in Cana of Galilee, or of that supper still less sensuous in Jerusalem, which they profess to represent. In the hands of the greater masters, these scenes assume an ideal character; and in the works of Michael Angelo, Leonardo, and Raphael, C., though still exhibiting something of a native trace, rises into the highest regions of poetical conception. The effort to avoid anachronisms by a previous historical and antiquarian study of the subject, belongs, indeed, almost entirely to the modern European schools of art, and many painters of late have devoted themselves to it to such an extent as almost to forget that it is a means, and not an end, except, indeed, to a mere painter of clothes.

But it is in theatrical representations that attention to C., particularly in its narrower sense, becomes most imperative. When the stage, in western Europe, commenced in the religious mysteries of the middle ages, the dress adopted was that which belonged to the time and the country. To this dress some fantastical object was generally added

to indicate the character intended to be personated. In this position matters remained during the time of Shakespeare in England, of Lope de Vega and Calderon in Spain, and even of Corneille, Racine, and Molière in France. Whether a Greek, a Roman, an Assyrian, or a Turk, was represented, the ordinary court-dress of the time was adhered to, and the turban, the helmet, or the laurel-crown was placed on the top of the peruke or the powdered hair. In like manner, shepherdesses and peasant-girls had their hair dressed in turrets like feudal keeps, and long white kid-gloves which covered their hands and arms to the elbow. Towards the middle of the 18th c.,, a reform was introduced by the famous actress Clairon, who acted Electra without hair-powder; but Talma was the first who introduced a C. really true to history. Garrick followed in the footsteps of the great Frenchman, though both he and Siddons, during their earlier period, personated the characters of Shakespeare in what has been called the rococo C.—knee-breeches and periwigs. Schlegel's *Hermann*, and Goethe's *Götz von Berlichingen*, were the first plays which were given in Germany with historical costume.

COS'TUS, or COSTUS ARAB'ICUS, an aromatic much esteemed by the ancients, and concerning which great doubt long existed, but which seems now to be ascertained to be the dried root of *Aucklandia costus*, a plant of the natural order *compositæ*, sub order *cynarocephalæ*. It is a native of the moist open slopes surrounding the valley of Cashmere. The roots are there burned as incense. They have a strong aromatic pungent odor, and are employed in protecting bales of shawls from moths.

COS'WAY, RICHARD, a very noted painter in his day, was b. at Tiverton, Devonshire, in 1740. He early displayed a taste for painting, and between his 14th and 24th year carried off five premiums from the society of arts. As a miniature-painter, he was particularly famous, and gained all the patronage of the nobility of his time. His works, in fact, were the fashion, and all attempts at rivalry were useless. Many of them were distinguished by great delicacy, correctness, and beauty, and his drawings were not unworthy of a place beside some of the old masters. The immense sums of money which he made enabled him to live in the most sumptuous style, and to give musical parties (his wife, on such occasions, being the principal performer), so far surpassing all other efforts of the kind that they formed a feature of the time, and were attended by all the rank, fashion, and intellect of that day. C. died in 1821.

COT, on shipboard, is an officer's hammock. It is made of canvas, in the form of a kind of chest, 6 ft. long, 2½ wide, and 1 deep. This receptacle is kept out at full length by means of a square wooden frame. The bed or mattress is placed within the C.; and the arrangement is more comfortable than that of a sailor's hammock; but both are alike slung from the rafters or beams of the cabin.

CÔTE-D'OR, a department in the e. of France, formed of part of the old province of Burgundy, in lat. 46° 55′ to 48° 10′ n., long. 4° 2′ to 5° 30′ east. It has an area of 3,350 sq.m., with a pop. in '76, of 377,663. The surface is in general rather elevated, and is traversed by a chain of hills forming the connecting link between the Cevennes and the Vosges. A portion of that range, called the Côte-d'Or ("golden slope"), receives its name (which it gives to the department) on account of the excellence of the wines produced on its declivities. See BURGUNDY WINES. A great part of the department is covered with forests. The valleys and plains are fertile, and there is good pasture-land; but agriculture is in a backward state. Côte-d'Or is watered by the Seine, which rises in the n.w., and by several of its affluents; by the Saone and by the Arroux, a tributary of the Loire. By means of canals, Côte-d'Or has water communication with the German ocean, Mediterranean, English channel, and bay of Biscay. The climate is temperate; iron, coal, marble, gypsum, and lithographic stones are found, the first in large quantities. Côte-d'-Or, is divided into four arrondissements; viz., Beaune, Châtillon-sur-Seine, Dijon, and Semur, with Dijon for a capital.

COTES, ROGER, a scientific man of much promise, was b. at Burbage, near Leicester, July 10, 1682; but death cut him off on the high-road to fame ere he had attained his 34th year; not, however, before he had left some marks of his presence in the history of exact science. He was the author of the admirable preface explaining the Newtonian philosophy, and answering objections to gravitation, which was prefixed to the second edition (1713) of Newton's *Principia*. Various mathematical papers of his own, tending greatly to the development of logarithms, were published after his death. Short as his life was, his influence on mathematics is clearly traceable. He was held in the highest esteem by the scholars and scientific men of his time; and sir Isaac Newton is asserted to have said of him that, had he lived, "we should have known something."

CÔTES-DU-NORD (northern coasts), a department in the n.w. of France, forming a part of Bretagne, and bounded n. by the English channel, in which are several small islands belonging to Côtes-du-Nord; lat. 48° 3′ to 48° 57′ n., long. 1° 53′ to 3° 35′ w.; area, 2,650 sq.m.; pop. '76, 630,957. The Armoric hills, called also the Montagnes Noires, and the Menez mountains, cross the department from e. to west. They have a breadth of about 16 m., and consist chiefly of granite and clay-slate. These formations give a rude and broken aspect to the coasts. The chief rivers, which are short but navigable, are the Rance, Gouet, Trieux, Guer, and Arguenon. The southern district has the advantage of a considerable length of the canal between Nantes and Brest. Though a great por-

tion of the s. and the higher plains is occupied by heaths and woods, there are, here and there, fertile spots; and in the n. the influence of the neighboring sea is favorable to vegetation. The cultivation of flax and hemp, with pasturage and iron-mining, supply employment in the mountainous districts; while in the sheltered valleys and on the coast-levels all European kinds of grain, with pears and apples and other fruits, are produced; and maize is cultivated, but does not always ripen. The coasts are well supplied with various kinds of fish. The department is divided into the five arrondissements of St. Brieuc, Dinan, Loudéac, Lannion, and Guingamp. The chief town is St. Brieuc.

COTES'WOLD, or COTSWOLD HILLS, a range of oolitic and lias hills, running through the middle of Gloucestershire, from Chipping Camden in the n.e., by Cheltenham and Stroud, to near Bath in the s.w. They are parallel to the Avon and Severn, and separate the lower Severn from the sources of the Thames. They are 54 m. long, and in some parts 8 broad, and cover 312 sq.m., with an average height of 500 to 600 feet. The highest points are Cleave hill, 1134 ft., and Broadway hill, 1086 feet. The soil is a clayey loam, with gravel and stone-brash. The surface is generally bare, with little wood; corn, turnips, and sainfoin are grown, and coarse-wooled sheep fed on them. At Stroud, they are crossed by the Thames and Severn canal, and the Swindon Junction railway.

CÖTHEN, or KÖTHEN, an ancient t. of Germany, in the duchy of Anhalt, 22 m. s.w. of Dessau, and about 82 s.w. of Berlin, on a tributary of the Saale, and at the junction of railways from Berlin, Magdeburg, Bernburg, and Leipzig. The streets are broad, the town is neat and well built, is surrounded by high walls, and is divided into the old and new town. It contains a castle with three towers, several churches and schools, a synagogue, a library, a handsome railway station containing a gaming-house, and various charitable institutions. Sugar from beet-root is largely manufactured here. Pop. '75, 14,408.

COTHUR'NUS. See BUSKIN.

COTICE, or COST, in heraldry, one of the diminutives of the bend (q.v.).

CO-TIDAL LINES, a system of lines on a globe or chart which show the movement of the ocean tidal waves. The lines mark the places of high water at the same moment.

COTIL'LON (Fr. under-petticoat), the name of a brisk dance, of French origin, performed by eight persons. The quadrille, which superseded it, is only a new variety of the cotillon.

COTINGA, *Ampelis*, a genus of birds of the family *ampelidæ*, or chatterers (q.v.), having a rather feeble and deeply cleft bill, and feeding both on insects and fruits. They are natives of South America, inhabit moist places, and are remarkable for the splendor of the plumage of the males during the breeding-season. Azure and purple are then their prevalent colors. During the rest of the year, they are clothed in a tame gray or brown.

COTONEASTER, a genus of plants of the natural order *rosaceæ*, suborder *pomaceæ*, having polygamous flowers; a top-shaped calyx, with five short teeth; five small, erect petals; erect, short stamens; and a top-shaped fruit, the nuts of which adhere to the inside of the calyx, but do not cohere in the center. The species are pretty numerous, shrubs or small trees; some of them evergreen; with simple undivided leaves, more or less woolly beneath; small flowers in lateral cymes; and small fruit not agreeable to the palate, but the bright color of which, and its remaining on the tree in winter, make them very ornamental. *C. vulgaris* is a deciduous species, a native of hills in Europe and Siberia, and said to be found wild in a single locality in Wales. *C. tomentosa* is also found in the Alps. Most of the species are natives of mountainous parts of Asia; they are sufficiently hardy for the climate of Britain, and have become among the most common of our ornamental shrubs. Some of them, as *C. rotundifolia* and *C. microphylla* —both from the n. of India—are much used for covering walls.

COTOPAX'I, the loftiest active volcano in the world, is in Ecuador, in the eastern chain of the Andes, and about 50 m. s. of the equator. Humboldt gave the height at 18,880 ft.; Reiss, the first to ascend it (in 1872), found it to be 19,500 ft. above the sea. The valley at its foot, however, is itself 9,000 ft. high. The upper part of C., a perfect cone of 4,400 ft., is entirely covered with snow, excepting that the immediate verge of the crater is a bare parapet of rock. Reiss estimated the crater, which is elliptical, as 1500 ft. in depth. Below the snow is a well-marked barren belt covered with lichens and shrubs, below which again is forest. Smoke issues from the summit; sounds as of explosions are occasionally heard; and above, a fiery glow is often visible by night. Lava rarely flows even during eruptions, but flame, smoke, and immense volumes of ashes are then ejected; and when the heat melts large masses of the snow lying on the sides, destructive floods are occasioned in the valleys beneath. The first eruption recorded was in 1533. Others followed in 1698, 1743, 1744, and 1768, the most terrible of all. On the latter occasion ashes were carried 130 m. distance, and thickly

covered an extensive area. C. was quiet till 1851. In 1854, 1855, and 1856, there have again been eruptions of more or less violence.

COTRO'NĒ, a t. of Italy, in the province of Catanzaro, built on a point of land projecting into the sea, in lat. 39° 7′ n., long. 17° 10′ east. It is almost surrounded by the Esaro (ancient Æsarus), which here has its *embouchure.* C. is very strongly fortified. Its streets are dark and narrow, and its port of no importance; pop. above 7,000. C., however, possesses interest from its antiquity and its historic associations. It owes its origin to a colony of Acheans, as far back as 710 B.C., its ancient name being Croton or Crotona. It soon became prosperous, wealthy, and powerful. Its walls measured 12 m. in circumference, and the territory over which it extended its sway was considerable. Its inhabitants were celebrated for athletic exercises, and they carried off most of the prizes at the Olympic games. Milo was its most renowned athlete. Pythagoras settled here about the middle of the 6th c. B.C.; but the influence which, by means of a league of his formation, he exercised, became obnoxious to the citizens, and he was expelled. About 510 B.C., C. sent forth an army of above 100,000 men to fight the Sybarites, who were utterly defeated, and their city destroyed. The war with Pyrrhus completely ruined the importance of C., and in the 2d c. B.C. it had sunk so low, that a colony of Romans had to be sent to recruit its well-nigh exhausted population. It never afterwards recovered its prosperity. Some ruins belonging to the old, exist in the vicinity of the modern city, the most important of which is a Doric column, part of a once magnificent temple to Juno, on cape Colonne or Nau (the Naus of the ancients).

COTTA, the name of a very old German publishing-house, established at Tübingen in 1649, and still one of the most flourishing in Germany. The family came from Italy about the beginning of the 15th century. Its most prominent member was Joh. Friedr., Freiherr von C., a meritorious theologian of the 18th century.

JOH. FRIEDR., FREIHERR VON C., one of the most eminent publishers that Germany ever produced, was b. at Stuttgart, 27th April, 1764. He was educated at the university of Tübingen, and for some time practiced as an advocate. In 1787, he undertook to conduct the family book-trade at Tübingen; and in 1795, established the *Horen,* a literary journal, under the editorship of Schiller. In the same year, he commenced two larger periodicals, the *Politischen Annalen* and the *Jahrbücher der Baukunde.* In 1798, he established the *Allgemeine Zeitung*—still published at Augsburg—the *Almanach für Damen,* and other works of a similar kind. C. now began to publish the works of the illustrious modern authors of Germany, such as Goethe, Herder, Fichte, Schelling, Jean Paul, Tieck, Voss, Therese Huber, Matthisson, the Humboldts, Joh. von Müller, and Spittler. Besides the periodicals already mentioned, C. established the *Morgenblatt* and the *Literaturblatt,* and carried on the *Kunstblatt,* founded by Schorn. In 1810, he went to live at Stuttgart. The nobility of his family, which dated far back, was confirmed in his person under the title of Freiherr C. von Cottendorf. In 1824, he introduced the first steam-press into Bavaria, and, shortly after, founded at Munich the literary and artistic institute. He died 29th Dec., 1832. C.'s political principles were liberal, but temperate. In the diet of Würtemberg, and afterwards as president of the second chamber, he was always the fearless defender of constitutional rights. In manners, C. was simple and pure; and although covered with titles and orders from different governments, he had neither the pride nor the selfishness of a hereditary patrician. The first Würtemberg proprietor who abolished servitude on his estates, C. also furthered the interests of his farmers by building model-farms, and by setting an example in all rural improvements.

COTTAGE, a small dwelling-house, detached from other buildings, and usually of one story in height. Originally applied to a humble order of dwellings in the country, the term C. now embraces a wide variety of structures, from the cottage *orné* of the French, to the simple but not unattractive cabin in the English rural districts, and the mountain *chalet* of Switzerland. In England, where universal security enables the people to establish dwellings in retired and picturesque situations, the building of cottages has been brought to great perfection; and it may be said with truth, that in no country in the world are there to be seen such a variety of beautiful cottages, scrupulously clean and neat in the interior, and ornamental exteriorly with flowers, shrubs, and bright green lawns. The different styles in which this class of houses may be built are well described in the elaborate work of J. C. Loudon, on *Cottage Architecture.* The subject of proper C. accommodation, as regards the laboring peasantry of England and Scotland, has lately engaged serious attention. See papers in the *Transactions of the National Association for the Promotion of Social Science.* The best methods of keeping cows, pigs, poultry, bees, etc., are ordinarily described under the comprehensive title of C. economy. See Cobbett's *Cottage Economy,* also *Chambers's Information for the People.*

COTT'BUS, or KOTT'BUS, a t. of Prussia, in the province of Brandenburg, situated on the Spree, about 70 m. s.e. of Berlin. It is an ancient place, surrounded by walls, and it has an old castle with towers, a royal palace, a gymnasium, and manufactures of beer, woolens, linen, leather, and tobacco. Pop. '75, 22,650.

COTTIN, SOPHIE, a very popular French authoress, was b. at Tonneins (Lot-et-Garonne) in 1773. Her maiden name was Ristaud. Educated at Bordeaux, she was

married when only 17 to M. Cottin, a Parisian banker, who left her a widow at the age of 20. From an early period she had exhibited a love of literature; and to cheer the solitude of her affliction (for she had no children), she now betook herself to the composition of verses, and even ventured on a lengthy history. But it was in fiction she was destined to win unfading laurels. In 1798, appeared *Claire d'Albe;* in 1800, *Malvina;* in 1802, *Amélie Mansfield;* in 1805, *Mathilde;* and in 1806, *Elisabeth, ou les Exilés de Sibérie,* a work which has been translated into most European languages, and has always been extraordinarily popular with the young. Madame C. died 25th Aug., 1807.

COTTLE, JOSEPH, 1774–1853; a publisher and bookseller of Bristol, England, and especial friend of Southey and Coleridge whose first poems he put before the public. He wrote poems himself, and a volume of reminiscences of the two poets named. His brother, who made a poor translation into English of the *Norse Edda,* lives only in Byron's sarcastic couplet in *English Bards and Scotch Reviewers.*

COTTON, an important vegetable fiber, extensively cultivated in various parts of the globe within the 35th parallels of latitude.

1. *Botanical and Commercial Classifications.*—C. is the produce of all the species of the genus *gossypium,* which belongs to the natural order *malvaceæ,* and is thus allied to mallow, hollyhock, hibiscus, etc., the general resemblance to which is very apparent both in the foliage and flowers. The species are partly shrubs, partly herbaceous, and either perennial or annual; they are natives of the tropical parts of Asia, Africa, and America, but their cultivation has extended far into the temperate zones. They all have leaves with three to five lobes, which in a very young state are often sprinkled with black points, and rather large flowers, which are mostly yellow, but sometimes in whole or in part purple; the flowers very soon fall off; they grow singly from the axils of the leaves, and are surrounded at the base by three large, heart-shaped, cut or toothed, involucral leaves or bracts, partially growing together as one. The fruit is a 3 to 5-celled capsule, springing open when ripe by 3 to 5 valves, and containing numerous seeds enveloped in C., which is generally white, but sometimes yellow, and issues elastically from the capsule after it has burst open. Some of the other kinds have the flowers larger in proportion, and the leaves divided into more numerous and much deeper and narrower lobes, but the general appearance of all is very similar. Difference of opinion exists among botanists as to the number of distinct species, and there are very many varieties in cultivation, the number of which, through climatic influences and other causes, is continually increasing; but there are certain leading peculiarities on account of which some botanists and practical farmers reduce all, at least of the cultivated kinds, to four primary species—viz., 1. *Gossypium Barbadense;* 2. *G. herbaceum* or *Indicum;* 3. *G. Peruvianum;* and 4. *G. arboreum.* The produce of the first species is the most valuable. The beautiful long-stapled silky wool known as "sea island" is a variety, and is grown exclusively upon the islands and a portion of the mainland of Georgia, South Carolina, and Florida; the saline ingredients of the soil and atmosphere being indispensable elements of the growth. The plant bears a yellow flower, and the seeds are small, black, and quite smooth, and the wool is easily separated therefrom; but when sown far inland, away from the saline influences of the coast, the seeds increase in size, and become covered with innumerable short hairs. A large percentage of the crops raised in Alabama, Louisiana, Mississippi, Texas, etc., are also varieties of this species, though, owing to climatic influences, the wool is shorter in staple, and less easily separated from the seeds than sea island. The commercial value of the latter kind varies from 1*s.* to 3*s.* per lb., rare specimens sometimes realizing 5*s.* or 6*s.* per lb. The better descriptions of Egyptian C. belong to *G. Barbadense,* and bring 1*s.* to 2*s.* 6*d.* per lb. in the Liverpool market. The short-staple varieties, known as New Orleans, Mobile, etc., sell at from 5*d.* to 10*d.*, extra qualities sometimes bringing 1*s.* per lb. *G. herbaceum* is found in India, China, Egypt, etc. The principal commercial varieties are those known as Surat, Madras, and short-stapled Egyptian. It is a small shrubby plant, bears a yellow flower, the seeds are covered with short grayish down, and the staple produced, though not long, is very fine. Its price varies from 3½*d.* to 9*d.* per lb. A variety is cultivated in the United States, and the C. known as nankeen is thought to belong to this species. *G. herbaceum* can be profitably cultivated in colder countries than any other species of C. plant. The third species is a native of South America, and the "green seed" C. of the United States appears to be a variety. The stem reaches 10 to 15 ft. in height, the flowers are yellow, and the capsules contain 8 or 10 black seeds firmly attached together in a cone-like mass. The wool is long and strong-stapled, and in value stands next in order to sea island and long-stapled Egyptian. Maranham, Bahia, and Maceio are varieties which sell in Liverpool at from 8*d.* to 1*s.* 2*d.* per lb. *G. arboreum* is found in India, China, etc., and, as its name imports, is a large tree-like plant. It bears a red flower, and produces a fine yellowish-white wool. Varieties of it have been long cultivated in the United States, and with the requisite soil and climate, are said to produce a wool somewhat resembling sea island.

2. *Cultivation.*—The plant is a very delicate organism, and requires a peculiar soil and climate for its due development. The method of cultivation is much the same in the various countries where the fiber is grown; but the most perfect system is that which obtains in the United States of America. Although the plant is not, strictly speaking,

an annual, it is found more profitable to destroy the shrub, after the crop is gathered, and sow new seed every year. The preparation of the land takes place during the winter months. After the ground has been thoroughly plowed, and as soon as all symptoms of frost have disappeared, the soil is laid off into rows varying in width from 3 to 4 ft., according to the situation and quality of the soil. The seed is then sown along the center of the beds in a straight furrow made with a small plow or opener; but in some plantations the seed is sown in holes from 12 to 18 in. apart. The sowing commences in Mar., and generally continues through April; but sometimes, owing to late spring frosts, the planting is prolonged to May. The young shoot appears above-ground in about eight to ten days, and is then and subsequently weeded and thinned. Blooming takes place about the beginning of June—in early seasons, towards the latter end of May; the average date is about June 5. As a general rule, C. is a dry-weather plant. For plowing, the planter requires just sufficient rain to give the soil a moist and spongy texture. During the early stages of its growth, the crop flourishes best with a warm steamy sort of weather, with an occasional shower until blooming; too much rain being productive of weeds and wood at the expense of wool, whilst a severe drought produces a stunted plant, forced into too early maturity, and resulting in a small and light-stapled crop. A great deal, however, depends upon the position of the plantation; lands situated in hilly or upland districts obviously requiriring more moisture than those lying in the plains and river-bottoms. From the date of blooming to the close of the picking season, warm dry weather is essential. Picking generally commences in Aug., occasionally in July, and continues until the occurrence of frost—about the end of Oct. or beginning of Nov.—puts a stop to the further growth of the plant. All the available hands of the plantation, young and old, are called into full employment during the harvest. The C. is gathered into baskets or bags suspended from the shoulders of the pickers, and when the crop has been secured, it is spread out and dried, and then separated from the seeds. The latter process was formerly performed by hand—a tedious operation, by which one hand could clean only a pound or so a day; but since the invention of the saw-gin, by Eli Whitney in 1793, the process of cleaning has been both rapid and effectual. This machine is composed of a hopper, having one side formed of strong parallel wires placed so close together as to exclude the passage of the seeds from within. The wool is dragged through the apertures by means of circular-saws attached to a large roller, and made to revolve between the wires, the seeds sinking to the bottom of the hopper. This process is adopted only in cleaning the short-stapled varieties of American C., the seeds of which adhere so firmly to the wool as to require a considerable amount of force to separate them. The Sea island variety is cleaned by being passed through two small rollers, which revolve in opposite directions, and easily throw off the hard smooth seeds. In India, though the saw and other machine-gins have been introduced in some districts, the wool is mostly cleaned by means of the primitive roller. Both descriptions of gins are used in Egypt and Brazil. The C. cleaned by the roller-gin, being uninjured thereby in staple, realizes the better price; but the deterioration caused by the saw-gin is compensated for by the greatly increased quantity cleaned; the latter turning out four or five times as much work as the former in an equal space of time, and thereby considerably reducing the expense of cleaning. The introduction of improved gins has very largely increased the production of C. in Egypt and Brazil during the past 14 years.

3. *Production and Distribution.*—The oldest C. producing country is India, in which empire the plant has been grown and manufactured from time immemorial. Early mention is also made of it in the annals of Egypt, and it is believed to have a high antiquity in all parts of Africa. In the western world, it was found by Columbus, but was not so extensively cultivated as in the east; though during the past half century the culture there has outstripped, both in quantity and quality, the produce of the old world. Down to the commencement of the present century, the C. consumers of Europe were dependent upon the East and West Indies and the Levant for their raw material; but the inventive genius, superior farming, and greater energy of the planters of the southern states of America, had, prior to the civil war, almost secured the monopoly of supplying the manufactures of Great Britain and the European continent with this valuable fiber. The average import of American C. into Great Britain in 1858–60 reached 79 per cent of the entire arrivals; during the war the proportion fell to 3½ per cent; but in 1871, it rose to 58 per cent. We will glance briefly at the history of the trade of the chief C. growing countries.

United States.—The introduction of the plant is traced as far back as 1536, but the export trade did not commence until two and a half centuries later, the first shipment of importance being about 2,000 lbs. in 1770. In 1791, the amount reached 189,316 lbs. In 1793, the invention of the saw-gin gave a new stimulus to the trade, and in 1800, the exports reached 17,789,803 lbs.; from which period the shipments have continued to increase, being over 124,000,000 lbs. in 1821; 277,000,000 lbs. in 1831; 530,000,000 lbs. in 1841; 927,000,000 lbs. in 1851; and about 2,160,000,000 lbs. in 1860. Simultaneously with this rapid increase in production, there was, down to 1851, a gradual decline in the price of the wool, in consequence of improved processes of cultivation and cleaning, and the cheapening of carriage, etc.; the average price in Liverpool, in 1793, being 1*s.* 6*d.* per lb.; in 1801, 2*s.* 2*d.*; in 1811, 1*s.* 2*d.*; in 1821, 9½*d.*; in 1831, 6*d.*; in 1841, 6¼*d.*;

in 1851, 5¾*d.* per lb.; from which period, however, the downward course was not only checked, but a movement in the opposite direction commenced, the average for 1856–61 being 7*d.* per lb.; the low prices current having caused consumption to overtake production. The outbreak of the civil war in 1861, and its continuance until 1865, completely revolutionized the industry of the south. The abolition of slavery added materially to the cost of producing C.; and this circumstance, along with the general rise which has taken place in values of all kinds during the past 12 or 15 years, has raised the price at which it will pay to sell American C. in Liverpool to nearly 8*d.* per lb., against an average of 7*d.* per lb. for the five years ended with 1861. During the war, middling Orleans touched 2*s.* 7½*d.* per lb. In 1867 (Dec.), there was a decline to 7⅛*d.*—every one expecting a return of old prices; within a few months, there was a reaction to 1*s.* 1*d.* Since then the tendency has been downwards: the average for 1875 being 7⅝*d.*, against 8*d.* in 1874, and 9*d.* in 1873.

STATEMENT OF THE PRODUCTION, DISTRIBUTION, AND AVERAGE PRICE OF THE LAST FIFTY CROPS OF AMERICAN COTTON, ACTUAL AND PROPORTIONAL, IN AVERAGE PERIODS OF FIVE YEARS EACH (EXPRESSED IN THOUSANDS OF BALES).

Periods of Five Years.	Average Produce of: Georgia *via* Savannah.	S. Carolina *via* Charleston.	N. Carolina and Virginia.	Florida *via* Apalachicola, etc.	Alabama *via* Mobile.	Louisiana, Miss., Ark., Tennessee, and Texas.	Average Total Crop.	Proportional Produce of: Georgia.	S. Carolina.	N. Carolina and Virginia.	Florida.	Alabama.	Louisiana, etc.	Average Exports to: Great Britain.	France.	Other Foreign Ports.	Total.	Average Consumption of U. S. (*N. of Virginia only.*)	Average Stock at close of Season.	Total Average Deliveries.	Proportional Distribution of Total Average Deliveries: Great Britain.	France.	Other Foreign Ports.	Consumption of United States.	Average Price p. lb. of Whole Crop: Five Years.	Last Year.

1871–75 . . .	604	375	469	14	339	1,939	3,730	168	10	12	13	87	53	1,898	261	507	2,666	1,062	85	3,727	503	7	138	284	5	5⅛

The figures between 1861–65 were disturbed by the war. Down to within a few years before the war, the bulk of the crops grown in the various states were shipped at the several ports of each state—Alabama C. at Mobile, Georgia C. at Savannah, and so on; but the more general introduction of railways has diverted a great deal of C. from the old channels. The increase under the head "N. Carolina and Virginia" is owing almost entirely to this cause. One of the most remarkable features in the last line of the above table is the large proportionate increase in the consumption of the United States. The particulars for three seasons, from 1872 to 1875, compare as follow.

	1872-73.	1873-74.	1874-75.
Receipts at the ports	3,792,000	4,042,000	3,702,000
Direct from plantations	138,000	128,000	130,000
Total crop	3,930,000	4,170,000	3,832,000
	1872-73.	1873-74.	1874-75.
Exported to Great Britain	1,906,000	1,868,000	1,894,000
" France	253,000	371,000	360,000
" other ports	521,000	602,000	431,000
Consumed, North	1,063,000	1,184,000	1,060,000
" South	138,000	129,000	130,000
Total deliveries	3,881,000	4,154,000	3,875,000
Stock, close of season	91,000	108,000	66,000

The following table is interesting as showing the wide fluctuations which have taken place in the exports of C. from the United States during the 12 years ending in 1871, expressed in millions of lbs.

	Weight, lbs.	Average Price, cents.		Weight, lbs.	Average Price, cents.
1859–60	1767.6	10.85	1865–66	650.6	43.24
1860–61	307.5	11.07	1866–67	661.5	30.1
1861–62	5.0	23.30	1867–68	784.3	19.2
1862–63	11.4	58.43	1868–69	644.3	24.9
1863–64	10.8	83.43	1869–70	900.4	23.4
1864–65	6.6	86.58	1870–71	1462.9	14.8

In 1871–72, there was a reduction to 933,000,000 lbs., owing to a failure of the crop. In 1874–75 the weight exported was about 1,178,700,000 lbs., or still considerably less than in the great crop season 1870–71.

East Indies.—After the United States, the most extensive cotton-producing country is India. The plant is indigenous to the soil, and the culture and manufacture have existed from prehistoric times. A century ago, the western world was almost entirely dependent upon the east for its C. goods, but within the past 100 years the order of things has been almost reversed. The mills of Lancashire are now in successful competition with the famed looms of India, and the natives of that vast empire find it cheaper to take our calicoes in exchange for their raw C., than it is to manufacture their own clothing. The first import of East Indian C. into Great Britain took place in 1783. The average receipts, from that year to 1792, were 65,550 lbs.; from 1793 to 1800, 2,223,039 lbs.; 1801 to 1810, 6,357,000 lbs.; 1811 to 1820, 24,016,805 lbs.; 1821 to 1830, 14,835,567 lbs.; 1841 to 1850, 79,815,403 lbs.; and 1851 to 1859, 23,017,310 lbs. In 1820, only 224 pounds-weight of cotton-yarn, and 14,191,177 yards of goods, were exported to India; but in 1874, the figures, including shipments *viâ* Suez, were 38,000,000 lbs. yarn, and 1,263,000,000 yards of calico! It is impossible to ascertain the total amount of C. raised in India; but we may observe that the fiber is grown all over the peninsula, and is used for all the purposes for which we employ C., flax, wool, and mostly hemp. The following figures will give the reader some idea of the extent of the export branch of the trade; they also show the marvelous expansion incidental to the American war.

WEIGHT AND VALUE OF COTTON EXPORTED FROM INDIA.

lbs.	£	lbs.	£
1857..319,653,524	4,437,949	1866..803,150,424	35,587,389
1860..345,953,569	5,637,624	1869..691,196,905	19,778,924
1863..473,678,421	18,779,040	1872..809,246,087	21,272,430

Prior to the American war, the supply of C. from India was merely supplementary to that from the United States. With a small crop in America, prices advanced, and the imports from India increased; but with a large American yield, prices drooped, and the receipts from India fell off; the surplus produce finding its way to China, or being consumed in the interior. This is in a measure still the case (as is shown in the above

figures), though not to the same extent as formerly. By the introduction of improved methods of cultivation, cleaning, etc., the quality of Indian C. has been greatly improved; and it is now much more generally used than it was 12 or 15 years ago.

Brazil.—The C. trade of Brazil has undergone a most extraordinary development during the past 10 years, owing to the impetus given to the cultivation of the plant during the American war, and to the general adoption of the saw-gin in place of the roller-gin; this substitution of the American gin has produced quantity at the expense of quality; but the demands of fine spinners have been met by increased supplies from Egypt. The subjoined statement shows the progress made by this branch of Brazilian trade:

IMPORT OF BRAZIL COTTON INTO EUROPE.

	Bales.		Bales.
1831–35, average.....	175,000	1861–65, average.....	201,000
1841–45, "	105,000	1866–70, "	614,000
1851–55, "	149,000	1871–74, "	723,000

Egypt.—The C. plant has been known in Egypt from time immemorial; but the trade, properly so called, was first introduced by the celebrated Mehemet Ali, about 50 years ago. The first exportation took place in 1821, and amounted to 944 cantars. During the seven years ending 1827, 1,011,697 cantars were produced, or 144,528 cantars per annum. In the next septennial period, there was a falling off, owing to the withdrawal of a large number of laborers to carry on the wars of the pasha in Saudan, etc., and Syria; the exports therefore only reached 900,521 cantars, or 128,646 per year. The transactions of the subsequent seven years show a considerable improvement, the total shipments being 1,498,042 cantars, and the annual average 214,006 cantars. During the years 1842–48, the total rose to 1,549,909 cantars, being an annual average of 221,415 cantars. Since then, the trade has continued to augment. The average shipments of the years 1849–59 were 473,282 cantars. The cantar is equal to 94 lbs., and there are about 5½ cantars to the bale of the present (1873) average size; so that the exports in 1849–59 represented 86,000 bales per annum. In 1865, the shipments reached 406,000 bales; in 1875, they amounted to 347,000 bales—or 2,020,000 and 1,908,000 cantars respectively. Great Britain is the principal consumer of Egyptian C., after which comes Austria, then France. The following figures show the destination of the C. exported from Alexandria during the six years ending Sept. 30, 1875.

EXPORTS TO

	England.	France and Spain.	Austria and Italy.	Total.
1870.....	177,631	26,356	26,735	230,722
1871.....	246,513	14,974	52,391	313,878

Other Countries.—In addition to the districts just passed in review, C. is grown in numerous other countries. During the infancy of the trade our spinners received 75 per cent of the C. consumed from the West Indies, and the remainder from the Levant; with the great expansion of the culture in America, the supplies from the West Indies gradually fell off, the planters finding it more profitable to occupy their labor and capital in the production of sugar and other growths. Early in the present century, the imports into Great Britain from the West Indies averaged 80,000 bales per annum; but by 1858, the arrivals had dwindled to only 6,500 bales, of which only about 2,200 bales were from the West Indies, properly so called. Under the stimulus of the high prices which ruled during the C. famine, the supplies from miscellaneous sources—that is, from all countries except the United States, East Indies, Brazil, and Egypt—rose from 6,500 bales in 1858, and 9,800 in 1860, to 23,000 in 1863, and 131,000 in 1865. With the decline in prices, the import fell to 100,000 in 1868. There was an increase to 166,000 in 1872, owing to the high prices ruling in that year, but the increase was chiefly from Peru. Since that year, with a falling market, the import from "other countries" has annually diminished, being only 89,000 bales in 1875, against 166,000 in 1872, the decrease, like the previous increase, being principally in Peruvian. Twenty years ago, Peruvian cotton was almost unknown in the Liverpool market; in 1864, the imports reached 27,000 bales; in 1872, they amounted to nearly 105,000 bales; but in 1875 they fell to 56,000 bales.

4. *Consumption.*—Our remarks under this head will be confined to Europe and the United States of America. An immense quantity of C. is consumed annually in India, China, and Africa, but there are no means of ascertaining even an approximation of the amounts so used. There are 11 spinning and weaving mills in Bombay, containing 404,000 spindles, and 4,294 looms; and there are 8 mills in other towns of the presi-

dency. "These," says an official report (1873), "are quite independent of the old native manufactories, and were started entirely in consequence of the inferiority of the piece-goods imported from Manchester." This inferiority was occasioned by the excessive and deleterious method of sizing adopted during the C. famine, in order to meet the demand for low-priced goods, and is a matter which has lately occupied the serious attention of the Manchester chamber of commerce. Besides the mills in the Bombay presidency, factories have also been erected in the Bengal and Madras presidencies; and in the North-west and Central provinces; a considerable native manufacture is also carried on in Burmah.

Great Britain.—The origin of the C. trade of the continent dates as far back as the 10th c., at about which period the staple was introduced into Spain by the Mohammedans. Since that time, the manufacture has continued to expand, more or less, until it has arrived at its present gigantic proportions. Though we have early mention of C. goods in the annals of almost every country of Europe, still the progress of the trade was very slow until within the past one hundred years. Indeed, before the middle of the 18th c., C. goods, properly so called, were never produced—the fabrics manufactured being a mixture of either C. and linen, or C. and wool, C. yarn being used for weft only. It is from the dates of the patents of Wyatt (spinning by rollers, 1738), Arkwright (water-frame, 1769), Hargreaves (jenny, 1770), Crompton (mule, 1779), and Cartwright (loom, 1785), that the rise of our modern manufacture must be dated. The stimulus given to the trade of our own country by these inventions was instantaneous, and when adopted on the continent, a few years after their utility had been sufficiently proved, similar effects followed there. The following figures will give the reader an idea of the rapid extension of the consumption of C. in Great Britain:

IMPORT OF COTTON WOOL INTO GREAT BRITAIN.

Year.	American. lbs.	Total of all kinds. lbs.
1701	none	1,976,359
1751	none	2,976,610
1771, one year after Arkwright's loom and Hargreaves' jenny	none	4,764,589
1780, year after Crompton's mule	none	6,766,613
1785	none	18,400,384
1791	189,316	31,447,605
1794, year after the invention of the saw-gin	487,600	19,040,929
1800		43,379,278
1820	89,999,174	151,672,655
1840	487,856,504	552,488,010
1860	1,119,890,608	1,390,938,752
1871	1,038,677,920	1,778,139,776
1875	816,223,920	1,458,598,470

The following table furnishes particulars of the imports, exports, and home consumption of C. during the past 75 years, in average periods of 10 years down to 1870, and for the 5 years 1871–1875.

SUPPLY AND CONSUMPTION OF RAW COTTON IN GREAT BRITAIN, IN THOUSANDS OF BALES, FROM 1801 TO 1875.

Average Periods of Ten Years.	Import.						Export.	Home Consumption.	Total Deliveries.
	United States.	Brazil.	Egypt.	West Indies, etc.	East Indies.	Total.			
1801–10	127	72	..	81	19	299	8	291	299
1811–20	159	130	..	54	70	413	31	346	377
1821–30	436	144	36	26	54	696	65	630	695
1831–40	818	128	31	22	131	1,130	97	1,014	1,111
1841–50	1,190	113	52	13	209	1,577	176	1,403	1,579
1851–60	1,778	125	106	9	432	2,450	362	2,070	2,432
1861–70	907	362	227	80	1,405	2,951	804	2,151	2,955
1871–75	1,873	525	397	129	1,138	3,962	727	3,183	3,910

The bales vary considerably in weight. In 1875, the averages were as follow: American, 439 lbs.; Brazilian, 160 lbs.; Egyptian, 602 lbs.; Smyrna, 370 lbs.; West Indian, etc., 205 lbs.; Surat, 390 lbs.; Madras, 300 lbs.; and Bengal, 300 lbs. During the C. famine, a considerable quantity of C. was received from China in bales averaging 266 lbs. The comparative statement in the following table shows the relative importance

of the various sources of supply—actual and proportional—in 1802, and on the average in 1828–30, 1858–60, and 1874–75. The quantities are given in millions of pounds—32.1 equal 32,100,000 lbs.

	WEIGHT IN LBS.				PROPORTION.			
	1802.	1828–30.	1858–60.	1874–75.	1802.	1828–30.	1858–60.	1874–75.
America	32.1	173.3	970.3	837.9	53.2	72.7	79.7	56.3

East Indies and China	2.7	23.2	176.4	386.6	4.4	9.8	14.5	26.0
Total	60.3	238.2	1217.0	1489.1	100.0	100.0	100.0	100.0

The factory returns for 1875, state that there were in Great Britain, in that year, 41,300,000 spindles (including 3,800,000 doubling spindles), and 463,000 looms, and that 479,500 persons were employed in the manufacture. The various buildings and machines are said to have cost £66,000,000, and it has been calculated that a floating capital of £30,000,000 is employed in carrying on the trade. If we take into consideration the persons employed in the building of the mills and making of the machines, and in the buying and selling of the raw and manufactured material, it will be found that something like 4,500,000 individuals are dependent upon the prosperity of the cotton trade for their livelihood. The total quantity of yarn exported in 1875, was 215,000,000 lbs., worth £13,200,000; and the total quantity of calicoes, cambrics, fustians, etc., was 3,480,000,000 yards, worth £52,700,000. Besides these, there were £5,000,000 worth of lace, small-wares, etc.; which raises the total value to £70,900,000.

France and Alsace.—The first import of C. into France took place in 1668—viz. 450,000 lbs. *viâ* Marseilles from the Levant. In 1750, the receipts reached 6,978,588 lbs.; but during the wars of the revolution and the first empire, little progress was made. In 1815, the import was 36,200,000 lbs.; in 1825, it rose to 55,150,000 lbs.; in 1836, to 118,000,000 lbs.; in 1846, to 159,000,000 lbs.; in 1856, to 211,000,000 lbs.; in 1860, to 270,000,000 lbs. In 1862, the arrivals fell to 127 millions, owing to the stoppage of supplies from America. In 1869, the consumption was estimated at 242 millions; but the war cut down the figures to 165 millions in 1870, and 185 millions in 1871. In 1874, there was a rise to 208 millions. These latter figures are exclusive of Alsace and Lorraine, which use about 65 million lbs.; making 273 millions for France, as she stood before the war, against 242 millions in 1869. The number of cotton spindles in France, is about 5,200,000. In Alsace, there are about 1,700,000.

Belgium.—The average import of C. into Belgium in 1836–40, was about 39,500 bales; in 1846–50, 56,600 bales; in 1856–60, 61,000 bales; in 1870, 91,000 bales; and in 1874, 127,000 bales. In the last-named year, 91,000 bales were consumed; part of the remainder was forwarded to Germany, Switzerland, or Alsace, and part was added to stock. The number of spindles in Belgium is variously estimated at from 650,000 to 800,000.

Switzerland.—The trade of this confederation has flourished considerably. In 1833, its consumption was about 6,000,000 lbs.; in 1843, about 22,000,000 lbs.; in 1859, about 28,000,000 lbs.; in 1874, about 52,500,000 lbs. The first spinning-machine was set up at Zurich in 1807. In 1826, the number of spindles was 300,000; in 1830, 400,000; in 1835, 650,000, in 1840, 750,000; in 1845, 850,000; in 1850, 950,000; in 1860, 1,350,000; and at the present time, about 2,100,000. Prior to the Franco-Prussian war, the Swiss spinners received the bulk of their raw material *viâ* France, but now they are supplied mainly through Holland and Germany. The manufactured products of Switzerland are well liked, and compete successfully with those of England in the various continental markets.

Holland.—The C. trade of Holland is chiefly a transit one. The imports in 1872, reached 268,000 bales; in 1873, 180,000 bales; and in 1874, 168,000 bales. The deliveries were 224,000 in 1872; 180,000 in 1873; and 183,000 in 1874; but only about 28,000 bales per annum were retained for consumption, the remainder passing to Germany, etc. The number of spindles in Holland is about 230,000.

German Empire.—Under this head are included the various political divisions of Germany. The several states have made considerable progress in the production of C. fabrics. The C. is received chiefly through the ports of Hamburg and Bremen, but a considerable quantity is also received *viâ* Holland and Belgium, while a further portion is received into South Germany from Trieste. The average imports into Hamburg, Bremen, Amsterdam, and Rotterdam, in the five years ended with 1840, reached 109,000 bales; in the five years ended with 1855, they averaged 233,000 bales; in the three years ended with 1874, they averaged 655,000 bales. The deliveries in the last-named period, how-

ever, did not exceed 644,000 bales—the balance being retained in stock. The number of spindles in Germany in 1846, was about 815,000; in 1858, 2,000,000; and in 1874, 3,500,000, besides 1,700,000 in Alsace; making a total of 5,200,000. The Germans consume nearly the whole of their own produce, and are besides large buyers of English yarns and goods. The leading seat of the manufacture after Alsace is Saxony; then follow Bavaria, Prussia, Baden, Würtemberg, etc.

Austria.—In the C. trade, Austria has made the least progress of any country on the continent. In 1854, there were in all Austria, including Lombardy and Venice, about 1,533,000 spindles; while in 1872 (including the Italian provinces for the purpose of comparison) there were only 1,900,000—an increase of only 24 per cent in 18 years. The manufacturers receive nearly the whole of their raw material *viâ* Trieste. The deliveries from that port averaged about 82,000 bales in the five years ended with 1840; 107,000 in 1851–55; and 125,000 in the three years ended with 1874. The C. trade of Trieste has increased considerably since the opening of the Suez canal, by which means the spinners of Austria and South Germany have been brought into direct communication with India. Formerly a large quantity of C. was annually exported from Liverpool to Trieste, but the success of M. Lesseps' enterprise has entirely destroyed this branch of trade.

Italy.—The statistical materials relating to this part of the continent are very scanty. The imports into Genoa and Naples in 1851 amounted to about 31,000 bales; in 1860, they reached 94,000, but a good portion of this was forwarded to Switzerland and other places. In 1870, the import was only 47,000 bales; in 1871, the figures reached 92,000; in 1874, fell to 64,000. There are considerable imports also into Venice and Naples. The number of spindles in Italy is estimated to amount to about 700,000, capable of using 88,000 bales per annum.

Spain.—The C. trade of Spain is the oldest in Europe, but until recently has made the slowest progress of any. During the past twenty-five years, however, things have greatly improved. In 1850, the annual consumption was only about 80,000 bales; in 1860, it reached 106,000; in 1870, 152,000; and in 1874, 189,000. There are in Spain about 1,500,000 spindles, capable of using about 189,000 bales of 370 lbs. each.

Russia.—The C. manufacture of this empire is of comparatively recent origin. The imports of raw C. in 1824-26 (average of three years) were only 2,700,000 lbs.; in 1833–35, they reached 6,200,000 lbs.; in 1845–47, 28,000,000 lbs.; in 1853–55, 55,000,000 lbs.; in 1858–60, 94,000,000 lbs; and in 1869–70, 100,000,000 lbs., besides a considerable quantity from Bokhara, say from 15,000,000 to 20,000,000 lbs. This immense increase in the consumption of raw C. has considerably curtailed the demand for English yarn. In 1833, we exported 19,311,877 lbs. yarn to Russia, but in 1865, only 1,700,000 lbs.; and in 1872, about 3,000,000 lbs. The number of spindles in Russia is estimated at 2,100,000, capable of using 136,000,000 lbs. of cotton. Except in times of depressed trade, the mills work night and day, each mill having two sets of hands.

Sweden, etc.—There are in Sweden and Norway about 300,000 spindles. The coarser sorts of yarn are produced, and the annual consumption of C. is about 18,000,000 lbs., or 48,650 bales of 370 lbs. each. The C. is imported partly from Liverpool, and partly direct from the United States.

United States.—The first cotton-mill built in the United States was in 1791; the second, in 1795; the third, in 1803; the fourth, in 1804; followed by 11 more during the next three years. In 1810, there were 31,000 spindles; in 1831, 1,246,503; in 1850, 3,633,693; in 1860, 5,035,798; in 1868, 6,600,000; and in 1874, 9,415,000. In 1831, the consumption of C. amounted to 182,000 bales; in 1850, 613,000; in 1860, 843,000; in 1868, 968,000; in 1871, 1,173,000; and in 1874, 1,313,000. In 1851–52 (average of two years), the consumption represented 21 per cent of the C. grown, but in 1871–75, 28½ per cent! Europe has therefore had to look to other countries to supply her increased requirements, as we have already shown in a previous portion of this article.

Down to 1845, supply kept constantly ahead of demand, and, at the close of that year, the stock of C. in Europe reached 1,219,000 bales, or about 27 weeks' consumption, the average rate at that time being about 45,000 bales per week. The result was a very serious fall in prices—middling Orleans descending to 3¾*d.* per pound. The produce of America had almost driven the growth of every other country out of the market, and in 1846, the imports from the United States represented 86 per cent of the total arrivals! The great decline in values naturally led to a serious reduction in the rate of production, which reduction was further aggravated by unfavorable seasons in the south, and in 1846 the imports from the United States fell to 401 million pounds, and in 1847 to 364 millions, against 626 millions in 1845. Then followed a sharp reaction in prices, and ultimately an important recovery in the amount of supply. Between 1845 and 1856, however, consumption encroached upon production to such an extent that the stock in Europe at the close of 1856 was only 439,000 bales, or about six weeks' consumption, against 1,219,000 bales, or 27 weeks' requirements, at the end of 1845. In the autumn of 1857, therefore, middling Orleans touched 9⅝*d.* per pound. Thence to 1860, there was a gradual recovery in stocks, and a corresponding decline in prices; but even at the end of 1860, the stock was only 782,000 bales, or about 9½ weeks' consumption, and though middling Orleans had, in the interval, declined to slightly below 6*d.*, the average price for the five years ended with 1861 was 7*d.* per pound. Then followed the American war, of the effects of which we have already written.

The following table furnishes particulars of the consumption of C. in Europe and the United States in average periods from 1826 down to 1874. (The total import of C. into the United Kingdom amounted, in 1877, to 12,100,725 cwts.)

In the healing art, C. and the cloth and wadding made from it are used for wrapping up and keeping warm, and of late much more than formerly for binding up burns and wounds. A prejudice formerly prevailed against the use of C., as irritating to wounds; but experience has shown this opinion to be unfounded, and C. is now used in many hospitals quite as freely as linen.

Cotton Manufacture.—It has already been remarked that the modern system of C. manufacture dates no further back than about 1760. Prior to the mechanical inventions of Hargreaves, Arkwright, Crompton, and Cartwright, the arts of spinning and weaving were entirely domestic, and the instruments of manipulation much the same as those which had been in use in the east for centuries before. By means of the ancient distaff and spindle, or the more recent spinning-wheel, only *one* thread at a time was produced, and the process, as may be imagined, was tedious, and not very remunerative; besides which, only a very inferior yarn was the result; for whilst a tolerable thread could be spun from flax, the produce of C. was soft, weak, and uneven, and in weaving was used for *weft* (or *transverse* yarn) only, with linen, woolen, or worsted for the *warp* (or *longitudinal* yarn). Altogether, in the middle of the 18th c., the machinery for spinning was much more imperfect than that for weaving, and the weavers of the time were often at a stand for want of yarn to go on with.

This state of things had long occupied the attention of the thinking portion of the spinners, but without any practical result until the invention of the "jenny," by Hargreaves, about 1767. By this machine, eight threads at a time could be spun against the one of the spinning-wheel. Hargreaves was much abused by the populace of his native town and neighborhood, who feared that the invention would deprive them of all employment; the machine was destroyed, and the inventor compelled to leave his birthplace. Genius, however, ultimately triumphed, and the "spinning-jenny" was

patented at Nottingham in 1770. The year previously, Arkwright had patented his "water-frame," or "throstle," for spinning by rollers, by means of which a stronger and much firmer yarn was produced. It was about this period that fabrics composed entirely of C. were woven for the first time, the "jenny" supplying the *weft*, and the "throstle" the *warp*. A few years later, Mr. Crompton brought out a new piece of mechanism, which he styled the "mule-jenny," from its combining the principles of both Hargreaves' and Arkwright's patents; but it had an advantage over both, insomuch as it produced a much finer yarn than either. The "mule" came into full play in or about 1780, which is the period assigned for the birth of the *muslin* trade. There was now no longer a scarcity of yarn; the fear was, that there would be too much, for it was clear that the hand-loom weavers of the time could not keep up with the improved spinning machinery. But the invention of the "power-loom," by Dr. Cartwright, in 1785, set aside all doubts in this respect; the question now was, whether a sufficient quantity of raw C. could be obtained in order to keep pace with the requirements of the rising manufacture. West India C., which in 1784 averaged 1*s.* 6*d.* per lb., rose to 2*s.* in 1788; 2*s.* 1*d.* in 1792; and 2*s.* 8*d.* in 1798. Great exertions were made to obtain increased supplies from India; but the invention of the saw-gin in America brought the required succor from an unexpected quarter. It was only by means of this machine that the production of the short-stapled C. of the United States could be made at all remunerative. The export of hand-cleaned C. in 1791 was only 189,316 lbs., and in 1792 only 138,328 lbs.; but the year after the appearance of the gin—viz., 1794—the exports rose to 1,601,700 lbs.; in 1795, to 6,276,300 lbs.; and in 1800 to 17,789,803 lbs.

But to return. The first "mule-jenny" contained about *thirty* spindles, which, instead of being stationary, as in the "jenny" and "throstle," were placed on a carriage, which was moved outwards, in order, whilst twisting, to increase the fineness of the thread, and inwards again, to wind the yarn on the spindles. This required the constant attendance of a spinner to wheel the carriage backwards and forwards; but subsequent improvements have gone so far as to produce what is called the self-acting mule, two or three of which only require the assistance of one person, generally a boy or girl, whose place it is to piece any of the threads which may break during spinning. Mules of this construction are made with as many as 1000 or 2,000 spindles, sometimes more; and with the self-actor, as now improved, a single thread has been produced measuring upwards of *one thousand miles in length*, and yet weighing but *one pound!*

A word or two on the processes preliminary to spinning. The raw material is received from the various producing countries, packed either in bags or square bales. On arrival at the mill, the C. first enters the *mixing-room*, where it is *sorted*, and the various qualities, which are often contained in a single purchase, laid out in layers of equal extent, one over the other, and trodden close together. In this manner, two descriptions of C. are sometimes placed in one mixing. When Surat, for instance, is scarce and dear, and short-stapled low American plentiful and cheap, spinners of what are called coarse numbers invariably use a mixture of both growths; the same of other kinds, provided there is an approach to equality in length of fiber. C. of different shades of color are also sometimes spun together, in order to produce a particular yarn. A quantity of this *bing*, as it is called, is then raked down from the top to the bottom of the side, a portion of each layer being thus secured. This is carried to the *scutching* or *willowing machine*, by means of which the C. is cleansed from all impurities, such as sand, seeds, leaf, etc. The cleaned C. is then taken to the *spreading-machine*, through which it passes, and is then wound, in a fleecy state, upon a large wooden roller, to be transferred to the *carding-machine*. The latter machine is brought into requisition for the purpose of drawing out the fibers of the C. into parallel layers, so as to facilitate the twisting of them together. Originally, this process was performed by hand. The first improvement was made by Lewis Paul in 1748, and the next by Hargreaves in 1760. Arkwright and subsequent spinners have perfected the machine. The C. was formerly cleaned by hand. The *sliver* is next passed through the *drawing-frame*, which removes all inequalities, and reduces the bands to one uniform thickness. Here also several of the slivers are joined together (called *doubling*), so as to form one continuous cord, which is still further lengthened and increased in fineness by the *roving-machine*, whence it passes on to bobbins ready for *spinning*. Under the heads SPINNING and WEAVING, will be found a full description of the various processes above briefly glanced at. Other branches of the subject are treated of under CALICO-PRINTING; CALENDERING; DYEING, etc.

The finer kinds of yarn are spun from sea island and long-stapled Egyptian, and from them are fabricated our muslins, laces, etc. From Brazil and the better classes of short-stapled American, come our cambrics, calicoes, shirtings, sheetings, etc., and from the inferior qualities of American and Surat are spun the coarse yarns required for fustians and other heavy fabrics. Yorkshire broadcloths are sometimes half cotton. From warps of C. and wefts of wool or worsted, are formed varieties of Orleans cloths, Cobourgs, mousselines de laine, damasks, etc. There are also fabrics composed of silk, and C., linen and C., alpaca and C., etc.

Of the total amount of yarn produced, from one fifth to one fourth is exported in its raw state. The following figures will give the reader an idea of the progress of our export trade in C. yarns and goods:

	YARN.			MANUFACTURED GOODS EXPORTED.			
	Total Spun.	Total Exported.		Entered by the Yard.		At Value only.	Total Value of Yarn and Goods.
	lbs.	lbs.	£	Yards.	£	£	£
1816	78,987,200	15,740,675	2,623,448	189,263,731	12,309,079	743,643	15,684,170
1830	622,840,000	63,678,116	4,133,741	441,578,498	14,119,770	1,175,153	19,428,664
1845	494,766,000	135,765,487	6,963,235	1,091,686,069	18,029,818	1,126,288	26,119,341
1860	965,993,000	197,343,655	9,870,875	2,776,218,427	40,346,342	1,795,763	52,013,380
1874	1,120,525,000	220,599,004	14,516,093	3,587,132,479	54,355,800	5,280,477	74,232,370

In 1818, 14,743,675 lbs. of twist were exported, of which 14,727,882 lbs. went to Europe, and only 1861 lbs. to India and China. In 1843, 149,206,448 lbs. were exported; 128,664,218 lbs. to Europe; 899,746 lbs. to America and Africa; and 12,642,484 lbs. to India and China. In 1874, of the 220,599,000 lbs. exported, 77,438,000 lbs. went to Germany and Holland, 62,781,000 lbs. to India, China, and Japan. In 1877, there were in all 227,651,402 lbs. of yarn exported.

In 1820, Germany was the best customer for both our plain and printed cottons. The next largest customer for *plain* cottons was Italy; then followed the Brazils, United States, Russia, Portugal, East Indies, Holland and Belgium, West Indies, etc.; and for *printed* cottons—British West Indies, United States, Italy, Holland and Belgium, Portugal, East Indies, Brazil, etc. The Netherlands were the principal buyers of our laces and small wares; then Germany, British West Indies, Central America, Brazils, United States, East Indies, Portugal, Russia, Italy, etc. At the present time, the East Indies take nearly one third of our exported manufactured goods. For *plain calicoes*, our next best customer is China; then follow Turkey, Brazil, Egypt, United States, Portugal, Italy, Germany, etc.; of *printed and dyed calicoes*, Turkey is the largest purchaser; then follow India, Brazil, Germany, United States, France, West Indies, Central America, etc. The United States take nearly one half of our exports of *lace and patent-net;* then follow Belgium, France, Holland, Germany, etc. The United States take over one third of our exports of *stockings*, and one half of our shipments of other sorts of *hosiery;* then follow Australia, the Argentine Republic, etc. One fourth of the *sewing-thread* exported goes to the United States; then follow Germany, Brazil, Russia, etc.

Subjoined is an estimate of the weight and value of the total production of cotton manufactures in Great Britain, with the cost of cotton consumed, and the balance remaining for wages, all other expenses, interest of capital, and profit for the years 1870, 1872, and 1874 (000's omitted; 1,071,770 = 1,071,770,000):

WEIGHT.

	1870. lbs.	1872. lbs.	1874. lbs.
Cotton consumed	1,071,770	1,175,345	1,266,129
Waste in spinning	129,310	134,965	145,604
Yarn produced	942,460	1,040,380	1,120,525
Exported in yarn	186,078	211,940	220,599
Exported in piece-goods, etc.	616,232	698,840	726,000
Consumption and stock	140,150	129,600	173,926
Total as above	942,460	1,040,380	1,120,525

VALUE.

Yarn exported	£14,671	£16,710	£14,516
Goods, etc., exported	61,424	69,900	66,934
Consumption and stock	17,050	15,660	20,110
Total	£93,145	£102,270	£100,560
Cost of cotton consumed	42,145	48,054	40,225
Left for wages, expenses, profits, etc.	£51,000	£54,216	£60,365

The figures relating to the export of "piece-goods, etc.," include two thirds of the goods shipped as apparel, haberdashery, etc. The average annual production of yarn and goods for the three years 1870–72, was 1,018,563,000 lbs., distributed as follows:

	lbs.	Per cent.
Exported to India, China, Japan, etc., including 47,000,000 lbs. yarn	333,000,000	32.70
Exported to all other countries, including 150,166,000 lbs. yarn	529,030,000	51.94
Left for home consumption and stock	156,533,000	15.36
Total as above	1,018,563,000	100.00

In round numbers, therefore, it may be said that one third of the total production of C. goods is exported to the east, one half to other countries, and one sixth consumed at home.

With the great improvements which have taken place in the mechanics of the trade, and the reduced price of the raw material, a gradual but considerable decline has taken place in the cost and price of the fabrics produced. The price of 1 lb. of yarn containing 100 hanks, in 1786, was 38*s.*; in 1807, 6*s.* 9*d.*; in 1829, 3*s.* 2*d.*; at the present time, 2*s.* 6*d.* The *cost* of weaving during the last 60 years has been reduced upwards of 60 per cent. A species of calico, selling at 6*s.* per yard towards the close of the last century, can be purchased in our day at as many pence! The average price per yard of *goods* exported in 1815 was 1*s.* 5¼*d.*; in 1825, 10½*d.*; in 1835, 6½*d.*; in 1845, 3 15/16*d.*; and in 1859, 3 7/16*d.* In 1864, the price rose to 6*d.* per yard, but in 1874 it fell to 3⅝*d.* per yard. The average price per lb. of *yarn* exported in 1815 was 3*s.* 7⅝*d.*; in 1825, 1*s.* 11½*d.*; in 1835, 1*s.* 4⅝*d.*; in 1845, 1*s.* 0½*d.*; and in 1859, 11¾*d.* In 1864, the average rose to 2*s.* 4¼*d.* per lb.; but in 1874, fell to 1*s.* 3¾*d.* per lb. The most profitable years for spinners are said to have been 1845, 1848, 1859, 1860, and 1871.

The earnings of the work-people are higher at the present time than they have ever been before. The following table furnishes the rates current in 1839, 1849, 1859, and 1875. It will be observed that the proportionate advance during the past 16 years has been much greater in the lowest than in the highest paid hands:

AVERAGE WEEKLY WAGES.

	1839. Week of 69 Hours.	1849. Week of 60 Hours.	1859. Week of 60 Hours.	1875. Week of 60 Hours.
	s. d.	*s. d.*	*s. d.*	*s. d.*
Steam-engine tenters	24 0	28 0	30 0	32 0
Warehousemen	18 0	20 0	22 0	26 0
Carding Department—				
Scutchers (women and girls)	7 0	7 6	8 0	12 0
Strippers (young men)	11 0	12 0	14 0	19 0
Overlookers	25 0	28 0	28 0	32 0
Spinning on Self-acting Mules—				
Minders	16 0	18 0	20 0	25 0
Piecers (women and young men)	8 0	9 0	10 0	16 0
Overlookers	20 0	22 0	26 0	30 0
Throstle Spinning—				
Spinners (girls 14 to 18 years)	4 0	4 6	5 0	9 0
" (women)	7 0	7 6	9 0	13 6
Overlookers	18 0	20 0	24 0	26 0
Ruling—				
Throstle reelers (women)	9 0	9 6	9 6	12 6
Warpers	22 0	22 0	23 0	26 0
Sizers	23 0	23 0	25 0	30 0
Doubling—				
Doublers (women)	7 0	7 6	9 0	12 6
Overlookers	24 0	25 0	28 0	32 0

Other branches show the same ratio of advance.

The following table exhibits the extent of the manufacture at the close of 1874:

Estimated weight of *cotton* consumed	1,226,129,000 lbs.
" value of same, at 7 5/8*d.* per lb.	£40,226,000
" weight of *yarn* produced	1,120,525,000 lbs.
Declared weight of yarn exported	220,599,000 lbs.
" value of yarn exported (1*s.* 3¾*d.* per lb)	£14,516,000
Number of yards of goods exported	3,587,132,000 yds.
Declared value of same (3⅝*d.* per yard)	£54,356,000
" " " other cotton goods exported	£5,380,000
Total declared value of all cotton manufactures exported	£74,232,000
" " " of all British exports	£297,650,000
Proportion of *cotton* exports to *entire* exports per cent.	25 per cent.
Estimated number of persons employed	479,000
" average rate of wages per week	13*s.*
" total amount of wages paid in 12 months	£15,190,000

ESTIMATED FIXED CAPITAL.

Cost of 41,300,000 spindles, at 25*s.* to 27*s.* per spindle, inclusive of buildings, etc.....	£53,690,000	
Cost of 463,000 power-looms, at £26 each.....	12,038,000	
		£65,728,000

ESTIMATED FLOATING CAPITAL.

Employed in carrying on the routine of business.	£18,000,000	
Cash at bankers.....	12,000,000	
		£30,000,000

The average price of cotton consumed in 1860 was $6\frac{5}{8}d.$ per lb.; in 1861, $7\frac{5}{8}d.$; in 1864, 1*s.* $10\frac{1}{2}d.$; in 1867, $10\frac{3}{8}d.$; in 1871, $8\frac{1}{2}d.$; and in 1874, $7\frac{3}{8}d.$ The average prices of the principal descriptions in 1871 to 1875 were as follows:

	Uplands. Mid.	Pernam. Fair.	Egypt. Fair.	Dhollera. Fair.	Bengal. Fair.
1871.....	$8\frac{9}{16}d.$	$8\frac{1}{2}d.$	$8\frac{7}{8}d.$	$6\frac{3}{4}d.$	$5\frac{7}{8}d.$
1872.....	$10\frac{9}{16}d.$	$10\frac{3}{8}d.$	$10\frac{1}{2}d.$	$7\frac{1}{2}d.$	$5\frac{1}{2}d.$
1873.....	$9d.$	$9\frac{3}{8}d.$	$9\frac{11}{16}d.$	$6\frac{3}{16}d.$	$4\frac{1}{8}d.$
1874.....	$8d.$	$8\frac{1}{2}d.$	$8\frac{1}{2}d.$	$5\frac{5}{16}d.$	$4\frac{1}{4}d.$
1875.....	$7\frac{3}{8}d.$	$7\frac{15}{16}d.$	$8\frac{7}{16}d.$	$5d.$	$4\frac{5}{16}d.$
1875, Dec. 31	$6\frac{7}{8}d.$	$7\frac{1}{2}d.$	$7\frac{5}{8}d.$	$4\frac{11}{16}d.$	$4\frac{1}{8}d.$

Except Bengal, prices at the end of Sept. and Dec., 1875, were lower than since 1860.

The Cotton Famine.—The American civil war broke out in 1861, and in 1862 our import of cotton fell to 524 million pounds, against 1257 millions in 1861, and 1391 millions in 1860. Increased supplies from India and other sources brought the arrivals up to 669 millions in 1863, 893 millions in 1864, 978 millions in 1865. The war closed in 1865, trade with America was resumed, and the imports in 1866 rose to 1377 million pounds, and the cotton industry shortly afterwards resumed its former dimensions. At the crisis of the famine the mills were not working more than half-time, and in Dec., 1862, 247,000 cotton operatives and others connected with the trade, were out of employment, and 165,000 others only partially employed. In the same month, 284,000 persons, or 24 per cent of the total population of the districts affected, were in receipt of charitable relief. In 1863, the average number of persons out of work was 189,000, and that of those only partially employed, 129,000; in 1864, the figures were 134,000 and 97,000 respectively; and those for the first five months of 1865, 107,000 and 68,000. During the course of the famine, the losses of the trade amounted to between £65,000,000 and £70,000,000, including from £28,000,000 to £30,000,000 loss of wages to operatives. Of the later amount about one fourth was recovered in the form of relief, or in wages for employment in public works, etc. The total sum distributed in charity alone was about £3,000,000. In some districts in 1863, the poor-rate rose to nearly 6*s.* in the £. In the same year, the average rate for the whole of the cotton districts was 2*s.* $2\frac{3}{8}d.$, against only $7\frac{3}{8}d.$ in 1861. See also COTTON FAMINE.

COTTON (*ante*). Cotton culture in the United States began feebly in Virginia in 1621, when the seed was planted by way of experiment, and its easy growth attracted much interest in England. In books relating to the early English settlements, "cotton wool" is spoken of as one of the products of that happy country "seated near the midst of the world, between the extremities of heat and cold." For a long time the cultivation was limited to gardens or small fields, and only for home use. The cultivation appears, somewhat singularly, to have spread northward rather than southward. Traces of the culture are found in Maryland, Delaware, New Jersey, and Pennsylvania, down to the era of the revolution. In 1776, it was grown near Philadelphia in sufficient quantity for domestic uses; but very little was used, human clothing being chiefly of linen and woolen fabrics. It was first planted in the Carolinas and Georgia in 1733, and in Louisiana in 1742. In 1747, several bags of the staple were exported from Charleston; and in 1770, there were shipped to Liverpool three bales from New York, four from Maryland and Virginia, and three barrels full from North Carolina. It was near the close of the 18th c. before the cotton trade of the United States became important. Our crop in 1791 was estimated to be 2,000,000 lbs. In 1795, the few factories in this country were still importing foreign cotton; the imports in that year were 4,107,000, and the exports 6,276,300 lbs. In 1801, the crop was 48,000,000 lbs., of which 21,000,000 lbs. were exported. In 1810, the exports were 94,000,000 lbs. In 1813, owing to the war with England, only 19,400,000 lbs. were exported; the price in the United States was 12c. per lb., while in England it was three times as much. In 1821, the yield of the United States was 180,000,000 lbs., of which nearly 125,000,000 lbs. were exported. In 1825, the crop rose to 255,000,000 lbs. The following table gives the annual product of the United States in bales since 1829. The average weight of a bale is 440 lbs.:

Year.	Bales.	Year.	Bales.	Year.	Bales.	Year.	Bales.
1829	870,415	1841	1,634,945	1853	3,262,852	1869	2,439,039
1830	976,845	1842	1,688,574	1854	2,930,027	1870	3,154,946
1831	1,038,848	1843	2,378,875	1855	2,847,339	1871	4,352,317
1832	987,487	1844	2,030,409	1856	3,527,845	1872	2,974,351
1833	1,070,438	1845	2,394,503	1857	2,939,519	1873	3,930,508
1834	1,205,324	1846	2,100,537	1858	3,113,962	1874	4,170,388
1835	1,254,328	1847	1,778,655	1859	3,851,481	1875	3,832,991
1836	1,360,752	1848	2,347,634	1860	4,669,770	1876	4,669,288
1837	1,422,930	1849	2,728,596	1861	3,656,006	1877	4,485,423
1838	1,801,497	1850	2,096,706	1866	2,193,987	1878	4,811,265
1839	1,360,532	1851	2,355,257	1867	2,019,774	1879	5,073,531
1840	2,177,835	1852	3,015,029	1868	2,593,993		

[There is no record of production during the war of the rebellion.]

The section of the United States where this staple is largely cultivated is called the "cotton belt," and includes nearly the whole of the states named in the following table of acreage, or surface in acres growing cotton in each year from 1871 to 1877:

States.	1871. Acres.	1872. Acres.	1873. Acres.	1874. Acres.	1875. Acres.	1876. Acres.	1877. Acres.
North Carolina	388,474	450,629	513,717	457,300	621,428	609,000	584,640
South Carolina	523,535	570,652	677,717	571,922	955,050	945,500	917,135
Georgia	1,170,832	1,311,331	1,455,577	1,310,020	1,311,702	1,515,000	1,530,150
Florida	143,727	158,099	167,584	152,501	182,393	165,000	166,650
Alabama	1,250,427	1,387,972	1,499,009	1,289,148	1,732,250	1,732,250	1,766,895
Mississippi	1,397,835	1,537,618	1,705,755	1,501,944	2,016,226	1,976,000	2,055,040
Louisiana	847,044	940,218	1,034,239	827,391	1,415,730	1,260,000	1,335,600
Texas	774,806	914,269	1,007,122	1,119,064	1,483,500	1,483,500	1,706,025
Arkansas	597,857	693,512	811,409	722,154	1,133,000	1,133,000	1,189,650
Tennessee	463,042	518,605	596,395	548,683	780,000	741,000	755,820
Total	7,557,579	8,432,905	9,509,524	8,499,335	11,934,379	11,560,250	12,007,605

The yield of cotton per acre varies from 100 to 250 lbs. The heaviest recorded production per acre for a series of years was in Arkansas, Texas, and Louisiana. Half a bale to the acre is considered to be a good crop.

This great staple is by no means easy to cultivate, and the results of the crop are always uncertain. The plant loves the sun, and is easily damaged by a wet season or by an early frost. It has, also, many insect enemies, and is liable to diminution by insufficient culture. The planting of seed, beginning in Texas in February, is later as one goes northward, closing in North Carolina and Tennessee not before early in May. The seed, resembling a bean in its early growth, shoots up two green leaves, striking a tap-root deep into the earth, and growing in a few days 2 or 3 in. high. More leaves soon appear, and in about three weeks a process of plowing and cutting out the superfluous plants begins, leaving only 3 or 4 plants in a bunch, the bunches being from 1 to 2 ft. apart. The plowing is twice repeated, followed by the hoe, cutting out all the grass, and all the plants except one in a hill. What is known as the "stand" of cotton is of great consequence. Bringing to a stand and cutting out all the plants except one on a hill, gives additional growth, vigor, and productiveness to the remaining plants. The flower or bloom of the plant, white in the morning, and red in the evening, comes usually in June. The flower drops off after about 3 days, leaving a small ball which incloses the cotton wool. The shell finally bursts and the balls are ready for picking from the bush from Sept. to Dec., according to latitude, season, and time of planting. The ball is about the size and shape of the egg of the guinea hen. The balls are picked by hand and cast into large sacks loosely suspended from the shoulders. A good picker will gather from 150 to 200 lbs. per day. The next process is the ginning, or separating the fiber from the seed. This is done by passing the balls over a revolving apron and circular saw run at high speed to cut the fiber from the seed. The seed falls to the ground, and the fiber is blown from the gin into the picking room. The seed weighs nearly twice as much as the fiber. About one fourth of it is reserved for planting, and the remainder is sold for making oil. The fiber is then compressed by powerful presses into bales, and is ready for market.

The raising of cotton in the United States shows a steady and rapid increase. In 13 years before the rebellion there were 40,994,419 bales produced; in 13 years following the war the product was 45,627,847 bales; and this in spite of the disturbance of labor in the cotton-raising states by emancipation and the extreme financial depression of the planters. The price of cotton from 1825 to 1877 inclusive is shown in the table below. The highest and lowest price for each year is given in cents. The figures from 1862 to 1877 represent United States currency, but those for the last year differ very little from gold:

Year.	Price. Lowest.	Highest	Year.	Price. Lowest.	Highest.	Year.	Price. Lowest.	Highest
1825	13	27	1843	5	8	1861	11	28
1826	9	14	1844	5	9	1862	20	68
1827	8	12	1845	4	9	1863	54	88
1828	9	13	1846	6	9	1864	72	1.90
1829	8	11	1847	7	12	1865	33	1.22
1830	8	13	1848	5	8	1866	32	52
1831	7	11	1849	6	11	1867	15	36
1832	7	12	1850	11	14	1868	16	33
1833	9	17	1851	8	14	1869	25	35
1834	10	16	1852	8	10	1870	15	26
1835	15	20	1853	10	11	1871	15	25
1836	12	20	1854	8	16	1872	18	25
1837	7	17	1855	7	11	1873	13	21
1838	9	12	1856	9	12	1874	15	19
1839	11	16	1857	13	15	1875	13	17
1840	8	10	1858	9	13	1876	11	13
1841	9	11	1859	11	12	1877	11	13
1842	7	9	1860	10	11	1878	9	12

The cost of production and the price obtained in the market for the cotton crop raised in 1876 and sold in 1877 are thus stated. To avoid fractions, the sums are put in mills, or tenths of a cent.

States.	Cost per lb. of product'n.	Price obtained.	States.	Cost per lb. of product'n.	Price obtained.
North Carolina	93	98	Louisiana	97	102
South Carolina	94	97	Texas	80	91
Georgia	93	98	Arkansas	90	99
Florida	87	92	Tennessee	90	98
Alabama	99	101			
Mississippi	98	102	Average	92	98

Even at this small margin of six tenths of a cent on a lb. the crop of 1876 paid the planters a profit of nearly $12,000,000. The total value of crop at place of shipment is but a little less than $200,000,000 per year.

The home manufacture of cotton is one of the most important industries of the country. The subjoined table shows the distribution of the manufacture by states, and into northern and southern groups. It gives the number of mills or factories, the number of spindles, and lbs. of cotton used in 1875.

States.	Mills.	Spindles.	Lbs. used.	States.	Mills.	Spindles.	Lbs. used.
Maine	27	638,944	33,603,236	Alabama	14	58,480	6,756,170
New Hampshire	36	815,709	57,326,126	Arkansas	2	1,781	132,400
Vermont	16	46,344	2,372,420	Georgia	47	131,340	23,299,303

Maryland	20	127,352	21,368,020	Texas	2	5,700	.....
Ohio	4	13,000	1,764,000	Virginia	9	54,624	5,560,835
Indiana	4	22,988	3,261,340				
				Total South	181	481,821	67,733,140
Total North	694	9,057,543	509,009,613	Whole country	875	9,539,364	576,742,753

This amount represents 1,242,080 bales.

In regard to the goods manufactured, the following figures will be interesting:

COTTON GOODS MANUFACTURED IN THE UNITED STATES—1875.

	N. England States.	Middle and Western.	Total Northern.	Total So'thern.	Total Un'd States.
Threads, yarns, and twines, lbs	45,000,000	19,000,000	64,000,000	19,000,000	83,000,000
Sheetings, shirtings, and plain goods, yds	540,000,000	94,000,000	634,000,000	92,000,000	726,000,000
Twilled and fancy osnaburgs, jeans, etc., yds	180,000,000	45,000,000	226,000,000	21,000,000	247,000,000
Print cloths, yds	640,000,000	109,000,000	749,000,000	.....	749,000,000

1879.....	162,304,250	10,853,950

There are some material differences in the varieties of cotton, as will be seen by the following classification in the principal English markets running from the most down to the least valuable: Sea island, middling; Egyptian, fair; Peruvian, fair; Pernambuco, fair; West India, fair; New Orleans, middling; Mobile, middling; upland, middling; and India cotton of four lower grades. Where the long staple Sea island (American) brought 23*d.* per lb., upland (which represents the average price of cotton at large) sold at less than 11*d.*

COTTON, CHARLES, 1630–87; an English translator and poet, educated at Cambridge. He was a friend of Izaak Walton, and accompanied him on his fishing excursions. His works, nearly all in verse, are translations of Corneille's *Horace;* the *Life of the Duke d'Espernon; The Fair One of Tunis,* a translation of Montaigne; *The Scarronides, a Virgil Travestie;* the *Voyage to Ireland;* and *The Wonders of the Peak.*

COTTON, GUN. See GUN COTTON.

COTTON, JOHN, 1585–1652; one of the earliest of Boston ministers, educated at Trinity college, Cambridge, and, in 1612, vicar of St. Botolph's church in Boston, Eng., where he remained 20 years. He leaned towards puritanism, for which he was cited to appear before archbishop Laud, instead of doing which he fled to America, arriving in Boston Sept. 4, 1633. There he became pastor of the First church. He was well educated, and was remarkable for simplicity and plainness in his pulpit discourses. It is said that from his strictness in keeping the Lord's Day, came the New England custom of beginning Sunday on Saturday night at sunset; but this can scarcely be correct, as earlier sources for this custom can easily be traced.

COTTON, Sir ROBERT BRUCE, a distinguished English antiquary, founder of the Cottonian library, now in the British museum, was born at Denton, Huntingdonshire, 22d Jan., 1570. He was educated at Cambridge, and soon after taking his degree of B.A. in his 16th year, he commenced those archæological pursuits which have made his name famous, and proved of such immense value to British historians. The dissolution of the monasteries about half a century before, dispersed many valuable collections of manuscripts into private hands, and C. hunted up and purchased these wherever practicable. On account of his eminent abilities and great knowledge, he was frequently consulted by ministers of state on difficult constitutional points and international questions. In 1600, at the request of queen Elizabeth, who desired to have the views of the society of antiquaries on the matter, he wrote *A Brief Abstract of the Question of Precedency between England and Spain.* King James, by whom he was made a knight, employed him to vindicate the conduct of his mother, Mary queen of Scots, and also to examine whether the Roman Catholics, on account of whom some alarm was then felt in the nation, should be imprisoned or put to death. C. took the most humane view of the matter. His intimacy with the earl of Somerset led him to be suspected of complicity in the death of sir Thomas Overbury, and in consequence he was imprisoned for about five months. In 1629, a tract entitled *A Project how a Prince may make himself an Absolute Tyrant,* was obtained from his library, the tendency of which was considered dangerous to the liberty of the state. His library was accordingly declared unfit for public inspection, and he himself was denied all use of it. His heart being bound up in his library, he pined and died in less than two years after, on 6th May, 1631.

The COTTONIAN LIBRARY, which now forms so important a part of the British museum, was, after the death of sir Robert C.'s son and grandson, who augmented it considerably, invested in trustees for the use of the public. In 1730, the library was removed to Ashburnham house, Westminster, where the royal collection was; and in the following year a fire occurred in the house, in which about 114 out of the 958 MS. volumes of which the library consisted were reported as "lost, burned, or entirely destroyed; and 98 damaged so as to be defective." Fortunately, however, under the care and intelligence of skillful keepers, a great number of these injured volumes have been restored, so that the library now consists of nearly 900 volumes, of which, says Mr. Edwards in his *Memoirs of Libraries,* "nearly 200 are state papers of the highest value. They include a vast series relating to the diplomatic intercourse between England and almost every state of Europe, extending from the reign of Edward III. to that

of James I.; and of these documents, no small proportion consists of the original letters of sovereigns and of statesmen. Even those papers which are not original have a high degree of authority, as being, for the most part, coeval transcripts." The Cottonian library was transferred to the British museum (q.v.) in 1757. In addition to the MSS., the Cottonian collection consists of many valuable coins and antiquities.

COTTON FAMINE. The history of manufacturing industry does not present a more striking episode than that which was connected with the effects of the civil war in America on the cotton manufactures of Great Britain in 1861 and following years.

The years 1859 and 1860, unparalleled for the magnitude of the cotton manufacture, had much to do with the collapse that followed. So rapidly has this branch of industry increased in Lancashire, that the immigrants into that county from other districts have varied from 10,000 to 20,000 a year for a long series of years, irrespective of the natural increase of population by the excess of births over deaths. The imports of raw cotton, the exports of manufactured cotton, the number of mills, the number of hands, all were at their maximum in 1860. The imports were 1390 million lbs., of which 1054 millions were worked up in Great Britain. There were 1920 mills in Lancashire, 275 in the adjacent portions of Cheshire and Derbyshire, and enough elsewhere to make up a total of 2,650. There were 440,000 hands employed in these mills; by age, 90 per cent adults and young persons, and 10 per cent children; by sex, 44 per cent males, and 56 females. The machinery was worked by steam-engines having an aggregate of 300,000 horse-power. There were more than 30,000,000 spindles, making from 4,000 to 6,000 revolutions per minute; and 350,000 power-looms. The fixed capital in mills and machinery was valued at £54,000,000; while the money paid for wages in that year was £11,500,000. The cotton goods of various kinds manufactured for home consumption used up 180 million lbs. of cotton, and were valued at £24,000,000; while the exported goods—consisting of 2,776 million yards of calico, muslins, etc., and 197 million lbs. of yarn—were valued at the enormous sum of £50,000,000; besides £2,000,000 more for cotton hosiery and small wares. The total value for home consumption and export, £76,000,000, exceeded the total imperial revenue for that year. Considering that, of 1390 million lbs. imported, no less a weight than 1120 millions came from the United States, there is at once evidence afforded of the tremendous effect that would be produced by any stoppage in the American cotton-trade. Irrespective of this, however, there would have been a stagnation in our manufacturing districts in 1861, even if raw cotton had been plentiful and cheap. The manufacturers had glutted all the markets by the wholly unprecedented extent of their operations in 1860. The English warehouses, as well as those elsewhere, were full; and time was needed to carry off the immense stock. There were cotton goods on hand in Great Britain at the end of the year valued at £20,000,000; while in India our merchants continued to pour in goods even when the consignments of 1860 exceeded £17,000,000.

Fort Sumpter was bombarded in April, 1861. This was virtually the beginning of the American civil war, and the beginning also of the rise in the price of cotton. A blockade was early established by the federal government of Washington; and it was only by "running" this blockade that cotton-laden ships could clear from the southern or confederate ports. The price of middling Orleans (the kind of cotton mostly used, and that which governs the price of all other kinds) rose from 7¾*d.* to 9*d.*, 10*d.*, and 12*d.*, as the year advanced. There was thus a twofold motive for lessening the operations of the Lancashire mills—the markets were so fully supplied with manufactured goods, that no immediate augmentation was necessary; while the increase in the price of the raw material rendered manufacturing less profitable than before. The Liverpool dealers made colossal fortunes by the enormous rise in price of every bale of cotton which could reach the country from any quarter; while the manufacturers were also prosperous, because they could sell their accumulated stocks of calicoes and yarns at much higher prices than had been obtainable in 1860. It was the operatives who suffered. One by one, the mills were put upon half-time, because the mill-owners had not much inducement to spin and weave, under the extraordinary double influence above adverted to. It was not until autumn, however, that these effects were heavily felt, when there was the enormous quantity of 1000 million lbs. of cotton, raw and manufactured, on hand in Great Britain. When half-time began at the mills in Oct., there were, in Lancashire and the two neighboring counties, 890 spinning-mills, 593 weaving-mills, 635 spinning and weaving mills, and 152 other cotton-mills of miscellaneous kinds, employing 369,453 factory-hands; and all these four classes of establishments became equally embarrassed. India or Surat cotton could still be had in considerable quantity, at 10*d.* per lb. instead of its former price of 5*d.*; but it was greatly out of favor, on account of its dirty condition and the shortness and hardness of its staple. In Nov., there were 49 mills stopped, throwing out 8,063 hands, while 119 were working half-time—placing something like 20,000 persons on half their usual wages. In Dec., middling Orleans rose to 12*d.* So singular was the state of things, and so unlike what would be called a "famine," under other circumstances, that the actual quantity of raw cotton in Great Britain at the end of the year (280 million lbs.) was greater than ever before known in the history of the trade; but as the market-price of yarns and piece-goods at that time scarcely equaled that of raw cotton, *plus* wages, the manufacturer could scarcely operate without a loss;

and, therefore he either closed his mill, or placed his hands on half-time. It was not so much a famine of cotton as a famine of employment.

The year 1862 opened very gloomily. Relief committees began to be formed in Manchester, Wigan, Blackburn, Preston, and other towns, to distribute subscribed funds to such of the hands as were totally out of work. The streets were thronged with the unemployed; but there was no disturbance, and scarcely any begging. Sewing-schools were established by ladies in the several districts, to teach the factory girls useful domestic needle-work—of which they are generally very ignorant—to get them to make clothes for themselves and others; and to shield them from the vicious temptations which would beset them during a period of idleness. The ladies also won upon the affection of the girls by reading to them and sympathizing in many ways with their sorrows. Many of the manufacturers set apart large rooms as school-rooms and soup-kitchens for the boys and men, and abundant stores of soup were provided at 1*d.* per basin. The poor-law board sent down instructions to the local guardians how to give as much elasticity as possible to the system of parochial relief. In April, Blackburn had only 18 mills on full-time out of 84, the rest being either on half-time or closed; and there were 9,000 of the inhabitants receiving parochial relief. Most of the other towns were in nearly as bad a plight. In May, matters were worse; Preston had 10,000 operatives out of work, and Blackburn had just about half-employment for 27,000. Middling Orleans rose in price to 15*d.*, and manufacturers had more inducement to speculate in cotton than to spin it. Meanwhile, great efforts were made to assist the distressed operatives. The letters of a "Lancashire Lad" in the *Times*, with the text, "Con yo help us a bit?" made a great impression. The *Daily Telegraph* raised a fund of £5,000 by its own exertions. The Lancashire landowners established a "cotton district relief fund" in London, to which they subscribed £11,000 in one day; the lord mayor established a "mansion-house committee," which received subscriptions from all parts of the world; Manchester established a "central relief committee," as a nucleus for various local funds; while a great county meeting brought in £130,000, of which £70,000 was subscribed in one day in one room. Mr. Farnall was sent down by the poor-law board, as special commissioner, to superintend the plans for parochial relief. A rate-in-aid bill was passed through parliament, to enable the government to issue orders in council, authorizing parishes to raise money on the guarantee of future rates; it was only to be done where the current poor-rate had already reached a high figure, and the money raised was to be applied strictly to mitigate the distress of the operatives. Notwithstanding all these sources of assistance, the work-people became reduced to great distress. "The pawnbrokers' stores," said an eye-witness, "were glutted with the heir-looms of many an honest family. Little hoards were drained to meet the exigences of the time. Many found it the sorest trial of their lives to ask for food; and it is a happy circumstance for all to remember, as it is honorable to those of whom it is recorded, that none suffered more severely than those who had a struggle to overcome their unwillingness to subsist upon food which they had not earned. Rents were falling in arrears, and many a house which had held only one family, was now occupied by three or four, in order to economize rent, fuel, and furniture." Nevertheless, none died of privation, and the average sickness was even less than usual. It was a fact well ascertained, that spirit-drinking was less indulged in than in times of full wages. Meanwhile, the manufacturers began to make great profits; the prices of yarns and calicoes rose rapidly, and the stocks were sold off which had been so long on hand. Middling Orleans rose to 2*s.* 3*d.* in Oct., and thus there was less inducement than ever to purchase for the sake of manufacturing. Strange as it may appear, 50,000 bales of cotton were resold by the manufacturers themselves during the year, at the very time when the phrase "cotton famine" was on the lips of every one; but the simple fact was, that more profit could be made by reselling than by manufacturing.

It was a gloomy winter, that of 1862–63, for the mill-hands. In Oct., the loss of wages was estimated at £136,000 per week. In Nov., there were 208,000 persons in the Lancashire district receiving out-door parochial relief, and 144,000 others aided by subscribed funds; there were at the same time 20,000 mill-girls at the sewing-schools. At Christmas, there were 250,000 hands totally out of work; those, and about as many more dependent on them, received £40,000 a week from the parishes and the committees. Vast sums were sent from various parts of the world to be spent in winter-clothing only, and prodigious stores of second-hand clothing were contributed by private families. As the money relief seldom exceeded 2*s.* or 2*s.* 6*d.* per weak per applicant, to purchase clothing out of this was of course impracticable. The small shopkeepers also suffered greatly; for there was only one third the amount of wages received by their customers per week that had been received two years before. Emigration schemes were much discussed, but were not carried on very largely, because Lancashire men felt convinced that trade would revive after a time. Meanwhile, the *rate* of wages was not lowered; few mill-owners proposed it, and the operatives were rootedly against it; however small the quantity of work, it was paid for at the old rate.

No date can be named for the actual cessation of the distress; it died out by degrees. When the manufacturers had sold off their old stocks, they recommenced buying more to spin and weave; because, although the price of raw cotton was enormously high (2*s.* 5*d.* for middling Orleans in May, 1863), the selling price for calicoes and muslins was

now proportionately high, and therefore they could manufacture at a profit. In June, 1863, a "public works act" was passed, to enable the government to advance £1,200,000 for public works in the cotton districts—partly to make good drainage, roads, water-supply, etc., and partly to yield £600,000 or £700,000 as wages to the unemployed cotton-hands in doing so much of the work as they could manage. The money (to be repaid by parish rates at subsequent dates) was to be advanced by the exchequer loan commissioners on the recommendation of the poor-law board, and a government engineer was to examine and sanction the several works to be executed. All these operations were to be confined strictly to the cotton districts, where the distress existed. Mr. R. A. Arnold, the resident government inspector of these public works, states in his *History of the Cotton Famine*, that by the month of June, 1865, there had been works planned, and in great part executed, under the clauses of this and a supplementary bill, to the amount of £1,846,000. They compromised the making or improving of 276 m. of street and highway, 304 m. of main sewer, reservoirs for 1500 million gallons of water, several parks and cemeteries, and a large area of land-drainage. Nearly 30,000 persons had been fed by the wages of the cotton operatives on these works. The subscriptions to meet the distress reached the vast sum of £2,000,000; while the out-door poor relief was about £1,000,000 more than in an equal period of average times.

The fluctuations in the value and quantity of cotton available during this extraordinary period are strikingly shown in the following parallel columns, relating to the raw cotton imported, and the money paid for it:

	Quantities (cwts.).	Value.
1860	12,410,000	£35,757,000
1861	11,223,000	38,653,000
1862	4,678,000	31,093,000
1863	5,978,000	56,278,000
1864	7,976,000	78,204,000
1865	8,732,000	66,032,000
1866	12,296,000	77,521,000

Remark here the sudden and tremendous increase in the amount paid for cotton in the latter half of the period; the payment, indeed, of forty millions sterling more in 1866 than in 1860, for about the same quantity. To show how India and Egypt benefited by this unprecedented state of affairs, we give (in pounds,* not cwts.) the quantities imported from those countries as compared with the imports from the United States:

	United States.	India.	Egypt.
1860	1,119,000,000	204,000,000	43,000,000
1861	816,000,000	369,000,000	41,000,000
1862	13,524,000	393,000,000	59,000,000
1863	6,394,000	434,000,000	94,000,000
1864	14,148,000	507,000,000	125,000,000
1865	139,000,000	446,000,000	177,000,000
1866	520,000,000	615,000,000	118,000,000

Look, again, at the prices per cwt.:*

	United States.			India.			Egypt.		
	£	*s.*	*d.*	£	*s.*	*d.*	£	*s.*	*d.*
1860	3	0	4	1	17	0	3	15	6
1861	3	12	5	2	17	5	4	4	9
1862	10	2	4	6	5	9	7	1	4
1863	11	5	8	8	18	11	10	11	8
1864	13	11	0	8	9	0	12	15	3
1865	9	18	6	6	5	7	8	16	1

The export of British Indian cotton is 1860 brought only £2,500,000; in 1864, it fetched £34,000,000. The largest quantity imported was in 1866. In 1876, the total value of Indian cotton was £5,874,704.

COTTON GRASS, *Eriophorum*, a genus of plants of the natural order *cyperaceæ*, having the fruit accompanied with long silky hairs which spring from the base of the ovary. The species are not very numerous; they are natives of the colder regions of the northern hemisphere. Several are found in Britain, and their white cottony fruit-bearing spikes are well known in our moors and bogs. The cottony substance has been used for stuffing pillows, making candle-wicks, etc. Mr. Helliwell has shown that a firm and beautiful cloth can be made of it; and, according to him, it might be gathered in some places, without cultivation, at a cost of twopence or threepence per pound. The stems of a Himalayan species, *E. cannabinum*, called *bhabhur*, yield a very strong fiber, and are much employed for making cordage, being simply twisted into cables, of which rope-bridges are usually made; but they are not durable, and require much repairing every year.—C. G. is said to be valuable for sheep-pasture. Its leaves were

*The board of trade tables, from which these figures are taken, are often difficult to consult, on account of the quantities of cotton being stated sometimes in *bales*, sometimes in *cwts.*, and sometimes in *pounds*.

formerly employed as a remedy for diarrhœa, and the spongy pith of the stem to expel tape-worms.

COTTONWOOD. See POPLAR.

COTTONWOOD, a co. in s.e. Minnesota on the Des Moines river, and the tributaries of the Big Cottonwood, intersected by the St. Paul and Sioux City. and the Winona and St. Peter's railroads; 725 sq.m.; pop. '80, 5,533. Surface undulating, and soil fertile.

COTTON WORM, the caterpillar of a moth of the tribe *noctuæ*. The insect is of triangular shape, about an inch long, the upper wings reddish gray, and the under wings darker. The caterpillars have 16 feet, and in creeping they raise the back like the inch-worm, or span-worm. They are green, with light yellow stripes, and black dots along the back. These worms are sometimes terribly destructive to young cotton plants.

COT'TUS, a genus of acanthopterygious fishes, of the *mailed cheek* family or *sclerogenidæ*, having a large depressed head, more or less armed with spines or tubercles, a tapering body destitute of scales, and two dorsal fins. Some of the species are marine, others inhabit fresh water. Of the latter, the bull-head (q.v.) is an example. The marine species are mostly found in northern seas. A few occur on the shores of Britain, of which the most common are the sea scorpion (*C. scorpius*) and the father lasher (*C. bubalis*), both of which are very often left by the receding tide in rock-pools, and amongst sea-weeds. The greatest size to which they attain on the British coasts is only about 10 in., but in more northerly seas, they become much larger. They form a principal part of the food of the Greenlanders. Notwithstanding their large gill-openings, they live long out of water.

COTURNIX. See QUAIL.

COTYLE'DON (Gr. a cup or cup-shaped hollow), or SEED-LOBE, in botany, a principal part of the embryo in phanerogamous or flowering-plants. Cryptogamous plants are *acotyledonous* (q.v.); their seeds or *spores* have no cotyledons. Phanerogamous plants are divided according to their seeds into *monocotyledonous* (q.v.), having only one C., and *dicotyledonous* (q.v.), having two cotyledons. With the latter are ranked some *coniferæ* remarkable for having more than two cotyledons, which form a sort of whorl. The cotyledons inclose the *plumule* or *gemmule;* and in germination they usually come above-ground as the first leaves (seed-leaves) of the young plant—the plumule in dicotyledonous plants, appearing between them—and they become at the same time more leaf-like; but in some plants, which have thick fleshy cotyledons, they remain under-ground. In either case, they contain a store of nourishment, by which the young plant is sustained on its first germination. Instances of cotyledons remaining under-ground, may be seen in the common pea and bean; and instances of cotyledons coming above-ground, in the kidney-bean and scarlet-runner, plants of the same natural order. Cotyledons are sometimes very thick, sometimes very thin and delicate; those of the same seed are generally equal, but not always so; they are frequently undivided, but sometimes cut and lobed. The cotyledons of dicotyledonous plants are often simply applied face to face; when if the radicle is folded along their edges, they are said to be *accumbent;* if it is folded on their back, they are *incumbent.* Sometimes the two cotyledons of a seed are *conduplicate,* or laterally folded; sometimes they are *reclinate,* or folded from apex to base; sometimes *convolute,* or laterally rolled up; sometimes *circinate,* or spirally rolled up with the apex innermost. These terms are of importance in descriptive botany, as characters of high value are often furnished by the seed.

COUCH, DARIUS NASH, b. N. Y., 1802; graduate of West Point. He served regularly in the army from 1846 to the close of the war of the rebellion, becoming maj.gen. of volunteers. In 1865, he resigned, and was in that year the democratic candidate for governor of Massachusetts, but failed of election.

COU'CHANT. In heraldry, a beast lying down, with his head up, is couchant. If the head is down, he is DORMANT.

COUCH GRASS, *Triticum repens,* also called *wheat grass, dog grass, quickens,* and *squitch* or *quitch,* a grass which, although of the same genus with wheat, is chiefly known to British farmers as a troublesome weed. It is common in most parts of Europe and North America. It grows to a height of 1½ to 3 ft., and has two-rowed spikes and flat spikelets, the side of which is applied to the rachis. It is perennial, and its creeping roots render it extremely difficult of extirpation; they are carefully gathered out of land under cultivation, but they make the plant very useful in fixing loose sandy soils, so as to form pasture. It is not, however, esteemed a very nutritious grass. The roots are sweet and mucilaginous, and are collected at Naples for feeding horses; they have also been dried and ground into meal, to make bread in times of scarcity. A kind of beer is made from them, and in some countries they are much used in domestic medicine. They are diaphoretic and aperient.—The popular name *squitch,* or *quitch,* is also given to some other perennial grasses.

COUCHING. See CATARACT,

COUCY, RENAUD CASTELLAN OF, a court-poet belonging to the n. of France, who flourished probably in the latter part of the 12th century. The love-songs ascribed to

him are distinguished above all similar productions of the same epoch by the great warmth of passion displayed. They are addressed, of course, to a mistress, whose name, in accordance with the fashion of the time, is not mentioned. From their contents, we can gather little or nothing of the circumstances of C.'s life, except that he had become a crusader, and had separated himself very reluctantly from the object of his adoration. It is supposed that he accompanied Philippe Auguste and Richard Cœur de Lion to the Holy Land, probably in the service of Raoul Sieur de Coucy, with whom, indeed, he is often confounded. Like Tristan and Isolde, C. and his mistress soon became patterns of true but unfortunate lovers. As early as the first half of the 13th c., the *Roman d'Aventure* gives a very prolix and incredible account of both. The best edition of the *Chansons du Châtelain de C.* was edited by Franç. Michel (Paris, 1830).

COU'GAR. See PUMA.

COUGHING, considered physiologically, consists, 1st, in a long inspiration which fills the lungs to a greater extent than usual; 2d, in the closure of the glottis, or narrow opening in the organ of voice (see LARYNX), at the commencement of the act of expiration; and 3d, in the sudden forcing open of the glottis by the violence of the expiratory movement. In this way, a blast of air is driven upwards from the lungs through the mouth, which carries with it any sources of irritation that may have been present in the air-passages. C. may occur from irritation in the back of the throat, in the larynx, trachea, or bronchial tubes, and may be excited by acrid vapors, by irritant gases, or by articles of food or drink—such as even a drop of water or a crumb of bread—making their way into the air-passages instead of into the pharynx, or by excessive or morbid secretion from the walls of the air-tubes, or even by the entrance of cold air, when the lining membrane of the air-passages is abnormally irritable.

It is not very easy to explain to the non-professional reader *how* cough is produced. From the medulla oblongata, or uppermost part of the spinal cord (lying within the cavity of the cranium), there is given off a very important nerve, called, from its distribution to the lungs and stomach, the pneumogastric nerve (q.v.), which contains both sensory and motor filaments. The sensory filaments are distributed to the mucous lining of the larynx, trachea, etc. Any of the irritating substances already mentioned may produce an impression upon these sensory filaments which, being conveyed to the medulla oblongata, gives rise, through the motor filaments, to the transmission of motor impulses to the various muscles which are concerned in the act of coughing. Other motor nerves, especially those supplying the intercostal muscles and the diaphragm, co-operate powerfully with the motor filaments of the pneumogastric.

The object of C. in the animal economy is unquestionably to guard against the danger of the entrance of mechanical and chemical irritants into the air-passages; and accordingly the mucous membrane, especially of their upper part, is endowed with a most exquisite sensibility; which, when aroused by irritation or by a state of disease, provokes incessant coughing until the irritation be allayed or removed. Cough is an exceedingly common symptom of all diseases of the respiration. See PNEUMONIA, CONSUMPTION, BRONCHITIS, CATARRH, etc.

Cough occurs amongst the lower animals under similar conditions. From continued breathing of a close foul atmosphere, the bronchial mucous membrane becomes unduly irritable, hence the prevalence of chronic cough amongst the cows in our overcrowded town-dairies. Chronic cough also occurs in horses, usually as a sequel to repeated attacks of bronchitis. It constitutes unsoundness, is best treated by repeated doses of belladonna and camphor, but often requires for its entire removal a run at grass.

COULOMB, CHARLES AUGUSTIN DE, known by his experiments on friction, and his invention of an instrument—the *torsion balance* (q.v.)—to measure the force of magnetic and electrical attraction, was b. at Angoulême in 1736, and in early life entered the engineers. In 1777, he gained a prize by an essay on the construction of magnetic needles (*Sur les Aiguilles Aimantées*). In 1779, his *Théorie des Machines simples* gained the prize offered by the academy; and in 1781, he was a third time successful in an essay on the friction and resistance of cordage, etc., used in machines. In the same year he was elected as member of the academy, and his services were employed on all the most difficult problems in mechanics. Having offended certain influential persons by reporting unfavorably on their project of a navigable canal in Bretagne, C. was for some time imprisoned, but received from the states of Bretagne a present of a seconds watch, as a reward of his firm opposition to an expensive and unprofitable sheme. C. lived in retirement during the revolution; became a member of the institute, 1804; and died Aug. 23, 1806.

COULTER. See PLOW.

COU'MARINE, or TON'KA STĔAROP'TEN (see STEAROPTEN), is a camphor-like substance of a very agreeable smell, which gives their fragrance to the well-known tonka bean (q.v.), (*dipterix odorata*), so much used for flavoring snuff; the woodruff (*asperula odorata*); the melilot (*melilotus officinalis*); a number of grasses, as the sweet-scented vernal grass (*anthoxanthum odoratum*); and the faam or faham leaves (*angræcum fragrans*), much prized among the Asiatics for their vanilla-like scent; and is probably the cause of similar fragrance in many other plants. C. may be procured from tonka beans

by digestion in ether. It crystallizes in small prisms, is colorless, has the smell of the bean, and is scarcely soluble in cold water, but dissolves pretty easily in boiling water. A beverage well known in Germany as *May drink*, and made of wine and woodruff, derives its flavor from coumarine.

COUNCIL (*ante*). Among Congregationalists is an assembly composed of ministers and delegates from neighboring churches, called by a local church, as occasion arises, to act or assist in ordaining a minister, or give advice on matters referred to it. Its power is only advisory. They have also a national C., whose name has been criticised as not accurately indicating its character, composed of delegates from all parts of the denomination, and meeting for conference concerning its work and welfare. The Pan-Presbyterian C. is composed of delegates from Presbyterian bodies throughout the world, and meets for conference on matters of general interest to the denomination. In the Reformed Episcopal church, each parish, in addition to the vestry which has direction of its temporal affairs, has a C., chosen by communicants, that holds an advisory relation to the pastor, and is associated with him in the reception, discipline, and dismission of members. The synodical C. is composed of delegates from a certain number of parishes; and the general C., representing the whole denomination, is clothed with supreme legislative authority.

COUNCIL, PRIVY. See PRIVY COUNCIL.

COUNCIL, or SYN'OD, is an assembly of ecclesiastical dignitaries held for the purpose of regulating the doctrine or discipline of the church. As early as the 2d c., church councils were convened in which only one or two provinces took part, the bishops and presbyters binding themselves to carry out the decisions arrived at in their own communities. These assemblies were commonly held in the chief town or metropolis of the province, and the bishops of such capitals—who, after the 3d c., bore the title of *metropolitan*—were wont to preside over the meetings, and to consider questions of doctrine and discipline which had arisen within the territory. Over these metropolitan councils were established, at a later period, the provincial synods, exercising authority over several united provinces, and finally, the national councils. After the 4th c., when the Christian religion was established in the Roman empire, we read of *œcumenical*, i.e., universal councils, so called because all the bishops of Christendom were invited or summoned by the emperor. In some early synods, we find bishops, presbyters, and others, taking part in the deliberations; but after the opening of the 4th c., only the bishops were convened. According to the doctrine of the Roman Catholic church, the pope alone, or, by way of exception, in some cases the college of cardinals had the power of convening œcumenical councils, which, in the Catholic view, represent the universal church under the guidance of the Holy Ghost. Questions were determined by the majority of votes, and the pope or his proxy presided and confirmed the resolutions carried in the synod. In matters of faith, the Holy Scriptures and the traditions of the church are the guide; while in lighter matters, human reason and expediency were consulted. In the former, œcumenical councils are held to be infallible, but in other matters of discipline, etc., the latest synod decides questions. The question of the pope's subordination to the decrees of the œcumenical councils was long and warmly debated, but the recent Vatican council may be said to have set the question at rest. Twenty œcumenical councils are recognized in the Roman Catholic church—9 eastern and 11 western.

1. The synod of apostles in Jerusalem, wherein the relation of the Christian doctrine to the Mosaic law was determined. (See Acts, c. XV.) 2. The first C. of Nice, held 325 A.D., to assert the Catholic doctrine respecting the Son of God, in opposition to the opinions of Arius. 3. The first C. of Constantinople, convoked under the emperor Theodosius the great (381 A.D.), to determine the Catholic doctrine regarding the Holy Ghost. 4. The first C. of Ephesus, convened under Theodosius the younger (431 A.D.), to condemn the Nestorian heresy. 5. The C. of Chalcedon, under the emperor Marcian (451 A.D.), which asserted the doctrine of the union of the divine with the human nature in Christ, and condemned the heresies of Eutyches and the Monophysites. 6. The second C. of Constantinople, under Justinian (553 A.D.), which condemned the doctrines of Origen, Arius, Macedonius, and others. 7. The third C. of Constantinople, convoked under the emperor Constantine V., Pogonatus (681 A.D.), for the condemnation of the Monothelite heresy. 8. The second C. of Nice, held in the reign of the empress Irene and her son Constantine (787 A.D.), to establish the worship of images. 9. The fourth C. of Constantinople, under Basilius and Adrian (869 A.D.), the principal business of which was the peace of the eastern and western churches, and the deposition of Photius, who had intruded himself into the see of Constantinople, and the restoration of Ignatius, who had been unjustly expelled. 10. The first Lateran C., held in Rome under the emperor Henry V., and convoked by the pope, Calixtus II. (1123 A.D.), to settle the dispute on investiture (q.v.). 11. The second Lateran C., under the emperor Conrad III. and pope Innocent II. (1139 A.D.), condemned the errors of Arnold of Brescia and others. 12. The third Lateran C., convened by pope Alexander III. (1179 A.D.), in the reign of Frederick I. of Germany, condemned the "errors and impieties" of the Waldenses and Albigenses. 13. The fourth Lateran C., held under Innocent III. (1215 A.D.), among other matters, asserted and confirmed the dogma of transubstantia-

tion and necessity for the reformation of abuses and the extirpation of heresy. 14. The first œcumenical synod of Lyon, held during the pontificate of Innocent IV. (1245 A.D.), had for its object the promotion of the crusades, the restoration of ecclesiastical discipline, etc. 15. The second œcumenical synod of Lyon was held during the pontificate of Gregory X. (1274 A.D.). Its principal object was the reunion of the Greek and Latin churches. 16. The synod of Vienne in Gaul, under Clemens V. (1311 A.D.), was convoked to suppress the Knights Templars, etc. 17. The C. of Constance was convoked at the request of the emperor Sigismund, 1414 A.D., and sat for four years. It asserted the authority of an œcumenical C. over the pope, and condemned the doctrines of John Huss and Jerome of Prague. 18. The C. of Basel was convoked by pope Martin V., 1430 A.D. It sat for nearly ten years, and purposed to introduce a reformation in the discipline, and even in the constitution, of the Roman Catholic church. All acts passed in this C., after it had been formally dissolved by the pope, are regarded by the Roman Catholic church as null and void. 19. The celebrated C. of Trent, held 1545–1563 A.D. It was opened by Paul III., and brought to a close under the pontificate of Paul IV. The Vatican C., above mentioned, held in 1870, decreed the infallibility of the pope. For details of the more important councils, see NICE, BASEL, CONSTANCE, TRENT, etc.

Among the provincial or local synods convened after the division of the church into east and west, we may mention that of Clermont (1096 A.D.), when the first crusade was proposed, and that of Pisa (1409 A.D.), when three popes were contending for the see of Rome. Among Protestants, no general C. has ever been convened; but several particular synods have decided various questions. Of these synods, one of the more remarkable was that of Dort, in 1618, when Calvin's creed was asserted against the Arminians.

The decrees of the Roman Catholic councils were edited by Mansi (31 vols., 1759–1798). See Hefele's *Conciliengeschichte* (7 vols., 1855–1874).

COUNCIL, TOWN. See TOWN COUNCIL.

COUNCIL BLUFFS, a city in Pottawottamie co., Iowa, on the Missouri river, 120 m. above Des Moines, and 1000 m. above St. Louis, on the Union Pacific and five other railroads; and connected by ferry and bridges with Omaha, Neb.; pop. '80, 18,059. The new bridge over the Missouri is over half a mile long and 50 ft. above high water, and is intended for railroad trains as well as ordinary travel. The city is nearly three m. from the river at the foot of the bluffs, a high and precipitous ridge. It is on a square, 6 by 4 m., making 24 sq. miles. It is well laid out in rectangular blocks, and finely built, chiefly of brick. The noteworthy buildings are the county court house, the city hall, high-school, and two public halls. There are many important manufactories, churches, and schools, and near by is the state deaf and dumb institution. It was a MORMON settlement in 1846, and was chartered as a city in 1853. The name is in memory of a council held with the Indians by the explorers, Lewis and Clarke, in the early part of the century.

COUNCIL OF WAR is a conference of officers, in military or naval warfare, on some matter in which the commander wishes to fortify his judgment by an appeal to that of others. The French make a special provision for a council of defense in a garrison. The governor or commandant may summon the heads of departments to meet him in consultation whenever he may think such a step desirable; and the opinions expressed at such meetings are placed upon record. The commandant of a garrison generally solicits the opinion of a C. of W. before surrendering to besiegers. The English military code leaves these matters to the discretion of the commander. In the navy, a C. of W. consists usually of flag-officers only; but officers of lower rank occasionally assist.

COUNSEL. See ADVOCATE and BARRISTER.

COUNT (Fr. *comte;* Lat. *comes*). In classical writers, down to the end of the 4th c., the meanings attached to the word *comes* were comparatively few and simple. At first it signified merely an attendant, and differed from *socius* chiefly in expressing a less intimate and equal relation to the person accompanied. Suetonius uses it for an attendant on a magistrate. A little later, in Horace's time, it was applied to those young men of family whom it had become customary to send out as pupils under the eye of a governor of a province, or the commander of an army. Very soon the fashion of having similar attendants at home was introduced, and Horace speaks of this necessity as one of the miseries of a high position. The emperor, of course, had many *comites* in this sense; and to these, as he gradually became the center of power, he transferred the various offices of his household, and even of the state. Around his person these comites formed a sort of council of state, very much resembling that instituted by the first Napoleon. The example of the emperors of the west was followed by the emperors of the east, though at Byzantium the title attached less to the office than to the individual. Most of the titles of our own court officials are translations of those belonging to similar officers in the lower empire. The *comes sacrarum largitionum* was the grand almoner; the *comes curiæ*, the grand-master of ceremonies; the *comes vestiarius*, the grand-master of the wardrobe; *comes equorum regiorum*, the grand equerry, etc. The *comes marcarum*, or count of the marches, there can be little doubt, was the original of

the *marquis* of later times. In France, the C. of the palace (*comes palatii nostri*) was the highest dignitary in the state after the *maire* of the palace; and in the 11th c., he had already acquired a rank apart from that of the other counts. He presided in the court of the sovereign in his absence, and possessed sovereign jurisdiction. The habit of instituting counts-palatine was adopted by Spain and England. Those counts, again, who, at a later period, as rulers of provinces, assumed something approaching to sovereign power, arrogating to themselves the right of appointing counts-palatine under them—e.g., the counts of Chartres, of Champagne, of Blois, Toulouse, etc.; and the ancient houses of Chartres and of Blois continued to claim in perpetuity the title of count palatine as that of their eldest sons. Counts of this sovereign class owed their origin to the feebleness of the later Carlovingian kings, under whom they contrived gradually to convert the provinces and towns which they had governed as royal officers into principalities hereditary in their families. It was then that the counts came to be known by the names of their counties. Since the great revolution, the title of C. in France has been purely honorary, and has been used with a license which has almost deprived it even of that character. The title was never used in England, though its Latin equivalent has always been the common translation for earl (q.v.), and the wife of an earl, from a very early period, has been styled *countess*. For the history of the office in Germany, where it was of great importance, see GRAF.

COUNTER APPROACH, in military engineering, is a trench or passage, cut by the defenders of a fortified post from some of the outworks towards the besiegers, and leading to a battery in a small work. Its object is to enable the defenders to foil the approaches of the besiegers by carrying the fight further away from the body of the place, and enabling the besieged to enfilade the besiegers' batteries and approaches.

COUNTER-CHANGED, or CONTER-CHANGED, in heraldry. When several metals and colors are intermixed, one being set against the other, they are said to be counter-changed.

COUNTERFEIT. See COINING.

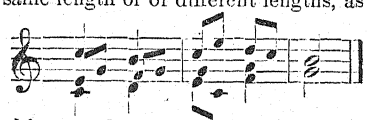
COUNTERFORT, in fortification, is a mass of stone or brickwork added to the revetment of a rampart, in such a way as to form a buttress for resisting the pressure of the mass of earth. Counterforts occur at intervals of about 20 ft., and assist in preventing the earth from pushing down the revetment-wall into the ditch.

COUNTER-GUARD, is an outwork designed to defend the two faces of a bastion or ravelin from a direct fire, so as to retard a breach being made. The counter-guard consists of two lines of rampart parallel to the faces of the bastion or ravelin, and separated from them by a narrow ditch. The crest of the counter-guard must be some three feet lower than that of the works it covers, in order not to obstruct the defense. Lest the enemy should establish a battery on the counter-guard, the terre-plein, or flat space behind its parapet, is made very narrow.

COUNTER-IRRITANTS, agents applied to the skin so as to redden (rubefacients), to vesicate (blisters or vesicatories), or to produce pustules, purulent issues, or even sloughs of skin and of the subcutaneous textures. The milder counter-irritants are mustard (see CATAPLASM), turpentine applied on warm cloths, and spirit or acetic acid in lotion. The stronger are blisters of cantharides (q.v.) or of ammonia; croton-oil (q.v.) or tartar emetic (q.v.), in ointment; setons, caustic or pea-issues, and the moxa; and above all, the actual cautery (q.v.) or hot iron. None of the stronger counter-irritants should be used without careful consideration and medical advice; great mischief is often done by their careless or improper use. Counter-irritants relieve internal pain, and tend to promote the absorption of morbid effusions.

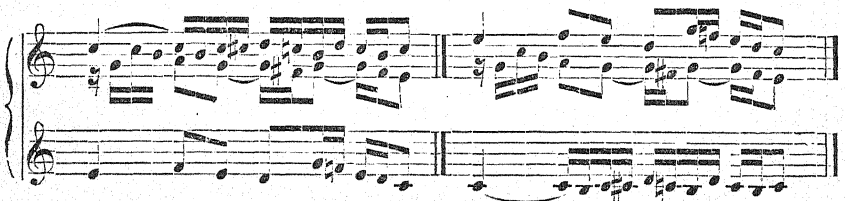
Amongst horses, counter-irritants are much used for strains and diseases of the joints, but should never be applied, as they too often are, in recent cases, or whilst the part is hot or inflamed. Cantharidine preparations, or ointment of biniodide of mercury, are the most convenient. For cows, use hot fomentations, followed by the smart infriction of mustard-paste; for dogs, soap-liniment, strengthened, if required, by ammonia or turpentine.

COUNTERMARCHING. See MARCHING.



COUNTER-MARK, a stamp sometimes found on ancient coins, or medals, usually an inscription or a figure, and supposed to show that the article was captured from an enemy.

COUNTERMINE, in military engineering, is a gallery or chamber excavated under the glacis or some other part of a defense-work of a fortress. Its purpose is to foil a besieger. In a fortress on a large scale, there are envelope galleries, counter-scarp galleries, listening galleries, galleries of communication, and other subterranean passages, under various parts of the outworks, all for the purpose of assisting the defenders in discovering and frustrating plans laid by the besiegers. Listening galleries are sometimes pushed forward even to the foot of the glacis. In such places, selected men put their ear to the ground, and listen for the approach of the enemy, as denoted by the sound of tools used in driving a mine or gallery of attack. The sound of a pickaxe so employed can be heard through the ground at a distance of 60 feet. As there are no



openings above, these galleries cannot be driven beyond a certain distance, as the sappers would be stifled for want of air. If a mine be driven to blow up the defense-works, a C. is driven to blow up the besiegers; and sometimes the two parties carry their works so far as to meet in the subterranean passages, and there fight. If there be only a thin wall of earth left between them, they will fire pistols through bored holes, or drive in cartridges or smoke-balls. This terrible work is mostly carried on by sappers and miners.

COUNTER-PASSANT, in heraldry, when two beasts are passing each other the contrary way.

COUNTERPOINT, in music, means the setting of a harmony of one or more parts to a melody. In the early age of the science, notation was represented by mere points on the lines. The setting of parts to a melody already represented by a row of dots or points was therefore called *punctum contrapunctum.* In this respect C. is nothing else but the uniting of various harmonious parts. In a more circumscribed sense, it is the art or manner of accompanying a given melody with other parts. Simple C. is a musical combination where the melody of the parts is not mixed or changed, and may be either all in notes of the same length or of different lengths, as for example:

If the parts be constructed in regard to one another so that they can be changed or transposed over or under each other, without alteration in the movement, or injury to the harmony, it is then called double C., for example:

As double C. consists of the changing or transposing of one part over or under another, it follows that there must be as many different kinds of it as there are different intervals in the scale. We have, therefore, double C. of the octave as above, of the twelfth, tenth, ninth, etc. That of the octave is, however, the most useful, as it is more free in movement, and easier to recognize. The following admits of different transpositions.

The first indication of contrapuntal writing is to be found in the 12th c. by Adam de la Hale, who received a genuine artistic education in the Netherlands, but was far in advance of his time, for his style of music was forbidden to be performed in the church by a bull of the pope, who gave Palestrina an order to replace it with a more simple music. The best masters for C. have been Kirnberger and Albrechtsberger in former times, and in modern times, Schneider, Hauptmann, and Dehn.

COUNTER-PROOF. An impression which is obtained from a freshly-printed proof of an engraving, by laying it, before the ink is dry, upon plain paper, and passing it through the press. By this means the ink is transferred from the wet proof to the plain paper, and a reversed impression is obtained, which is often of use in enabling the engraver to judge of the success of his work.

COUNTERSCARP, in fortification, is the vertical, or nearly vertical side of the ditch nearest to the besiegers, and opposite to the scarp or escarp.

COUNTERSIGN, in military discipline or maneuvers, is a word exchanged between sentinels, inspectors of posts going their rounds, or persons having business with the soldiers in camp or garrison. The C. in use at any particular time is supposed to be known only to those immediately concerned, and is generally a simple word.

COUNTERSIGN, the signature of a secretary, minister, or other subordinate, to any writing signed by the principal or superior, as a guarantee for its authenticity.

COUNTER-TENOR, the highest adult male voice, and the lowest female voice.

COUNTER-VAIR, a heraldic fur. It differs from *vair* by having its cups or bells of the same tinctures placed base against base, and point against point. The tinctures are OR and AZURE.

COUNTERVALLATION, in military engineering, is a chain of posts constructed by the besiegers of a fortified place; it completely surrounds the place at a certain distance, and is intended to prevent sorties of the besieged. The posts are generally small redoubts, either isolated or connected by a line of earthworks. It is only during very protracted sieges that countervallations are constructed. They bear a certain relation to circumvallation (q.v.).

COUNTIES CORPORATE. In England there are certain cities and towns, some having territory annexed to them, some scarcely any, which possess the privilege of being governed by their own sheriffs and other magistrates altogether independently of the counties in which they are situated. The act 3 Geo. I. c. 5, for regulating the office of sheriff, enumerates 12 cities and 5 towns in this position. The cities are London, Chester, Bristol, Coventry, Canterbury, Exeter, Gloucester, Lichfield, Lincoln, Norwich, Worcester, and York. The towns are Kingston-upon-Hull, Nottingham, Newcastle-upon-Tyne, Poole, Southampton. From forming no part of the counties with which they were locally connected, they had no share in the county elections. To this extent 12 of the number are now included in their respective counties (2 Will. IV. c. 45, s. 17, schedule G).

COUNT AND RECKONING, the technical name given in the law of Scotland to a form of process, by which one party compels another to account judicially, and to pay the balance which may be found to be due. In these actions a remit is usually made to an accountant.

COUNTRY DANCE (Fr. *contre-danse*, of which the English term is a corruption), a dance in which as many couples can take part as there is space to accommodate them; at the commencement, the gentlemen being arranged on one side, and the ladies on the other. In its figure, the dancers are constantly changing places, leading one another back and forward, up and down, parting and uniting again. The numerous different figures, which give an interest to this dance, are generally designated with a particular name. The music is sometimes in $\frac{2}{4}$ time, and sometimes in $\frac{6}{8}$ time, and the step is more smooth than springing. The C. D. keeps its ground in England notwithstanding the introduction of many fashionable new dances. See DANCING.

COUNTY, a term equivalent to shire. Although of the same signification, the terms are applied on no uniform principle. In England and Scotland, the shires are also called counties; but in Ireland, the term C. seems to be exclusively employed. Such, likewise, appears to be the case in the British colonies and United States. See SHIRE.

COUNTY (*ante*), a common, in fact universal political division in the various states of the American union (except in Louisiana, where the similar division is called a "parish"). For purposes of local government, each county has at least one court and one prison, and usually an almshouse. The smaller divisions are townships, from three or four to a dozen or more in a county; and the supervisors of these towns, chosen by popular suffrage, form an administrative board to conduct the financial and other county affairs. In all the United States there are now nearly 3,500 counties. Usually each county chooses one or more members to the lower house of the state legislature. In some cities, such as New York, wards, or special election districts, answer for townships, and the boards of common council have the powers of supervisors.

COUNTY COURTS. The present C. C. were established in 1846, principally for the purpose of affording a cheap and speedy mode of recovering small debts. The old C. C., kept by the sheriffs, were in most cases limited to the recovery of sums not exceeding 40*s.*, and the expense and difficulty of enforcing moderate claims often amounted to a denial of justice. There were a few local courts whose jurisdiction had a rather wider range, but in most cases there were great abuses connected with their management. The courts now take cognizance of all personal actions where the debt or damage claimed is not more than £50, except actions of "ejectment, or in which the title to any corporeal or incorporeal hereditaments, or to any toll, fair, market, or franchise, shall be in question, or in which the validity of any devise, bequest, or limitation, under any will or settlement, may be disputed, or any malicious prosecution, libel, or slander, criminal conversation, seduction, or breach of promise of marriage." But all the actions here excluded, except action of criminal conversation, may be tried in the C. C. by consent of the parties concerned. By similar consent, actions for any greater amount than £50 may be tried.

In England and Wales, there are 499 courts, divided into 56 circuits, and presided over by 57 judges, the Liverpool circuit possessing two. The judges are appointed by the lord chancellor, or, where the whole district is in the duchy of Lancaster, by the chancellor of that duchy. Their salaries, owing to extended jurisdiction, are now nearly

all £1500, and have, with slight variations, been made uniform throughout the country. Judges resigning from permanent disability are allowed a retiring pension not exceeding two thirds of their annual salary. Each court has a resident registrar, except in a very few cases, where officials in the old county or local courts claimed vested rights in the first appointments to C. C. offices. The registrars are appointed by the judge, but the lord chancellor, or chancellor of the duchy of Lancaster, may remove them for misconduct. Their salaries depend on the number of *plaints* entered in their districts. In courts under 6,000 plaints, they vary from £120 to £180, out of which the registrar provides a staff of clerks. Where the plaints exceed 6,000, the salary is £650 and clerks; where they exceed 8,000, £700 and clerks. Each court has also a high-bailiff, whose duties are outside, serving process and levying executions. In the smallest courts, their salaries may fall to about £50; in the largest, they may rise to £700 net. There are 23 treasurers, who superintend the accounts of all the courts. They are appointed and removable by the lords of the treasury, and their salaries are £700 and £850 per annum. All the property of the court is vested in them.

In cases above £5, and in cases of replevin and interpleader, either party to a suit may demand a jury. But this is very seldom done. Out of 495,474 causes determined in 1874, only 991 were tried by jury. In 478,323 cases, the plaintiff gained his point. There is no right of appeal where the debt is under £20; but the decisions of the court seem to be willingly accepted as final, as appeals are exceedingly rare even in the heavier causes. There is no imprisonment for debt merely, but a defendant may be committed to prison for contumacy, fraud, or refusal to pay his debts when able to do so. This ground of imprisonment declines, owing to greater reluctance of judges to commit. In 1874, there were 4,198 persons imprisoned out of 23,232 warrants issued, the majority having paid before committal. No debtor can be committed for more than six weeks for failure to pay a debt, though he may be committed for such period in respect of each installment.

In 1874, the amount of debts recovered was £1,293,409, and the costs amounted to £64,901, and the fees on all proceedings were £350,152. There were 831 orders made to protect married women's goods against deserting husbands. There were, out of the whole cases, 28 appeals to the supreme courts. The courts dispose of 61 causes per day. The number of plaints or cases commenced and entered in each court during the year is about 15,200. Attorneys conduct most of the business in these courts, and even they are frequently dispensed with, so that the litigation is inexpensive as well as speedy. In 1875, they obtained power to dispose of all questions between masters and workmen.

The C. C. have also jurisdiction in insolvency cases, where the insolvent is not a trader within the meaning of the bankruptcy statutes, and where, being a trader, or a prisoner in jail for debt, he owes less than £300. They also have jurisdiction in equity and admiralty cases, and administer estates of persons who have died leaving not more than £200.

COUNTY COURTS (*ante*). In the United States there is a regular court in each county, possessing the usual jurisdiction, and presided over by a judge elected by the people or appointed by the governor and senate. In New York, the judges are elected for four years. The courts have original civil jurisdiction only in cases where money or personal property not exceeding $100 in amount is demanded; and jurisdiction also in the foreclosure of mortgages on real estate, and the collection of what may be due after the sale of the property; the partition of real estate in the county; admeasurement of dower; management of the property of infants; mortgage and sale of the property of religious corporations, etc. The county courts have also supervisions of an appelate jurisdiction from decisions of justices of the peace. In counties that have a population of less than 40,000 the county judge acts as surrogate.

COUNTY RATE, a local tax levied in England and Wales, for the purpose of defraying the expenses to which counties are liable; such as the maintenance of bridges, jails, lunatic asylums, prosecutions and costs incident thereto, coroners, etc. It is levied on all property liable to be assessed for the relief of the poor. Rogue-money in Scotland, and the grand jury cess in Ireland, are the taxes most nearly resembling the English county rate. See the poor-law commissioners' *Report on the Local Taxes of the United Kingdom*, 1846.

COUP is a French word signifying "stroke." It is used in certain phrases that have become current in Europe. *Coup d'état*, "stroke of state," means an arbitrary encroachment suddenly effected by the governing authorities upon the constitution of the state, altering or setting aside the prerogatives of other parts of the body politic.—*Coup de main*, "a stroke of the hand," is applied, in the language of war, to a sudden and successful attack.—*Coup d'œil*, "a stroke or glance of the eye," is applied in speaking of persons who have the faculty of comprehending all there lations of a complicated matter at one survey; or, in art, it expresses the general effect of a picture or group at first sight.—*Coup de theâtre*, means properly a trick of the stage to produce an effect by surprise, and is hence applied to any analogous proceeding.

COUPED (Fr. *coupé*), in heraldry, is used to describe the head, or any limb of an animal cut off from the trunk, and smooth. It is distinguished from *erased*, i.e., forcibly torn off, and therefore ragged and uneven. A distinction is also made between

couped and *couped close*, the latter signifying that the head or limb is cut off close, leaving no part of the neck or trunk attached to it. When crosses, bars, bends, and the like, are cut so as not to touch the sides of the escutcheon, they are also said to be couped.

COUPLES, the name given in statics to pairs of equal parallel forces acting in opposite directions, and at different points of a body. It is shown in the art. Parallel Forces (q.v.), that when two parallel forces act in opposite directions on a body, they may be replaced by one equal to their difference acting parallel to them in the direction of the greatest, at a point *not* between but *beyond* the points where they are applied; and which point recedes the further from their points of application the nearer they approach equality, getting to an infinite distance when they become equal, and when their resultant accordingly is zero. In this limiting case, the forces constitute a couple; they have no tendency to *translate* the body; their action goes wholly to make it rotate about an axis passing through its center of gravity, and perpendicular to the plane in which the couple acts. Such being the case, a couple cannot be replaced or counteracted by any single force, for such a force would produce translation; it can only be replaced or balanced by other couples. The length of the straight line which meets the lines of action of the forces at right angles is called the "arm" of a couple, and the product of the force into its arm is called its "moment."

Most of the leading propositions in the theory of C. are readily seen to be true, as soon as they are stated. For instance, as the axis round which a couple tends to make a body rotate passes through the body's center of gravity perpendicularly to the plane of the couple, it does not matter what position the couple occupies in its own plane. Also, supposing the body to be rigid, the couple may be moved into any plane parallel to its own, provided its new position be rigidly connected with the original position. It is also obvious, on the principle of the lever, that the efficiency of the couple depends on its moment simply, so that its arm may be shortened or lengthened at pleasure, provided the force be increased or diminished as the case may require, so as always to make the product of the force and arm the same. Suppose ropes fastened at the bow and stern of a ship pulling with equal force in opposite directions; they will make the ship turn round an axis through its center of gravity, at a rate depending on the force applied to the ropes. If the ropes be fastened to opposite points of the vessel nearer midships, it will only turn round at the *same* rate, provided the force applied to the ropes be *increased;* and, on experiment, it would be found that the force must be increased so as that its product into the distance between the ropes shall equal the product of the force in the first case into the length of the ship. Through this we can compound C. acting in the same plane, for we can turn them round till their arms coincide, and then give them a common arm; their forces will then act in the same lines, when their resultant into the arm will be the new couple. So two C. which are situated in planes inclined at any angle to each other may be replaced by a single couple (see fig.). Suppose the C. both to be moved in their respective planes till their arms coincide with the line of intersection of the planes, CD. Bring them then to a common arm in this line, AB. At each end of this arm we shall have a pair of forces, say P and Q, inclined to one another at the angle of inclination of the planes. Their resultant, by the composition of forces, will be a force R, acting in a line between the planes. We shall have then forces R acting at each end of the arm, and evidently in directions parallel and opposite. R $\times$ arm, AB, then, is moment of the resultant couple. Having seen how to compound C. whose planes are inclined to one another, the theory of the composition of C. may be said to be complete, for if they are in parallel planes, we know we can bring them into the same plane and to a common arm, and so into a common couple. In statical theory, any number of forces acting on a body, and not in equilibrium, may be reduced to a single force, a single couple, or a single force and a single couple. We have shown that the C. may all be reduced to one, as well as those forces which do not produce couples. If the single force do not act perpendicularly to the plane of the couple, it can always be compounded with the forces of the couple, so as to reduce the whole to a single force; if it act perpendicularly, then it cannot be compounded with the couple, and the body will have at once a motion of translation and motion of rotation.

COUPLET. Any two lines which rhyme together may be called a C.; but the term is more frequently used by critics to denote two lines which contain the complete expression of an idea, and are, therefore, to a certain extent independent of what goes before or what follows. The poetic wits of the age of queen Anne excelled in this kind of aphoristic versification. Pope, it has been said, reasons in couplets. For example:

> "'Tis with our judgments as our watches, none
> Go just alike, yet each believes his own."

COUPLING, an organ register, by which two or more rows of keys can be connected by a mechanism, so that they can be played together.

COUPON (Fr. *couper*, to cut), a term signifying any billet, check, or other slip of paper cut off from its counterpart. It is, however, applied chiefly to a dividend or

interest warrant, which is presented for payment by holders of debentures. Coupons in Great Britain must now be stamped.

COURANT, in heraldry, always used for *running*, which is its meaning in French.

COURAYER, PIERRE FRANCOIS DE, 1681–1776; a Roman Catholic writer on theology, a native of Normandy. He published a work *On the Validity of English Ordinations*, in which he endeavored to prove that there had been no break in the line of ordination from the apostles to the English clergy. He was persecuted in France for his opinions, and fled to England. In 1736, he published a French translation of Sarpi's *History of the Council of Trent*, and afterwards a translation of Sleidan's *History of the Reformation*.

COURBET, GUSTAVE, 1819–77; a French painter. He began to study law in 1859, but having a strong liking for art, he took lessons and studied the old masters, working privately for several years with little success. After the revolution of 1848, he began to be appreciated, and rapidly acquired fame. In 1871, he was an active leader of the commune, and directed the demolition of the Vendome column. When the commune failed he was caught and tried for treason, but was awarded only six months' imprisonment. Two years later he was prosecuted for destroying the Vendome column, and his effects were seized and sold. He was noted for studies of the nude female form.

COURBEVOIE, a t. of France in the department of Seine, situated on the left bank of the river of that name, about 5 m. n.w. of Paris. C. has well-built houses, mostly supplied with gardens, and large barracks erected by Louis XV. Its principal manufactures are white-lead and brandy, and it has some commerce by the Seine. Pop. 1876, 11,811.

COURGNÉ, a market-t. of Piedmont, situated at the foot of a hill on the w. side of the Orca. 12 m. w.s.w. of Ivrea. It has several convents, and a pop. of 5,600.

COURIER, PAUL LOUIS, a French scholar and political writer, was b. in Paris, Jan. 4, 1772. He was educated for the army, but, without neglecting his military studies, he showed a special predilection for ancient literature. In 1793, he became lieut. of artillery, served in the Italian campaign 1798–99, and in 1803, was appointed *chef-d'escadron*. After the battle of Wagram, he tendered his resignation, which was accepted. He now proceeded to Switzerland and Italy, returning to his native country in 1812. Up to this period, he was known publicly only by his translations from the classics. In 1816, he appeared for the first time as a political pamphleteer, and rapidly obtained a brilliant reputation. The piece in which he made his *début* was the *Petition aux Deux Chambres*. In 1819–20, he published, in a journal called *Le Censeur*, a series of letters containing an exposition of his political ideas, which were those of an ardent constitutional reformer. These letters, for keenness, wit, and eloquence, have been compared to those of Pascal. His *Simple Discours* (1821) was directed against the project then entertained of purchasing Chambord for the Duc de Bordeaux in the name of the nation. It is exceedingly vigorous, clever, and sensible, and had a great success. For his audacity, he was tried and condemned to one month's imprisonment. In 1823, he published his *Livret*, a kind of memorandum-book; and in 1824, his *Pamphlet des Pamphlets*, which is finely called by Armand Carrel *Le Chant du Cygne* (the Swan's Death-song). On the 10th April, 1825, he was assassinated near his own house at Veretz, in the department of Indre-et-Loire, a little before sunset. The murderer was never detected. C. was the pamphleteer of the middle class. Manly earnestness, pleasant wit, cutting irony, and admirable sense are his characteristics. Time, which generally dims the luster of a pamphleteer's reputation, has not touched that of C., which is still as bright as ever.

COURIERS. There are two distinct classes of couriers. The first to be noticed are employed by government to carry, securely and expeditiously, important dispatches to and from ambassadors at foreign courts. Active and accustomed to travel, speaking several languages, and with a sufficient idea of their own consequence, they will set out at a moment's notice, pursue their way by steamer, by rail, by hired voiture, or on horseback, with little intermission by night and by day, until they reach their destination. Acquainted with routes, officials, and methods of clearing the way, and provided with all proper credentials, including a requisite supply of cash, nothing interrupts them in their eager course. Such are *government C.*, a useful class of public servants. The other class of C. are not dissimilar in accomplishments, but their services are limited to private parties, and coming more generally into notice, we may enter more minutely into a description of their character.

Private Couriers.—These are usually persons of middle age, natives of Switzerland, France, or Germany, who have either been at some time gentlemen's servants, or been long employed as attendant on families while traveling on the continent. In some instances, they are of English origin, and have traveled again and again through Europe with employers who relish the dignity of having a man-servant, and dislike personal responsibility and trouble. Of whatever country, the courier has settled down into a perfectly cosmopolitan character. With equal fluency, he speaks English, French, Italian, and German, with perhaps Spanish, Portuguese, and Russian; he is acquainted with processes of getting passports and visés; knows the best routes, the best hotels,

and where anything curious is to be seen. Acting for the time as a servant, he is not intrusive. Whether by railway or steam-boat, he knows his place, and makes his appearance only when he is wanted. No doubt, the courier is an expensive luxury; his usual wages being from £8 to £10 a month, independently of traveling-fares. His keep at inns is nominally paid by himself; but, of course, it weighs with the hotel-keeper in making out the bill. "A courier, however, though an expensive luxury, is one which conduces much to the ease and pleasure of traveling, and few who can afford one will forego the advantage of his services. He relieves his master from much fatigue of body and perplexity of mind, in unraveling the difficulties of long bills and foreign moneys, sparing his temper the trials it is likely to endure from disputes with innkeepers, postmasters, and the like. If clever and experienced, and disposed to consult the comfort of his employer, he is a most useful person. His duties consist in preceding the carriage at each stage, to secure relays of post-horses; he must make arrangements for his employer's reception at inns where he intends to pass the night; must secure comfortable rooms, clean and well-aired beds, and order meals to be prepared, fires to be lighted, taking care that his master is called and the post-horses ordered at the right hour. He ought to have a thorough knowledge of everything that relates to a carriage; he should examine it at the end of each day's journey, to ascertain whether it requires any repairs, which should be executed before setting out. He should superintend the packing and unpacking of the luggage, etc. It falls to the courier to pay innkeepers and post-boys; and he ought to take care that his master is not overcharged. Besides this, he performs all the services of waiting and attendance, cleaning and brushing clothes; and he is not perfectly accomplished unless he has a smattering of the art of cookery" (Murray's *Hand-book for Travelers on the Continent*). As among ordinary domestics, there are honest and dishonest C., and it is of importance that travelers should not hire them without proper recommendations as to character. For places at which C. are to be heard of, we refer to the work just quoted, also to Bradshaw's *Continental Railway Guide*. In Paris, information respecting them will be obtained at Meurice's hotel.

COURLAN, *Aramus scolopaceus*, a wading fowl, the only one of its family. It is more than 2 ft. in length, with broad rounded wings, and cleft toes; the color usually chocolate brown streaked with white. It runs rapidly, but its flight is weak and short. Its note is between a squeak and a cackle. Its home is in Florida and the West Indies.

COUR'LAND, or KURLAND, a Russian government, and one of what are called the Baltic provinces, in lat 56° to 58° n., long. 21° to 27° east. It was formerly an independent duchy—properly, indeed, consisting of two duchies, Courland and Semgall—and belonged, along with Livonia, to the Teutonic knights. The difficulty of resisting the Russians led to the acknowledgment, in 1561, of the feudal sovereignty of Poland; and the last grand-master, Gotthard Kettler, secured the duchies of Courland and Semgall for his family. The country was long distracted by the contentions of two parties, one Russian and the other Polish; and after being for some time very completely under Russian influence, and the scene of many Russian intrigues, it was finally united to Russia in 1795. It contains about 10,500 sq.m., with a pop., in 1870, of 619,154, mostly Protestants. It is generally a level country, with ranges of low hills, and contains many lakes, bogs, forests, and downs, but some parts have a very fertile soil. The proprietors of land are mostly German; the peasantry, of Lettish or Esthonian extraction, are chiefly engaged in husbandry; there is little manufacturing industry or commerce. The capital is Mitau; but the most flourishing town is Libau.

COURSE, in building, is a continuous range of stones or bricks of uniform thickness.

COURSES, on shipboard, is a name given collectively to all the lower sails; above them is the group of topsails; and, highest of all, the group of topgallant sails. The C. comprise the mainsail, foresail, main-staysail, fore-staysail, and mizzen-staysail.

COURSING, a method of hunting hares by greyhounds, in which the dogs follow the game by *sight*, instead of by *scent*. C. is of very ancient date, having been practiced by the Greeks. Within the last 20 years, however, its popularity as a sport has greatly increased, and the breed of the greyhound is now studied with nearly the same care and zest as that of the race-horse. The method pursued in C. is briefly as follows:

Meetings are held in open districts, well frequented by hares, where the greyhounds —technically called "dogs," as foxhounds are technically called "hounds"—are entered by their owners for a variety of stakes, which are to be competed for—C., in this respect, partaking of the nature of a race between horses. The first thing done is to select a judge to decide upon the merits of the best dogs; second, a "slipper" is appointed to hold the dogs in leash, and start them at the hare; and, third, a flag-steward is chosen, who remains near the judge and announces the color of the victorious dog by means of a red or white flag, according as the competitors are arranged. The next thing done is to "beat" the field for a hare. When one is found, the judge usually allows it 80 or 100 yards "law" before he cries to the "slipper" to let the dogs "go." Upon the word "go," the "slipper" liberates the animals by a spring attached to the "slips"—i.e., the long strong cord held by the "slipper" and communicating with the leathern collars fixed round the necks of the dogs. The judge's duties now

begin in earnest. He follows the dogs wherever they go, calculating carefully the number of "points" made by each—a "point" being any meritorious achievement on the part of the dogs (as when the one outstrips the other at any time, or turns the hare, i.e., causes it to "double"); and at last he adjudges the victory, not *necessarily* to the dog which has killed the hare, but to the one which has made the most points during the course, i.e., which has exhibited the finest qualities of speed, sagacity, endurance, etc.

COURT (Fr. *cour*, Ital. *corte*, from Lat. *cohors* or *chors*, *chortis*, an inclosure or cattle-yard; allied to Polish *grod*, a city; Sw. *gard;* Eng. *yard* and *garden*) was originally applied to the square or space inclosed by the buildings of a feudal castle; and hence it came to denote the persons immediately surrounding a feudal chief or superior. Its application is now confined to the residence and surroundings of sovereign princes. In England, and in other free countries, when we speak of the "court," we mean little more than the family and attendants of the sovereign, viewed not in a private, but a public capacity. The bishops and nobles, the ministers of the queen for the time being, and other persons entitled to precedence, either on hereditary, official, or personal grounds, are those who habitually encircle the sovereign; and "the court circle,' consequently, means those persons of distinction, and their families, who are in the habit of approaching the queen, and of associating with the other members of the royal family. But this circle is one the circumference of which is marked by no absolute line, like that which in France, under the old monarchy, divided the C. from the city.

COURT, ANTOINE, 1696–1760; called the "Restorer of Protestantism in France;" born of peasant parents, adherents of the reformed church, which was then undergoing cruel persecution. Court was 8 years old when the Camisard revolt was suppressed, and 19 when the infamous decree of Louis XIV. was published, declaring that all who professed the reformed faith should be punished as relapsed heretics. When but 17 years old, Court began to speak at the secret meetings of the Protestants, held literally "in dens and caves of the earth," and often in darkness, with no pastor present to teach or counsel. He entertained a great desire to build up the church so ruthlessly persecuted; and to this end he proposed four things: 1. Regular religious meetings for teaching and worship; 2. Suppression of the fanaticism of those who professed to be inspired, and of the consequent disorders; 3. Restoration of discipline by the establishment of consistories, conferences, and synods; and 4. The careful training of a body of pastors. To the exercise of this great task he devoted his life. From audiences of half a dozen trembling in secret, he came to address openly 10,000 at one time. In 1724, further fury was hurled at the Protestants in a decree which assumed that there were no Protestants in France, and prohibiting the most secret exercise of the reformed religion. A price was set on Court's head, and in 1730 he fled to Lausanne. There, after immense exertion, he founded a college for the education of clergy, of which, during the remaining 30 years of his life, he was the chief director. This college sent forth all the pastors of the reformed church of France until the close of the 18th century. Court intended to write a history of Protestantism, and made extensive collections for the purpose; but he did not live to do the work. He was the father of the more widely known Court de Gibelin.

COURT, PRESENTATION AT. The honor of being presented at court, or introduced to the sovereign, is only to be obtained by persons of respectable position, and is a thing sought after not only for the *éclat* of the ceremonial, but as giving a certain stamp of character; for, having been received by the sovereign, a person may with justice expect to be received anywhere. Valuable so far as a credential, a reception at court is carefully guarded from abuse. At the court of her majesty, queen Victoria, there is a scrupulous and very proper exclusion of all parties, male or female, of damaged reputation. Those who aim at the distinction of being presented at court belong chiefly to what are called the higher circles—nobility and landed gentry; officers in the army, navy, and higher departments of the civil service; judges, magistrates, church-dignitaries, members of the learned professions; and the wives and daughters of these respective classes. Men of scientific, literary, or artistic attainments do not generally attempt to appear at court, and neither, of course, do the classes engaged in trade. It is usual to be presented on taking office, or on attaining some personal dignity, or on arriving from an important and distant expedition. Young ladies of good family are said "to come out," on being presented at court. What perhaps contributes more than anything else to secure selectness, is the obligation of appearing in "court-dress," an expensive and somewhat fantastic costume of old date; from which only those who assume professional uniforms are exempted. As is well known, the court-dresses of ladies are superb. It will thus be seen that the notions prevailing among foreigners arriving in England—those from the United States in particular—as to the practicability of indiscriminate presentation at court, are erroneous. It is the duty of the lord chamberlain at St. James's to furnish information regarding the steps to be adopted by those who desire to be presented at court, either at levées, which are restricted to gentlemen, or at drawing-rooms, which are chiefly, though not exclusively, intended for ladies. The days on which these receptions take place are advertised in the newspapers some days before, with the necessary directions for preventing confusion. Her majesty's birthday is the occasion on which

the greatest reception of the year takes place, but there are no new presentations on tha day. Any British subject who has been presented at court in England, can claim to be presented by the British ambassador at any foreign court. Those who wish to be mere spectators, can obtain tickets to the corridor, where they see the company passing in and out, by applying to the lord chamberlain. For this purpose, however, an introduction is required. It is indispensable that the names of gentlemen desiring to be presented, and of the nobleman or gentleman who is to present them, be sent to the lord chamberlain's office several days previously, in order that they may be submitted for the queen's approbation. Gentlemen are also requested to bring with them two large cards, with their names clearly written upon them, one of which is left with the queen's page in the presence-chamber, and the other is delivered to the lord chamberlain, who announces the name to her majesty. The same rules apply to ladies. Lists of presentations appear next day in the principal London newspapers,

COURT, in law, in the United States, a body in the government to which the public administration of justice is delegated. The presence of a sufficient number of the members of such a body regularly convened in an authorized place at an appointed time, engaged in the full and regular performance of its functions, is a court. Courts are said to belong to one or more of the following classes, according to the nature and extent of jurisdiction and proceedings, and the principles on which they administer justice: admiralty, appellate, central, civil, criminal, ecclesiastical, equity, general jurisdiction, inferior, law, limited jurisdiction, local, martial, not of record, original jurisdiction, of record, superior, supreme, and in some states there are other classifications.

COURTALLUM, a t. of the district of Tinnevelly, in the presidency of Madras, stands in lat. 8° 56′ n., and long. 77° 20′ e., near the junction of the eastern and western Ghauts. Open towards the e., at a height of 700 ft. above the sea, it is elsewhere embosomed in hills, having in its immediate neighborhood a deep glen which affords easy communication between the opposite shores of Hindustan. The place is a favorite retreat for invalids, deservedly enjoying a reputation for salubrity of air, richness of vegetation, and beauty of scenery. The indigenous flora comprises 2,000 species, and many exotics, such as the nutmeg, clove, and cinnamon, have been introduced with success.

COURT BARON. See COMMON LAW, COURTS OF.

COURT OF COMMON PLEAS. See COMMON LAW, COURTS OF.

COURTESY, or CURTESY, in law, is the life interest which the surviving husband has in the real or heritable estate of the wife. It is remarkable that, both in England and in Scotland, this customary right should be regarded as a national peculiarity—that in England it should be called the C. of England, and in Scotland the C. of Scotland—whereas it is well known to be peculiar to neither of them. Traces of it are to be found in a constitution of the emperor Constantine (code 6, 60, 1); and there can be no doubt that it had found a place, with all the peculiarities which now belong to it, in the *coutume* of Normandy, from whence there is every reason to think that it was transferred to England (Barnage, vol. ii. p. 60; Stephen's *Com.* vol. i. p. 264; Fraser's *Domestic Relations*, i. p. 635). The four circumstances which are requisite to make a tenancy by C. in England are—marriage, seizin of the wife, living issue, and the wife's death. The rule that the child must have been heard to cry, which at one time was followed in England, is still adhered to in Scotland. It is not necessary, however, in either country, that the child survive; it is enough that it was once in existence, although it should have died immediately after its birth. In both countries, the child must be the mother's heir, and it is consequently said that C. is due to the surviving husband rather as the father of an heir than as the widower of an heiress. By 19 and 20 Vict. c. 120, which enables tenants for life of *settled* estates (see SETTLED ESTATE) to make effectual leases for 21 years, subject to the exceptions and provisions in the act contained, a similar power is also conferred upon tenants by the C. of *unsettled* estates (Stephen, i. p. 267). As to the law of Scotland on the point, see Hunter on Landlord and Tenant, i. p. 119.

COURTESY TITLES, Titles of honor (q.v.) are imparted by the sovereign or other competent authority. Independently of these, there are C. T. assumed by or given to individuals, and which have no validity in law. The term courtesy title is best known in connection with the titles given by popular consent to the sons and daughters of certain peers. English dukes, marquises, earls, and viscounts have several titles, accumulated by distinct patents in their progressive steps in the peerage. Thus, a duke may at the same time be a marquis, an earl, a baron, and a baronet; a marquis may be also an earl, etc.; and an earl is almost always a baron. In ordinary parlance, they respectively take only their highest title. One of the inferior titles so set aside is permitted, as a matter of social dignity, to be assumed by the eldest son. For example, the duke of Bedford being also marquis of Tavistock, his eldest son takes the title of marquis of Tavistock; and the duke of Buccleuch and Queensberry being also earl of Dalkeith, his eldest son takes the title of earl of Dalkeith. When it happens that the inferior title is of the same name as the first, there is a somewhat different usage. For example, the earl of Gosford being also viscount Gosford, his eldest son, to prevent confu-

sion, takes only the family surname, Acheson, with the prefix lord—lord Acheson. The younger sons of dukes and marquises have the courtesy title of lord prefixed to their Christian and surname: as, for example, lord Frederick Charles Cavendish, a younger son of the duke of Devonshire; or lord Archibald Campbell, a younger son of the duke of Argyll. The eldest son of an earl, when not a viscount, takes his father's second title of lord: as, for example, the eldest son of the earl of Wemyss is styled lord Elcho. A proper understanding of these conventional customs will serve to clear up some of the perplexities into which foreigners are apt to become involved in thinking of our highly artificial social system. It is to be kept in mind, that titles by courtesy do not raise their bearers above the rank of commoners; and that, consequently, they are eligible for election as representatives to the house of commons. Very many of the peers, indeed, begin their political career as county or borough representatives under their C. T.; serving in this way a kind of apprenticeship as statesmen before they are advanced, by the decease of their fathers, to the house of lords.

The daughters of dukes, marquises, and earls have the title lady prefixed to their Christian and surname; and in the event of their marrying a person of inferior rank, they retain the title lady with their Christian name, adding the surname of their husband. Yet, these are but courtesy titles. The only valid title they can claim in virtue of their birth, is the prefix honorable, which is applicable alike to the sons and daughters of peers. The wives of baronets receive the courtesy title of lady; their lawful designation being dame. Ladies who have had a title by a first marriage, retain it as a matter of courtesy when they are married a second time, though the alliance be with a person without a title—a circumstance sometimes leading to a certain awkwardness in designation. In Scotland, the eldest son of a baron has the courtesy title of master. For example, the eldest son of lord Elibank is styled master of Elibank.

The title right honorable is given in some few instances by courtesy to officials, as in the case of the lord advocate for Scotland. The judges of the court of session in Scotland, on first taking their seat on the bench, assume the courtesy title of lord along with their own surname or a territorial title. But such titles are used only senatorially. In writing, the real name is subscribed. The titles of Mr. or master and esquire (q.v.), are now given by courtesy to nearly all classes of persons. For an exact definition of titles by courtesy as applicable to members of the peerage, we refer to the *Secretary's Assistant*, London, 1831.

COURT-FOOL. From very ancient times there existed a class of persons whose business it was to while away the time of the noble and wealthy, particularly at table, by all manner of jests and witty sayings. Alexander the great, Dionysius of Syracuse, Augustus and his successors, maintained such jesters. It was, however, during the middle ages that this singular and repulsive vocation became fully developed, and that the office of jester or fool became a regular and indispensable court office. The symbols of such a personage were: the shaven head; the fool's cap of gay colors, with ass's ears and cock's comb; the fool's scepter, which was variously formed; the bells, which were mostly attached to the cap, but likewise to other parts of the dress; and a large collar. The rest of the costume was regulated by the taste of the master. Of these professional fools, some obtained a historical reputation, as Triboulet, jester to king Francis I. of France, and his successor, Brusquet; Klaus Narr, at the court of the elector Frederic the wise of Prussia, whose jests have been repeatedly printed; and Scogan, court-fool to Edward IV. of England. The kings and regents in Scotland had their jesters, as was usual in their time; and the sarcastic sayings of some of these privileged personages—such as those of Patrick Bonny, jester to regent Morton—are still remembered among the national *facetiæ*. English court-jesters died out with the Stuarts; one of the last of the race being the famous Archie Armstrong, whose death took place characteristically, on April 1, 1646. Besides the regular fools recognized and dressed as such, there was a higher class, called merry counselors, generally men of talent, who availed themselves of the privilege of free speech to ridicule in the most merciless fashion the follies and vices of their contemporaries. Of these, Kunz von der Rosen, jester to the emperor Maximilian I.; John Heywood, a prolific dramatic poet and epigrammatist at the court of Henry VIII.; and Angely, a French courtier, were particularly distinguished for talent and wit. In all times, there existed at courts persons who, without becoming jesters by profession, were allowed the privilege of castigating the company by their witty and satirical attacks, or who served as the general butts. Among these were, on the one hand, the Saxon general Kyaw, celebrated for his blunt jests; and on the other, the learned Jacob Paul, baron Gundling, whom Frederic William I. of Prussia, to show his contempt for science and the artificial court system, loaded with titles. An interesting history of the whole subject was written by Flögel, entitled *Geschichte der Hofnarren* (Liegn. and Leips. 1789). Such a history forms a kind of barometer of the manners and morals of courts at different times. At a later period, imbecile or weak-minded persons were kept for the entertainment of the company. Even ordinary noblemen considered such an attendant indispensable; and thus the system reached its last stage, and towards the end of the 17th and beginning of the 18th century, was finally abolished. It survived longest in Russia, where Peter the great had so many fools that he divided them into distinct classes.

COURT-HAND, a name given in England to the old, Gothic, or Saxon handwriting, as distinguished from the modern or Italian handwriting. The old way of writing continued to be used in the law-courts after it had been superseded elsewhere, and hence its name of court-hand.

COURT-MARTIAL, a court for the trial of any one belonging to the army or navy, for some breach of military or naval law. The members of the court fill the functions both of judge and jury. In the British army, courts-martial are *general*, *district*, or *regimental*. The first is the only one of the three empowered to award death or transportation for life, as a punishment to the offending person. It consists of 13 commissioned officers, if so many can be obtained at the time and place; and a deputy judge-advocate is specially appointed to conduct the prosecution. A non-commissioned officer, or a private, may be tried by any one of the three kinds of court; but a commissioned officer only by a general court-martial. A *district* or *garrison* court-martial may be convened by a field-officer commanding a district or corps, without requiring the sovereign's sign-manual. It consists of a number of members, varying from three to seven, with a captain or higher officer to act as deputy judge-advocate. Such a court tries warrant officers, non-commissioned officers, and rank and file; and can only treat such offenses, or alleged offenses, as meet with secondary punishment. A *regimental* C. may be convened by the commanding officer of a regiment or detachment; it consists of three or more members; it treats of minor offenses, and can award only minor punishments.

In all these kinds of court-martial the members are sworn in; the court is an open or public one; the vote or sentence is decided by majority, the junior members voting first; but two thirds of the whole number, in a general court-martial, are necessary to give validity to a sentence of death. Before execution, the sentence of every military court-martial has to be approved and confirmed by the convening authority.

Sometimes *courts of inquiry* are held instead of a court-martial, not to try or to punish, but to make an investigation; the members not being on oath. Such a court occasionally precedes a court-martial.

Naval courts-martial consist of admirals, captains, and commanders, who try for offenses against the naval articles of war. The chief admiral of the fleet or squadron appoints the members; but all captains have a *right* to sit, if not implicated. The court-martial is open to all the crew and others as spectators. The sentence is final, and needs no confirmation.

COURT-MARTIAL (*ante*), in the United States, composed of not less than thirteen commissioned officers of suitable rank. Regimental courts-martial, having jurisdiction of minor offenses, consists of not less than three commissioned officers; garrison courts-martial are similarly constituted. A general court-martial for the army can be held only on the order of the president, or the general of the army, or an officer commanding a separate department. For the navy, a court-martial must be ordered by the president, the secretary of the navy, the commander of a fleet, or the commander of a squadron beyond United States jurisdiction.

COURT OF LOVE, an outgrowth of the extreme romance of the age of chivalry. Such a court was to decide in matters of courtesy and etiquette, particularly in affairs where love was or might be concerned. It was composed of women of high birth and position. There was a code (still preserved) of 31 articles, in accordance with which decisions were made. Here is a specimen of the important questions passed upon: "A lady listened to one admirer, pressed the hand of another, and touched with her toe the foot of a third. Which of those three was the favored suitor?" To the great annoyance of mankind, the decision has never been known. Among the eminent presiding divinities of these courts were the countess de Die called the Sappho of her age, and Laura de Sade, who was celebrated by Petrarch. René, king of Anjou; and Richelieu, the great cardinal, made ineffectual efforts to resuscitate these courts.

COURTOIS, JACQUES and GUILLAUME, 1621–76, and 1628–79; brothers and painters, natives of France, and sons of a painter; both educated in Italy under Guido and other celebrated masters. Jacques excelled in battle pieces. Late in life he joined the Jesuits and took orders, but still continued his artistic work. Guillaume also excelled in battle pieces, adding thereto many religious compositions.

COURTRAI (Flemish, *Kortryk*), a t. of Belgium, in the province of West Flanders, about 30 m. s. of Bruges, lat. 50° 49′ n., long. 3° 18′ east. C., which is built on both sides of the Lys, is surrounded with walls, and has a castle, a citadel, a fine old bridge flanked with Flemish towers, a noble town-hall, and a beautiful Gothic church, founded in 1238 by Baldwin, count of Flanders. Though a busy manufacturing place, C. is nevertheless very clean. Table damask and other linen are the principal articles of manufacture. There are extensive bleaching-grounds in the vicinity, and the neighboring plains supply fine flax in large quantities to many European markets. Pop. '75, 27,076. In 1302, the Flemings, citizens of Ghent and Bruges chiefly, won a splendid victory over the chivalry of France beneath the walls of C., more than 700 gilt spurs (worn only by French nobles) being afterwards gathered from the dead by the victors. The battle was hence named "the battle of the spurs."

COURT OF SESSION, the highest civil tribunal in Scotland, was instituted in the reign of king James V., by statute dating 17th May, 1532. The object of its institution was to discharge the judicial functions which originally belonged to the king and his council, and which, since 1425, had in a great measure devolved on a committee of parliament, as the great council of the nation. The C. of S. consisted at first of 14 ordinary judges and a president. One half of these judges and the president were churchmen, and the practice of appointing ecclesiastics to the bench did not cease for some time even after the reformation. The king had the privilege of appointing, in addition to the ordinary judges, three or four peers or members of his great council, to sit and vote with the lords of session. When the lord chancellor (see CHANCELLOR OF SCOTLAND) was present, he was president of the session. His office was abolished at the union, and the habit of appointing peers gradually fell into disuse, though, when a peer chances to be present, he is still, as a mark of courtesy, accommodated with a seat on the bench. From its foundation, till 1808, the C. of S. consisted of one court; in that year it was divided into what are known as the first and second divisions, two separate courts possessing co-ordinate jurisdiction. The lord president is still president of the whole court when called together for consultation, and enjoys other privileges in that capacity; but on ordinary occasions he officiates simply as president of the first division. In 1810, another very important change was made. The first division up to this time had consisted of 7, and the second division of 6 ordinary judges, the latter being presided over by the lord justice-clerk (q.v.), as the former was by the lord president. The three junior judges were now taken from the first division, and the two junior judges from the second, and appointed to sit as permanent lords ordinary in the outer house. The quorum, which had formerly been four, was now reduced to three in both divisions. In 1830, the number of judges in the C. of S. was reduced to 13; and that is still the full number, though since 1877 there have actually been but 12 judges. Of the five lords ordinary, four only sit daily. The judgments of the outer house, with a few statutory exceptions, are appealable to the inner house. The youngest judge, or junior lord ordinary, officiates in a separate department of the outer house, called the bill chamber (q.v.), where summary petitions, and other branches of business peculiarly requiring dispatch, are disposed of. This department alone is open during the vacations of the court, the judges, with the exception of the lord president and lord justice-clerk, officiating in it in rotation. Either division of the C. of S. may call in the aid of three judges of the other, when equally divided in opinion (31 and 32 Vict., cap. 100). In cases of still greater difficulty, the lords ordinary are also called in, and a hearing before the whole court, or *in presence*, as it is called, takes place. Since the 31 and the 32 Vict., cap. 100, no hearings before the whole court have taken place; the cases being decided in written arguments submitted to the judges. The judges of the C. of S. are appointed by the crown, and hold their offices for life. No one is eligible to the office unless he has served as an advocate or principal clerk of session for five, or as a writer to the signet for ten, years. Practically, none but advocates are appointed. No action for debt can originate in the C. of S. in which the interest of the pursuer is less than £25. With few exceptions, the judgments of the inferior courts of Scotland are reviewable by the C. of S., but this rule does not apply to the small-debt courts. The judgments of the C. of S. may be appealed to the house of lords within two years.

COURT-YARD. See FARM BUILDINGS.

COUSCOUS, or SPOTTED PHALANGER, a marsupial animal about the size of the domestic cat, black and white with brown spots. It has a prehensile tail. It is found in the Spice islands, and sought for both its fur and its flesh. It is sometimes called the *shamsham*.

COUSIN, VICTOR, the founder of systematic eclecticism in modern philosophy, was b. in Paris, Nov. 28, 1792. He studied with brilliant success at the *Lycée Charlemagne*. In 1812, he was appointed Greek tutor in the *Ecole Normale*, and, in 1814, examiner in philosopher. In the following year he became assistant-professor to Royer-Collard at the Sorbonne, and threw himself heartily into that reaction against the sensualistic philosophy and literature of the 18th century, which was then the order of the day. Following the path of his senior, he became an exponent of the doctrines of the Scotch metaphysicians, but exhibited far more brilliancy, energy, and warmth of expression than the original authors of these doctrines. In 1817, C. visited Germany, where he was introduced to bolder and more speculative systems of philosophy than any he had yet known. He studied successively, or at the same time, Plato, Kant, Jacobi, Fichte, and Schelling. A second visit to Germany, in 1824–25, had also important consequences. Suspected of carbonarism, he was arrested at Dresden by the police, and sent to Berlin, where he was detained for six months. He took advantage of his compulsory residence in the capital of Prussia to study the philosophy of Hegel, which exercised considerable influence on his susceptible intellect. On his return to France, he took a decided stand against the reactionary policy of Charles X.; and in 1827, when the comparatively liberal ministry of Martignac came into office, C., who had for some years been suspended from his professorial functions, was reinstated in his chair. Meanwhile, C. had appeared as an author. During 1820–27, he published his editions of Proclus and Descartes, and part of his celebrated translation of Plato, which was finished in 1840, in 13 vols. The

year 1828 witnessed the most splendid triumph in the career of C. as a philosophic teacher. It is said that to find an audience as numerous, and as passionately interested in the topics discussed, as gathered round C., it would be necessary to go back to the days of Abelard and other medieval teachers of philosophy. C. was still young, simple, and pure in his habits; his doctrines were for the most part new to his hearers, bold, and in harmony with the spirit of the time. The finest qualities of the national genius appeared in his lectures, a wonderful lucidity of exposition, an exquisite beauty of style such as no modern or ancient philosopher, excepting Plato, has equaled; a brilliancy of generalization and criticism that enchanted every one; and a power of co-ordinating the facts of history and philosophy in such a manner as to make each illustrate the other, and reveal their most intricate relations. At this period, C. was one of the most influential leaders of opinion among the educated classes in Paris; and consequently, after the revolution of 1830, when his friend Guizot became prime-minister, C. was made a member of the council of public instruction; in 1832, a peer of France; and later, director of the *Ecole Normale*. His efforts for the organization of primary instruction are to be seen in those valuable reports which he drew up, from personal observation, on the state of public education in Germany and Holland. In 1840, he was elected a member of the *Académie des Sciences Morales et Politiques*, and in the same year became minister of public instruction in the cabinet of Thiers. The revolution of 1848 found in C. a friend rather than an enemy. He aided the government of Cavaignac, and published an anti-socialistic brochure, called *Justice et Charité*. After 1849, he disappeared from public life, and died in 1867.

It is more easy to state what philosophical doctrines have received exposition at the hands of C., than to determine precisely what are his own. At first a disciple of Royer-Collard and the Scotch school, he was attached to the psychological method of investigation; afterwards a keen student of the German school, he expounded the views of Schelling with such copious enthusiasm, that he might legitimately enough have been considered a thorough pantheist. Judging from such a book as *Du Vrai, du Beau, et du Bien* (1853), he seemed more disposed, latterly, to regard philosophy in its religious and æsthetic relations. See ECLECTICISM.

C.'s chief works (besides those already mentioned) are *Fragments Philosophiques* (1826); *Cours de l'Histoire de la Philosophie* (1827); *Ouvrages inédites d'Abelard* (1836); *Cours d'Histoire de la Philosophie Moderne* (1841); *Cours d'Histoire de la Philosophie Morale au XVIIe Siècle* (1840–41); *Leçons de Philosophie sur Kant* (1842); *Des Pensées de Pascal* (1842); *Etudes sur les Femmes et la Société du XVIIe Siècle*, etc. (1853). C. also contributed a great variety of papers to the literary and philosophic reviews of France.

COUSINS, FIRST. See MARRIAGE.

COUSTOU, NICOLAS, 1658–1738; son of a wood-carver of Lyons, who became rector and chancellor of the academy of painting and sculpture in Paris. He was remarkable as a painter. Some of his works are the "Union of the Seine and the Marne," the "Bergen Chasseur;" and the "Descent from the Cross," behind the choir of Notre Dame.

COUTANCES, a t. of France, in the department of La Manche, at the confluence of the Soulle and Bulsard. It is built on a conical hill, a few miles from the English channel, and is a somewhat lugubrious place. Its cathedral, however, is one of the finest structures of ecclesiastical architecture in the early pointed style in Normandy. One of the towers of the edifice is lighted up with a lantern, that serves as a beacon for ships navigating the channel. C. has manufactures of druggets, muslins, etc., and a trade in corn. Pop. '76, 8,008.

COUTHON, GEORGES, a fanatic of the French revolution, was b. in 1756 at Orsay, near Clermont, in Auvergne. At the outbreak of the revolution, he was engaged as an advocate, and in 1790 was elected president of the tribunal for the district of Clermont. In 1791, he was sent by his fellow-citizens to the national convention, where he made himself conspicuous by his furious hatred of the court, the priesthood, and the monarchy. In spite of an infirmity which prevented him using his limbs, C. soon became very influential from the rabid violence of his sentiments. He voted for the death of the king without delay or appeal to the country, and (after a brief relapse into moderatism) became a devoted and bloodthirsty partisan of Robespierre. In July, 1793, he was appointed a member of the *Comité de Salut Public*, and along with Châteauneuf-Randon and Maignet, was sent against the Lyonnese insurgents. After some opposition, the city was taken, when a multitude of the citizens were put to death. On his return to the convention, he became quite maniacal, demanding the "impeachment" of all the kings of the earth, and voting for Pitt being declared "the enemy of the human race," and the English nation "a traitor to humanity." The fall of Robespierre brought down C. also. Accused by Fréron, he was thrown into prison, delivered by the mob with whom he was popular, recaptured by the soldiers of the convention, and executed 28th July, 1794, along with St. Just and Robespierre.

COUTRAS, a t. of France in the department of Gironde, situated on the left bank of the Dronne, about 26 m. n.e. of Bordeaux. C. has a considerable trade in flour, and the district produces red wine; but the place is known principally on account of the

bloody victory gained here, 1587, by Henry of Navarre over the forces of the league. In this battle the duc de Joyeuse, commander of the leaguers, was slain, as well as many other great noblemen on the same side. Pop. '76, 2,202.

COUTTS. See BURDETT-COUTTS, *ante*.

COUTURE, THOMAS, b. 1815; a French painter, pupil of Delaroche. His first noteworthy work was "The Love of Gold." In 1847, he greatly enhanced his reputation by the "Romans of the Decadence," which secured for him the cross of the legion of honor. He has taught many pupils, and has had great influence over contemporary art.

COVENANT, in English law, an agreement by *deed* (q.v.). In the common law-courts, a special form of action is appropriated to the enforcement of a C. called an action of covenant. But in many cases it may also be enforced by the form called an action of debt. A C. may also be *implied*. "Covenant running with the land," is a C. affecting the land into whosesoever hands it comes.

COVENANT (*ante*), in law there is a great variety of covenants, for almost any agreement may fall under that designation. There are affirmative covenants; covenants against incumbrances; alternative, auxiliary, collateral, concurrent, declaratory, dependent, disjunctive, executed, executory, and express covenants; also, covenants for further assistance; covenants for quiet enjoyment; covenants for title; implied covenants; covenants in deed and in law; illegal covenants; independent covenants; and inherent, intransitive, joint, negative, and obligatory covenants; also, covenants of right to convey; of seisin, of warranty, and personal covenants. There need be no particular form in a covenant.

COVENANT (Lat. *convenire*, to come together), a contract or agreement; a term much used by theologians, and in its ordinary signification, as well as in its theological use, nearly if not always exactly equivalent to the Hebrew *berith* of the Old Testament and the Greek *diathēkē* of the New. Applied to relations established between God and men, the term C. must be understood with a certain modification of the meaning which it bears when employed concerning the relations of men to one another, when two independent parties enter into a C., which they have equal right to make or to refuse to make; and is sometimes employed as equivalent to *dispensation*, and the Jewish dispensation is called the *Old C.* (or *testament*, by another translation of *diathēkē*), in contradistinction to the Christian, which is called the *New*. God, in his supremacy, is regarded as appointing certain conditions for his creatures, which they cannot but accept, yet their willing consent to these conditions gives to the relation established the nature of a C.; and thus God is commonly said to have made two covenants with man: the *first C.*, or *C. of works*, with Adam, as the representative of the whole human race, promising life (with perfect happiness), upon condition of perfect obedience, whilst death was threatened as the penalty of transgression; the *second C.*, or *C. of grace*, being that on which depend the whole hope and salvation of man, since the first C. was broken, and in which life is freely offered to sinners, and they are simply required to believe in Jesus Christ that they may be saved. This C. God is regarded as having made with Christ, as the representative of his people, and with them in him. The older theologians often speak of the *C. of redemption* between God and Christ, employing the term *C. of grace* rather to designate the whole dealings of God with men in giving effect to the C. of redemption; but the term *C. of grace* has long been almost universally employed to include all that was comprehended under both terms. The *Abrahamic C.* is the C. of grace as declared to Abraham, in its particular relation to him and his seed. God is represented in Scripture as sustaining a *C. relation* to his *own people*, to the Jews under the old C., to believers in Christ under the new; and doctrinal theology consists not a little in tracing out the nature of this relation, and the consequences which flow from it. As the people of God collectively sustain a C. relation to him, so do believers individually; and it has not been an uncommon thing for pious persons to endeavor to reduce to writing their sense of this "*C. obligation*," under the notion of a *personal covenanting* with God; and of binding themselves by a stronger obligation to what they believed to be good and their duty. It has also been common for men, from the earliest ages, to enter into covenants with one another with more or less of religious solemnity; and this has in particular been done among those who have suffered persecution, or have been engaged in contests concerning matters of religion, for which the authority of certain passages of the Old Testament is strongly pleaded. Instances occur in the history of the Waldenses, and of some of the reformed churches, particularly in the history of the reformation in Scotland. But the most memorable covenants in Scottish ecclesiastical history belong to a period subsequent to the reformation.

COVENANTERS. See CAMERONIANS, and COVENANTS, *ante;* and REFORMED PRESBYTERIANS.

COVENANTS, THE, known in Scottish history and tradition, are chiefly two in number—the NATIONAL COVENANT and the SOLEMN LEAGUE AND COVENANT. As it is necessary to discriminate between these, we shall speak of them separately.

NATIONAL COVENANT.—This was a bond of union or agreement, drawn up at Edinburgh in 1638, by the leading Presbyterian ministers, and subscribed by vast numbers

of persons of all ranks of life. It embodied the confession of faith of 1580 and 1581, subscribed by James VI. in his youth, and again recognized in 1590 and 1596; and was binding on all who signed it to spare nothing which might save their religion. The proximate cause of this extraordinary manifestation of feeling was the attempt of Charles I. to enforce Episcopacy and the use of the service-book in Scotland. The subscribing of the national covenant began on the 28th of Feb., 1638, in the Greyfriars' church and church-yard, at Edinburgh. Numerous copies were also circulated through the country for signature—a circumstance which accounts for many copies being still extant. "In the library of the faculty of advocates at Edinburgh are preserved five parchment copies, with the original signatures of Rothes, Montrose, Loudon, and many others of the nobility, gentry, commissioners of counties and burghs, and ministers, though only one of these five copies is apparently connected with the first signing, and the other four, which are dated 1639, were subscribed after the ratification by the general assembly."—*Historical Sketch Illustrative of the National Confession of Faith* (Davidson, Edinburgh, 1849), to which we refer for a variety of details. The general assembly, which met at Glasgow, Nov. 21, 1638, ratified the national covenant and the confession of faith which it embraced, and deposed the whole of the hierarchy which had been established by Charles I. The national covenant was subsequently ratified by the 5th act of the second parliament of Charles I., held at Edinburgh June 11, 1640, and subscribed by Charles II. at Spey, June 23, 1650, and Scoon, Jan. 1, 1651. The document will be found in the volume which comprehends the *Westminster Confession of Faith*, in use by the church of Scotland. Those who subscribe the national covenant, promise to "continue in obedience of the doctrine and discipline of this kirk." They also give assent to various acts of parliament in the reign of James VI., which besides repudiating the jurisdiction of the pope, and all the ceremonial observances and errors of the Romish church, ordain "all sayers, wilful hearers, and concealers of the mass, the maintainers and resettors of the priests, Jesuits, trafficking Papists, to be punished without any exception or restriction."

Solemn League and Covenant.—This was a document of date four to five years later than the national covenant, since the signing of which, Charles I. had broken with the English parliament, set up his standard at Nottingham (Aug., 1642), and from his various successes, it was thought he might finally be able to reinstate Episcopacy in Scotland. With some alarm on this ground, the Scotch willingly received overtures from commissioners deputed from the English parliament. Hopes were held out to the Scottish nation, that in the event of success against the king, the Presbyterian model should supersede the Episcopalian both in England and Ireland. Approving of a measure of this kind, the Scottish estates entered into what was called a solemn league and covenant with the English parliament. One of the provisions of the bond of agreement was, that the Scotch should send an army into England against the king, which they did in Jan., 1644.

The solemn league and covenant was subscribed by many of all ranks in Scotland and England, including the assembly of divines at Westminster, was ratified by the general assembly at Edinburgh, Aug. 17, 1643, and the Scottish parliament, July 15, 1644; and subscribed by Charles II. at Spey, 1650, and Scoon, 1651. Like the national covenant, it has, till the present day, a place in the volume which comprehends the *Westminster Confession of Faith* of the church of Scotland. While the national covenant refers to the observance of the Presbyterian polity within Scotland alone, the solemn league and covenant is much more comprehensive. Those who subscribe it, setting out with a profession of attachment to the church of Scotland, are to endeavor to bring about a uniformity in religion and church-discipline in the three kingdoms; and further—"That we shall in like manner, without respect of persons, endeavor the extirpation of popery, prelacy (that is, church-government by archbishops, bishops, their chancellors, and commissaries, deans, deans and chapters, archdeacons, and all other ecclesiastical officers depending on that hierarchy), superstition, heresy, schism, profaneness, and whatsoever shall be found to be contrary to sound doctrine and the power of godliness, lest we partake in other men's sins, and thereby be in danger to receive of their plagues; and that the Lord may be one, and his name one, in the three kingdoms."

Such were the famous C., at one time enforced by civil penalties, and for which their adherents, under the name of covenanters, fought and suffered in Scotland, between the restoration and revolution, maintaining to the last that both C., notwithstanding certain recissory acts of parliament, were still binding on the whole nation. At the revolution, the two C. were set aside, and cannot be said to have now any practical effect in any part of the United Kingdom. As above stated, they have a place in the volume which comprehends the *Westminster Confession of Faith*, but for what reason, it is difficult to say; for the church of Scotland does not make adherence to them obligatory on either clerical or lay members. Certain Scottish and Irish dissenters, however, still profess attachment to the C., and on particular occasions renew their subscription of them. See Cameronians. The obligations undertaken by the sovereign, and the modern acts of parliament abolishing religious tests on taking civil office, and admitting Roman Catholics, Non-conformists, and Jews to parliament, not to speak of public opinion, are totally at variance with the covenants. It is customary in popular

lectures on the covenanters to overlook the fact, in compassion for their sufferings, that they contended for what is now quite adverse to the principles of religious toleration. Yet, in so far as the manful struggle in which they were concerned helped to accelerate the revolution, the history of the covenanters must ever be associated with that of civil and religious liberty.

W.C.

COVENT GARDEN (properly *Convent Garden*, from having been originally the garden of Westminster Abbey) is a square in London celebrated for its great market of fruit, vegetables, and flowers. In the 17th c., C. G. was a very fashionable quarter of the town—the residence of many eminent persons. The scene of one of Dryden's plays is laid here, and frequent allusions are made to the place in plays of Charles II.'s time. The market, now so famous, appears to have originated about 1656 in a few wooden sheds and stalls. C. G. is for a stranger one of the sights of London, and is seen to greatest advantage about three o'clock on a summer morning; Tuesday, Thursday, and Saturday being the principal days.

COVENTRY, a t. in Kent co., R. I., on the Pawtuxet river and Hartford, Providence and Fishkill railroad; pop. '80, 4,519. The main business is the manufacture of cotton goods, plain and printed, of mouseline-de-laines, and machinery.

COVENTRY (Convent Town), a city, parliamentary and municipal borough, and manufacturing town in the north of Warwickshire, on the Sherbourne, an affluent of the Avon, 18½ m. e.s.e. of Birmingham. It stands on a gentle eminence in a valley, with a ridge of hill on the s., and contains many old houses, with timbered fronts, projecting into narrow streets, and belonging to the 15th and 16th centuries. The modern part of C., however, is well, though not regularly, built. The chief buildings are the churches, with imposing spires. St. Michael's church, built 1313–95, is said to be the largest parish church in England, and is one of the noblest of the lighter Gothic structures. St. Mary's hall, built 1450, for the Guild, is one of the finest specimens of ornamental work in England, with grotesque carved oak roof, ancient tapestry, and great painted window. In the market-place formerly stood a rich hexagonal Gothic cross, 57 ft. high, erected in the 16th c., in three stories, with exquisitely finished pillars, pinnacles, and niches, with statues of English kings and saints. Before the year 1760, the cross had fallen to decay, and in 1771, the remains of it were taken down and removed. The ancient walls, three miles in circuit round C., were demolished by Charles II. Pop. '71, of municipal borough, 37,670. C. returns two members to parliament. The chief manufactures are ribbons and watches. There are large silk-dyeing works. C. is nearly in the center, between the four great English ports, London, Bristol, Liverpool, and Hull, and has extensive canal communication with other parts of the country. It is a very ancient place. In 1044, earl Leofric and his wife, lady Godiva, founded here a magnificent Benedictine monastery. In memory of Godiva (q.v.), who is said to have ridden round the town naked, to free it from certain imposts laid on by her husband, curious and splendid processions were formerly held in C. In the 15th c., religious mysteries or plays were often acted here by the gray friars before kings. Henry VIII. demolished the beautiful cathedral of C. Here occurred the famous meeting for the intended trial by battle between the dukes of Norfolk and Hereford, immortalized in Shakespeare's *Richard II.* Two memorable parliaments were also held in the monastery of C. in the 15th century. The one contained no lawyers, while the other passed many attainders against the duke of York, etc. In the 15th, 16th, and 17th centuries, C. was famous for woolens, broadcloths, caps, and blue thread bonnets. The Lammas land lying around C. and comprising about 1100 acres, was not long ago divided between the proprietors and the freemen, numbering about 4,000, in the proportion of about two thirds to the former, and one third to the latter. C. was visited by the plague six times between 1350 and 1625. The phrase, "to send to Coventry," took its rise most probably from the derivation of the name C., and meant "to send to a convent;" i.e., to shut out from society.

COVENTRY, Sir JOHN, has obtained a niche in English history from accidental circumstances. In the month of Oct., 1670, he rose in parliament and asked a question relative to a measure before the House, which was taken as an unwarrantable reflection on the king's amours. Charles was furious, and sent some of his guards to watch in the street where C. lived, and leave a mark upon him. C. was attacked one night, and had his nose cut to the bone. Parliament took notice of this atrocious outrage, and passed a bill known by the name of the COVENTRY ACT, making cutting and maiming a capital offence; but they had not courage sufficient to bring the king's bravoes to trial.

COVERDALE, MILES, an eminent English divine, was b. in Yorkshire in 1487. He was educated at Cambridge by the Augustin friars, and becoming an Augustin monk, was ordained at Norwich. He appears, however, to have soon changed his religious opinions, and to have devoted himself earnestly to the work of the reformation. Being abroad in 1532, he assisted Tyndale with his translation of the Scriptures, and three years afterwards appeared his own translation of the Bible, with a dedication by himself to Henry VIII. This was the first English Bible sanctioned by royal authority, as, indeed, it was the first complete translation of the Bible printed in the English language.

The psalms of this translation are those still used in the book of common prayer. In 1538, C., with the consent of king Henry VIII., and with the permission of Francis I., went to Paris to superintend another English edition of the Scriptures, his reason for going to Paris being that paper and workmanship were there cheaper and better than in England. The inquisition, however, notwithstanding the royal license of Francis, interfered, seized the whole impression, consisting of 2,500 copies, and condemned them to the flames. But through the cupidity of one of their executive officers, who sold a considerable number of the heretical books to a haberdasher as waste paper, some copies were saved and brought to London along with the presses, types, etc., which had been employed in printing them. Several of the workmen also came over to London; and Grafton and Whitchurch, the noted printers of that day, were thus enabled to bring out in 1539, under C.'s superintendence, the *Great Bible*, commonly called *Cranmer's Bible*, on account of that prelate having written a preface to it. In 1551, C. was appointed to the see of Exeter, the duties of which high ecclesiastical office he discharged with great zeal, until the accession of Mary in 1553, when he was ejected, and thrown into prison, from which he was only released after two years' confinement, on the earnest intercession of the king of Denmark, whose interest was evoked by his chaplain, C.'s brother-in-law, and on the condition that he should leave the country. C. went to Denmark, and subsequently to Geneva, where he assisted in producing the *Geneva Translation* of the Scriptures (1557–60). On the accession of Elizabeth, he returned to England, but certain notions concerning ecclesiastical ceremonies imbibed at Geneva operated against his preferment in the church; and it was not until 1564 that he was collated to the rectory of St. Magnus, London. Owing to age and infirmities, he resigned this living in 1566, and died in about two years afterwards. C. was the author of several tracts designed to promote the reformation, and made various translations from the works of the continental reformers. The tri-centenary of the issue of his Bible was celebrated throughout the English church, Oct. 4, 1835, and medals were struck in honor of the occasion.

COVERT WAY, or COVERED WAY, in fortification, is a road or broad path outside the ditch of a fortified place, between the counterscarp and the glacis. It is about 30 ft. wide, and is sunk so far below the crest of the glacis, that soldiers standing upon it cannot be seen by the besiegers; hence the name of covert or hidden way. Sentinels, placed in the C. W., prevent all access of the enemy's spies to examine the ditch; and when musketeers mount on the banquette or raised platform on the side next the glacis, they can pour out a grazing fire on the enemy over the crest. The C. W. is broad enough to allow bodies of troops to form on it, either to act defensively or to make sorties; and to increase this accommodation, enlarged portions, called *places of arms*, are made at certain spots.

COVILHÃ', a t. of Portugal in the province of Beira, about 40 m. w. of Coimbra, picturesquely situated among the mountains of Estrella. It has a population of 7,000, chiefly engaged in the manufacture of a brown cloth, worn all over Portugal, called saragoca. There are some sulphureous baths in the neighborhood, recommended for nervous diseases.

COVINGTON, a co. in s. Alabama, on the Florida border, drained by Yellow-water and Conecuh rivers; 1200 sq.m.; pop. '80, 5,650—657 colored. It is level, and the soil is sandy and poor. Pine timber is the main product. Co. seat, Andalusia.

COVINGTON, a co. in s. Mississippi, watered by the tributaries of Leaf river; 680 sq.m.; pop. '80, 5,993—2,002 colored. Soil, light and sandy; chief productions, corn, cotton, and sweet potatoes. Co. seat, Williamsburg.

COVINGTON, a city of Kentucky, U. S., on the s. bank of the Ohio river, and w. of the mouth of Licking river, opposite Cincinnati, with which it is connected by a lofty suspension bridge and steam-ferries. It has a city hall, 25 churches, the western theological college, a Roman Catholic cathedral, and manufactories of cotton, hemp, silk, tobacco, and iron. There are also several establishments for packing pork and beef. Pop. '60, 16,471; '70, 24,505.

COVINGTON (*ante*), a city in Kenton co., Ky., at the junction of the Licking with the Ohio river, opposite to Cincinnati, O., with which it is connected by a bridge and by ferries. It is substantially a suburb of the city in Ohio, as Brooklyn is of New York, and its growth has been in equal degree with the chief city. The bridge (wire suspension) was finished in 1867, and cost $2,000,000; the main span is 1057 ft., and the height above low-water is 100 ft. There is also a wire suspension bridge, over the Licking, to Newport. From Covington starts important railroad communication with s.w. states. Besides general trade, the city has a large manufacturing business. Covington was founded in 1812, and incorporated in 1834. Its population in 1870 was 24,505—1114 colored. There is a large foreign population, most of whom are Germans.

COW. See OX, DAIRY.

COWBANE. See HEMLOCK.

COWBERRY. See WHORTLEBERRY.

COW-BIRD, or COW BUNTING. See COW-PEN BIRD, *ante*.

COW'BRIDGE, a municipal and parliamentary borough in the s. of Glamorganshire, on the Ddaw, 12 m. w. of Cardiff. It chiefly consists of one long and wide street. It once had walls with three gates, built in the end of the 11th century. One of the gates, a Gothic structure, still remains. Pop. '71, 1134. With Cardiff and Llantrissant, it returns one member to parliament.

COWES, WEST, a seaport and watering-place in the n. corner of the isle of Wight, on the w. side of the mouth of the estuary of the Medina (here a third of a mile broad). It stands on a hill slope, and has a striking aspect from the sea. There are many elegant villas in the vicinity. C. has much trade, being the port of the isle of Wight. It has daily steam communication with Southampton, from which it lies 10¼ m. to the s.s.e., and with Portsmouth, from which it lies 11 m. to the w.s.w. At the angle formed by the Medina and the sea, is a small battery built by Henry VIII. C. is the head-quarters of the royal yacht squadron and club, who hold their annual regatta here. Pop. '71, 5,730. In 1875, 4,863 vessels, of 126,675 tonnage, entered the port, and 1927, of tonnage 51,551, cleared it.—EAST COWES is situated on the e. side of the mouth of the Medina, and 2 m. n.w. of Osborne house, the marine residence of queen Victoria. Pop. '71, 2,058.

COWETA, a co. in n.w. Georgia, intersected by the Atlanta and West Point railroad, and bounded on the n.w. by Chattahoochie; 378 sq.m.; pop.'80, 21,109—11,804 colored. The surface is even and the soil fertile, producing corn, wheat, cotton, etc. Co. seat, Newman.

COW'AGE, COW'HAGE, or **COW'ITCH**, consists of short, slender, brittle hairs, which grow on the outside of the pods of plants of the genus *macuna*, natives of the tropical parts of America and Asia. This genus belongs to the natural order *leguminosæ*, suborder *papilionaceæ*, and has a knotted, two-valved pod, divided by transverse partitions. The species are twining plants, shrubby or herbaceous, with leaves of three leaflets. That which yields most of the C. brought to Europe is *M. pruriens*, a native of the West Indies, with racemes of fine purple flowers, which have a disagreeable alliaceous smell, and pods about 4 in. long. *M. prurita* of the East Indies, and *M. urens*, the oxeye bean of the West Indies, yield C. of similar quality. The hairs readily stick in the skin, and cause intolerable itching. C. is used in medicine, acting mechanically in killing and expelling worms, particularly the species of *ascaris* (q.v.). That it does not act on the inner surface of the intestinal canal, is supposed to be owing to the mucous secretion. It is generally administered in syrup, treacle, or honey.—Before the pods of C. plants are ripe, they are used as a vegetable like kidney-beans, and are very palatable.

COWL, a hood generally attached to a loose cloak and worn on the head. It was common in England in the middle ages, but has come to be used chiefly by monks or members of some religious order, such as the Benedictines and Franciscans.

COWLEY, a co. in s.e. Kansas, bordering on the Indian territory, bounded on the w. by the Arkansas river; 804 sq.m.; pop.'80, 21,539. Agriculture is the chief business. Co. seat, Winfield.

COWLEY, ABRAHAM, was b. in London in 1618. He was the son of a grocer, and was educated at Westminster school and Trinity college, Cambridge. According to his own statement, he was made a poet by the perusal of Spenser, whose works were wont to lie in his mother's parlor. A volume of poems, entitled *Poetic Blossoms*, was published by him at the age of 15, and one of the pieces contained therein was written when he was 10 years old. At Cambridge he obtained distinction through the elegance of his translations; and while there, he composed the greater part of the *Davideis*, an epic in four books—a work which he never completed. He was attached to the court party, and, in consequence, was ejected from his college in 1643, after he had taken his degree of M.A. In 1646, he followed the queen to Paris, in which city he remained 10 years; and on his return to England, being under suspicion, he was seized and bound in heavy securities for his future behavior. In the same year, he published an edition of his poems, with a preface, in which certain passages appeared, supposed to have a political bearing, which were suppressed in subsequent editions. After the restoration, he expected to obtain the mastership of the Savoy, but was disappointed. He subsequently obtained a lease of the queen's lands at Chertsey, in Surrey, whither he retired in 1665. He died in July, 1667, in his 49th year, and was buried in Westminster abbey, near Chaucer and Spenser. In 1675, a monument was erected to his memory by the duke of Buckingham.

Although almost forgotten now, the time was when C.'s poetry was considered equal to Shakespeare's or Spenser's. It certainly possesses merits of ingenuity and verbal brilliancy. He is often splendid, but it is the splendor of the rocket rather than of the glowworm or the star. His prose is more natural than his verse, and some of its passages reach a stately eloquence, reminding the reader of the magnificent prose of Milton.

COWLEY, HENRY RICHARD WELLESLEY, first earl (his father being first baron Cowley, better known as sir Henry Wellesley), an English diplomatist of liberal opinions, was b. in 1804. He early devoted himself to diplomatic pursuits. An attaché at Vienna in 1824, he was afterwards successively promoted to be secretary to the legation at Stutt-

gart, and to the embassy at Constantinople. Having acted as minister-plenipotentiary to Switzerland, and afterwards to Frankfurt, he was (1851) appointed minister to the Germanic confederation, and in the following year he succeeded the marquis of Normanby as ambassador at Paris. For this position he displayed eminent qualifications, and held the appointment whether his party was in or out of office till 1867, when he resigned. Along with the earl of Clarendon he represented Great Britain at the Paris congress of 1856; and it was greatly owing to his tact and temper that ill-feeling between the two countries did not result in more serious disagreement. He was created viscount Dangan and earl Cowley in 1857, and made a K.G. in 1865.

COWLITZ, a co. in s.e, Washington territory on the Columbia river, which separates it from Oregon; 460 sq.m.; pop.'80, 2,062. It is mountainous but fertile, and as yet little settled. Co. seat, Freeport.

COW PARSNIP, *Heracleum*, a genus of plants of the natural order *umbelliferæ*, having petals bent in at the middle, and flat compressed fruit. One species only is a native of Britain, the common C. P. or HOG-WEED, called *kiesh* in Scotland; a common and rank weed, with coarsely-hairy leaves, and stem about 3 to 5 ft. high. It is gathered in some parts of England for fattening hogs, and is said to afford wholesome food for cattle. Some Siberian species are much larger, and have been recommended for cultivation on account of the great quantity of herbage which they yield very early in the season, particularly *H. panaces*, which sometimes attains a height of 10 ft., and the root leaves are 3 to 5 ft. long.

COW-PEN BIRD, *Molothrus pecoris*, also called cow bird, cow troopial, cow blackbird, cow bunting, etc., a bird nearly allied to the Baltimore birds and troopials, having a short, conical beak, and remarkable for its habit of depositing its eggs, like the cuckoo, in the nests of other birds. It is a native of North America, common in some of the southern states in winter, and migrating northward in spring. Great flocks are sometimes seen together. The cow-pen bird is about 7 in. in entire length, of glossy brownish black plumage. It derives its name from its frequenting cow-pens, to feed on the insects contained in, or attracted by the dung. It selects for the reception of its eggs the nests of birds smaller than itself, and by an interesting provision of nature, its egg, which is not much larger than theirs, is hatched sooner, and theirs appear to be generally removed as addled eggs.

COWPENS, a village in Spartanberg co., S. C., near the n. border of the state. The place is noted chiefly for a battle there Jan. 17, 1781, between the British under col. Tarleton and the Americans led by gen. Morgan, in which the former were defeated, losing 300 killed and wounded and 500 prisoners. The Americans had only 12 killed and 60 wounded.

COWPER, WILLIAM, Earl, 1664–1723; an English lawyer and judge, member of parliament, and lord keeper of the great seal. In 1706, he was made a peer, and was one of the commissioners to negotiate the union of Scotland with England. In 1707, he was lord chancellor; in 1716, lord high steward; and earl in 1718.

COWPER, WILLIAM, an English poet, was b. on the 26th Nov., 1731, in the parsonage house of great Berkhamstead. His father, who was chaplain to George II., married Ann, daughter of Roger Donne, esq., of Ludham hall, in Norfolk. This lady expired in childbirth, in 1737, leaving two sons, William, the poet, and John. This event made a deep impression on C.'s mind; and the lines addressed to his mother's portrait have drawn more tears than any other poem in the English language.

C. was a delicate and sensitive child, and boyhood brought with it only deeper melancholy and depression. At the age of six he was placed at a considerable school, kept by a Dr. Pitman, in Market street, Hertfordshire. The period he spent here was very miserable, and laid the foundation of that settled gloom which oppressed him till death. It is to the remembrance of these wretched days that we are indebted for the fierce invective that burns in the somewhat one-sided *Tirocinium, or a Review of Schools*. C. completed his studies at Westminster school, and shortly after was articled to a Mr. Chapman, an attorney in London.

After completing his three years' articles with Mr. Chapman, C. went, in 1752, to reside in the Middle Temple. In 1754, he was called to the bar, but never practiced. His father died in 1756, and left him a small patrimony. In 1759, he removed to the Inner Temple; and, although at this period he expected to secure some legal appointment through the influence of his family, he hated law with a perfect hatred, and seldom opened a book that bore on his profession. Yet he was industrious enough; he scribbled poetry, read Homer, and, in conjunction with his brother, translated some of the books of the *Henriade*. Soon after his settlement in the Inner Temple, he was appointed a commissioner of bankrupts; but there is no reason to believe that he ever entered on the duties of his office. An influential relative now offered him the office of clerk of the journals of the house of lords, which was accepted; but he, having to undergo an examination at the bar of the house, was seized with nervousness, and could not appear. At this period his misery was so great, that he meditated suicide, but fortunately failed to carry out his intentions for want of courage. In Dec., 1763, he was removed to the house of Dr. Cotton at St. Albans—a prey to the deepest remorse.

C.'s pecuniary means had suffered considerably by the loss of his appointments, but his friends contrived to make up an income sufficient for his wants. After his removal from St. Albans, he went to reside in the town of Huntingdon. Here he formed acquaintance with Mrs. Unwin, the Mary of his poems—an acquaintance which ripened into the deepest friendship, and which subsisted till death. He went to reside with the Unwins, and enjoyed much tranquil happiness under that religious roof. When on a visit, in Jan., 1773, to, the Rev. Mr. Newton, a friend of the Unwins, and a man of sincere piety, but, from the peculiar cast of his religious views, perhaps not the best physician "to minister to a mind diseased," his malady returned. Mrs. Unwin carefully tended him through the crisis of his delirium, and through his long and slow recovery. When convalescent, he betook himself to writing hymns along with Mr. Newton, and to domesticating hares, with the particulars and little incidents of which amusement the world is pleasantly familiar. Mrs. Unwin also suggested, as a subject suited to his genius, *The Progress of Error*. C. set to work in Dec., 1780, and by the following Mar. had completed *Truth*, *Table-Talk*, *The Progress of Error*, and *Expostulation*. Although the volume was completed in 1781, its publication was delayed till the following year.

In 1781, C. made the acquaintance of lady Austen, who suggested to him *The Task*, urged him to translate *Homer*, and—what the world is perhaps still more grateful for—she related to him the history of John Gilpin. The story so seized C.'s fancy, that in the course of a single night he produced the poem which has tickled the midriffs of three generations. *The Task* was begun in the winter of 1783, and published in 1785. Its success was great, and C. began to be considered the greatest poet of his day. In 1784, he began the translation of Homer, which appeared in 1791. It was received with great applause. He had labored hard, and had now to pay the penalty. The pen was the only weapon with which he could keep his constitutional malady at bay; but now, when seated at his desk, his genius would not answer the call. He began to hear again the voices and the whisperings which had afflicted him in earlier days. Mrs. Unwin's faculties also became affected, and the two friends were groping in the same twilight, deepening for both into the darkness of death. They left Olney, and were received into the house of Mr. Johnson, in Tuddenham, in Norfolk. Here Mrs. Unwin died on the 17th Dec., 1796. C. now fell into a state of utter dejection; in 1799, he was attacked by dropsy. He died on the 27th April, 1800.

C. was a great innovator in English literature; he destroyed the sentimentalists led by Hayley, and the image-hunters headed by Darwin. His poetry is eminently healthy, natural, and unaffected. C. and Robert Burns we have to thank for bringing back nature to English poetry. Besides being a poet, C. was perhaps the most delightful letter-writer in the English language. Nothing can surpass the charm of his epistles—full of fun, gentle sarcasm, anecdote, acute remark, and a tender shadow of melancholy thrown over and toning down the whole. The best edition of C.'s works (accompanied by an admirable biography) is that of Southey, 15 vols. 12mo, Lond. 1837–38.

COWPER'S GLANDS, two small yellow lobulated glands in man under the membraneous portion of the urethra. They secrete a mucus which flows into the bulb of the urethra. In woman, the vulvo-vaginal glands are amalagous.

COW PLANT, *Gymnema lactiferum*, a perennial plant of the natural order *asclepiadaceæ*, a native of Ceylon; with erect stem, ovate leaves, and very short umbels; which has acquired a factitious celebrity from the statement made and often repeated that its milky juice is used as a substitute for milk, and that its leaves are boiled to supply the want of cream! But this, according to sir J. E. Tennant, is altogether a mistake, and the name is derived merely from the appearance of the juice.

COWRY, *Cypræa*, a genus of gasteropodous mollusks of the order *pectinibranchiata*—the type of a family, *cypræidæ*, to all of which the name C. is often extended—having the margin of the mantle prolonged into a siphon, by which water is conveyed into the gill chamber, and a spiral convoluted shell, the spire visible in the young, but entirely concealed in the adult, and the outer lip then thickened and bent in. The aperture extends the whole length of the shell. The shells, called *porcelain shells* by the French and Germans, are almost entirely calcareous in their composition, are richly enameled, and often very beautiful. They are most abundant and attain their largest size in the seas of warm climates. Only a few very small species are found on the British coasts. Some of the species are much prized by collectors of shells. The money C. (*C. moneta*) is of commercial interest, for its general use as a substitute for coin in many parts of Asia and Africa. It is not of great beauty, is yellow or white, often with a yellow ring, about an inch long, and nearly as broad as long. It is found on the Indian coasts, and in particular abundance on those of the Maldive islands, and is one of their principal exports. In Bengal, 3,200 cowries are reckoned equal to a rupee, so that a C. is about equal in value to one thirty-sixth of a farthing. Yet cowries to the value of 200,000 rupees are said to have been at one time imported annually into Bengal. Many tons of cowries are annually imported into Britain, to be used in trade with the w. of Africa, and this importation began when it was in the slave-trade that they were employed.—To the family *cypræidæ* belong the shells called *poached eggs* (*ovulum*), the *weaver's shuttle shell* (*ovulum volva*), remarkable for its prolongation at both ends, etc. Fossils of this family are numerous in some strata, as in the *bagshot beds* (q.v.).

COWSLIP (*primula veris;* see PRIMROSE), a common native of pastures in England and many other parts of Europe, although rare in Scotland, a delicate and modest little flower, a universal favorite, both for its beauty and its fragrance. The flowers are small, in an umbel at the top of the scape, the limb of the corolla short and concave. The flowers have sedative properties, and are sometimes used as an anodyne and antispasmodic. They are fermented with sugar to make *cowslip wine*, an agreeable and favorite soporific domestic medicine.—The name VIRGINIAN COWSLIP is given to the *dodecatheon meadia*, a perennial plant, also of the natural order *primulaceæ*, a native of North America, with a stalk about 8 in. high, bearing an umbel of gracefully pendent lilac flowers, the petals reflexed over the calyx, the stamens and pistil long, and the anthers of a golden color. It is very ornamental in the flower-border, flowering in the end of April or beginning of May.

COW TREE, a name given to a number of species of tree of different natural orders, the bland milky juice of which is used instead of milk. They are all natives of tropical countries, and mostly belong to natural orders in which acridity is the general characteristic of the milky juice. Some of them belong to the natural order *moraceæ*, and are closely allied to fig; others to the natural order *artocarpaceæ*, one of which is the famous PALO DE VACA or C. T. of the Cordilleras and Caraccas (*galactodendron utile*, now rather referred to the genus *brosimum*, see BREAD-NUT). Another is the HYA-HYA (*tabernæmontana utilis*), a native of equatorial America, belonging to the natural order *apocynaceæ*.

The PALO DE VACA grows in rocky situations, at an elevation in equatorial regions of about 3,000 feet. It is a lofty tree, with laurel-like leaves, 10 to 16 in. long, and very small flowers. For several months in the year, not a shower moistens its foliage, and its branches appear dead; but as soon as the trunk is pierced, there flows from it a copious stream of sweet and nourishing milk. The milk flows most freely at sunrise. The natives are then to be seen hastening from all quarters with bowls to receive it. The milk has an agreeable odor and a viscidity which does not belong to the milk of animals; it becomes yellow in a short time, and thickens or forms a sort of cream at the surface, which gradually thickens into a cheesy consistency before it begins to putrefy. This milk is nutritious, and is much used by the negroes and Indians; but differs very materially in its composition from the milk of animals; more than one half being wax and fibrin; a little sugar, a salt of magnesia, and water, chiefly making up the rest.

The HYA-HYA also yields a copious milky juice, which is used in Demerara and elsewhere as a substitute for milk, and is very agreeable and nutritious.

COW-TREE (*ante*), the name of several trees native in the tropics, whose sap is used as a substitute for milk. The cow-tree of the Cordilleras grows in rocky places 3,000 ft. above tide. For the greater part of the year its branches appear to be dead, but when the trunk is pierced it yields a copious stream of sweet and nourishing juice much resembling milk. It has a pleasant odor and is somewhat viscid. It soon turns yellow, and cream rises to the surface. It is much used by negroes and Indians, who go at sunrise to gather it, as then the sap flows most abundantly.

COW-WHEAT, *Melampyrum*, a genus of plants of the natural order *scrophulariaceæ*, having an oblong two-celled capsule, with a few seeds somewhat resembling grains of wheat. The species are natives of the temperate parts of the northern hemisphere, annual plants with opposite narrow leaves and yellow flowers, growing in woods, cornfields, pastures, etc. Several are natives of England. They are said to be very fattening to cattle, and to give a yellow tinge and peculiar excellence to butter made from pastures in which they abound.

COX, DAVID, 1793–1859; an English painter excelling in landscapes. In 1814, he published a *Treatise on Landscape Painting in Water Colors*, still accepted as authority.

COX, JACOB DOLSON, b. Canada, 1828. He studied law in New York, and afterwards at Oberlin college, Ohio, in which state he was admitted to the bar in 1852. In 1859, he was elected to the legislature. In the war of the rebellion he was active on the union side, rising to be maj.gen. of volunteers. In 1866, he was elected governor of Ohio, and in 1869, he was appointed secretary of the interior, but resigned the next year.

COX, RICHARD, 1499–1581; b. Buckinghamshire, England; educated at Eton and Cambridge. Wolsey invited Cox to Oxford, but he had adopted the reformed ideas, and the cardinal gave him imprisonment instead of preferment. He was afterwards master of Eton school and prebendary of Ely cathedral. He was tutor to prince Edward, and when the latter became king, he made Cox one of the privy council and king's almoner. Mary put him in prison, but he escaped to Strasburg, where he lived with Peter Martyr. Elizabeth restored him to the see of Ely. Cox translated for the Bishops' Bible the four Gospels, the Acts, and the Epistle to the Romans, and wrote a number of polemical essays. He was distinguished for the violence of the measures which he recommended for the extirpation of popery and dissent.

COX, SAMUEL HANSON, D.D., LL.D., b. N. J., 1793, of a Quaker family. He began to study law, but left it for theology, and was ordained a Presbyterian minister in 1817. Three years later he had charge of a church in New York city, and was mobbed on account of his anti-slavery sentiments, his house and church being sacked.

In 1834, he was chosen professor of sacred rhetoric in the theological seminary at Auburn, N. Y., and in 1837, became pastor of the First Presbyterian church in Brooklyn, remaining there until 1854. He was, in the mean time, professor of ecclesiastical history in Union theological seminary. At the division of the Presbyterian church, 1837, he became a leader in the new school branch, and was on several occasions a delegate to conventions in Europe, and at one time moderator of the general assembly. In 1854, his voice failed, and he resigned his pastorate. Among his published works are: *Quakerism not Christianity; Interviews, Memorable and Useful;* and many discourses.

COX, SAMUEL SULLIVAN, b. Ohio, 1824. He is a graduate of Brown university, and was a lawyer and editor in Ohio. He has traveled in Europe, and was appointed secretary of legation in Peru. In 1856–62, he was a representative in congress from Ohio. In 1866, he removed to New York, was reëlected to congress, and is still a member of the house of representatives (1880). He has published *The Buckeye Abroad; Eight Years in Congress; Search for Winter Sunbeams; Why we Laugh;* and some speeches.

COXAL'GIA, or COXI'TIS, commonly called the "hip-joint disease." It is usually a severe inflammation in the joint, extending to the ligaments and surrounding soft substances. The form in which it oftenest appears in young persons is inflammation of the membraneous lining, and it frequently originates from rheumatism. In children it is sometimes started by a blow or a fall. Lymphatic and scrofulous persons are most subject to it.

COXCIE, or COXIS, MICHAEL, 1499–1592; a Flemish painter, known by his copy of the "Adoration of the Lamb," from the original, made by the brothers Van Eyck, for Philip II. of Spain, at a cost of two years' work. His illustrations of the story of "Cupid and Pysche" have furnished models for innumerable paintings and engravings.

COXE, ARTHUR CLEVELAND, D.D., b. 1818, in N. J.; a son of Samuel Hanson Coxe. He graduated at the university of New York in 1838, took orders in the Protestant Episcopal church, and officiated as pastor in New Jersey, Connecticut, Maryland, and New York. In 1865, he was chosen bishop of western New York, in which office he has shown earnestness and zeal. He is widely known as a writer, and among his works are some volumes of poems; *Sermons or Doctrinal Duty; Christian Ballads; Impressions of England;* and *Moral Reforms Suggested in a Pastoral Letter.*

COXE, WILLIAM, a very industrious historical writer, was b. in London, Mar., 1747, and was educated at Cambridge. As tutor to the sons of several noblemen, he, at various times, spent many years on the continent, where he neglected no opportunity of collecting information about the countries which he visited. The result appeared in many volumes of travels and history, all of which are characterized by close observation, care, and research; but the writing in general is far from sprightly. Among the best known of C.'s works is his *History of the House of Austria,* which is still a standard work. C. also wrote *History of the Kings of Spain of the House of Bourbon; Memoirs of the Duke of Marlborough; Memoirs of Sir Robert Walpole;* and *Memoirs of the Pelham Administration,* besides many contributions to our knowledge of the topography and social condition of several continental conntries. C., who commenced his clerical life in 1771 as a curate at Denham near Uxbridge, ended it as archdeacon of Wilts, which appointment he obtained in 1805. He died June, 1828. Several of his works have been published in Bohn's *Standard Library.*

COXIM', one of the head-waters of La Plata, rises in Matto Grosso, a frontier province of Brazil, towards Bolivia and Peru. After flowing first to the n.e., and then to the n.w., it enters the Taquari, itself a tributary of the Paraguay, in lat. 18° 24′ south. The C. receives many affluents.

COYOTE. See WOLF, *ante.*

COY'PU, *Myopotamus coypu,* a rodent quadruped nearly allied to the beaver, with which it agrees in the number and character of its teeth, in its short limbs, in its feet having five toes each, the hinder feet webbed and the forefeet not webbed, and to a considerable extent in its habits; but from which it differs in the form of its skull, having a more elongated muzzle and a contracted palate, and in its slender tail resembling that of a mouse. It is the only known species of its genus, and inhabits great part of South America, on both sides of the Andes, burrowing in the banks of the rivers, and sometimes in forests near the sea-beach. It is very nearly equal in size to the beaver, has small ears, very long and stiff whiskers, and long hair mixed with dense and soft short hair, the upper parts beautifully penciled with different shades of yellow, the sides and under parts lighter and more uniform in color. The fur has become an important article of commerce, under the names of racoonda (q.v.) and nutria, the latter name signifying in Spanish an otter, having apparently been given to it by mistake, but being that chiefly used in Britain.

COZZENS, FREDERICK SWARTWOUT, 1818–69; b. N. Y.; in early life a wine-merchant, and editor of the *Wine Press,* for which he wrote papers on the culture of the grape and the manufacture of wine. This led him to more popular authorship, and he contributed to magazines. His first volume was *Prismatics, by Rishard Haywarde.* Then

came the *Sparrowgrass Papers*, his best effort. Afterwards he published *Acadia, or a Sojourn among the Blue Noses;* and a *Memorial of Fitz-Hugh Halleck.* One of his latest and best works is *Sayings, Wise and Otherwise.*

CRAB, the popular name of all the crustaceans of the order *decapoda* (the highest order of crustaceans, characterized by great concentration of the nervous system and corresponding general concentration, by five pair of thoracic limbs, and by having the gills inclosed in a special cavity on each side of the thorax, covered by the carapace) and sub-order *brachyoura* (characterized by the small size of the abdomen, which resembles a short tail curved under the thorax and appressed to it, all the most important viscera being included in the thorax), and extended also to some of the sub-order *anomoura* (purse-crabs, hermit-crabs, etc., characterized by a condition of abdomen intermediate between that of the *brachyoura* and that of the *macroura*, or long-tailed decapod crustaceans, such as the lobster, cray-fish, etc.). All the crabs, besides many other crustaceans, were comprehended in the Linnæan genus *cancer;* but the number of species is very great, and the *brachyoura* alone are now arranged into many genera and even families. The different kinds of crabs differ very much in the form of the carapace (the back), which in some is orbicular or nearly so; in some, much broader than it is long; in others, longer than broad; in some, prolonged in front into a kind of beak, etc.; also in its smoothness, or roughness with hairs, tubercles, or spines; in the length of the legs, etc. The eyes are compound, with hexagonal facets, and are elevated on stalks, which are generally short, but sometimes considerably lengthened, and which have the power of motion, so as to turn the eye in different directions. The first pair of limbs are not used for locomotion, but exhibit in great perfection the characteristic claws or pincers (*chelæ*) of the decapod crustaceans. Crabs are inhabitants of almost all seas; most of them, however, having their limbs formed for walking rather than for swimming, are found chiefly near the coast; some inhabiting comparatively deep water, and others abounding in those parts which are left by the receding tide, where they occur equally in the rock pools and among the moist sea-weeds. Some small kinds of crabs (*pea crabs*) are often found in the inside of mussels and other bivalve mollusks. Some crabs inhabit fresh water, particularly in the warmer parts of the world; and others, known as land-crabs (q.v.), live among moist herbage, or burrow in sand or earth. Some have the last pair of limbs expanded at the extremity into a broad blade for swimming, and some have even all the four pair of limbs intended for locomotion thus expanded, and sometimes occur far out at sea. Some of the crabs, with very long legs, are known as spider-crabs. Crabs molt or change their shell, not at fixed intervals or seasons, but according to the exigencies of their growth; the change being made with great frequency when they are very young, but rarely in advanced age; indeed, from the mollusks, and other animals sometimes found adhering to the carapace, it is inferred that the same covering is sometimes worn for a number of years.—The metamorphosis of crabs is noticed in the article CRUSTACEANS.—Crabs are interesting inmates of the aquarium, from their readiness in seizing food, their activity in tearing and eating it, their general habits, and, in particular, their pugnacity. The number of specimens is apt, however, to be soon diminished by the stronger killing and eating the weaker.—Many kinds of crabs are used as articles of food in different parts of the world, as the large edible C. (*cancer purus*) and small edible C. (*carcinus mœnas*) of the British shores. The latter is extremely common on all parts of the coast, but is not nearly so much esteemed as the former, which is much sought after, and is caught either in the holes of the rocks at low tide, or by means of a kind of trap, a basket which readily permits its entrance but not its escape, and which is baited with meat or animal garbage of some kind. In winter it seems to retire to deeper water. Its black claws and very broad carapace, arched at the sides, readily distinguish it from all other British species. It is sometimes nearly a foot in breadth. The claws of the edible C. were formerly ground to powder and used as a medicine, having, however, no properties but those of carbonate of lime.

CRAB, ROGER, a singular secretary of the English revolution, had served for seven years in the parliamentary army, and though he had his "skull cloven" by a royalist trooper, yet, for some breach of discipline, Cromwell sentenced him to death, a punishment subsequently commuted to two years' imprisonment. After his release from jail, C. set up in business as "a haberdasher of hats" at Chesham, in Buckinghamshire. His wandering mind, probably not improved by the skull-cleaving operation, then imbibed the idea that it was sinful to eat any kind of animal food, or to drink anything stronger than water. Determined to follow, literally, the injunctions given to the young man in the gospel, he sold off his stock in trade, distributing the proceeds among the poor, and took up his residence in a hut, situated on a rood of ground near Ichenham, where for some time he lived on the small sum of three farthings a week. His food consisted of bran, dock-leaves, mallows, and grass; and how it agreed with him we learn from a rare pamphlet, principally written by himself, entitled *The English Hermit, or the Wonder of the Age.* "Instead of strong drinks and wines," says the eccentric Roger, "I give the old man a cup of water; and instead of roast mutton and rabbit, and other dainty dishes, I give him broth thickened with bran, and pudding made with bran and turnip-leaves chopped together, at which the old man (meaning my body) being

moved, would know what he had done, that I used him so hardly. Then I showed him his transgressions, and so the wars began. The law of the old man in my fleshly members rebelled against the law of my mind, and had a shrewd skirmish; but the mind, being well enlightened, held it so that the old man grew sick and weak with the flux, likely to fall to the dust. But the wonderful love of God, well pleased with the battle, raised him up again, and filled him full of love, peace, and content of mind, and he is now become more humble, for now he will eat dock-leaves, mallows, or grass."

The persecutions the poor man inflicted on himself, caused him to be persecuted by others. Though he states that he was neither a Quaker, a Shaker, nor a Ranter, he was cudgeled and put in the stocks; the wretched sackcloth frock he wore was torn from his back, and he was mercilessly whipped. He was four times arrested on suspicion of being a wizard, and he was sent from prison to prison; yet still he would persist in his course of life, not hesitating to term all those whose opinion differed from his by the most opprobrious names. He published another pamphlet, entitled *Dagon's Downfall, or the Great Idol digged up Root and Branch; the English Hermit's Spade at the Ground and Root of Idolatry.* This work shows that the man was simply insane. We last hear of him residing in Bethnal Green. He died on the 11th of Sept., 1680, and was buried in Stepney church-yard.—*Chambers's Book of Days,* vol ii. p. 334.

CRAB APPLE. See APPLE, *ante.*

CRABB, GEORGE, 1778–1854; an English lawyer and philologist, a graduate of Oxford, author of text books on language and a *History of English Law,* but known chiefly by his valuable book on *English Synonyms.*

CRABBE, GEORGE, a late English popular poet, was b. at Aldborough, in Suffolk, on the 24th Dec., 1754. His father was a warehouse keeper, and collector of the salt-duties at Aldborough, and exerted himself to secure for his son a superior education. C. early exhibited a passion for all kinds of book-learning, with a decided bias towards poetry. After being tolerably grounded at school in mathematics and classics, he was, in his 14th year, apprenticed to a surgeon at Wickham Brook, near Bury St. Edmunds; but he had no liking for the profession, and ultimately proceeded to London, where he arrived in 1780, with £3 in his pocket, to make a trial of literature. For a while he was very unfortunate. At last when threatened with arrest for debt, he resolved to make his case known to Burke. He told Mr. Lockhart, years after, "the night after I delivered the letter at the door, I was in such a state of agitation that I walked Westminster bridge backwards and forwards until daylight." The great orator at once appointed an interview, looked over C.'s poetical compositions, suggested several alterations which were adopted, and finally took *The Libarry* and *The Village* to Mr. Dodsley, by whom the first-named poem was published in 1781. C. went to reside at Beaconsfield with his generous and brilliant acquaintance, and while there met Fox, sir Joshua Reynolds, and lord Thurlow; the last of these invited the new celebrity to breakfast, and presented him with a bank-note for £100 at parting.

By the advice of Burke C. entered into holy orders, and was ordained curate of his native place in 1782. Shortly after, he was appointed domestic chaplain to the duke of Rutland, and took up his residence at Belvoir castle. *The Village* appeared in 1783, and established the reputation of its author. Shortly after lord Thurlow presented him with two small livings in Dorsetshire; and now, finding himself above all fear of want, he married Miss Sarah Elmy, and entered into the enjoyment of the purest domestic happiness. In 1785, he left the castle, and took up his residence in the parsonage of Strathern, thereafter for many years he botanized, studied geology, wrote poems, saw—in hurried visits to London—the distinguished men of his time, and was courted by them, enjoying an uninterrupted course of happiness and honor.

The Newspaper appeared in 1785; in 1807, C. published *The Parish Register;* in 1810, *The Borough;* two years after he produced his *Tales in Verse;* and in 1819, he gave to the world his *Tales of the Hall.* In 1813 his wife died, and shortly after he procured the living of Trowbridge, where for the remainder of his life he resided. In the autumn of 1822, he visited Edinburgh, and was the guest of sir Walter Scott. His health began to fail in 1828; he died on the 3d of Feb., 1832, aged 78.

C. disdained all the luxuries of his art. He has no heroes with a Hyperion front, and no heroines radiant as Aurora. He worked with the delf, not with the porcelain of human clay. He concerns himself with wild smugglers, denizens of villages by the sea, full of ancient and fish-like smells; gypsies on the heath cooking the fowl purloined from the neighboring barnyard; with tramps, vagabonds, and vagrants, and the inmates of the workhouse. On his page these unsavory individuals live, carouse, curse, brawl, and die. He has pages stern as anything in *The Inferno;* many droll as Hogarth's pictures; and one or two so sweet, and tender, and pathetic, that no man possessed of any sensibility can read them unmoved.

CRABETH, DIRK and WOUTER, the last surnamed the Elder, were two brothers, glass-painters, b. (it is supposed) at Gouda in s. Holland, and who flourished in the latter half of the 16th century. It seems Dirk visited France in his youth, whilst Wouter journeyed to Italy, where he studied the works of Raphael, as is evident from his productions. Wouter, it is said, surpassed his brother in drawing, grace, and clearness,

whilst Dirk surpassed him again in coloring. They, however, were jealous of each other, and each concealed from the other the secrets of his processes. Their conjoint work in the church of St. John at Gouda, is the masterpiece of the two brothers. Of the eleven painted windows in that church, seven are by Dirk, and four by Wouter. They were done between 1555 and 1571. Dirk died it is believed in 1601. It is unknown when Wouter died. The brothers were buried in the sanctuary they had so surpassingly illustrated.

CRA'BRO, hymenopterous insects of the section *aculeata*, and the sub-section *fossores*, or "burrowers." a creature of the hornet family which excavates nests in decayed wood, fences, etc.

CRACKED HEELS. From careless grooming, washing horses' legs and imperfectly drying them, permitting them to stand in accumulations of filth or exposed to draughts, the skin becomes inflamed, tender, itchy, thickened, and by and by cracked. An ichorous noisome discharge exudes, and lameness often results. In animals with round, *gummy* legs, it is sometimes constitutional; underbred horses with rough hairy fetlocks present the majority of cases; white heels, being more delicate, are especially affected; whilst the hind limbs, exposed as they are to filth and cold, suffer most frequently. Cleanse carefully with tepid water; wash with a diluted solution of Goulard's extract, or any other mild astringent; or dress occasionally with oxide of zinc ointment. Give, besides, a half-dose of physic, and a few mashes, carrots, Swedes, or such laxative food, and where persistent, use diuretics (q.v.). When dry and irritable, poultice and apply glycerine before proceeding with astringents. In cold weather, and especially when the horse is heated, interdict washing the legs, except with tepid water, and enjoin careful drying.

CRACK'LIN, a kind of chinaware, the glazing of which is purposely cracked in the kiln, as an ornament.

CRACOVIENNE (*krakowiak*), the national dance of the Polish peasantry around Cracow. It has a rather melancholy than lively melody in $\frac{2}{4}$ time, and is accompanied by singing. The pair who lead off the dance often begin with only the music of their own voices, and are soon followed by others, and the charm of the dance consists much in the diverting movements by which they seem to chase and avoid each other. The Poles have a multitude of little ditties of two lines each, adapted to this music and dance, which generally contain some allusion to natural phenomena, accompanied with some slight pleasantry.

CRA'COW (Pol. *Krakov*), formerly the capital of a small Polish republic, and anciently the capital of the kingdom of Poland, is now an Austrian city, situated on the left bank of the Vistula, where it becomes a navigable river, in a beautiful plain surrounded by an amphitheater of gentle hills. Lat. 50° 4′ n., long. 19° 52′ east. Pop. '69, 49,834, of whom 14,000 are Jews. It contains 46 churches, 15 monasteries, 10 nunneries, and 7 Jewish synagogues. The ancient city of C. is a labyrinth of narrow, dark, and deserted streets, but contains many fine specimens of Gothic architecture in its churches and other edifices; and some handsome buildings are also to be seen in the more modern suburbs. The old walls have been converted into a promenade. In the midst of the houses rises the castle, a huge building of an imposing appearance. The cathedral contains the tombs of many of the Polish kings, and of some of the greatest men of the Polish nation. The university was founded in 1364, by Casimir the great, whose design was carried into effect by Jagello and Hedwig in 1401. It was long the center of light for Poland, but decayed under the influences of the Jesuits, till it ceased to exist. It was reorganized and reopened in 1817, and underwent important changes in 1833. It possesses a museum of natural history, a botanic garden, a library of more than 140,000 volumes, and many MSS. of great value in connection with Polish history. Its manufactures are trifling, and its trade, at one time extensive, became, for a period, very limited, but has of late years greatly revived, owing to the extension of its railway communications, which connect it with Vienna, Berlin, Warsaw, and Lemberg. Three miles w. of the city is a vast tumulus to the memory of Kosciusko. It is composed of earth taken from all the patriotic battle-fields of Poland.

C. was founded by Krak, prince of Poland, from whom it derives its name, about the year 700, became the capital of Poland in 1320, and continued to be so till 1609, when that honor was transferred to Warsaw by Sigismund III. It was taken by the Bohemians in 1039, by the Mongols in 1241, by the Swedes in 1655 and 1702, and by the Russians in 1768. On the third partition of Poland, in 1795, it was assigned to Austria. From 1809 to 1815, it formed part of the duchy of Warsaw. The congress of Vienna established it as a republic, with a small territory containing about 140,000 inhabitants, under the protectorate of Russia, Prussia, and Austria. The territory bordered with that of each of these great powers. Internal dissensions between the nobles and the common people afforded a pretense for interference, and the sympathy shown by the inhabitants of C. for the cause of Polish independence in 1830 and following years was made the ground of proceedings, which terminated in 1846 in the annexation of C. to the Austrian dominions, a measure alleged to be necessary for the security of the neighboring states, but against which Britain and France protested. C. now forms

part of the Austrian crown-land of Galicia. An extensive line of fortifications has been constructed around it by the Austrians, with numerous detached forts, and one immense fortress on a height commanding the city, whose outworks extend over a space of about five miles. These works are intended as a barrier against the the advance of Russia.

CRAFT is a general designation for lighters, hoys, barges, etc., employed in loading or unloading large ships. In the royal navy, the name *small C.* is sometimes given to vessels commanded by lieutenants, such as cutters, schooners, gun-boats, etc. Also a term applied by seamen to any vessel whatever.

CRAFTS, SAMUEL CHANDLER, 1768–1853; b. Conn.; graduated at Harvard. When young he removed to Vermont, where he filled civil offices of various degrees up to governor of the state. In 1842, he became U. S. senator to fill a vacancy.

CRAG, a local term given specially to those masses of shelly sand which have been used from very ancient times in agriculture to fertilize soils deficient in calcareous matter. Geologists have used it to characterize several groups of strata. See NORWICH or MAMMALIFEROUS CRAG, and RED CRAG.

CRAIG, a co. in s.w. Virginia, on the West Virginia border, e. of the Alleghanies; 250 sq.m.; pop. '80, 3,794—236 colored. The surface is rough, but the valleys are fertile. Agriculture is the main business. Co. seat, New Castle.

CRAIG, JOHN, an eminent preacher of the reformation, was b. in Scotland about 1512. Having spent some time as a tutor in England, he returned to Scotland and entered the Dominican order, of which he had not long been a member when he fell under the suspicion of heresy, and was cast into prison. On his release, he traveled on the continent; and after some time was, through cardinal Pole's influence, intrusted with the education of the novices in connection with the Dominican order at Bologna. While here, Calvin's *Institutes* fell in his way, and converted him to Protestant doctrines. Having openly avowed the change in his opinions, he was brought before the inquisition, and sentenced to be burnt—a fate from which he was saved by the mob, on the death of pope Paul IV., breaking open the prisons in Rome, and setting the prisoners at liberty. C. escaped to Vienna, and obtained some favor at the court of Maximilian II.; but the news of his being there reached Rome, and the pope demanded his surrender as one condemned for heresy. The emperor, however, instead of complying with the request of his holiness, gave C. a safe-conduct out of Germany. He now returned to Scotland, and was appointed the colleague of John Knox in the parish church of Edinburgh. Thinking the marriage of queen Mary and Bothwell contrary to the word of God, he, while holding this position, boldly refused to proclaim the banns. In 1572, C. was sent "to illuminate the dark places" in Forfarshire and Aberdeenshire, and remained in the north until 1579, when he was appointed minister to king James VI. in Edinburgh. He now took a leading part in the affairs of the church, was the compiler of part of the *Second Book of Discipline*, and the writer of the national covenant signed in 1580 by the king and his household. He was a man of great conscientiousness, and was not slow to oppose the proceedings of the court when he deemed them opposed to Scripture, and to speak wholesome but unpleasant truths to his majesty himself. He died Dec., 1600.

CRAIG, THOMAS, author of the well-known *Treatise on the Feudal Law*, was b. probably about 1538. What part of Scotland he was born in is not known. Educated first at St. Andrews, he afterwards prosecuted his studies at Paris, and passed as an advocate at the Scottish bar in Feb., 1563, and in that or the following year was appointed justice-depute to Archibald earl of Argyle, hereditary justice-general of Scotland. In literary pursuits, C. had distinguished himself above all his contemporaries, and while at the head of the criminal judicature of Scotland he did not neglect the *belles-lettres*, as is evidenced by an epithalamium on the queen's marriage with Darnley, and by a poem on the birth of James I. Besides his work on *Feudal Law*, C. wrote on the *Succession to the Throne of England*, in which he took a warm interest; a treatise on the union of Scotland and England, and one on *Homage*, vindicating Scotland from the charge of feudal dependence on England, which had been asserted by Hollinshed in his *Chronicles*, together with many poetical pieces. In the latter part of his life, C. acted as advocate for the church of Scotland. He seems to have been high in favor with James VI., who wished to confer the honor of knighthood upon him; and when C. steadily refused, ordered that all persons should address him as if he really had accepted the honor. He died Feb., 1608.

CRAIGHEAD, a co. in n.e. Arkansas, bounded on the e. by the St. Francis river and lake; 950 sq.m.; pop. '80, 7,037—260 colored. Chief productions, corn, cotton, and tobacco. Co. seat, Jonesboro.

CRAIGLEITH' STONE, a silicious sandstone belonging to the carboniferous series, quarried at Craigleith, near Edinburgh, and largely used for building in that city, for which it is admirably adapted by its purity, durability, and the ease with which it can be wrought.

CRAIG AND TAIL, a term used to designate a peculiar hill conformation, in which a bold and precipitous front exists on one aspect of a hill, while the opposite is formed of a sloping declivity. Those who first observed this form of the surface, believed it was the effect of currents of water moving in the direction indicated by the C. and T.; but latterly there have been speculations calling in the aid of ice, though not excluding the presence of water also. Fine examples of this structure occur in and around Edinburgh, where the western current has left the bold "craig" facing the w., and the "tail" sloping towards the e.; as, for example, the castle rock, precipitous and unapproachable on every side except to the e., where it has protected the shale and sandstone beds from erosion. The direction and progress of the current can easily be traced; rushing against the hard basalt of the castle rock, it was turned aside, and continued its course eastward, hollowing out the Nor' Loch on the one side and the Cowgate valley on the other, until the influence of the rock being lost, and aided by the resistance of the Calton hill and Salisbury craigs, the currents again met in the valley at Holyrood, when the "tail" entirely disappears.

CRAIK, DINAH MARIA MULOCK, b. 1826; an English authoress, chiefly of works of fiction; the daughter of a clergyman. In 1849, she published *The Ogilvies*, her first novel, and rapidly afterwards, *Olive; The Head of the Family; Alice Learmont; Agatha's Husband; John Halifax, Gentleman* (a wonderful success); *A Life for a Life; Christian's Mistake; Two Marriages; A Noble Life; The Unkind Word; Fair France;* and a great number of short papers. In 1865, she married George Lillie Craik. Among her latest works are *Sermons out of Church*, and *Life and Remains of John Martin, Schoolmaster and Poet.*

CRAIK, GEORGE LILLIE, was by birth a Scotchman. Born in Fifeshire in 1799, he was educated for the church at St. Andrews university, but, preferring a literary career, he went to London in 1824. His first work of importance was the *Pursuit of Knowledge under Difficulties* (1831), forming part of the series of publications issued by the society for the diffusion of useful knowledge. He also contributed largely to the *Penny Cyclopædia.* In 1839, C. became editor of the *Pictorial History of England*, some of the most valuable chapters of which were written by himself, and have since been enlarged and republished separately as independent works. Such are his *Sketches of the History of Literature and Learning in England from the Norman Conquest to the Present Time* (6 vols., 1844), and his *History of British Commerce from the Earliest Times* (3 vols., 1844); and in the same year, *Bacon, his Writings and Philosophy.* In 1849, C. was appointed to the chair of history and English literature in Queen's college, Belfast, a situation which he occupied till he died in 1866. C. possessed an energetic mind, his thinking was clear, his style accurate, and he was conscientious in his statement of facts. Many of his slighter works contained suggestions in politics and social science which were both valuable and original, some of which were afterwards appropriated by, or ascribed to, others. In the first class we may mention the idea of mutual citizenship; and in the second, that of the representation of minorities, which unquestionably originated with him. Between 1849 and 1852, appeared his *Romance of the Peerage;* in 1855, his *Outlines of the History of the English Language*, which has passed through various editions; and in 1857, his essays on *The English of Shakespeare*, successive editions of which appeared in 1859, 1866, and 1867.

CRAIK, JAMES, 1731–1814; a native of Scotland, family physician to George Washington. He accompanied Washington in the Braddock expedition, and subsequently entered the medical service of the revolutionary army, being director of the hospital at Yorktown. After the war he settled near Mt. Vernon, and attended Washington until his (Washington's) death.

CRAIL, a royal and parliamentary borough and seaport in the "East Neuk" of Fifeshire, 2 m. s.w. of Fifeness, and 10 m. s.e. of St. Andrews. Pop. '71, 1126. Along with St. Andrews, East and West Anstruther, Cupar, Kilrenny, and Pittenweem, it returns one member to parliament. C. was a town of some note in the middle ages, being then called Caryll. In 847, there was a skirmish with the Danes here, and at Fifeness there are still the traces of what is believed to have been a Danish encampment. There are traces of an old castle, in which David I. occasionally resided; of a priory college, and other adjuncts of an ecclesiastical establishment. The established church, though it has undergone many alterations, is still substantially the ancient structure, and the square tower, with the broach (q.v.) which springs from it, are in their original condition, and very perfect in form. It was after a sermon preached in this church by Knox in 1559, that his hearers rushed in an infuriated mob to St. Andrews, and burnt the magnificent cathedral of the Episcopal metropolis. Archbishop Sharp was for some time minister of Crail. The harbor of C., though small, is safe; but there is a much more commodious site for a harbor in what is called Roome bay, in the immediate neighborhood, the desirableness of converting which into a harbor of refuge has often been urged on government. Could this improvement be effected, it is believed that C. would again become, as it was formerly, the great rendezvous for the herring-fishery. Even without this advantage, there has been a great revival in this branch of trade of late years, and fish is now cured to the value of £20,000 to £30,000 annually in the little fishing towns in this neighborhood. Being a retired spot, with many traces of the

well-being and good taste of earlier times still clinging to it, C. is eminently suited for a summer residence for sea-bathing purposes. Its bold coast offers pleasant rambles, and interesting excursions to the geologist and botanist. The town is lighted with gas, possesses good shops and markets, a reading-room, lecture institute, etc.

CRAKE, *Crex*, a genus of birds of the rail family (*rallidæ*), differing from the true rails in having the bill shorter than the head and comparatively thick. The wings are also armed with a small concealed spine. The name is derived from the harsh call-note of the male. The best known species is the common corn-crake or land-rail (*C. pratensis*), the frequent call-note of which is heard from every field of corn or rye-grass in valleys and low grounds in the early part of summer, and is associated by almost every inhabitant of Britain with all that is pleasant in that pleasant season. The corn-crake is a very pretty bird, of a reddish-brown color, marked with dark-brown in streaks along the middle of the feathers, lighter below; it has rather long legs and long toes; the tail is very short and pointed. It runs very swiftly, so as to be able sometimes to escape from a dog; but flies rather heavily, although it is a bird of passage, and is seen in Britain only in summer. It visits, in like manner, all the northern parts of Europe, and extends its migrations even to Iceland, spending the winter on the shores of the Mediterranean and in Africa. Its call-note may be so exactly imitated by passing the edge of the thumb-nail briskly along the points of the teeth of a small comb, that it can thus be decoyed within a short distance, although it is a very shy bird, and multitudes are familiar with its cry who never saw it in their lives. Its weight is ordinarily about six ounces. It is very highly esteemed for the table; and, according to Drayton, "seldom comes but upon rich men's spits." Two or three other species, very rare in Britain, but more common in the southern parts of Europe, are chiefly found in marshy grounds, and sometimes receive the name sora (*zapornia*). With them is ranked the Carolina rail or sora rail (*C. Carolinus*) of North America, which spends its winters in the states near the gulf of Mexico, but migrates northwards in summer, and is sometimes seen in vast numbers about marshes and the reedy margins of lakes and rivers, particularly in its migration southward in autumn. Its size is about equal to that of the corn-crake; and its color is very similar, but with mingled short streaks of white. It is much esteemed for the table.

CRAM'BÉ, a genus of plants of the natural order *cruciferæ;* having a pouch (*silicle*) of two unequal joints, of which the upper is globose and one-seeded, the lower abortive. The cotyledons (q.v.) are conduplicate. The species, which are not very numerous, are scattered over the world. One is a native of Britain; *C. maritima*, the well-known sea-kale (q.v.). Another, *C. Tartarica*, with much divided leaves and a great fleshy root, a native of Hungary and other central parts of Europe and of Asia, is sometimes called Tartar bread; and its root is eaten in the countries of which it is a native, either boiled, or more generally peeled and sliced with oil, vinegar, and salt.

CRAMER, JOHN BAPTIST, 1771–1858; a German composer of music, who passed the most of his life in London. His work is esteemed for simplicity of construction, grace, and beauty.

CRAMP, an irregular, involuntary, and painful contraction of a voluntary muscle, without insensibility or other disturbance of the general system. C. is often the effect of cold, and has proved fatal to swimmers by attacking them suddenly when in the water. Otherwise it is a disease of little importance, and readily removed by warmth and friction, with regulated movement of the muscles affected. Cramps are a distressing symptom in cholera (q.v.), in which disease it has been proposed to treat them by applying a tight bandage or tourniquet (q.v.) to the affected limbs. See SPASM.

CRAMP RINGS, were rings which were supposed to cure cramp and the "falling-sickness." They are said to have originated as far back as the middle of the 11th c., in a ring presented by a pilgrim to Edward the confessor, which, after that ruler's death, was preserved as a relic in Westminster abbey, and was applied for the cure of epilepsy and cramp. Hence appears to have arisen the belief that rings blessed by English sovereigns were efficacious in such cases; and the custom of blessing for distribution large numbers of C. R. on Good Friday continued to exist down to the time of queen Mary. The accomplished lord Berners, ambassador to Spain in Henry VIII.'s time, writes from Saragossa to cardinal Wolsey: "If your grace remember me with some crampe ryngs ye shall doo a thing muche looked for; and I trust to bestow thaym well with Goddes grace." The metal the rings were composed of was what formed the king's offering to the cross on Good Friday, usually either gold or silver. The superstitious belief in the curative property of C. R. made out of certain pieces of silver obtained in particular ways, still lingers in some of the less enlightened English counties.

CRANACH, LUCAS, a celebrated German painter, was b. in the bishopric of Bamberg in the year 1472. Little is known of his early life, except that he was instructed in art by his father—that he visited Palestine in 1493, with the elector Frederick the wise of Saxony, who made him his court painter in 1504, at which period we find him in high reputation, especially noted for his facility. In 1508, the elector made him a grant of armorial bearings, having for crest a winged serpent. He made a journey into the Netherlands in 1509, and there drew a picture of Charles V.—the future emperor—then

nine years old. C. seems to have acted as *factotum* at the court of the elector and his two successors, preparing for and directing the ceremonies and festivities, and knew besides how to follow other lucrative trades. In 1520, he bought an apothecary's business at Wittenberg, where he was also a bookseller and paper-maker, became councilor and chamberlain, and was twice chosen burgomaster of the town.

C. was closely bound up with the early reformers. He was the intimate friend of Luther, whose picture he several times painted. In 1550, he went to Augsburg to share the imprisonment of the elector, and returned with him to Saxony in 1552. C. died at Weimar, on the 16th Oct., 1553, in the 81st year of his age, and was buried in the court church there. He had two sons, one of whom, Lucas, was known by the name of "the younger Cranach," an excellent colorist and portrait-painter.

C. has left behind him an unusually large number of authentic pictures—indeed, he painted beyond his powers. He excelled in portraits, in painting animals, in fabulous and droll pieces, and was an excellent colorist; but failed in form, grace, and unity, and in the higher walks of art. His last and greatest work is an altar-piece in the church of Weimar—a mystical representation of the crucifixion. His peculiar humor is best seen in such pictures as his "Samson and Delilah" and his sylvan scene containing "Apollo and Diana."

CRANBERRY, *Oxycoccus,* a genus of small evergreen shrubs of the natural order *vaccineæ,* distinguished from the genus vaccinium (see WHORTLEBERRY) by the wheel-shaped corolla, with segments rolled back and the filaments leaning to the pistil. The species are few, natives of the colder regions of the northern hemisphere. The fruit is acid, and is in great request for making tarts. The only British species is the common C. (*O. palustris,* formerly *vaccinium oxycoccus*), a native also of the northern parts of Europe, Asia, and America. It grows in peaty bogs and marshy grounds, and is a small wiry shrub with creeping thread-like branches, and small oval leaves rolled back at the edges. The blossoms are small but beautiful, of a deep flesh color. Large quantities of the fruit are collected in some places in the n. of England, and in other countries, although the draining of bogs has now made it scarce where it was once plentiful. In Germany it is collected by means of a wooden comb, and preserved with sugar. In England, cranberries are often preserved in bottles closely corked or filled with pure water, in which they may be kept for a long time. They are an excellent addition to sea stores. Wine is made from them in Siberia, and a beverage made from them is sold in the streets of St. Petersburg.—The AMERICAN C. (*O. macrocarpa*) is a much larger and more upright plant, with leaves much larger and less rolled back at the margin. The berries are also larger and of a brighter red. It is a native of North America, frequent in Canada, and as far south as Virginia, growing in bogs, and particularly in elevated situations and where the soil is sandy. The berries are collected by means of a rake. Large quantities of them are exported to Europe. Cranberries are imported into Britain from Russia and other parts of the continent. Both kinds may be cultivated in gardens, in a peat-soil kept very moist, or round the margin of a pond; and the produce of a small space properly managed is so great, that it is surprising that a C. plot should not be much more frequent.—The berries of the red whortleberry (*vaccinium vitis idæa*) are sold under the name of cranberries in Aberdeen and other places, and are used in the same way.—A third species of C. (*O. erecta,* formerly *vaccinium erythrocarpon*), a native of lofty mountains in Virginia and Carolina, is a shrub 2 ft. high, and with a habit more like that of the whortleberries than of the other cranberries; it has a fruit remarkable for transparency and of exquisite flavor, and appears to deserve an attention and cultivation which it has not yet received.—The TASMANIAN C. is the fruit of *astroloma humifusum,* a little shrub with trailing stems, leaves somewhat resembling those of juniper, and beautiful scarlet blossoms, which is found in all parts of Van Dieman's Land. It belongs to the natural order *epacridaceæ.* The fruit is of a green or whitish color, sometimes slightly red, about the size of a black currant, and consists of a viscid apple-flavored pulp, inclosing a large seed.—*Styphelia adscendens,* a small prostrate Australian shrub of the same natural order, has a fruit very similar to this; and in New South Wales the name C. is likewise given to the red acid berries of *lissanthe sapida,* a low evergreen shrub, with small white flowers, also belonging to *epacridaceæ.*

CRAN'BROOK, a small t. in the s. of Kent, 30 m. s.w. of Canterbury. It lies near the Crane, on an outlying ridge of the Hastings sand formation, and is the chief village of the Weald. Pop. of parish (1871), 4,331. It has a large hop business. It was once the center of the clothing manufacture, introduced by the Flemings in the time of Edward III.; but this branch of industry has long since disappeared.

CRANCH, CHRISTOPHER PEARSE, b. Va., 1813; graduated from Columbian college, Washington; in 1831, studied in the divinity school of Harvard university, and was licensed to preach; but he turned his attention to landscape painting. He has spent many years in Europe, but when at home usually resides in or near New York. Besides producing a great number of landscape paintings, he has written much for current magazines, and has published tales for children, and a volume of poems. He is a son of judge William Cranch.

CRANCH, WILLIAM, LL.D., 1768–1855; b. Mass.; graduate of Harvard, and bred to the bar, being admitted in 1790. In 1801, he was appointed a justice of the United States circuit court for the district of Columbia, and in 1805, he was promoted to chief-justice, which position he held all his life. His reports of the decisions of his own court and of the United States supreme court are widely known.

CRANE, *Grus*, a genus of birds of the order *grallatores*, the type of the family *gruidæ*. This family differs from herons, bitterns, storks, etc., in having the hind-toe placed higher on the leg than the front ones. It consists also of birds less addicted to marshy places, and which feed not only on animal, but, to a considerable extent, on vegetable food. They are all large birds, long legged, long necked and of powerful wing, although their wings are rounded and not elongated; some of them performing great migrations, and flying at a prodigious height in the air. One of these is the COMMON C. (*G. cinerea*), which breeds in the northern parts of Europe and Asia, retiring in winter to tropical or sub-tropical regions. Flocks of cranes periodically pass over the southern and central countries of Europe, uttering their loud harsh cries in the air, and occasionally alighting to seek food in fields or marshes. The C., when standing, is about 4 ft. in height; the prevailing color is ash-gray, the face and throat nearly black, the wing primaries black. The tertial feathers of the wings are elongated, reaching beyond the ends of the primaries, and their webs are unconnected; they are varied and tipped with bluish-black, and are the well-known plumes once much used in ornamental head-dresses. The visits of the C. to Britain are now very rare, although in former times they were comparatively frequent. It feeds on roots, seeds, etc., as well as on worms, insects, reptiles, and even some of the smallest quadrupeds. It is much esteemed for the table.—There are several other species of crane. The WHOOPING C. (*G. Americana*) is considerably larger than the common C., which it otherwise much resembles except in color; its plumage, in its adult state, is pure white, the tips of the wings black. It spends the winter in the southern parts of North America. In summer it migrates far northwards, but rather in the interior than the eastern parts of the continent.—To the C. family belong also the demoiselles (q.v.), with which, rather than with the true cranes, the Balearic cranes or Balearicans are ranked.—Cranes use their bill as a dagger, and when wounded are dangerous to the eyes of a rash assailant.

CRANE, a machine employed for the purpose of lifting weights. Cranes are of various kinds, but the most common consist of an upright revolving shaft, with a projecting arm or jib, having a fixed pulley at the extremity, over which is passed one end of the rope or chain to receive the weight, the other end being attached to a cylinder with wheel and pinion, by means of which the weight is raised to the required height. By the revolving motion of the upright portion, the load can be deposited on any spot within the sweep of the jib.

CRANE-FLY, *Tipula*, a genus of dipterus (two-winged) insects of the family *tipulidæ*, to the whole of which the name C. is often extended, nearly allied to the gnat family (*culicidæ*), which they resemble in their beautifully feathered and tufted antennæ, but from which they differ in having a comparatively short proboscis. The true crane-flies are also of comparatively large size. They have lanceolate spreading wings, and very long legs. One species (*T. oleracea*) is the well-known *Daddy* (or *Harry*, or *Peter*) *Long-legs*. This and other species abound in arable lands, gardens, meadows, etc., in summer; and their larvæ—remarkably tough worms without legs, sometimes confounded with wire-worms by farmers—are extremely destructive to crops of various kinds, devouring the roots of corn and pasture-grasses, potatoes, turnips, and almost all the plants ordinarily cultivated either in field or garden. Rolling of fields is useful in killing them; and soot, salt, and other applications are employed in gardens.

CRANE'S-BILL. See GERANIUM.

CRANGANORE', a maritime t. of the district of Malabar, on the w. coast of Hindustan, stands at the mouth of a river of its own name, otherwise called the Aycotta. It is 19 m. to the n. of Cochin, and 75 to the s. of Calicut, being in lat. 10° 14′ n., and long. 76° 16′ east. At one time possessed by the Portuguese, it was taken from them by the Dutch about 1663; and after being purchased by the rajah of Travancore in 1789, and wrested from him by Tippoo Sultan in 1790, it was conceded by the latter to the British. But the more ancient history of the place is still more interesting, for here have existed from the 4th and 5th centuries respectively congregations of Jews and Christians.

CRANGON. See SHRIMP.

CRA'NIUM. See SKULL.

CRANK, in machinery, is an arm or a bend on an axle or shaft, which may be driven by a connecting-rod or by the hand, its use being to convert an alternating straight motion into a continuous revolution. A crank may have part of the shaft on both sides, so that one rod may drive two wheels. There are two positions in a C. in which the connecting-rod exercises no power whatever—viz., when the arm of the crank is parallel to the connecting-rod, and again when the crank is at the opposite point of its course. A push or pull of the rod in such circumstances can only press the shaft against its

bearings. The effect is greatest when the rod and the crank-arm are at right angles, and it decreases gradually on both sides of that position, until at the top and bottom it is reduced to nothing. In order to carry the C. over these *dead points*, as they are called, a fly-wheel is fixed on the shaft; this receives part of the force of the rod while at its best, acts as a reservoir, and by its stored-up momentum carries the shaft round when the rod is powerless.

CRANMER, THOMAS, one of the chief reformers of the English church, and the first Protestant archbishop of Canterbury, was b. at Aslacton, in the co. of Nottingham, on the 2d of July, 1489. He was descended from an old Norman family, which is said to have come into England with William the conqueror. In his 14th year, he went to Jesus college, Cambridge, of which he was elected a fellow in 1510. He devoted himself diligently to the study of the learned languages, and also to the study of Scripture. His mind seems to have been early interested in the writings of Erasmus, Luther, and Le Fevre, and especially in their interpretations of Scripture. In his 23d year, he married, and so lost his fellowship; but his wife dying about a year after marriage, he was restored to it by his college. In 1523, he took his degree of D.D., and was appointed lecturer on theology. In 1528, during the prevalence of the sweating sickness in Cambridge, he retired with two pupils to Waltham abbey: and Henry VIII., in company with Gardiner and Fox, afterwards bishops of Winchester and Hereford, happening to be in the neighborhood, the event proved a turning-point in the life of Cranmer. The king was then seriously concerned about his divorce from Catharine of Aragon, and in conversation on the subject with Gardiner and Fox, C. suggested that the question should be "tried according to the word of God." Fox having mentioned this suggestion to the king, Henry was greatly pleased, and "swore by the mother of God, that man hath the right sow by the ear." From this time, Henry never lost sight of Cranmer. He was asked to reduce his suggestion to writing, and to have it submitted to the European universities. After this he was appointed archdeacon of Taunton, and one of the royal chaplains. He was also sent to Rome on a special embassy about the divorce, but met with little success. Subsequently, he was dispatched to the emperor on the same errand, and while in Germany, he married a second time, a niece of the German divine, Osiander. This took place in 1532; and shortly afterwards, on the death of archbishop Warham, he was recalled to fill the vacant see. Under his auspices, Henry's divorce was speedily carried through, and C. married the king to Anne Boleyn, on the 28th May, 1533. In Anne's subsequent disgrace, and again, in the affair of Anne of Cleves, the archbishop took a part not very creditable to him. His position was no doubt a difficult one; but his character was naturally pliable and timid, rather than resolved and consistent. The same spirit characterizes the measures of religious reform which were promoted by him. On the one hand, he joined actively with Henry in restricting the power of the pope, and in suppressing the monasteries; but, on the other hand, he was no less active in persecuting men like Frith, Forrest, and others, who, on matters of religious faith, were disposed to advance further than himself or the king. He did what he could, however, to resist the reactionary movement which took place in 1539, and which is known by the institution of the "six articles." He was also instrumental in promoting the translation and circulation of the Scriptures. On Henry VIII.'s death, C. was appointed one of the regents of the kingdom, and along with Latimer and others, largely contributed to the advance of the Protestant cause during the reign of Edward. He assisted in the compilation of the service-book and the articles of religion. The latter are said to have been chiefly composed by him. He was also the author of four of the homilies.

On the accession of Mary, he was committed to the Tower, along with Latimer and Ridley. In Mar., 1554, they were removed to Oxford, and confined there in the common prison, called the Bocardo. Latimer and Ridley bore their cruel fate with magnanimous courage; but the spirit and principles of C. temporarily gave way under the severity of his sufferings. He was induced, in the hope of saving his life, to sign no fewer than six recantations; but his enemies were determined to be satisfied by nothing short of his death. On the 21st Mar., 1556, he suffered martyrdom, as his fellow-reformers had done, opposite Baliol college. His courage returned at the end, and he died protesting his repentance for his unworthy weakness in changing his faith, and showing an unexpected fortitude in the midst of the flames.

CRANNOGES, the name given in Ireland and in Scotland to the fortified islands in lakes which were in common use as dwelling-places and places of refuge among the Celtic inhabitants. The etymology of the word is uncertain, but it is believed to refer to the timber which was employed either in the fortification of the island, or in the construction of the houses which were placed upon it.

The earliest notice of such lake-dwellings which has been observed, is in the pages of Herodotus (book v. chap. 16). Writing of the Persian invasion of Thrace and Macedonia under Darius—about 500 years before the Christian era, and less than 100 years before his own death—he relates how the satrap Megabazus, warring against the Pæonians, led certain tribes of them captive into Asia, but failed to conquer those who inhabited lake Prasias. "He sought, indeed," says the historian, "to subdue the dwellers upon the lake, but could not effect his purpose. Their manner of living is the

following. Platforms, supported upon tall piles, stand in the middle of the lake, which are approached from the land by a single narrow bridge. At the first, the piles which bear up the platforms were fixed in their places by the whole body of the citizens; but since that time the custom which has prevailed about fixing them is this· They are brought from a hill called Orbelus, and every man drives in three for each wife that he marries. Now, the men have all many wives apiece, and this is the way in which they live. Each has his own hut, wherein he dwells, upon one of the platforms, and each has also a trapdoor giving access to the lake beneath; and their wont is to tie their baby-children by the foot with a string, to save them from rolling into the water. They feed their horses and their other beasts upon fish, which abound in the lake to such a degree, that a man has only to open his trap-door, and to let down a basket by a rope into the water, and then to wait a very short time, when he draws it up quite full of them. The fish are of two kinds, which they call the paprax and the tilon." The lake Prasias of the father of history seems to be the modern lake Takinos, on the Strymon or Kara su, a river which, rising on the borders of Bulgaria, flows southward through Roumelia, and, after expanding its waters into a lake, falls into the gulf of Contessa. The fish named by Herodotus have not been identified by naturalists; lake Takinos abounds in carp, tench, and eels.

The island-dwellings of lake Prasias met with comparatively little attention until archæologists, quite recently, found the remains of similar habitations in other parts of Europe. The first discovery was made in Ireland in 1839, by Mr. W. R. Wilde, one of the secretaries of the royal Irish academy. The small lake of Lagore, near Dunshaughlin, in the county of Meath, having been drained, a circular mound which had been an island in its waters, was observed to be thickly strewed with bones. As these were to be carted away for manure, it was found to be an artificial structure. Its circumference, measuring 520 ft., was formed by upright piles of oak about 7 ft. long, mortised into oak planks laid flat upon the marl and sand at the bottom of the lake. The upright piles were tied together by cross-beams, and the space which they inclosed was divided into compartments by oak beams, some of which had grooves, so as to allow panels to be driven down between them. The compartments thus formed were filled with bones and black peaty earth. Portions of a second tier of upright piles were observed rising from the first tier. The bones were ascertained to be those of several varieties of oxen, of swine, deer, goats, sheep, dogs, foxes, horses, and asses. Along with them were found a vast number of weapons, ornaments, and utensils, fashioned of stone, bone, wood, bronze, and iron; such as swords, knives, spears, javelins, daggers, whetstones, querns (or hand-mills), beads, pins, brooches, combs, horse-trappings, shears, chains, axes, pots, and bowls. On reference to the ancient annals, in which Ireland is so rich, it was seen that, in 848 A.D., a hostile Irish chief "plundered the island of loch Gabhor [as Lagore was then written], and afterwards burned it, so that it was level with the ground;" and that again, in 933 A.D., "the island of loch Gabhor was pulled down" by the piratical Norsemen.

Mr. Wilde's discovery at Lagore was followed by other discoveries of the same kind elsewhere in Ireland, so that in 1857 the existence of about 50 C. had been ascertained; and every succeeding year had seen an increase of the number. They show several varieties of construction. The island at Lagore is a type of the purely artificial crannoge. But most frequently the crannoge was partly natural. An islet just level with the water, was raised artificially a foot or two above it. An islet too small to be a convenient habitation, or too easy of landing to be a place of defense, had its area artificially enlarged, or its banks artificially strengthened, generally by piles or stockades, but occasionally by heaps of stones. The space thus inclosed is generally a circle of from 60 to 80 ft. in diameter; but in some cases the inclosed space is larger, and of an oval shape. The piles are generally of oak, mostly young trees, from 4 to 9 in. broad, still bearing marks of the hatchet; usually a single row has been considered enough, but there are instances of two, and even of three rows. It would seem that originally the piles had risen several feet above the water, and it has been supposed that they were interlaced with branches placed horizontally, so as to form a screen or breastwork. The area within the stockade is sometimes wholly or partially covered with a layer of round logs, from 4 to 6 ft. long, having stones, clay, or gravel above them. Fragments of oak-framing, with mortises and cheeks cut in them, have been found within the piles. In almost every instance, a few flat stones, apparently serving as a hearth, have been observed near the middle of the inclosure; in several C., two or three hearths have been met with. In some cases, a causeway leads from the island to the mainland; but in general the crannoge was to be reached only by boat, and scarcely any crannoge has been discovered without the remains of a primitive canoe, hollowed out of the trunk of an oak, being found beside it. In at least one crannoge, a pier or jetty projected from the island; it was a double row of piles and stretchers, running parallel to each other at a distance of about 8 ft., and supporting a platform of logs. On almost every crannoge one or two querns (q.v.) have been found, along with bones of oxen, deer, goats, and swine, horns of cattle, deer, sheep, and goats, boars' tusks, and sharpening stones: fragments of pottery, and articles of stone, bone, horn, wood, glass, copper, bronze, brass, and iron, are of somewhat rarer occurrence. Many of the C. had been submerged by the gradual rise of the lakes in which they stood, so that their existence only

became known as the great drainage-works of late years reduced the waters to their old level.

In a section of the crannoge in Ardakillin lough, near Stokestown, in the county of Roscommon, the upper surface of the crannoge was formed of a layer of loose stones, surrounded by a wall, partly supported by piles. The stones rested on the natural clay, peat, and boulders of the island, in digging through which strata of ashes, bones, and logs of timber were met with. The stockades were of oak; the oblique or slanting stockade is a girdle of sheet-piling which quite encircled the crannoge.

Of one of two C. in Drumaleague lough, in the county of Leitrim, the circle within the ring of stockades is 60 ft. in diameter; in some places there are two, and in others, three rows of stockades; and within this outer ring, there are groups of piles, some of them arranged apparently for some special purpose. The oblong space in the middle, marked A, is covered by a rude platform of round logs, chiefly of alder, from 4 to 6 ft. in length; it was probably the floor of the log-house, which was the chief or only dwelling-place on the islet. B shows where the hearth stood—a collection of stones, still retaining traces of fire; C marks a heap of stiff clay; D, the root of a large tree nearly buried in the peat, the surface of the wood being beveled off with a hatchet, so as to form a sort of table, under which was found a heap of bones, apparently of deer and swine.

The Irish annals, it has been seen, make mention of C. as early as the 9th c., and they figure in history down to the middle of the 17th century. The crannoge of lough Lynch, in Antrim, is shown as the birthplace of Colkitto, a chief who figured in Montrose's wars, and has found a place in one of Milton's sonnets. The crannoge of Roughan lake, near Dungannon, was the last retreat of sir Phelim O'Neil in 1641. Two years later, there is record of an attempt to flood the crannoge of Loughinsholin, in the county of Londonderry, by turning a stream into the lake, and damming up its outlet. This attempt failed; but in 1645 the garrison were compelled by hunger to give the crannoge to the flames, and make their escape. In 1567, an agent of the English government, who was asked what were the castles of the O'Neil, wrote in reply: "For castles, he trusteth no point thereunto for his safety, as appeareth by the razing of the strongest castles of all his countries; and that fortification that he only dependeth upon is in certain fresh-water lochs in his country, which from the sea there comes neither ship nor boat to approach them: it is thought that there, in the said fortified islands, lieth all his plate (which is much), and money, prisoners, and gages [i.e., hostages]; which islands have in wars heretofore been attempted, and now of late again by the lord-deputy there, sir Harry Sydney, which for want of means for safe conduct upon the water hath not prevailed."

While archæologists were still exploring the C. of Ireland, structures of a similar kind were discovered in the heart of the European continent. The winter of 1853–54 was one of the driest that had been seen in Switzerland, and the lakes sank to a lower level than was ever known before. The inhabitants of the village of Meilen, on the lake of Zurich, took advantage of this unusual subsidence to reclaim a piece of land from the lake. As the work went on, a learned antiquary, Dr. Ferdinand Keller, discovered the remains of rows of deeply driven piles, and, imbedded in the mud around them, found heaps of rpimitive weapons, tools, and utensils, made of stone and bone. Closer examination satisfied him that the piles had supported a platform; that on this platform huts had been raised; and that after being thus occupied, probably for centuries, the structure had been destroyed by fire. The discovery in the lake of Zurich of these *Keltische pfahlbauten* (Celtic pile-buildings), as Dr. Keller called them—*habitations lacustres* (lake-dwellings), as other Swiss archæologists have termed them—was followed almost immediately by the discovery of erections of the same kind in other lakes of Switzerland. No fewer than from 30 to 40 have been found in the upper and lower lakes of Constance; as many as 30 in the lake of Geneva; more than 20 in the lake of Neuchâtel; 10 in the lake of Bienne; besides others in the deep peat-bogs which surround the hill of Chamblon, in the Vallée de l'Orbe, and in the lakes of Morat, Inkwyl near Soleure, Moosseedorf near Bern, Pfaffikon near Zurich, Wauwyl near Lucerne, and Nussbaumen in the canton of Thurgau. The site chosen for these lake-dwellings was generally a sunny and sheltered bay, with a gently shelving bottom of mud or clay. The piles, from 4 to 10 in. in diameter, were rudely fashioned of whatever wood was at hand, oak, fir, ash, beech, birch, cherry, or apple. They were driven in a depth of not less than 6 or 7 ft. of water, at a distance of from 100 to 300 ft. from the shore. They were ranged generally from 1 to 2 ft. apart, in the form of a narrow parallelogram, having its longest side in a line with the edge of the lake. At Wangen, on the lower lake of Constance, the piles, from 30,000 to 40,000 in number, extend about 700 paces in length, and about 120 in breadth. At Morges, on the lake of Geneva, the piles stretch 1200 ft. in length by 120 ft. in width, so that they would have supported a platform with an area of about 18,000 ft., sufficiently capacious, according to the calculations of M. Frederic Troyon of Lausanne, to contain 316 huts, with a population of 1264 persons. The huts, it would seem, were for the most part circular in shape, measuring from 10 to 15 ft. in diameter; they were of wattles, plastered with clay, masses of which hardened by fire, still bearing the marks of the wattles which it had received when wet and soft, have been recovered from the beds of the lakes. In at least one instance, the remains of a bridge or gang-

way, leading from the platform to the shore, have been discovered. Many small boats, hollowed out of the trunks of trees, have been found; and one large vessel of the same kind, 50 ft. long, and 3½ ft. wide, has been observed at the bottom of the lake of Bienne.

The lake-dwellings of Switzerland have obviously much more resemblance to those of lake Prasias, described by Herodotus, than to the C. of Ireland. But the Swiss at the same time can show examples of the Irish type. At Nidau Steinberg, in the lake of Bienne, there is an artificial mound of stones, resting on horizontal planks, and encircled by a row of upright piles. It is now submerged, but when—as the Swiss believe—the lake stood at a lower level, it must have been an island. At Moringen, in the same lake, there is another pile-building, inclosing a mound of stones which has an area of about half an acre. A canoe which had been used in its construction lies with its load of stones at the bottom of the lake. Structures still more nearly resembling the Irish C. have been found in the lakes of Inkwyl, Nussbaumen, and Wauwyl.

History and tradition are alike silent as to the pile-buildings of the Swiss lakes. That they belong to a remote age, will readily be granted, even by those who may hesitate to accept "the stone, bronze, and iron periods" on which the Swiss antiquary rests their claims to "pre-historic" antiquity; or who may question the grounds on which the Swiss naturalist assigns them to the 15th c. before the Christian era. Of the remains found in them, many appear to be those of a rude people—such as spear-points, arrow-heads, axes, chisels, knives, and even small saws, of flint and stone; arrow-heads, daggers, hammers, bodkins, needles, pins, rings, bracelets, necklaces, of bone or horn. Articles of bronze, some of them richly ornamented, are at the same time of common occurrence; and swords and other objects of iron are met with in considerable numbers. Some of the Swiss archæologists seem at one time to have thought that the piles surrounded by stone and bone implements showed marks of greater age than the piles surrounded by bronze implements. It is now admitted, however, that both stone and bronze objects, and bronze and iron objects, are to be found in the same group of piles. It is to be remarked, too, that many of the objects of stone, bone, horn, bronze, and iron, are fashioned of the same shape, and for the same use, differing only in the substance of which they are made. Whoever the dwellers on the *pfahlbauten* were, their remains show that they grew wheat and barley; that they ate the flesh of the ox, the goat, the sheep, and the pig; that among the beasts of the chase which they hunted down was the now extinct species of the aurochs (see BISON); that they had horses, dogs, and cats; that they had apples, pears, wild-plums, and wood-raspberries; that they baked pottery; that their women plied the distaff and knitted; that they made hempen mats; and that they wove linen cloths.

Hitherto, archæologists knew of lake-dwellings as existing only in Ireland and Switzerland; but in 1857, Mr. Joseph Robertson read a paper to the society of Scottish antiquaries, proving that they were to be found in almost every province of Scotland. He not only ascertained the existence of about 50 examples, but was able to show from records that they were known in Scotland by the same name of C. which they received in Ireland. The resemblance between the Scottish and Irish types seems, indeed, to be complete. Every variety of structure observed in the one country is to be found in the other, from the purely artificial island, framed of oak-beams, mortised together, to the natural island, artificially fortified or enlarged by girdles of oak-piles or ramparts of loose stones; from the island with a pier projecting from its side, to the island communicating with the mainland by a causeway. If there be any difference between the C. of the two countries, it is that the number of C. constructed altogether of stones is greater in Scotland than in Ireland—a difference which is readily explained by the difference in the physical circumstances of the two countries. Among the more remarkable of the Scotch C. is that in the loch of Forfar, which bears the name of St. Margaret, the queen of king Malcolm Canmore, who died in 1097. It is chiefly natural, but has been strengthened by piles and stones, and the care taken to preserve this artificial barrier is attested by a record of the year 1508. Another crannoge—that of Lochindorb, in Moray—was visited by king Edward I. of England in 1303, about which time it was fortified by a castle of such mark that in 1336, king Edward III. of England led an army to its relief through the mountain-passes of Athol and Badenoch. A third crannoge—that of Loch Cannor, or Kinord, in Aberdeenshire—appears in history in 1335, had king James IV. for its guest in 1506, and continued to be a place of strength until 1648, when the estates of parliament ordered its fortifications to be destroyed. It has an area of about an acre, and owes little or nothing to art beyond a rampart of stones and a row of piles. In the same lake there is another and much smaller crannoge, which is wholly artificial. Forty years after the dismantling of the crannoge of loch Cannor, the crannoge of Lochan-Eilean, in Strathspey, is spoken of as "useful to the country in time of troubles or wars, for the people put in their goods and children here, and it is easily defended." Canoes hollowed out of the trunks of oaks have been found as well beside the Scotch, as beside the Irish crannoges. Bronze vessels, apparently for kitchen purposes, are also of frequent occurrence, but do not seem to be of a very ancient type. Deer's horns, boars' tusks, and the bones of domestic animals, have been discovered; and in one instance a stone hammer, and in another what seem to be pieces for some such game as draughts or backgammon, have been dug up.

Since 1857, the existence of lake-dwellings has been discovered in Savoy, in upper Italy, in Hanover, in Prussia, and in Denmark. Less certain traces have been found in England, in draining a mere at Wretham Hall, near Thetford, in Norfolk. The savages of Borneo and New Guinea still live on the water, in huts perched upon platforms supported by piles; and wooden houses raised upon piles are common in Burmah and Siam, on the creeks and rivers of the strait of Malacca, and it is believed elsewhere in Asia. A bass-relief from the palace of Sennacherib, engraved in Mr. Layard's *Monuments of Nineveh*, represents what seem to be artificial islands, formed, it would seem, by wattling together the tall reeds of the marshes on the lower part of the Euphrates.

The C. of Ireland are described in the *Proceedings of the Royal Irish Academy*, vols. i., v., vii.; Mr. Wilde's *Catalogue of the Museum of the Royal Irish Academy; The Archæological Journal*, vols. iii., vi.; Mr. Digby Wyatt's *Observations on the Early Habitations of the Irish* (Lond. 1858); *The Ulster Journal of Archæology*, No. 26; *Proceedings of the Kilkenny Archæological Society*, No. 27. The chief works on the lake-dwellings of Switzerland are Dr. Ferdinand Keller's three papers on *Pfahalbauten*, and Dr. L. Rutimeyer's *Untersuchung der Thierreste aus den Pfahlbauten*, all published in the *Mittheilungen der Antiquarischen Gesellschaft in Zurich*, band ix., xii., xiii.; M. Frederic Troyon's *Habitations Lacustres de la Suisse* (Lausanne, 1857); his *Ossemens et Antiquités du Lac de Moossedorf*, in the *Bibliothèque Universelle de Genève*, for May, 1857; his *Details of Discoveries at the Lake Habitations of Switzerland*, in the *Ulster Journal of Archæology*, No. 29; MM. Alb. Jahn and J. Uhlmann's *Die Pfahlbau-Alterthümer von Moossedorf* (Bern, 1857); and M. A. Morlot's *Etudes Géologico-Archéologiques en Danemark et en Suisse*, in the *Bulletin de la Société Vaudoise des Sciences Naturelles*, t. vi. (Lausanne, 1860). The Scottish C. are described in the *Proceedings of the Society of Antiquaries of Scotland*, vol. iii. On the subject of pile-buildings generally, reference may be made to Mr. W. M. Wylie's paper *On Lake-dwellings of the Early Periods*, in the *Archæologia*, vol. xxxviii. (Lond. 1860), and to papers in the *Gentleman's Magazine* for December, 1860, and February, 1861.

CRANSTON, a t. in Rhode Island, on the Providence, Hartford, and Fishkill railroad; 4 m. s. of Providence; pop. '80. 5,942. The people are largely engaged in the manufacture of cotton and machinery.

CRANWORTH, Robert Monsey Rolfe, Baron, 1790–1868; an English jurist, educated at Cambridge and called to the bar in 1816. He was in parliament from 1832 to 1839, and at the same time solicitor-general. In 1850 he was made vice-chancellor, and in 1865–66 again held the same office.

CRAPE, a thin fabric made of raw silk, which has been tightly twisted, without removing the viscous matter with which it is covered when spun by the worm. It is simply woven as a thin gauze, then dressed with a thick solution of gum, which in drying causes the threads partially to untwist, and thus gives a wrinkled and rough appearance to the fabric. It is usually dyed black, and used for mourning apparel.

CRAS-CROM, an ancient and rude instrument of agriculture in the Highlands, consisting, as its name in Gaelic imports, of a crooked stick shod with iron, with a small projecting bar to rest the foot upon.

CRASHAW, Richard, an English poet, whose devotional strains exhibit imagination of a high order, with great copiousness and beauty of language, was the son of a clergyman in the English church, and was b. in London, at what date is unknown. He was educated at the Charter-house, and at Cambridge, where he obtained a fellowship in 1637. He entered the church about 1641, it is said, and became an earnest and eloquent preacher; but in 1644 he was ejected from his fellowship by the parliament, for refusing to take the covenant. He went to France, adopted the Roman Catholic faith, and suffered great pecuniary distress, until, through Cowley's influence, he was introduced to queen Henrietta Maria, who recommended him to certain dignitaries of the church in Italy. He soon obtained a secretaryship to one of the cardinals at Rome, and was made a canon of the church of Loretto. In this office he died about 1650. In 1634, C. published a volume of Latin poems, in which appeared the famous line, sometimes attributed to Dryden and others, relative to the miracle of the water being turned into wine.

"*Nympha pudica Deum vidit et erubuit.*"
"The modest water saw its God and blushed."

In 1646 appeared his *Steps to the Temple, the Delights of the Muses*, and *Carmen Deo Nostro*, in which there is much fervid poetry. C. greatly resembles George Herbert in his cast of thought, and is not inferior to him in richness of fancy, though we find in him more exaggeration and conceit.

CRASSULA'CEÆ, a natural order of exogenous plants, some of them shrubby, and some herbaceous, all remarkable for their succulency. About 300 species are known, among which are house-leeks, stone-crops, rose-root, etc. They are widely distributed over the world, but South Africa particularly abounds in them. Most of them grow in dry places, and derive their nourishment from the air rather than from the soil, their

roots seeming chiefly intended to fix them to the spot. Many of them are much cultivated in greenhouses, more on account of their grotesque forms than for the beauty of their flowers. Some are refrigerant, and one or two are even used as food; others, on account of the tannin which they contain, are astringent; and some are acrid.

CRAS'SUS, the surname of several old Roman families, among which that of the Licinii was most remarkable.—CRASSUS (LUCIUS LICINIUS), b. in 140 B.C., was the best orator of his age, and was as distinguished for his wit as for his rectitude in the capacity of proconsul. In 95 B.C. he was elected consul, along with Quintus Mucius Scævola (who had been his colleague in all his previous offices). During their consulship was enacted the *Lex Licinia Mucia de Civibus regundis*, banishing from Rome all who had not the full rights of citizens. This imbittered the feelings of foreigners toward Rome, and partly led to the social war. As censor, C., 92 B.C., closed all the schools of the rhetors—asserting that they had exercised a bad influence on the minds of young men. In consequence of the excitement attending a debate in the senate, C. died in 91 B. C.

CRASSUS, MARCUS LICINIUS, the triumvir, was born sometime before 115 B.C. His father and brother suffered death from the party of Marius, 81 B.C., and he himself—though young—was subjected to a jealous and dangerous surveillance. In 85 B.C., to escape from this, he went to Spain. He afterwards joined Sulla (83 B.C.), and distinguished himself in the battle against the Samnites at the gates of Rome. As prætor he crushed the Servile revolt, by the conquest of Spartacus at the battle of Lucania (71 B.C.), and in the following year was made consul with Pompey, a colleague whom he hated. On the other hand, Cæsar valued the friendship of C., the most wealthy of Roman citizens. During his consulate, C. gave a feast to the people, which was spread on 10,000 tables, and distributed a provision of corn for three months. Plutarch estimates the wealth of C. at more than 7,000 talents, and Pliny states that the lands of C. were worth 8,000 talents. About 60 B.C., Cæsar, Pompey, and C. entered into a private arrangement for their common benefit. This paction is known as the first *triumvirate*. See CÆSAR. In 37 B.C., as consul with Pompey, he gained the province of Syria, and professed to make preparations of war against the Parthians; but the acquisition of more wealth seems to have been his main object, and this he effected by plundering the towns and temples in Syria. At length, however, he set out, but was misguided by a treacherous Arab, and utterly defeated at the river Bilecha by the Parthians. C. now retreated to the town of Carrhæ, intending to pass into Armenia; but was beguiled into a conference with the Parthian gen., Surenas, and was slain at the appointed place of meeting. His quæstor, Cassius, with 500 cavalry, escaped into Syria; but the remaining Romans were scattered and made prisoners, or put to death.

CRATÆ'GUS, a genus of plants of the natural order *rosaceæ*, sub-order *pomeæ*, very nearly allied to *mespilus* (medlar) and *pyrus* (pear, apple, etc.), but distinguished by the acute calycine segments, and by the round or oval fruit, closed at the apex, and concealing the upper end of the bony cells. The species are pretty numerous, natives of the temperate parts of the northern hemisphere, and in general have flowers in beautiful terminal corymbs. They are all large shrubs or small trees, more or less spiny, whence the name THORN has been very generally applied to them. The only native of Britain is the common hawthorn (q.v.), (*C. oxyacantha*). Most of the species resemble it considerably in habit, size, form of leaf, etc. A number of them are now frequent in plantations and shrubberies in Britain, of which perhaps the most common is the COCK'S-SPUR THORN (*C. crus-galli*, a native of North America from Canada to Carolina. Its leaves are not lobed; its fruit rather larger than that of the hawthorn. The AZAROLE (*C. azarolus*), a native of the s. of Europe, and the ARONIA (*C. aronia*), a native of the Levant, are occasionally cultivated for their fruit, which is about the size of the Siberian crab, and is used either for dessert or for pies. *C. orientalis* (or *odoratissima*) and *C. tanacetifolia* have also fruit of considerable size. The latter is much eaten in Armenia. *C. Mexicana* has a large fruit, like a small apple, but not eatable. It is, however, very ornamental. The wood of most of the species much resembles that of the hawthorn. It is common to graft the rarer species on the hawthorn.—*C. pyracantha* differs much in appearance from most of the genus; being a pretty evergreen shrub, with lanceolate crenate leaves, and rich clusters of red berries, which remain on it all winter; a native of rocky places in the s. of Europe and the Caucasus. It is often employed in Britain as an ornamental covering for walls, and is known as the PYRACANTHA.

CRA'TER (Gr. a cup), the central cup-shaped cavity in the summit of a volcano (q.v.), through which the lava, stones, scoria, etc., are for the most part ejected. These materials sometimes escape from immense rents in the sides of the volcano, as was the case in the famous eruption of Hecla in 1783, when two enormous streams of lava poured from its side to the distance, the one of 40, the other of 50 miles. Nor are the volcanic materials, when they escape through a crater, always ejected through the old vent on the summit; some other portion of the mountain may yield more readily to the pressure from within, and thus one or more lateral craters be formed, which, however, increase in height from the accumulation of ejected materials, and eventually, if the eruption continues, overtop the former cone.

CRAT'ERUS, a gen. of Alexander the great, killed in battle with Eumenes 321 B.C., two years after Alexander's death. On the division of the empire, Craterus and Antipater received jointly the government of Macedonia, Greece, Illyria, and Epirus, Antipater taking command of the military forces, and Craterus attending to civil affairs.

CRA'TES, an Athenian actor and writer of comedies in the 5th c. B.C. His plays were remarkable for not depending on political points for success, as had been common; and he was the first one to introduce a drunken character on the stage, where the inebriate individual has since remained as a frequent feature.

CRA'TES, a cynic philosopher of Thebes, of the 4th c. B.C., a pupil of Diogenes, rivaling even his master in cynicism. His large fortune he placed in charge of a banker, with orders that if his sons should turn out to be fools the property should go to them; but if they should become philosophers it should be given to the poor. Crates wrote a number of philosophical letters.

CRA'TES, a Greek grammarian and stoic philosopher of the 2d c. B.C., leader of a literary school, and chief of the library of Pergamus. Little is known of his life except the event of his visiting Rome 157 B.C., as ambassador of Attalus II., king of Pergamus, which event led him to study Latin grammar. He wrote on agriculture, geography, and a treatise on the Attic dialect.

CRATI'NUS, a Greek comic poet, b. about 519 B.C. Next to his younger contemporaries, Eupolis and Aristophanes, he is the most valuable representative of the old Attic comedy. He changed its outward form considerably, and also sought to add to its vigor and power. Before his time, the number of actors had been indefinite; he limited them to three. He was the first to make comedy pungent and personal. The habits, manners, institutions—in fact, the whole public and private life of the Athenians—were considered by C. a legitimate mark for censorious satire. The greatest men did not escape. Pericles, for instance, was frequently and fiercely abused. C.'s style was very metaphorical and ingenious. Of his twenty-one comedies, nine of which obtained the first prize in the public competitions, we possess only some fragments. These have been collected by Meineke in his *Fragmenta Comicorum Græcorum* (Berlin, 1840).—There was also a younger CRATINUS, a contemporary of Plato, who belonged to the school of the middle comedy.

CRATIP'PUS, a peripatetic philosopher, was a native of Mitylene, and a contemporary of Cicero. He appears to have been held in the highest estimation by the great men of his age. Cicero calls him the prince of all the philosophers whom he had known. Pompey visited him after his defeat at Pharsalia, and received at his hands the consolations of philosophy; and Brutus went to Athens, to which city C. had lately betaken himself, to listen to his prelections, even while making preparations to meet Octavius and Antony. Nothing that C. wrote has survived.

CRAVEN, a co. in s.e. North Carolina, bordering on Pamlico sound, and intersected by the Neuse river and the Atlantic and North Carolina railroad; 1000 sq.m.; pop. '80, 19,729—13,067 colored. It is low and swampy, and covered to a great extent with pine forests, the lumber from which constitutes the chief article of trade. Other productions are corn, cotton, rice, and sweet potatoes. Co. seat, Newbern.

CRAVEN, THOMAS T., b. N. H., 1808; entered the navy as midshipman in 1822, rising through the various stages to rear-admiral in 1866. He was engaged in the capture of New Orleans, and with the batteries at Vicksburg.

CRAWFORD, a co. in w. Arkansas, on the border of the Indian territory, bounded s. by Arkansas river; 585 sq.m.; pop. '80, 14,740—1409 colored. Surface mountainous; coal and some minerals are found. The productions are corn, cotton, and molasses. Co. seat, Van Buren.

CRAWFORD, a co. in s.w. Georgia, on Flint river, intersected by the Southwestern railroad; 289 sq.m.; pop. '80, 8,656—4,716 colored. The surface is uneven, with moderately fertile soil, producing cotton, sweet potatoes, etc. Co. seat, Knoxville.

CRAWFORD, a co. in s.e. Illinois, separated from Indiana by the Wabash river, and drained in part by the Embarras; 420 sq.m.; pop. '80, 16,190. The surface is chiefly prairie, and fertile, producing wheat, corn, tobacco, sorghum, etc. Co. seat, Robinson.

CRAWFORD, a co. in s. Indiana, bordering on the Ohio river, and watered by the Little Blue; 280 sq.m.; pop. '80, 12,356. The valleys are fertile, but the uplands are mostly sterile. Coal, iron, and limestone are found; lumber, pork, and beef, are exported. Co. seat, Leavenworth.

CRAWFORD, a co. in w. Iowa, intersected by Boyer river, and the Chicago and Northwestern railroad; 700 sq.m.; pop. '80, 12,413. The soil is productive; grain and wool are the main productions. Co. seat, Denison.

CRAWFORD, a co. in s.e. Kansas, on the Missouri border, watered by the head streams of Neosho river, and intersected by the Missouri River, Fort Scott and Gulf

railroad; 504 sq.m.; pop. '80, 16,854. The productions are chiefly agricultural. Co. seat, Girard.

CRAWFORD, a co. in Michigan on the upper waters of Au Sable river; 620 sq.m.; very little settled. Pop. '80, 1159—9 colored.

CRAWFORD, a co. in s.e. Missouri, intersected by the Maramec river and the Atlantic and Pacific railroad; 600 sq.m.; pop. '80, 10,774—123 colored. It has a diversified surface, and is rich in minerals, of which the chief are copper, iron, and lead. Co. seat, Steeleville.

CRAWFORD, a co. in n. central Ohio, watered by the head streams of Sandusky river, and intersected by the Pittsburg, Fort Wayne, and Chicago railroad; 412 sq.m.; pop. '80, 30,583. The surface is level, and the soil fertile. Chief productions, wheat, corn, oats, butter, and wool. Co. seat, Bucyrus.

CRAWFORD, a co. in n.w. Pennsylvania on the Ohio border, watered by Venango river, and intersected by the Beaver and Erie canal, the Oil Creek and Alleghany River railroad, the Atlantic and Great Western, and the Erie and Pittsburg railroads; 975 sq.m.; pop. '80, 68,604. It is a good agricultural region, although lumber is still an important article of export. The chief productions are wheat, rye, corn, oats, buckwheat, potatoes, hay, cheese, butter, wool, maple sugar, and hops. Co. seat, Meadville.

CRAWFORD, a co. in s.w. Wisconsin, on the Mississippi river, bounded s. by the Wisconsin, and intersected by Kickapoo river and the Milwaukee and St. Paul railroad; 612 sq.m.; pop. '80, 15,644. Surface partly prairie and partly hilly; productions agricultural. Co. seat, Prairie du Chien.

CRAWFORD, Nathaniel Macon, D.D, 1811–71; b. Ga.; graduated at Franklin university. He studied law, and was admitted to the bar, but never practiced. In 1837, he was chosen professor of mathematics in Oglethorpe university; licensed to preach in 1843, and ordained the next year, becoming pastor of a Baptist church. In 1847, he was chosen professor of biblical literature in Mercer university, and in 1854 he became president of that institution. In later years he filled chairs in the Western Baptist theological seminary and the university of Mississippi, returning to the presidency of Mercer university in 1858. A year later he was chosen president of the Bible revision association. He published *Christian Paradoxes*.

CRAWFORD, Samuel Wylie, b. Pa., 1829; appointed assistant surgeon in the federal army, 1851. In the war of the rebellion he served as an officer on the union side, rising to brevet-maj.gen. He was one of the garrison of fort Sumter. In 1873, he retired from active service on account of wounds.

CRAWFORD, Thomas, 1814–57; an American sculptor; b. New York. At the age of 22 he went to Rome and became a pupil of Thorwaldsen. The first work which brought him prominently into notice was his "Orpheus entering Hades in Search of Eurydice," finished 1839. This was followed by other poetical compositions, such as "Babes in the Wood," "Flora," "Hebe and Ganymede," "Sappho," "The Dancers," and "The Hunter." Among his works are a bust of Josiah Quincy; a statue of Washington at Richmond, Va.; of Beethoven, in the Boston music hall; of Dr. Channing; of Henry Clay; and the colossal figure of "Liberty" (in armor) for the capitol at Washington. For this building he also executed the pediment and bronze doors. During his later years he suffered from tumor of the brain, which deprived him of sight, so that he was compelled to leave many works unfinished.

CRAWFORD, William Harris, 1772–1834; b. Va., but removed with his family to Georgia when a child. He was self-educated, and in 1798 was admitted to the bar. In 1802, he was chosen a member of the state senate, in which body he presented a resolution, which was adopted by both houses of the legislature, requesting Mr. Jefferson to permit his name to be used as a candidate for a third term of the presidency. In 1807, he was chosen to fill a vacancy in the United States senate. During the canvass, he fought two duels, killed one man, and was wounded in the next venture. He was re-elected to the senate in 1811, and in 1812 was chosen president *pro tempore* when George Clinton, the vice-president, was disabled by sickness. He at first opposed, but finally supported the war with England. In 1813, he was appointed minister to France, where he became one of La Fayette's friends. In 1815, he was made secretary of war, and the next year secretary of the treasury. Crawford thought himself entitled to succeed Monroe as president, and was nominated by a congressional caucus, which was then the regular way; but this caucus system had grown odious, and there were four other candidates against him, Calhoun, Adams, Jackson, and Clay. Calhoun was pacified with the vice-presidency, to which he was chosen by 182 out of 261 votes. There was no choice for president, the vote being: Jackson, 99; J. Q. Adams, 84; Crawford, 41; Clay, 37. About the time of the election, Crawford was stricken with paralysis, a disease from which he never recovered. His condition rendered it impossible to consider him a candidate when the election came to be decided in the house of representa-

tives, although even in such a condition he got four of the 24 votes. From this time Crawford was out of the political field. In his own state, he was made a judge, filling the office until his death.

CRAWFORDSVILLE, a city in Montgomery co., Indiana, 44 m. n.w. of Indianapolis, reached by several railroads; pop. '70, 3,701. The city is in a fine agricultural region, and is the seat of Wabash college, a large educational institution under the care of the Presbyterians.

CRAYER, CASPAR DE, a Flemish historical and portrait painter, was b. at Antwerp in 1582. He lived first at Brussels, and afterwards at Ghent, where he died in 1669. For the churches at Ghent he executed 21 altar-pieces. His works are to be found all through Flanders and Brabant. The galleries of Vienna and Munich also possess a few. Their main characteristics are vigor and boldness of design, and care and truthfulness in execution. Rubens was a great admirer of Crayer.

CRAY'FISH, or CRAW'FISH (*Astacus fluviatilis*), a crustacean of the order *decapota* (see CRAB), sub-order *macroura* (i.e., long-tailed—characterized by the elongation of the abdomen, and its termination in a sort of fin composed of five pieces and expanded laterally); nearly allied to the lobster, from which, however, it differs in having the middle plate of the tail-fin transversely divided by a suture. It inhabits the rivers and streams of many parts of Europe, and is common in some of those of England, making burrows in clayey banks, and coming forth at night in search of food, which consists chiefly of mollusks, small fishes, larvæ of aquatic insects, and animal substances of almost any kind. It is esteemed for the table, and is readily attracted by a bait of decaying flesh or animal garbage, which being inclosed in a net or in a bundle of twigs, numbers of C. may be captured at a time.—Other species of C. abound in some of the warmer parts of the world.

CRAYON (Fr. a pencil). Though used in French, and occasionally in English, to designate pencils generally, including those made of lead, the word C. is more frequently applied, in England, to those small cylinders of charcoal, or of pipe-clay or chalk colored with various pigments, which are used for drawing. Cohesiveness is given to the paste of which the cylinders are formed by means of gum, wax, soap, etc. C. drawings are often remarkable for the delicacy and softness with which objects are represented, but they are deficient in power. See PENCIL, CHALK.

CREAM, the butyraceous and richer portion of milk, which, being lighter, rises and settles on the surface. See MILK. The term C. is applied in a variety of ways, indicative of something superior in quality; as *cold cream* (q.v.), and *cream of the valley*, a fine kind of English gin. The French, in referring to persons in the height of fashion, speak of *la crême de la crême*—the cream of cream.

CREAM OF TARTAR exists naturally in grape juice, but being insoluble in alcohol, it is gradually deposited, in the form of argol, as the sugar of the juice becomes converted into alcohol by fermentation. In the preparation of C. of T., the argol is dissolved in hot water, to which charcoal or fine clay is added, to take up the coloring matter; by boiling and filtering, a clear colorless solution is obtained, from which, on cooling, the C. of T. separates as crystals. Some of the crystals form at the bottom; others form a crust on the top, like cream, whence the name, cream of tartar. In chemical composition, it is the bitartrate of potash ($KO,HO,\overline{T}$), and contains potash, water, and tartaric acid. It is readily soluble in hot water, though it takes 60 parts of cold water to dissolve one part of the cream of tartar. It has an acid taste, and gritty feel. When taken repeatedly in small doses of a scruple to a dram, it acts as a refrigerant and diuretic; in doses of one to two drams, it is useful as an aperient; and in larger doses of from two to three drams, it acts as a purging agent, accompanied by flatulence and griping. *Imperial liquid* is prepared by dissolving about a dram of C. of T. in a pint of boiling water, and adding a little lemon-peel and sugar to flavor it; when an agreeable refrigerant drink is obtained, which is highly serviceable in allaying thirst in feverish cases. C. of T. whey is obtained by adding two drams of the salt to a pint of milk.

CRE'ASOTE, or KRE'ASOTE, is an artificial organic substance, generally obtained from the products of the destructive distillation of wood. It is procured incidentally as one of the constituents of wood-tar, from which it is separated by a tedious process. The principal supplies are obtained from Stockholm, Archangel, and America. In the pure condition, C. is a colorless oily liquid, with high refractive powers; but the commercial specimens are generally colored yellow or light brown. It boils at 398° F.; does not readily inflame; but when set fire to, burns with a smoky flame. It has a hot burning taste, and is very poisonous to plants and animals. It has a great power of coagulating albumen, and hence may be employed with advantage in toothache; a drop placed on the exposed nerve coagulates the albuminous tissue, and destroys its vitality and sense of pain. The most important property possessed by C., however, is its antiseptic or preserving power over vegetable and animal organs and structures. Thus, ordinary meat treated with only one-hundredth of its weight of C., and exposed to the air, does not putrefy, but becomes hard and dry, and assumes the taste and odor of smoked meat. Again, timber treated with C. does not suffer from dry-rot or other disease; and thus C.,

in a crude form, is employed in the preservation of wood (q.v.). The crude pyroligneous acid of commerce, which is often employed in the curing of hams, etc., owes part, at least, of its preserving powers to the presence of a trace of C., which leaves its characteristic odor so well known as obtained from the burning of wood for the smoking of hams, etc. When used medicinally, C. acts externally by destroying the cuticle; internally, in small doses of a drop or two, it is serviceable in arresting obstinate vomiting; whilst in large doses it produces nausea and severe vomiting, and, in many cases, fatal results.

CRE'ATINE, or KRE'ATINE (Gr. *kreas*, flesh), was discovered in 1835 by Chevreul, but little was known about it till Liebig published his *Researches on the Chemistry of Food*, in 1847. From his investigations, and those of subsequent chemists—amongst whom we may especially name the late Dr. William Gregory, of Edinburgh—the following facts regarding its properties and occurrence have been established.

C. forms transparent, glistening crystals, belonging to the clinorhombic system, and usually occurring in groups, the character of which is exactly similar to that of sugar of lead. Although usually grouped among the basic bodies, it is neutral in its reaction. It dissolves in 74.4 parts of cold water, and in boiling water in such quantity that the solution on cooling solidifies into a mass of delicate needles. These crystals contain two atoms of water and one atom of anhydrous C., whose composition, according to Liebig, is represented by the formula $C_8H_9N_3O_4$. There is no direct chemical test for the detection of C., and the methods which have been employed to obtain it are too complicated for insertion in this article.

C. is constantly present in the juice both of voluntary and involuntary muscles. The quantity differs in the flesh of different kinds of animals, and even in different muscles of the same animal, but is always very small; and lean animals yield relatively more than fat ones. According to Liebig, the flesh of hens yields the largest amount, viz., 0.32 per cent, the average quantity from horse or ox flesh being 0.07 per cent. Gregory determined its amount in the flesh of various mammals, birds, and fishes; and Schlossberger found 0.067 per cent in human flesh. It has likewise been detected in very small quantity in the blood of oxen, also in the liquor amnii of women who have died in advanced pregnancy, and it can usually be obtained from the urine, although it is doubtful whether it is a normal constituent of that fluid. It does not exist in the liver or kidneys, but has been found among the soluble constituents of the brain.

Although the view has been advocated that, from its occurrence in flesh, and from its large amount of nitrogen (32.06 per cent), it must be an important nutritive agent, there are most decisive reasons for opposing this opinion, and for ranking it among the products of excretion; for, in the first place, if it could be employed with further advantage in the organism, it (or its near ally, creatinine) would not be allowed to escape by the kidneys; secondly, the readiness with which it may be converted into unquestionable products of excretion (as, for instance, into urea, by the action of heat and baryta water), proves its approximation more nearly to these substances, than to such bodies as albumen or fibrin; and thirdly, there is no instance of a tissue-forming food occurring in a crystalline form.

CRE'ATININE is closely allied in its chemical and physiological relations to creatine. Liebig found that, when heated with a strong mineral acid, a solution of creatine no longer yields crystals of that substance, but a new body of totally different chemical properties, to which he gave the name of creatinine. Its chemical composition is represented by the formula $C_8H_9N_3O_2$, and on comparing this formula with that for creatine, we see that the conversion of the latter into the former, by the action of mineral acids, depends upon the separation of the elements of water. Liebig shortly afterwards detected C. as a constituent of the muscular juice. In the latter fluid, it occurs in less quantity than creatine; while in the urine, where it is also found, it is the more abundant of the two. Traces of it have also been found in the blood and in the liquor amnii.

C. crystallizes in oblique rhombic prisms, is a most decided alkaloid, reacting strongly on vegetable colors, and having almost as caustic a taste as ammonia; it further differs from creatine in its far greater solubility in water, alcohol, and ether. There can be little doubt that C. takes its origin from creatine.

CREATIONISM, a term recently applied to that theory of the origin of man which is thought to be opposed to evolutionism (see ANTHROPOLOGY, EVOLUTION). C., however, has for centuries been used to indicate a theory as to the origin of the soul. The question in theology has been, whether the soul of each man is immediately created by God, or is generated by the parents as really as is the body. The former theory is called *creationism;* the latter, *traducianism.* The following arguments are advanced by traducianists: 1. The Scripture declaration that "Adam begat a son in his own likeness, after his image." Concerning this son, they affirm that, as he consisted of body and soul, these must both have been in the image and likeness of his father, and both must have been derived, mediately, from him. 2. The advocates of this theory affirm that it is necessary in order to account for the transmission of a sinful nature from Adam to his posterity. Community of essence, they say, produces community in sin. If mankind were not in Adam as to essence, they did not sin in him, and do not derive

their corrupt nature from him; but if they were in him as to essence. then his sin was their sin. 3. Some urge also that the incarnation of Christ involves the truth of the traducian theory. He was born of a woman. Unless both his human soul and his body were derived, mediately, from his virgin mother, he cannot truly be of the same race with mankind. 4. Another argument is drawn from the transmission from one generation to another of ethnical, national, family, and parental peculiarities of mind, temper, and disposition, as well as of physical constitution. On the other hand, in behalf of C —the theory that every human soul is created by the immediate agency of God—the following arguments are maintained: 1. That it is in accordance with the general teaching of Scripture. In the account of the creation of man, there is, they say, a marked distinction between the origin of the body and of the soul. The one is, mediately, from the earth; the other, immediately, from God; and this distinction is continued through the Bible. The body and soul are not only represented as different substances, but also as having a different origin: "The dust shall return to the earth as it was, and the spirit shall return unto God who gave it." God is called "the God of the spirits of all flesh," and "the Father of spirits." 2. C., it is said, is more consistent with the nature of the soul which, being immaterial and spiritual, must be indivisible. The traducian theory, on the contrary, implies that the essence of the soul is capable of division. Some of its advocates, indeed, deny that there is any division; but the great majority of them admit that the derivation of one soul from another requires a division of essence. 3. The advocates of C. think they have an argument for it in the very teaching of Scripture concerning the person of Christ to which their opponents resort. He assumed our nature by taking to himself a true body and a rational soul. He was born of a woman; in his human nature, he was the son of David, and was descended from the fathers. As such, the advocates of both theories admit, he was without sin. But if, as traducianism affirms, mankind derive a sinful nature from Adam because of their community of essence with him, then C. replies that the human nature of Christ, sharing the same community of essence, must also have shared in the sinfulness. While these two theories are generally arrayed in opposition, as if one or the other must be true, it is conceivable that there is a truth in both. Many theologians do not affirm either; but, regarding the mode of the soul's coming into being as a part of the mystery which envelops the whole subject of the existence, maintenance, and transmission of life, are content to say with Augustine, "When I wrote my former book I did not know how the soul derives its being, and I do not know now." See TRADUCIANISM, *ante*.

CRÉBILLON, CLAUDE PROSPER JOLYOT DE, the younger, son of the dramatist, was b. in Paris, Feb. 14, 1707. In an age of licentious manners, he acquired popularity by a series of romances, remarkable chiefly for their violation of decency, the principal of which are *Le Sopha; Le Hasard du Coin du Feu; Les Egarements du Cœur et de l'Esprit.* His own moral character is described as correct, but his writings undoubtedly served to extend the influence of the immoralities which he described. C. died in Paris, April 12, 1777.

CRÉBILLON, PROSPER JOLYOT DE, a French dramatist, was b. at Dijon, in 1674. He was sent to Paris to study law, but ended by devoting himself wholly to poetical pursuits. His first piece, *La Mort des Enfants de Brutus*, was rejected by the actors; but the succeeding dramas of *Idoménée* (1705) and *Atrée* (1707) were successful. *Rhadamiste* (1711), a tragedy of the dismal kind, was reckoned C.'s masterpiece, and established his reputation. After producing some other pieces, C. fell into pecuniary difficulties and neglect, and for more than twenty years produced nothing. His talents were then called again into requisition by Mme. de Pompadour, who wished to humble Voltaire. He received from the king a pension of 1000 francs, and completed the tragedy of *Catilina*, for which the king himself supplied all the properties. When 81 years old, C. wrote his tragedy, *The Triumvirate*, and, still later, commenced but did not finish, another called *Cleomède.* He died June 17, 1762, and Louis XV. erected a monument to his memory. C., in general, displays little skill in the conduct of his plots; the monologues of the speakers are too numerous and too long; but in the opinion of his countrymen he is surpassed, in the "grandeur of his sentiments," only by the author of the *Cid* and *Horace.* The best edition of C.'s works is that published by Didot (2 vols., Paris, 1818).

CRÉCY, or CRESSY, a small t. of France, in the department of Somme, situated on the Maye, about 12 m. n. of Abbeville. C. is chiefly celebrated on account of the brilliant victory obtained here, 26th Aug., 1346, by Edward III., with 40,000 English soldiers, over a French army amounting, according to Froissart, to 100,000 men, under the command of the count of Alençon. In this great battle, one of the most honorable to English prowess recorded in history, the flower of French chivalry was slain, as well as the kings of Bohemia and Majorca, who were fighting on the side of France. Altogether, about 30,000 of the French army bit the dust. In this battle the black prince, who greatly distinguished himself, gained his spurs; and the crest of the slain Bohemian king, composed of three ostrich feathers, with the motto, *Ich Dien*, "I serve," was adopted by him in memory of the victory, and still continues to be borne by the prince of Wales. C. is an ancient place, but its population in 1872 amounted to only 1359.

CREDENCE, a small table beside the altar or communion-table, on which the bread and wine are laid before being consecrated. In the Greek church this is called the *trapeza prothesis*. Archbishop Laud was a great stickler for the C., and pleaded the authority of bishop Andrews and other bishops for its use. There are credences in various Anglican churches; among others, in the Collegiate and St. John's churches, Manchester; and in the parish church at Ludlow, where they have been in use from time immemorial. Sometimes the place of the C. was supplied by a mere shelf across the fenestella (q.v.). The term was also used for a buffet, or sideboard, at which the meats were tasted in early times before being presented to the guests, as a precaution against poison. Hence the origin of the word, which is derived from the Ital. *credenzare*, to taste meats and drinks before they were offered to another, an ancient court practice, which was performed by the cup-bearers and carvers, who for this reason were called in Ger. *credenzer*. The getting up of credences or side-altars is one of those restitutions of old usages which has maked the Puseyite movement in England. See PUSEY.

CREDENTIALS, papers or letters given to an ambassador or other public minister, to a foreign court, in order to enable him to claim the confidence of the court to which he is sent.

CREDIT, in political economy, is one of many terms used in that science, of which it is said that we yet possess no scientific definition. This is the less to be regretted, as the practical meaning of the word is thoroughly known, so as to enable every one to understand what is meant, when economists speak of the extent to which C. is safe or proper, unsafe or improper, in this or that class of cases. We have come, perhaps, thus far towards an exact scientific notion of the nature of C., that while it serves the purpose of capital, it can only do so while there is capital ready to come and take its place if necessary. Credits which are not in this position—though they may happen to serve their turn, as a ship may sail some distance unwrecked without a steersman—do not accomplish the purpose of capital. The real power of C., properly resting on capital, is that it enables that capital to be devoted to more than one purpose. A bank is a great emporium of C.; that is to say, it consists of a certain amount of capital, which can be operated on by a whole community—not all at one time, but by individuals as occasion requires. Thus, a comparatively small stock of money can be made to do duty for carrying on numerous transactions. But it is indispensable for insuring a safe system of C. that money must be instantly available when wanted; and this principle applies not alone to banking, but to every species of transaction in which postponed payment is concerned. Unfortunately, this principle is too often set aside, and C. is grossly abused. The facts brought out in great bankruptcies generally teach the moral, that men who have every element of human well-being in their power, ruin themselves both in purse and fortune, by trying to make £30,000 do the work of £100,000. In many bankruptcies, too, there is a curious illustration of the power of C. as a representative of capital, in enabling men to keep up for a considerable time the appearance of being wealthy traders, though they never had a farthing they could honestly call their own. In the few instances where such projects succeed, there is the kind of applause which is given to the successful winner in any game of chance; and it is naturally felt that if the successful are applauded, it is hard to condemn the unsuccessful; so that there is perhaps a dangerous leniency in public opinion towards speculators on credit.

In a modified shape, C. is a thing which, to all apppearance, can never be abolished There is scarcely a human being in a civilized country, who does not transact a piece of credit business almost every day of his life. The workman hired by the week, and paid at its end, gives his employer C. from Monday morning to Saturday evening. The same workman, when getting a coat made for himself, even although he engaged to pay ready money on delivery, gets C. from the tailor during the making. It is necessary to consider these things, because a course of C. is often so hurtful to people of the working-classes, by fastening ruinous obligations on them, that some people have proposed to abolish all C. where they are concerned, by rendering them free from all legal procedure for the recovery of debts. The answer to this is, that although it is practicable to relieve any class from obligations, and their legal enforcement, it is impossible in a trading country to suppress debt and credit. It is practicable, however, so far to modify the legal remedies against debtors of the poorer class, that there may not be, as there too often is, a temptation to traders to transact a special business, in holding out temptations to working-people to purchase on credit.

CREDIT, CASH. See CASH ACCOUNT.

CREDIT, LETTER OF. This is the term applied to accounts, usually in the form of a *letter*, addressed by one party to another, whereby the former requests the latter to pay a sum therein specified to the bearer of the letter, or some other third party named in it, and authorizes him to reimburse himself for such payment, either by debiting it in account between the parties, or by drawing on the first party for the amount. This arrangement may take place between merchants or others, but in general it occurs between *bankers* residing in different places—as, for example, between a banker in Edinburgh and his correspondent in London; and it is designed for enabling a party who has money lodged at either place, to obtain the use of it at the other, without the risk

or trouble of actually carrying it between the two cities. For this convenience, a small charge is made by the bank issuing the letter, termed the exchange or commission. Sometimes the letter is addressed to *all* or *several* of the correspondents of the bank issuing it, in which case it is termed a *circular credit;* and any of them may pay the sum mentioned, or sums to account as desired, taking the holder's receipt, or his draft on the granter, in exchange; and the sums so paid are *indorsed* on the letter, to show how far the credit has been used. If the party holding a circular letter can be properly introduced, even at a place where the granter has no correspondent, little difficulty will be experienced in obtaining money upon it; and the practice is to reimburse any one who has given the money, if within the amount of the credit. It will thus appear that the system is productive of much convenience to all parties who have occasion to travel, or transact business away from home, especially in foreign countries, where it might be difficult otherwise to make their way, except by carrying with them an unsafe amount of coin or other valuables.

Some bankers, having an extensive correspondence abroad, issue what are called *circular notes*, usually of the value of £10 or £20 each, which any of the granter's correspondents, or indeed any one else, may cash to the holder, on his "indorsation:" but a third party must take his risk of its being questioned. For this kind of credit, the receiver at once reimburses the granter; whereas for the ordinary letter of C., he is only reimbursed when the drafts under it are advised to him, the holder continuing during the interval to raise interest on his money deposited for covering it. The circular-note plan was devised about 1770 by Mr. Herries, the founder of the eminent London banking-house of Herries, Farquhar & Co., who had originally been a continental merchant, and well knew the difficulties which travelers or traders then had to encounter in foreign countries. Although the system is now highly appreciated, it cost him no little trouble and perseverance to establish it in public estimation. See CIRCULAR NOTES.

CREDIT FONCIER, a peculiar method of borrowing money in France on the security of landed property. It was established by an edict of 28th Feb., 1852. Its peculiarity is, that the repayment of the loan is by an annuity terminable at a certain date; the date and the amount of annuity being so calculated, that when the last payment is made, the loan and the interest on it will be extinguished. Another method of describing it is as a loan repayable by installments. The transaction is precisely regulated by the edict, which prohibits an advance on more than a half of the value of the property pledged or hypothecated. Three several companies were established by the French government, with the privilege of making such advances.

CREDIT MOBILIER. See MOBILIER.

CREDIT MOBILIER OF AMERICA, the name of an organization chartered in Pennsylvania in 1859, as a corporation for a general loan and contract business. It was organized in 1863 with a capital of $2,500,000; and in 1867, the charter having been purchased by a company formed for the construction of the Union Pacific railroad, the stock was increased to $3,750,000, and soon afterwards rose to great value, paying enormous dividends. It was charged in 1872, that a number of senators and members of congress were privately owners of the stock, and a congressional investigation was ordered, whose result showed that in some cases the charges were well founded. There was no law to prevent such ownership; but as the building of the railroad was greatly assisted by grants of land made by congress, it was considered at the least highly improper for any member to have a pecuniary interest in such a concern. The senate committee reported the innocence of several who had been accused, and recommended the expulsion of one senator; but no action was taken. In the house, resolutions censuring two members were adopted. It became evident, on the whole, that the charges, though not without some basis, had been applied so promiscuously as to involve some men absolutely free from offense.

CRED'ITON, or KIRK'TON, a borough in the middle of Devonshire, on the Creedy, a tributary of the Exe, 8 m. n.w. of Exeter. It lies in a narrow vale between two steep hills. Pop. '71, 4,222. At C. was born the Anglo-Saxon Winfred, or St. Boniface, who was the first to preach Christianity in central Germany, founded the monastery of Fulda, and was archbishop of Mainz. C. was the seat of a bishopric from 909 to 1050, when the sees of Devon and Cornwall were united and placed at Exeter. The chief manufactures were formerly woolens and serges, but now shoes. C. was much injured by fires in 1743 and 1769.

CREDITOR. See DEBTOR, BANKRUPT.

CRE'DO (Lat. *I believe*), a part of the service of the mass, beginning with the words *Credo in unum Deum.*

CREEDMOOR, a station on the Long Island railroad, 11 m. e. of New York, where there is the largest and most complete rifle range in the United States. It is much frequented by riflemen for target practice.

CREEDS AND CONFESSIONS are the names given to the authorized expressions of the doctrine of the church at large, or of the several main sections into which it is divided. Such statements of doctrine sprang up naturally in the course of the church's progress. As the simple truths taught by Christ in an unreflective and mostly concrete form

became the subjects of thought, of argument, of controversy, they could not fail to receive a more defined intellectual expression, and to be drawn out into more precise dogmatic statements. Men's minds could not be exercised on subjects of such vast importance to them without this result; and the great creeds, as they rise in succession before us, and mark the climax of successive controversial epochs in the church, are nothing else than the varying expressions of the *Christian consciousness and reason*, in their efforts more completely to realize, comprehend, and express the originally simple elements of truth as they are recorded in Scripture. The study of the creeds would be nothing else than the study of theology in its highest historical development—in its reflex settlements after the great agitations of Christian thought had run their course.

Corresponding to this view, we find that the creeds of Christendom grow in complexity, in elaborate analysis and inventiveness of doctrinal statement, as they succeed one another. The first are comparatively brief and simple in sense and form; the last are prolix and largely didactic. From the apostles' creed to the decrees of the council of Trent, or the chapters of the Westminster confession of faith, there is a wide change, during which the Christian consciousness has grown from a childlike faith to a critical opinionativeness.

What has been called the *apostles' creed* is the earliest form of Christian creed that exists, unless we give the precedence to the baptismal formula at the close of St. Matthew's gospel, out of which many suppose the apostles' creed to have grown. There were in the early church differing forms of this primitive creed: that which is received and repeated in the service of the church of England, has come to us through the Latin church; and in several of its clauses, as, for instance, "He descended into hell," and again, "The communion of saints," is supposed to have been interpolated according to later notions. A great variety of opinions has been held as to the origin of this creed. The Roman Catholic church has not only attributed it to the apostles directly, but professes to settle, on the authority of a spurious sermon of St. Augustine, the clauses respectively contributed by the several apostles: "Petrus dixit, Credo in Deum Patrem omnipotentem. Joannes dixit, Creatorem cœli et terræ. Jacobus dixit," etc. The earliest account of its origin we have from Rufinus, a historical compiler and traditionalist of the 4th century. His statement is, that the apostles, when about to separate to preach the truth to different nations, agreed upon a "form of sound words" which should express the sum of their common teaching. "When met together, and filled with the Holy Ghost, they composed this compend of what they were to preach, each one contributing his share to the one composition, which they resolved to give as a rule of faith to those who should believe." No great weight belongs to this testimony; Rufinus is no historical authority. It is not improbable in itself, however, that even in the age of the apostles some formula of belief existed. The exact form of the present creed cannot pretend to be so ancient by 400 years, but a form not much different from it was in use long before. Irenæus, the scholar of Polycarp, the disciple of St. John, when he repeats a creed not much unlike to the present, assures us that "the church dispersed throughout the whole world had received this faith from the apostles and their disciples;" and Tertullian also affirms that a similar creed had been "prevalent as a rule of faith in the church from the beginning of the gospel." The same thing is proved by the creeds administered to the candidates for baptism in the 2d and 3d centuries. They correspond, with slight variations, to the apostles' creed. The true view of this formula of church belief, therefore, seems to be that which regards it as the Roman or Latin form of the creed which prevailed in all the early churches. It is not strictly apostolic—certainly not in the order of words derived through the Latin church, in which it is now received and repeated; but it is substantially apostolic—fairly representative of the different elements of Christian faith as handed down from the apostles, and well claiming, therefore, the credence of the universal Christian church. Since the reformation in England, it has been the usage to exhibit the apostles' creed and Ten Commandments in legible characters on boards near the communion-table in churches, in order that they might be seen and repeated by the common people, who were unprovided with books.

The *Nicene*, or rather the Niceno-Constantinopolitan creed, is the next great expression of doctrinal truth that we meet in the history of the church. It sprang out of the conflict, which had begun even in the 2d c., as to the dignity and character of Christ. From the beginning, Ebionitism had looked upon Christ as merely a Jewish teacher of distinction; Theodotus and Artemon openly taught such a doctrine in Rome towards the close of the 2d century. Others, on the contrary, taught a doctrine which identified Christ with God absolutely in such a manner as to destroy all distinction of persons in the Godhead. Monarchianism, as it was called, which held rigorously and formally to the unity of God, was the ruling principle of both doctrines, opposite as were the expressions it assumed in the two cases.

The controversy thus begun in the 2d, perpetuated itself in the 3d c., under various modifications. Paul of Samosata carried out the Unitarian tendency, which reduced Christ to the level of a mere man; Sabellius carried out the same tendency in the opposite direction, which made Christ not merely divine, of the same substance with the Father, but looked upon him as merely a manifestation of the Father, without any dis-

tinct personality. Sabellianism recognized a Trinity of manifestations, but not a Trinity of essences. God was one and all-comprehending, and the Son and the Spirit were merely names or expressions for the different modes in which he reveals himself. Sabellius flourished about the middle of the 3d c., and Paul of Samosata somewhat later. Arius, who was a presbyter of Alexandria, grew up in the midst of these heretical influences, and soon distinguished himself in the Alexandrian church for his advocacy of the doctrine that Christ, although in a true sense divine, or the Son of God, was yet not the very God. He denied that he was "of the substance of God," or "without beginning;" he was only the highest of created beings, in a sense divine, but not the same in substance with the Father, nor equal with him in power and glory. Athanasius came forward as the opponent of Arius, and the contest between them raged keen and wide throughout the church.

The council of Nicæa was summoned in 325 by Constantine, with the view of settling this controversy; and the Nicene creed was the result There were these three parties in the council—the Athanasians, or extreme orthodox party; the Eusebians, or middle party; and the Arians, or heretical party. The heretics were few in number, and possessed but little influence; but the Eusebians were a strong party, and for sometime resisted certain expressions of the orthodox or Athanasians, which seemed to them extreme and unwarranted; but at length the Homöousians, as they were called, carried the day; and Christ was declared not merely to be of like substance (*homoiousios*), but of the same substance (*homöousios*) with the Father. At the later council of Constantinople, the additional tenet of the divinity of the Spirit was added, and the creed completed in the form in which it is familiar to the English reader in the communion service in the book of common prayer. In it we confess, as has been said, to the holy and undivided Trinity, and distinctly own the divinity of each person. We commemorate the creation of the world by "God the Father Almighty;" we acknowledge Jesus Christ to be our "Lord;" to have been "begotten" from all eternity; to be "of one substance with the Father," and with him Creator of all things; that "for our salvation he came down from heaven, was made man, and suffered and died for us." We commemorate his resurrection, ascension, and sitting at God's right hand; express our expectation of his second coming; and declare that "his kingdom shall have no end." We confess to God that he hath appointed baptism for the remission of sins, and given us leave "to look for the resurrection of the dead" and "the life of the world to come."

The next remarkable monument of doctrinal truth in the church is what is called the *Athanasian creed*, a product of the 5th c., much later than Athanasius himself, but representing, with great formal minuteness and fidelity, his doctrine of the Trinity, as apprehended and elaborated by the western church. See ATHANASIAN CREED.

The Apostles', the Nicene, the Athanasian, may be said to form the great Catholic creeds of the church. After the time of the last-mentioned formula, there is no general symbol of faith that claims our attention till the period of the reformation. Theology continued to be cultivated during the middle ages, and especially during the 12th and 13th centuries, with great assiduity. Scholasticism is nothing else than the vast expression of the intellectual labor bestowed upon this subject during these ages, when scarcely any other subject can be said to have engaged men's minds. It was characteristic of scholasticism, however, to work mainly upon the doctrinal *data* already adopted and authorized by the church, developing these data in endless sentences and commentaries. There was, withal, no real freedom of inquiry, nor life of speculation. But as soon as the eye of free criticism and argument was turned upon Scripture with the reformation, new creeds and confessions began to spring up. On the one hand, Protestantism had to defend its position and its scriptural authority by appeal to its system of belief; and, on the other hand, the church of Rome, after many delays, gave forth at the council of Trent (1545 to 1563), a more extended and detailed statement of its doctrine than was to be found in any previous creed. The *decrees of Trent* are the fixed authoritative symbol or confession of faith of the church of Rome.

Of the Protestant churches, the most notable confessions of faith are the Lutheran; the continental Calvinistic or Reformed; the Anglican, or 39 articles of the church of England; and the Puritan, or Westminister confession of faith.

The Lutherans call their standard books of faith and discipline, *Libri Symbolici Ecclesiæ Evangelicæ;* and reckon among them, besides the three catholic creeds, the Augsburg confession (q.v.), the Apology for that confession by Melancthon, the articles of Smalkald drawn up by Luther, Luther's catechisms; and in some churches, the formula of Concord, or the book of Torgau.

Of the continental Calvinistic or Reformed churches, there are numerous confessions, the principal of which are—1. The Helvetic confessions—that of Basel, 1530, and Bullinger, *Expositio Simplex*, 1566; 2. The Tetrapolitan confession, 1531; 3. The Gallic confession, 1559; 4. The Palatine or Heidelberg confession, 1575; 5. The Belgic confession, 1559.

The *thirty-nine articles* of the church of England have been already described. See ARTICLES. They were originally 42, and are supposed to have been chiefly composed by Cranmer. In 1571, they were revised and approved by convocation and parliament.

The Westminster *Confession of Faith* was the product of the great Puritan agitation

of the 17th century. As soon as the Long parliament assembled in 1640, it set itself to consider the question of the reformation of religion. It carried resolution after resolution directed against the existing government of the church of England; and at length, on the 23d of Nov., 1641, it passed the famous remonstrance, in which it proposed that, "in order the better to effect the reformation in the church, there should be a general synod of grave, pious, learned, and judicious divines, who should consider all things necessary for the peace and good government of the church." Out of this proposal sprang the Westminster assembly, although the parliamentary ordinance actually summoning the assembly was not issued until a year and a half later—viz., June 12, 1643. According to this ordinance, the assembly was to consist of 121 clergymen, assisted by 10 lords and 20 commoners as lay assessors. Many of these appointed members, however, never took their seat in the assembly. The bishops were prevented from doing so by a counter ordinance of the king.

Among the most notable divines who did assemble were Burgess, Calamy, Gataker, and Reynolds, and Gillespie, Henderson, Baillie, and Samuel Rutherford, the commissioners from Scotland, of the Presbyterian party; Goodwin, Nye, and Burroughs, of the independent party; and Lightfoot and Coleman, with Selden, of the Erastians. The Presbyterians greatly predominated, and the acts of the assembly bear throughout the stamp of Calvinistic Presbyterianism. It began its sittings in the autumn of 1643, and sat till the 22d Feb., 1649, having lasted upwards of five years and a half. During this period it had met 1163 times.

The most important labors which it achieved were the directory of public worship and the confession of faith. This latter document was completed in the third year of its existence (1646), and laid before parliament in the same year. It was approved by the general assembly of the church of Scotland in 1647, and again in 1690, on the renewed establishment of Presbyterianism after the revolution.

The confession of faith, as it is the latest of the great Protestant creeds, so it is one of the most elaborate of them all. It extends to 33 chapters, beginning with *Holy Scripture*, and ending with *The Last Judgment*. Of its 33 chapters, 21 may be said to be distinctly doctrinal — the first 19 and the last 2. The others concern such subjects as *Christian Liberty, Religious Worship, Oaths and Vows*, the *Civil Magistrate*, the *Church*, the *Sacraments, Synods and Councils*. The tone of the doctrinal chapters is that of the later and formal Calvinism which spread from Holland among the English Puritans. The ecclesiastical spirit is Puritan-Presbyterian. "God alone" is declared to be "Lord of the conscience;" yet the "publishing of opinions contrary to the light of nature, or to the known principles of Christianity," is at the same time declared to be matter of censure by the church, and of punishment by the civil magistrate. In composition, the confession is an able and comprehensive summary of theological truth, showing great logical skill in the deduction of particular doctrines from certain main principles. The third chapter, *Of God's Eternal Decree*, may be said to be the key-note from which its most characteristic doctrines follow in immediate sequence and harmony. It is well deserving the attention of all students of theology, not only as a remarkable monument of Christian learning, but as the most representative expression of a great spiritual movement which has deeply tinged the national thought of Britain, and modified the course of its history. It is issued, under authority, as a cheap duodecimo volume by printers in Edinburgh, for general use throughout Scotland. Incorporated in the volume is the text of the covenants, but these are not esteemed part of the confession. See COVENANTS.

CREEK, in geography, is a small inlet on a low coast, and in rivers formed by the mouths of small streams. In America, the term C. is applied to small inland rivers.

CREEKS, a nation of Indians originally living in Alabama and Georgia. During the revolutionary war they adhered to the English, and were hostile to the colonists even after peace. But in 1790, they made a treaty with the federal government, in which nearly a dozen other nations or tribes joined. They again supported the British in the war of 1812, and perpetrated a number of outrages, the most important of which was the massacre of 400 men, women, and children at fort Mimms. Unsparing war was made upon them by gen. Jackson and other leaders, and in Mar., 1814, they were completely crushed. They had lost 2,000 warriors, and their country had been desolated. Still, there was trouble with them almost constantly until, in 1836 they were removed to the present Indian territory. The whole number removed was 24,594. They resisted all efforts of missionaries and teachers, and it was not until 1843 that the first school was established among them. In 1857, they numbered only 14,888. In the war of the rebellion, they were about equally divided. They defeated the confederates in two small engagements; but in a third they were routed, and more than 6,000, men, women, and children fled to Kansas. In 1872, their number was estimated at 12,000, and they had 34 schools. The governmental system of these Indians is peculiar. Each town is independent of all others, and is ruled by its own elective king, the next officer being the chief warrior. The number of chiefs became so oppressive that a change was made, and, in 1868, a plan was adopted to choose a first and second chief, a house of warriors and a house of kings. In 1869, the fugitives of the tribe were returned to their nation.

CREEPER, *Certhia*, a genus of birds, the type of the family *certhiadæ;* having a longish, slender, arched, and pointed bill; a long, narrow, sharp-pointed tongue, jagged near its tip; the tail rather long, and the tips of the tail-feathers firm and pointed, extending beyond the webs. The feet are rather slender; the hinder toe about as long as the other toes. Of this conformation of feet and tail great use is made in climbing trees, the stiff feathers of the tail being employed for support. Although the family is large, it is doubtful if the genus contains more than one true species, the COMMON C. (*C. familiaris*), a bird found in all temperate parts of the northern hemisphere, wherever wood abounds. It is common in Britain, but is not so well known as many other birds, in consequence of its restless habits, its rapid movements, and prompt retirement to the opposite side of a tree or branch from a spectator. It searches for insects and their larvæ in the crevices of the bark, and generally ascends from the root to near the top of a tree before it flies off to another tree or branch. It generally builds its nest in a hole of a decayed tree. It is one of the smallest of British birds, although considerably larger than the wren. Its note is monotonous, and often repeated. Its prevalent color is reddish-brown above, different shades being beautifully intermingled, and speckled with white; the under parts white. In Scotland, it is frequently called *bark-speeler* (Anglicè, bark-climber). —The WALL C. (*tichodroma muraria*) of the s. of Europe, frequents walls and the faces of rocks; it has a more slender bill, and the tail-feathers are not pointed.

CREEPS, a miner's term for the depression which takes place on the surface from the removal of beds of coal beneath. Masses of the coal-seam, like huge pillars, are left by the miners for the support of the superincumbent strata; the pressure, however, of these beds is so great that, in course of time, the ceiling gradually sinks, or, as is more frequently the case, because of the ceiling consisting of hard rock, the softer shale pavement rises, until the intervening spaces between the pillars, left by the removal of the coal, are filled up. A consequent depression takes place in the beds above, as also an alteration of the surface-level. But this being so gradual is seldom noticed, except when it is made evident from the accumulation of surface-water, or in districts where railways pass over the coal-fields.

CRE'FELD. See KREFELD.

CRE'MA, a t. of northern Italy, province of Cremona, situated in a fine plain on the right bank of the Serio, 25 m. e.s.e. of Milan. C. is an ancient place, having been founded by the Longobards in the 6th century. It suffered much during the wars of the Guelphs and Ghibellines. C. is well built, is surrounded by a wall and ditch, has an old castle and cathedral, and manufactures of silk and lace. Pop. 10,000.

CREMATION, the burning of human corpses, appears to have been a general practice in early times, with three exceptions: Egypt, where they were embalmed; Judea, where they were laid away in sepulchers; and China, where they were buried in the earth. In Greece, suicides, children not yet having teeth, and persons struck by lightning, were denied the right to be buried. At Rome, burning was the rule down to the end of the 4th c. after Christ. Whether in any of these cases cremation was adopted or rejected for sanitary or religious reasons, it is difficult to say. Embalming would probably not succeed in climates less warm and dry than that of Egypt; the scarcity of fuel might also be a consideration. The Chinese are influenced by the doctrine of Feng-Shui, or incomprehensible wind water; they must have a properly placed grave in their own land, and with this view corpses are often sent home from California. Even the Jews used cremation in the vale of Tophet when a plague came; and the modern Jews of Berlin and the Spanish and Portuguese Jews at Mile-End cemetery have been among the first to welcome the lately revived process. Probably, also, some nations had religious objections to the pollution of the sacred principle of fire, and therefore practiced exposure, suspension, throwing into the sea, cave-burial, desiccation, or envelopment. Some at least of these methods must obviously have been suggested simply by the readiest means at hand. Cremation is still practiced over a great part of Asia and America, but not always in the same form. Thus, the ashes may be stored in urns, or buried in the earth, or thrown to the wind, or (as among the Digger Indians) smeared with gum on the heads of the mourners. In one case the three processes of embalming, burning, and burying are employed; and in another, if a member of the tribe die at a great distance from home, some of his money and clothes are nevertheless burned by the family. As food, weapons, etc., are sometimes buried with the body, so they are sometimes burned with the body, the whole ashes being collected. The Siamese have a singular institution, according to which, before burning, the embalmed body lies in a temple for a period determined by the rank of the dead man—the king for six months, and so downwards. If the poor relations cannot afford fuel and other necessary preparations, they bury the body, but exhume it for burning when an opportunity occurs. There can be little doubt that the practice of cremation in modern Europe was at first stopped, and has since been prevented in great measure, by views which had become associated with the Christian doctrine of the resurrection of the body; partly also by the notion that the Christian's body was redeemed and purified. Science has shown that burning merely produces quickly what putrefaction takes a long time to accomplish; but the feeling of opposition still lingers among the clergy of more than one nation. Some clergymen, however, as Mr. Haweis in his *Ashes to Ashes, a Cremation P. elude*, have been promi-

nent in the reforming movement The objection was disposed of by lord Shaftesbury when he asked, "What would in such a case become of the blessed martyrs?" The very general practice of burying bodies in the precincts of a church, in order that the dead might take benefit from the prayers of persons resorting to the church, and the religious ceremony which precedes both European burials and Asiatic cremations, have given the question a religious aspect. It is really a sanitary one. The disgusting results of pit-burial made cemeteries necessary. But the cemeteries are equally liable to overcrowding, and are often nearer to inhabited houses than the old church-yards. There is indeed a disposition to build villas near ornamental cemeteries. It is possible to make a cemetery safe approximately, by selecting a soil which is dry, close, and porous, by careful drainage, and by rigid enforcement of the rules prescribing a certain depth (8 to 10 ft.) and a certain superficies (4 yards) for graves. But one has only to read such a work as *Baker's Laws Relating to Burial* to see how many dangers burial legislation has to contend with. A certain amount of irrespirable gas will escape into the air, or into sewage drains, and thus reach houses, or corrupt material will percolate so as to contaminate water which is afterwards used. The great Paris cemeteries inflict headache, diarrhea, and ulcerated sore throat on their immediate neighbors; and a great mass of similar well-authenticated facts may be brought against even recent cemeteries in various countries. A dense clay, the best soil for preventing the levitation of gas, is the worst for decomposition. The danger is strikingly illustrated in the careful planting of trees and shrubs to absorb the carbonic acid. Vault-burial in metallic coffins, even when saw-dust charcoal is used, is still more dangerous than ordinary burial. It must always be remembered that the cemetery system can only be temporary. The soil is gradually filled with bones; houses crowd around; the law itself (in England) permits the re-opening of graves at the expiry of 14 years. We shall not, indeed, as Browne says, "be knaved out of our graves to have our skulls made drinking bowls, and our bones turned into pipes." But on this ground of sentiment, cremation would certainly prevent any interruption of that "sweet sleep and calm rest" which the old prayer that the earth might lie lightly has associated with the grave. And in the meantime we should escape the horrors of putrefaction and of the "small cold worm that fretteth the enshrouded form." For the last 10 years many distinguished physicians and chemists in Italy have warmly advocated the general adoption of cremation, and in 1874, a congress called to consider the matter at Milan resolved to petition the chambers of deputies for a clause in the new sanitary code, permitting cremation under the supervision of the syndics of the commune. In Switzerland, Dr. Vegmann Ercolani is the champion of the cause, and there are two associations for its support. So long ago as 1797, cremation was seriously discussed by the French assembly under the directory, and the events of the Franco-Prussian war have again brought the subject under the notice of the medical press and the sanitary authorities. The military experiments at Sedan, Chalons, and Metz, of burying large numbers of bodies with quicklime, or pitch and straw, were not successful, but very dangerous. The question was considered by the municipal council of Paris in connection with the new cemetery at Mery-sur-Oise; and the prefect of the Seine in 1874 sent to all the cremation societies in Europe a circular asking information. The municipality of Vienna has actually made cremation permissive. There is a propagandist society, called the "Urne," and the main difficulty for the poor seems to be the conveying the bodies five miles. To overcome this a pneumatic tube has been proposed. Dresden, Leipsic, and Berlin are the centers of the German movement. In Britain the subject has slumbered for two centuries, since in 1658 sir Thomas Browne published his quaint *Hydriotaphia, or Urn-burial*, which was mainly founded on the *De Funere Romanorum* of the learned Kirchmannus. In 1817, Dr. J. Jamison gave a sketch of the *Origin of Cremation*, and for many years prior to 1874 Dr. Lord, medical officer of health for Hempstead, continued to urge the practical necessity for the introduction of the system. It was sir Henry Thompson, however, who of late first brought the question prominently before the public, and started in 1874 the cremation society of London. Its object is to introduce through the agency of cemetery companies, and parochial and municipal authorities, and burial boards, some rapid process of disposing of the dead, "which cannot offend the living, and shall render the remains absolutely innocuous." Thompson's problem was—"Given a dead body, to resolve it into carbonic acid, water, and ammonia, rapidly, safely, and not unpleasantly." Relying on the evidence which suggested recent burial legislation, he pointed out that in the neighborhood of cemeteries there is a constantly increasing risk of contaminated air and water. The problem he solved by the Siemens process of cremation, which, when generally employed, would effect a great saving in the cost of funerals, and would also leave a quantity of bone earth equal in value to the bones imported into this country chiefly for manure. The British authorities in India have already had much practical experience of cremation. Poor Hindus often did not supply wood and oil enough for the total consumption of the body, and hence sir Cecil Beadon at Calcutta, and the sanitary commissioner at Madras, both found it necessary in the public interest to erect cinerators on the burning-ghat or ground, which might be used on payment of a fee. So also at Poonah, col. Martin, struck with the high cost (above 12 rupees) of even a poor funeral, constructed in 1864 a pentagonal cinerator for the use of Brahmans and the other Hindu castes.

Among the practical methods of cremation which have recently been attempted, we

may mention, in the first place, the experiments of Dr. Polli at the Milan gas-works, and those of prof. Brunetti, who exhibited an apparatus at the Vienna exhibition of 1873, and states his results in *La Cremazione de Cadaveri*, Padua, 1873. Polli obtained complete incineration or calcination of the bodies of dogs by the use of coal-gas mixed with atmospheric air, applied to a cylindrical retort of refracting clay, so as to consume the gaseous products of combustion. The process was complete in two hours, and the ashes weighed about 5 per cent of the weight before cremation. Brunetti used an oblong furnace of refracting brick with side-doors to regulate the draught, and a cast-iron dome above with movable shutters. The body was placed on a metallic plate suspended on wire. The gas generated escapes by the shutters, and in two hours carbonization is complete. The heat is then raised and concentrated, and at the end of four hours the operation is over; 180 lbs. of wood costing 2*s.* 4*d.* sterling was burned. In the reverberating furnace used by sir Henry Thompson, a body, weighing 144 lbs. was reduced in 50 minutes to about 4 lbs. of lime-dust. The noxious gases, which were undoubtedly produced during the first five minutes of combustion, passed through a flue into a second furnace, and were entirely consumed. In the ordinary Siemens regenerative furnace (which has been adapted by Recalm in Germany for cremation, and also by sir Henry Thompson) only the hot-blast is used, the body supplying hydrogen and carbon, or a stream of heated hydrocarbon mixed with heated air is sent from a gasometer supplied with coal, charcoal, peat, or wood, the brick or iron-cased chamber being thus heated to a high degree before cremation begins. In one arrangement both gas and air are at a white heat before they meet and burst into flame in the furnace. The advantage of the Siemens furnace and gas producer (which would cost about $4,000 in construction) are that the heat of the expended fuel is nearly all retained by the regenerators, and that the gas retort admits of the production being stopped without much loss. Some difficulty has been felt about keeping the ashes free from foreign material. The Greeks used a shroud of asbestos, the Egyptians one of amianth. Mr. Eassie suggests a zinc coffin—that metal being volatile. It is also suggested that the ashes might be deposited in urns, and these placed in a columbarium, which might be in the church or at home. (The substance of the foregoing is from *Encyclopædia Britannica*, ninth edition.)

CRÉMIEUX, Isaac Adolphe, 1796–1880; b. at Nîmes, France, of Jewish parents. He studied law, and was admitted to the bar in 1817. About 1830, he went to Paris, where he soon became famous as an advocate, particularly in the defense in political prosecutions. He entered political life in 1842 as a deputy from Chinon, and served till 1848. He sat on the left, and in opposition to the reigning dynasty. Under the republic of 1848, he was elected as a deputy to the constituent and legislative assembly, acting and voting always with the left.

On the night of the 2d of Dec., when Napoleon throttled the republic, Crémieux was arrested and thrown into the prison of Mazas. During nearly the whole reign of Napoleon he remained in private life, devoting himself to his profession. In Nov., 1869, he was elected a deputy to the corps legislatif, where he took his seat on the extreme left, voting always with Gambetta, who was for a time a clerk in his law-office. His name is connected with many acts of legislation and many decrees. It was he who rendered the famous decree which chased from their seats the infamous magistrates composing the "mixed commissions" under the empire, whose infamous judgments drove from France into exile so many of her most distinguished and most gifted sons. Another decree justly bears his name, the "Decree Crémieux," which naturalized in mass 30,000 of his coreligionists in Algeria. The French nation will never forget his private subscription of 100,000 francs for the liberation of the French territory. He was a man of the highest sense of honor. Deutz, a Jew, who had surrendered up the duchess de Berri at Bordeaux, finding his treason overwhelmed by universal reprobation, asked from Crémieux what was called a "memoire justificatif." The advocate addressed him a letter in reply, which created much sensation at the time. He said: "I can do nothing for you. It is impossible for me to justify you in the eyes of the public. France is deaf to the justification of cowardice. It is necessary to submit to shame when one has committed a treason. I can see nothing that will excuse a crime which I detest, and which arraigns you before no other judges than public opinion. If you count me as your coreligionaire you will see your error." A member of the provisional government of 1848, he was one of the first seven named by the chamber, and proclaimed to the people from the Hotel de Ville. They were Marie, Lamartine, Ledru-Rollin, Crémieux, Dupont de l'Eure, Arago, and Garnier Pagès. With the death of Crémieux, no one of that number now survives.

Crémieux was made minister of justice of the government of 1848. Under the republic, which followed, he was elected a member of the chamber of deputies, and again in 1869. In 1875, was conferred upon him his last and greatest honor in his election as life senator under the French republic. He had an authority and influence among his people which no other man possessed. Wherever a Jew was persecuted, there appeared the old Hebrew advocate. It was in 1840 that C. went into Syria to defend the grand rabbi of Damascus, against whom had been made the accusation, as absurd as it was terrible, that he had cut the throat of a monk in order to moisten with his blood

the bread that the Jews eat during Easter. The great advocate procured the acquittal of his client and those accused with him. As a recognition of that service, it is said he was escorted out of the country on his return by 12,000 Jews on horseback.

CREMONA, a province of Lombardy, Italy, between the rivers Adda and Oglio, n. of the Po, which separates it from Parma and Piacenza; about 50 m. long from n.w. to s.e., and 15 m. wide; 632 sq.m.; pop. '71, 300,595. The surface is level and the soil fertile, producing abundant crops of wheat, corn, flax, and rice. Except the spinning of silk, there are no important manufactures.

CREMO'NA, an important city of northern Italy, situated on the n. bank of the Po, which is here crossed by a bridge, about 48 m. s.e. of Milan. It is surrounded by walls with flanking towers and wet ditches, its circumference being nearly 5 miles. A canal uniting the Oglio and the Po passes through the city; and the latter river is navigable for large boats from this point to the sea. The streets of C. are wide and regular, and it has some fine buildings—the principal of which are the cathedral, built at different times, exhibiting various styles of architecture; the churches of San Margherita, Sant' Agostino, Santa Agata, and San Giorgio; the palazzo publico, campo santo, and the torazzo or belfry—one of the loftiest and finest towers in Italy, being 396 ft. high, and commanding magnificent views over the fertile plains of Milan. By means of the Po, C. carries on a considerable trade in the produce of the district; and it has manufactures of silk, cotton, earthenware, and chemicals. It was formerly greatly celebrated for its manufacture of violins, the most famous maker being Amati, who flourished in the beginning of the 18th century. Its musical strings were also in great repute, but now neither violins nor strings have more than ordinary excellence. Pop. '72, 30,919. C. is the capital of a province of the same name, which has an extent of about 500 sq.m., and a pop. of 300,595.

CRENELLE, sometimes used for a battlement, but more frequently for the embrasures in a battlement. The adjective *crenellated* is in frequent use to signify that a building is supplied with crenelles. See BATTLEMENT.

CRENELLÉ, in heraldry, embattled, is used to signify that any ordinary is drawn like the battlements of a wall.

CRE'NIC ACID is one of the constituents of vegetable mold, and is produced wherever leaves and other plant matter are decaying, especially in peat-bogs and marshes.

CRENSHAW, a co. in s.e. Alabama, drained by Conecuh river, recently formed from portions of several adjoining counties; about 600 sq.m.; pop. '80, 11,755—2,612 colored. The surface is level and mostly covered with pine forests, and the soil is poor. Corn, cotton, and rice are the chief productions Co. seat, Rutledge.

CRËOLE (Span. *criollo*) is a word used in speaking of the inhabitants of South America and the West Indies. In its widest sense, it designates any individual born in the country, but of a race not native to it. Thus, a negro born in the country is sometimes called a C., in opposition to one imported. It is usually applied, however, to persons born in the colony or country and of pure European blood, as distinguished from immigrant Europeans, and also from the offspring of mixed blood, such as mulattoes and mestizoes. Brazilian creoles call themselves also Brasileiros.

CREON, a fabulous king of Thebes, succeeding on the death of Laius, the husband of his daughter Jocasta. Thebes was then trembling before the cruelty of the Sphinx, and Creon offered his crown and his daughter to whomsoever would solve the enigma proposed by the monster. Œdipus, the son of Laius and Jocasta, ignorant of his parentage, having solved the riddle, received the reward, and thus became the husband of his own mother, by whom he had two sons, Eteocles and Polynices, who, after their father's death, mutually agreed to reign in alternate years. Eteocles began, but when his year ended he refused to resign, and war followed, which was decided by the brothers in single combat, when both were killed. Creon resumed the government during the minority of Leodamus, the son of Eteocles, and commanded that the Argives, and above all Polynices, the cause of all the bloodshed, should not receive the rights of sepulture, and that any one who infringed this decree should be burned alive. Antigone, the sister of Polynices, refused to obey, and sprinkled dust upon her brother's corpse. The threatened penalty was inflicted; but Creon's crime did not escape punishment. His son, the lover of Antigone, killed himself on his grave, and Thebes was attacked by Theseus, by whose hand Creon fell.

CREOSOTE. See CREASOTE, *ante.*

CRESCENDO, in music, means a gradual increasing of sound, or changing from piano to forte and fortissimo. It is marked thus  , or with the abbreviation *cresc.* The swell of an organ, when well constructed, produces a most perfect crescendo.

CRESCENT. A representation of the half-moon with the horns turned upwards, called a C., is often used as an emblem of progress and success. It is generally spoken of as "the arms" of the Turkish empire; but is more properly the emblem of the empire and people—not a very appropriate one in our day. It was, however, the emblem of the Greek before it became that of the Turkish rule; and at the present day, is fre-

quently to be seen on churches in Moscow and elsewhere in Russia, generally surmounted with the cross, marking unquestionably the Byzantine origin of the Russian church.

CRESCENT, TURKISH ORDER OF. In 1799, after the battle of Aboukir, the sultan Selim III. testified his gratitude to Nelson by sending him a C. richly adorned with diamonds. It was not intended as an order, but Nelson wore it on his coat, and on several occasions called himself the knight of the C. Selim was flattered by the value which the English admiral, already decorated with so many orders, seemed to attach to his gift; and it was this circumstance which determined him, in 1801, to found the order of the crescent. Mohammedans being forbidden, in the Koran, to carry such marks of distinction, the order is conferred only on Christians who have done service to the state. The second person on whom it was conferred was gen. Sebastiani, for his defense of Constantinople against the English fleet in 1807. The insurrection of the Janissaries suspended the efforts at Europeanizing which Selim had begun, and when they were resumed by Mahmud, he instituted several other decorations. See MEDJIDIE, ORDER OF. There was an old order of the C. instituted at Angiers by René, duke of Anjou, brother and heir of Louis III., king of Naples, in 1464. Its objects were those common to the religious military orders of those days, the honor of God, the defense of the church, the encouragement of noble actions, and the glory of the founder. The dukes of Anjou and kings of Sicily were sovereigns of the order. The badge was a C. of gold, on which was the word Loz, enameled in red letters, the import being Loz (laus) en Croissant—Praise by Increasing. Like many other orders founded by the smaller sovereigns, the order of the C. did not survive the founder.

CRESCENT, in heraldry, is used both as a bearing or charge, and as a difference, or mark of cadency. In the latter case, it designates the second son, and those that descend from him. See CADENCY.

CRESCENT CITY, a small t. near the center of the state of California, stands on the right bank of the Tuolumne, about 20 m. above the entrance of that river into the San Joaquin, itself a tributary of the Sacramento, which falls into the noble harbor of San Francisco. The Tuolumne is navigable for steam-boats to a distance of 10 m. above Crescent City.

CRESCEN'TIA. See CALABASH TREE.

CRESCENTI'NO, a t. of n. Italy, in the province of Novara, about 22 m. n.e. of Turin. It is situated in a marshy district, near the confluence of the Dora Baltea with the Po. From its plan, it would appear to have been an old Roman station. It has manufactures of silk and woolens. Pop. about 3,000.

CRESCEN'ZI, PIETRO DE, 1230–1320; an Italian writer on agriculture, author of a work containing not only his personal observations and experiences, but such information as he could gain from ancient agriculturists.

CRESS, a name given to many plants, of which the foliage has a pungent, mustard-like taste, and is used as a salad. It is sometimes more strictly confined to the genus *lepidium*, a genus of the natural order *cruciferæ*, having small white flowers, and oblong or rounded laterally compressed pouches (silicules), with the cells one-seeded, and the valves keeled or winged on the back. The COMMON C., or GARDEN C. (*L. sativum*), is an annual, a native of the east, frequently cultivated in our gardens, and used in a young state as a salad; being easily procured in a few weeks from the time of sowing, and, by the aid of a little artificial heat, even in winter. There is an esteemed variety with curled leaves. Like most of the other plants of similar pungent taste, particularly those of the order *cruciferæ*, the garden C. is powerfully anti-scorbutic. Still more pungent, and almost like pepper in tast, is its congener, PEPPERWORT, *dittander*, or *poor man's pepper* (*L. latifolium*), found in wet places near the sea in some parts of Britain, and occasionally used as a condiment by the poorer classes. It was once in high repute as a remedy for various diseases. VIRGINIAN C. (*L. Virginicum*) resembles the garden C. in its properties, and is eaten as a salad, and used as a diaphoretic medicine in North America and the West Indies. *L. piscidium*, a native of the South Sea islands, is there used to stupefy fish; it is also one of the plants used by sailors for prevention or cure of scurvy. The name WINTER C. is given to species of the genus *Barbarea*, also cruciferous biennial or perennial plants, with racemes of yellow flowers, quadrangular pods, and lyrate or pinnate leaves. The common winter C. (*B. vulgaris*), formerly known as herb St. Barbara, is plentiful in moist pastures and hedge-banks in Britain, and throughout Europe and North America. It is occasionally cultivated as a winter salad; in Sweden it is used as a boiled vegetable. Its pungency is combined with some degree of bitterness. A double variety is common in flower-borders, and bears the name of YELLOW ROCKET. Very similar to this, and also occasionally cultivated, is the early winter C., or AMERICAN C. (*Barbarea præcox*), a native also of Britain, the continent of Europe, and North America. BITTER C. (*cardamine*) is another cruciferous genus, with linear pods, and flowers sometimes of considerable beauty, as in the common bitter C. or cuckoo-flower (*C. pratensis*), also known by the name of lady's smock—a very common ornament of moist meadows in Britain, with white, blush-colored, or light purple flowers; the flowers of which are stimulant and diaphoretic, and had at one time a high reputation for the cure of epilepsy, particularly

in children, and still retain a place in the pharmacopœias. The young leaves of this species, as well as of *C. amara*, a species with still more beautiful flowers, and *C. hirsuta*, a small flowered species, both British, are used as salads, but more generally in some continental countries than in Britain, being pungent with a little bitterness. The leaves of *C. amara* are brought to market in large quantities in Bohemia and Saxony. The juice of *C. pratensis* is much used as an anti-scorbutic in the n. of Europe, to counteract the effect of the constant use of salted meat and salted fish. WATER C. (*nasturtium officinale*) is a perennial aquatic cruciferous plant, much used both in England and on the continent of Europe as a spring salad. The genus *nasturtium*, which contains a considerable number of species, has a spreading calyx, and a nearly cylindrical pod. *N. officinale* is a native of almost all parts of the world. The leaves have a pungent bitterish taste, with a little saltness. They possess medicinal properties similar to those of SCURVY-GRASS. In favorable weather, they may be procured in winter as well as in spring, and may be frequently cut over during a season. The plant is cultivated to a considerable extent both in Germany and near London, in wide ditches, which are filled with slowly flowing and pure water. It grows best in clear shallow running water, with a bottom of sand or gravel. Mud is injurious both to its growth and to the flavor of its leaves. For INDIAN CRESS, see TROPÆOLUM.

CRESSET (Fr. *croisette*, diminutive of *croix*, cross), a name given to a great light on a beacon or watch-tower, to a lamp or torch, or a light fixed on a pole. The name owes its origin to the fact that formerly beacons were usually surmounted by a cross.

CRESSON, a village in Cambria co., Penn., on the Pennsylvania railroad, 102 m. e. of Pittsburg. It is on the top of one of the Alleghany mountains, 3,000 ft. above tide, and is a famous summer resort because of the purity of the air and the beauty of the scenery.

CRESSON, ELLIOTT, 1796–1854; a Quaker merchant of Philadelphia, who paid much attention to the Indian population of the country; also to the emancipation of the negroes from slavery, his method being mainly by colonization. He left over $120,000 to various benevolent institutions, besides an estate of more than $30,000 to found a home for aged or infirm merchants and gentlemen who had fallen into poverty.

CREST (Lat. *crista*, a tuft, from *cresco*, to grow up). Though popularly regarded as the most important feature in heraldic emblems, the C., in the eyes of heralds, is an external adjunct to the shield, without which the bearing is complete, and which may consequently be altered without materially affecting its significance. Occupying the highest place on the helmet, it is the member of the bearing by which the knight was commonly known in battle; and from this circumstance, it is to it that the term *cognizance* (from *cognosco*, to know) is properly given. Its claim to a classical origin is probably better than that of any other portion of coat armor. Jupiter Ammon is represented as having borne a ram's head on his helmet, and Mars the figure of a lion or a tiger. Alexander the great, on the pretense that he was sprung from Jupiter, assumed the ram's head; and Julius Cæsar bore a star, to denote that he was descended from Venus. The helmet, as we see it represented on ancient statues and gems, was frequently adorned with a crest. Sometimes it was of horse-hair; at other times a lion or other animal was placed on the helmet, either erect or couchant.

Newton, in his *Display of Heraldry*, says that the first C. to be met with in the monuments of English chivalry, is that on the great seal of Richard Cœur de Lion. The helmets in this instance, and in that of Roger de Quincy, earl of Winchester, differ in form from those afterwards used, the C. occupying a much larger space. Crests are said to have come into general use about the time of Henry III., and to have been used as marks of distinction by commanders in the holy wars, as they had formerly been by the Roman centurions. For lightness they were often made of stuffed leather, which was gilt, silvered over, or painted—a circumstance which explains their greater size then than in later times, when they were made either of wood or metal. The earliest example of the wreath on which the C. is now invariably placed, is that on the monument of sir John Harsick. It consisted of two pieces of silk, of the colors of the armorial bearings of the wearer, twisted together by the lady who had chosen him for her knight. Though crests are now invariable appendages to shields, and many of them are appropriated to particular families by hereditary descent, they are believed to have been originally assumed at the pleasure of the wearers; and they are even now less strictly under the cognizance of the heralds than the devices on the shield, which must always be assigned by competent authority. Crests are so various that a classification of them is scarcely possible. The following is an abridgment of that given by Newton, who has written very fully on the subject in his *Display of Heraldry*. The most ancient class of crests he believes to have consisted of ferocious animals, which were regarded as figuratively representing the bearer and his pursuits. Secondly, they were devices assumed as memorials of feats of chivalry, and for the purpose of perpetuating traditions and family legends, either in addition to, or differing from, those represented on the shield. Thirdly, they served only to give a more prominent place to objects already represented on the shield. Fourthly, they commemorated religious vows, or expressed the religious or knightly aspirations of the bearer. Fifthly, they were mere whims, and were adopted for no very definite reason, and served no very definite purpose. As

many of them belonged to persons not only unconnected by family, but of different names, they no longer served the purpose of distinction when separated from the shield. To this latter class belong the vast majority of modern crests assumed at the suggestion of seal-engravers and coach-painters.

The lion assumed by Richard I., during the crusade in the Holy Land, to express the bravery for which he was proverbial, was borne by Edward III., Henry VII., Edward VI., and James I.; and since that time has been recognized as the appropriate C. of the royal family of England. In early times, the same C. was not always borne even by the same person. Besides the lion, Edward III. occasionally bore a white raven crowned; and other monarchs made use of similar additions. Anciently, the nobility mostly bore plumes of feathers. But several of the earls of Warwick, of the Beauchamp family—the last of whom died in 1445—bore for C. a bear with a rugged staff, muzzled, collared, and chained, as it is still to be seen on signs. The origin of the wreath has been already mentioned. It is now represented as consisting of two stripes of gold or silver lace, twisted into a circular cord. Its tinctures are always those of the principal metal and color of the arms. It is a rule in delineating the wreath, which is shown edgewise above the shield, that the first coil shall be of metal, and the second of color. Civic, triumphal, and other crowns were used as wreaths; and this practice is supposed to have given rise to the use of coronets, out of which crests are sometimes represented as issuing, even in the case of persons who are not noble.

CRESTE, in architecture, an ornamental finishing, either carved in stone, or of tiles running along the top of a wall, or the ridge of a roof. *Crest-tiles,* or, as they are corruptly called, cress-tiles, or crease-tiles, are frequently in the form either of small battlements or Tudor flowers. See Cops.

CRESTED, in heraldry. When a cock or other bird has its comb of a different tincture from its body, it is said to be C. of such a tincture, naming the tincture.

CRES'WICK, Thomas, R.A., one of the best and most popular of recent English landscape-painters, was b. at Sheffield, 1811. He early exhibited a taste for drawing, and in his 17th year removed to London, with a view to study the art as a profession. But already he had so far advanced, that two of his pictures were, during that year, admitted into the royal academy's exhibition. C. loved to paint the beautiful streams, and glens, and wooded dells of his native land; and these, which form the subject of his best paintings, are represented on his canvas with the very fidelity and freshness of nature itself. Among his greatest works are "England," "London Road a Hundred Years Ago," and the "Weald of Kent." His knowledge of aërial perspective was unsurpassed. C. also painted some admirable sea-side studies. He was elected an associate of the royal academy in 1842, and R.A. in 1851. C. was one of the artists to whom the arrangement of the gallery of modern paintings at the Manchester exhibition of 1827 was intrusted. He died in 1869.

CRETA'CEOUS GROUP, or Chalk Formation, the upper strata of the secondary series, immediately below the tertiary beds, and resting on the oolite. This group is separated from the eocene tertiary beds by a decided change in both the rocks and fossils. The eocene strata rests unconformably upon the chalk; it is, however, more than probable that a number of beds may yet be discovered to fill up the gap which apparently here exists in the sequence of the rocks.

The C. G. covers a large extent of surface in Europe and the e. of Asia; beds of the period have also been noticed in North and South America. The typical strata occur in the s.e. of England, and are connected with similar beds in the n of France and Germany, and in Denmark. Indeed, the bed of the German ocean seems to be composed of rocks of this group, as is evidenced by the masses of chalk and flint thrown on the shores of Scotland after storms.

The strata of the group have been arranged in the following order. The maximum thickness of the divisions is given in feet.

		Feet.
Upper	1. Maestricht	100
	2. Chalk with Flints	500
	3. Chalk without Flints	600
	4. Chalk Marl	100
	5. Upper Greensand	100
Lower	6. Gault	150
	7. Lower Greensand	850
	8. Wealden beds	1300

1. The maestricht beds (q.v.) consist of pistolitic limestones in the n. of France, and of loose yellowish sandstones in Holland. 2. The chalk with flints is a great mass of pure white pulverulent limestone, usually too soft for a building-stone, but sometimes passing into a more solid state. It occurs in beds of great thickness, with the stratification often obscure, except when rendered distinct by interstratified layers of flint a few inches in thickness, occasionally in continuous beds, but oftener in nodules, and recurring at intervals from 2 to 4 ft. distant from each other. Iron pyrites is found frequently

in these beds in radiated nodules; it readily decomposes, and produces rusty stains on the rock. 3. Chalk without flints; this differs from the upper chalk only in the want of flints. 4. Chalk marl; the white chalk, by the gradual admixture of argillaceous matter, becomes hardened, until it passes into a pale buff-colored marl or argillaceous limestone, sometimes of a sufficient compactness to be used as a building-stone. 5. Upper greensand (see GREENSAND), composed of alternating layers of sands, clays, and limestones, occasionally, but not always, colored with green particles of a chloritic mineral. 6. Gault (q.v.), a stiff dark clay, used for brickmaking, with many beautifully preserved shells. 7. Lower greensand (q.v.), so like petralogically to the upper greensand, that when the intervening Gault is absent, it is impossible to separate them, except by their organic contents. The Specton clay, a local Yorkshire bed of dark clay, is of the same age. 8. Wealden (q.v.), divided into the two groups, the Wealden clay and Hastings sand, consists of a great series of shales and sandstones, with scattered beds of lime and ironstone.

The most remarkable petralogical characteristic of the group is the chalk, which exists in such abundance as to have given its name to the formation (Lat. *creta*, chalk). It is a white, soft, and pulverulent limestone, consisting almost entirely of carbonate of lime; the only foreign matter in any quantity being silex, which is aggregated together in an amorphous condition, in nodules or layers of flint. Occasional pebbles are also found, but they are extremely rare. Chalk was formerly supposed to be a chemical precipitate: the microscope has, however, shown it to be composed of minute shells mixed with the broken fragments of larger ones; and, very recently, the use of an improved deep-sea sounding apparatus has revealed a sediment now accumulating in many places, which agrees in every point, save solidity, with the chalk. When a piece of white chalk is rubbed down to powder with water, by means of a soft brush, and the powder examined by the microscope, it will be found that the greater portion consists of shells of the minuter kinds of foraminifera, mixed with the disintegrated prisms of pinna or other large shells of like structure, the shells of cytherina, a marine entomostracan, and probably a few diatoms. Deep-sea soundings have disclosed a formation precisely similar, as taking place at the present time. Of some gatherings obtained at a depth of 2 m. from the great Atlantic plateau, prof. Bailey says: "I was greatly delighted to find that *all* these deep soundings are filled with microscopic shells; not a particle of sand or gravel exists in them. They are chiefly made up of perfect little calcareous shells (foraminifera), and contain also a small number of siliceous shells (diatomaceæ)." The occurrence of pebbles in the chalk can easily be accounted for, if we suppose them to have been floated in, attached to the roots of trees, or more probably to sea-weeds. It is more difficult to account for the origin of the flint. Prof. Bailey found that some seas, especially in the Arctic regions, supplied an enormous quantity of siliceous frustules of the diatomaceæ, and spicules of sponges. That such organisms may have been converted into the flint nodules seems very probable, when we remember that many of the nodules have the external conformation of sponges, and show occasionally also the internal structure. Mr. Bowerbank's microscopic examination of flint nodules, seems to lead to the conclusion that all flints are produced from the siliceous skeletons of organic beings. Chalk, then, seems to have been a deposit in very deep seas, far out of the reach of land-currents, which would certainly have brought with them argillaceous and arenaceous débris.

The C. G. is highly fossiliferous. The remains of plants are abundant in the freshwater wealden beds; amongst them have been found fragmentary portions of dicotyledons. If we except the microscopic diatomaceæ, which are not unfrequent in the white chalk, vegetable remains are rare in the other members of the group. The various divisions of the animal kingdom are represented in the organic remains of the chalk, if we except the warm-blooded vertebrata, which have hitherto—if they existed—escaped notice. Foraminifera were enormously abundant in the seas, and active in the secretion of the soluble carbonate of lime, fixing it in their minute shells, which, after their death, as has been shown, formed the principal material of the chalk.. In the lower beds, polyzoa have been found in great abundance on the continent. Echinoderms are in immense numbers, and beautifully preserved. Crustacea are occasionally found. Of mollusca, the brachiopoda and cephalopoda are especially abundant, both being pelagic types. Ctenoid and cycloid fishes appear in this group for the first time, though yet in small numbers—the placoids and ganoids being still the predominant forms. Reptiles, though not so numerous as in the former period, were yet far from rare. For further details of the fossils, see DIATOMACEÆ, VENTRICULITES, FORAMINIFERA, TEREBRATULA, RHYNCHONELLA, HIPPURITES, AMMONITES, PTYCHODUS, MOSOSAURUS, PLESIOSAURUS, ICHTHYOSAURUS, PTERODACTYL, etc.

CRETACEOUS SYSTEM (*ante*), in North America, extends along the Atlantic, s. of New York—where, though mostly hidden by the tertiary formation, it is visible in New Jersey and further s.—around the n. and w. shores of the Mexican gulf, up the Mississippi valley to the mouth of the Ohio, and, on the w , from Texas northward over the sides of the Rocky mountains. Its greatest development is in Wyoming, Utah, Colorado, and w. of the Sierra Nevada in California. In some portions of these last named regions it rises to heights of 10,000 and 12,000 feet. It is found also in Arctic

America, near the mouth of the Mackenzie river. The American cretaceous beds consist of layers of greensand—called also *marl*, and extensively used in New Jersey and elsewhere for fertilizing land—sands of other kinds, clays, shells, and, on the gulf of Mexico, especially in Texas, limestone. In New Jersey the formation is 400 or 500 ft. thick, in Alabama 2,000, in Texas 800, chiefly solid limestone, in the upper Missouri more than 2,000, and e. of the Wahsatch more than 9,000. In Colorado, New Mexico, and Vancouver's island the formation contains important beds of brown coal or lignite. The coal-beds of Wyoming and Utah, and some southward, are regarded by some geologists as belonging to this formation; others assign them to the tertiary age. Among American cretaceous fossils are included 100 species of the earliest dicotyledonous plants yet found on this continent, half of which are allied with living American forms. Among them are species of oak, willow, poplar, beech, maple, hickory, fig, tulip, sassafras, sequoia, American palm, and cycads. Among the mollusca are species of *terebratula, ostrea, gryphæa, inoceramus, hippurites, radiolites, ammonites, scaphites, hamites, baculites, belimnites, ancyloceras*, and *turrilites*. Of the fishes of the American cretaceous seas nearly 100 species are known. They include large representatives of modern predatory types like the salmon and saury, together with cestracionts and ganoids. The American reptiles of this period are especially remarkable for their number, variety, and size. Cope (who includes, however, in his statement the lignite group, which other geologists rank among the tertiary formations) enumerates 18 species of deinosaurs, 4 pterosaurs, 14 crocodilians, 13 sea saurians, 48 testudinates, and 50 sea serpents. Some of the pterosaurs from the Kansas rocks measured from 20 to 25 ft. in expanse of wing. The sea saurians were from 10 to 50 ft. long. The elasmosaurus Cope describes as a snake-like form 40 ft. long, with an arrow-shaped head on a swan-like neck that rose 20 ft. out of the water. Consequently it could swim many feet below the surface, and yet have its head extended into the air for breath. The American rocks supply 40 species of the sea serpents, some of which were 75 ft. long, with a head 4 ft. long, and a mouth of enormous size, having 4 rows of immense curved teeth with which to seize their prey and joints in the lower jaw to enable them the better to swallow it whole. In the American portion of this formation, 9 species of birds, have been found. Three belonged to the order of swimmers, which includes modern ducks, geese, and gulls; four were waders, and two, of an order long extinct, resembled fishes and reptiles as well as birds. During the cretaceous period it is supposed that the Delaware and Chesapeake bays were in the main ocean, that Florida was under water, that the valley of the Missouri was a salt water region, that the Rocky mountains were in great part submerged, and that the gulf of Mexico extended over much of Georgia, Alabama, and Mississippi, northward to the mouth of the Ohio and far on to the n.w., perhaps even to the Arctic seas.

CRETE. See CANDIA.

CRE'TINISM, from *crétin* (French), an idiot of the Alps, and this again probably from *chrétien*, a Christian, one who, from his state of fatuity, could not sin, and was viewed with some degree of religious respect. The name of C. is now applied in a more general sense to idiocy, or defective mental development depending upon local causes, and associated with bodily deformity or arrested growth. C. is very often found in connection with goitre (q.v.), in the lower Alpine valleys, not only of Switzerland and Italy, but of the Pyrenees, Syria, India, and China. In Europe, it is rarely met with at a higher elevation than 3,000 ft., and haunts chiefly the valleys surrounded by high and steep walls of rock, which exclude the light, and limit the free circulation of air. Cretins are always pitiable, and frequently repulsive objects; they are generally dirty, shameless, and obscene; their appetite is commonly voracious; the mouth is large and open, the tongue often protruded, the eyes small, the nose flat and broad, the skull narrow and small in all its dimensions, the forehead retreating, the complexion cadaverous; in addition to which, the whole body is dwarfish, the hands and feet large, the limbs often rickety, the belly protuberant. The cause of C. is still imperfectly understood; the recent researches of Virchow tend to the conclusion that it is a physical degeneration, dependent on the reception of an undue amount of calcareous matter into the system; and this agrees with the general result of numerous observations previously made, as to the prevalence of goitre and C. in places where calcareous waters are alone accessible to the inhabitants. See GOITRE. Many attempts have been recently made to improve the condition of the cretin in childhood, by removing him from the locality of his birth, and by careful training; the institution founded by Dr. Guggenbühl on the Abendberg (q.v.), near Interlaken in Switzerland, having been the prototype of many others on the continent, and of some in England and Scotland, for the education of idiots.

CREUSE, a river and a department in the center of France. The river rises in the mountains on the southern border of the department of C., and flows in a generally n.n.w. direction through that department, then in a n. and westerly direction through Indre, and dividing the departments Vienne and Indre-Loire, falls into the Vienne, a tributary of the Loire, about 12 m. n. of Chatellerault, after a course of about 150 miles.—The department to which the river gives its name lies in lat. 45° 39′ to 46° 26′ n., and long. 1° 24′ to 2° 36′ east. On an area of about 2,200 sq.m., it had a pop., in 1872, of 247,663: at the census of 1876, the pop. was 278,423. Low mountains and chains of hills occupy

the greater part of the land. The streams, with the exception of the C., are insignificant. The climate is moist and variable, and the soil thin and light in the southern hilly district, which is interspersed with stretches of heath and pasture, but better in the lowlands of the n.e. The products are rye, buckwheat, oats, and potatoes; but agriculture is backward and the rearing of cattle forms the chief branch of rural industry. Large quantities of chestnuts and fruit are grown. The minerals are not important. The people of C. are but slightly educated, and use a coarse patois; but are generally industrious, and annually migrate in large numbers to find work in various parts of France. C. is divided into the arrondissements Aubusson, Bourganeuf, Boussac, Guéret, with Guéret for its capital.

CREUTZ, GUSTAF FILIP, Count, b. Finland, 1729–85; a Swedish poet. He was educated at Abo, where he made the acquaintance and friendship of Gyllenborg, and the two became the "Beaumont and Fletcher" of their country. Creutz's best work was *Atys and Camilla*, a charming idyllic poem. In 1763, Creutz was sent as ambassador to Spain, and afterwards to France.

CREUZER, GEORG FRIEDRICH, a learned German philologer, was b. at Marburg Mar., 10, 1771, and studied there and at Jena. In 1802, he was appointed a professor at Marburg, and in 1804, obtained the chair of philology and ancient history at Heidelberg, which he occupied for 44 years in the worthiest manner. In 1848, he retired into private life, the infirmities of age having forced him to renounce the fatigue of teaching. He died at Heidelberg, 15th Feb., 1858.

C.'s whole life was devoted to the study of antiquity. His first, and probably his greatest work, was *Symbolik und Mythologie der alten Völker, besonders der Griechen* (4 vols., Leip. 1810–12). This treatise, which asserted the symbolical character of ancient mythologies, excited a lively controversy, in which Hermann and Voss appeared as the opponents of Creuzer. His next work in importance was a complete edition of the works of Plotinus (3 vols., Oxford, 1835). Along with G. H. Moser, C. edited several works of Cicero—*De Natura Deorum* (1818); *De Legibus* (1824); *De Republica* (1826); and *De Divinatione* (1828), etc. Between 1837 and 1848, he published a partial collection of his writings in 10 vols. (*Deutsche Schriften.* Leip. and Darms.); the last of which contains an autobiography of C. under the title *Aus dem Leben eines Alten Professors.* He was also the writer of essays on archæological topics too numerous to be mentioned. In 1854, appeared *Friderici Creuzeri Opuscula Selecta.*

CREUZOT, LE, a t. of France, dep. of Saone-et-Loire, 12 m. s.s.e. of Autun. It is situated in the midst of a district rich in coal and iron, and possesses large iron foundries, which turn out cannon, anchors, steam machinery, etc., and which employ 10,000 workmen. A short railway connects the town with the canal du Centre, which traverses the coal-field. There is also a glass manufactory, one of the most important in France. C. has of late increased rapidly in size and importance. The population, which in 1841 was 4,000, in 1876 had reached 15,599.

CRÈVECŒUR (*Heart-breaker*), the name of a Dutch port in the province of North Brabant, on the left bank of the Meuse, where this river receives the Dieze, about 4 m. n.n.w. of Bois-le-Duc. It figures somewhat prominently in the wars of the Dutch and Spaniards.

CRÈVECŒUR, HECTOR SAINT JOHN DE, 1731–1813; a French traveler and agriculturist, who settled in New York as a farmer. In the American revolution he was sent to England as a prisoner, was exchanged, and went to Normandy. Afterwards he returned to the United States, and became consul-general for the states of New York, New Jersey, and Connecticut. He found that his wife was dead and his property destroyed, but his children had been protected by a gentleman of Boston. He wrote *Letters of an American Agriculturist; Travels in Pennsylvania and New York;* and a paper on the introduction of the potato into Normandy.

CREVILLENTÉ, a t. of Spain, in the province of Alicante, about 20 m. w.s.w. of the city of that name. It is situated at the foot of the hills forming the boundary of Murcia, and has a population of about 7,000, who are chiefly engaged in weaving and in agricultural pursuits.

CREW, of a ship, is a collective name for all the persons employed therein, but usually limited to designate petty officers and seamen only. In men-of-war the entire C. are divided into five groups: 1. Commissioned and warrant officers; 2. Chief petty officers; 3. First-class working petty officers; 4. Second-class working petty officers; 5. Able seamen, ordinary seamen, landsmen, and boys. In the very largest war steamers now afloat, there are upwards of 152 different ranks, grades, or offices among the C., excluding officers and marines.

In a merchant ship, under the new mercantile marine act, the master, before he starts on a voyage, must send a list of his C. to the customs' comptroller at the port of departure, and a similar list within 48 hours after his return. The masters of coasting vessels, however, are required to do this only twice a year. Emigrant officers insist that ships to Australia shall have four seamen as C. to every 100 tons burden, and three to ships bound for America. In the large sea-going steamers, however, the number of

hands is relatively greater, owing to the various duties relating to the machinery; a steamer of 1000 tons will have as many as 60 or 70 hands, if bound for a long voyage.

CREWE, a t. in the s. of Cheshire, forming a central station of five important railways, to which it owes its present importance. Pop. '61, 8,159: '71, 17,810, chiefly employed in the railway stations, and in the manufacturing of railway carriages and locomotives. About the year 1840, there were only two or three houses where C. now stands. The London and Northwestern Railway Company have erected a handsome church, and a large mechanics' institute, containing an assembly room.

CREWKERNE, a t. in the s.e. of Somersetshire, in the fertile valley of the Parret and Isle, 10 m. s.s.w. of Ilchester, and surrounded by a wide amphitheatre of highly cultivated hills. Pop. '71, 3,557. The chief manufactures are sail-cloth, sacking, hair-seating, webbing, and girths. Its weekly markets, and annual fair, which is held on 4th Sept., for sheep, cattle, and horses, are much frequented and well supplied. The word C. means "hermitage of the cross."

CRIBBAGE is a game with cards, played by two, three, or four persons, the whole pack being used. When three are engaged, each plays for himself; when four, they take sides. The value of the cards is the same as at whist; but there are no trumps. The number of cards dealt is usually 5 or 6, the mode of playing the game varying slightly with the number of cards used. The points are scored on a board with holes for pegs, and 61 constitutes game. The terms used in the game are as follow: *Crib,* the cards laid out by each party, the points made by them being scored by the dealer. *Pairs* are two similar cards, as two aces or two kings; they reckon for two points, whether in hand or [illegible]g. *Pairs royal* are three similar cards, and reckon six points. *Double pairs royal* are four similar cards, and reckon twelve points. These various points are thus made: If your adversary plays a seven, and you another, a pair is made, which entitles you to two points; if he then play a third seven, he makes a pair royal, and marks six; and if you play a fourth seven, it constitutes a double pair royal, and entitles you to twelve points. *Fifteen.*—If any combination, whether of two or more cards, in your hand, or in play, make together fifteen, such as a ten and a five, a two, a five and an eight, etc., you reckon two points. *Sequences* are three, four, or more successive cards, and reckon for an equal number of points; and in playing a sequence, it is of no consequence which card is played first; for instance, if your adversary plays an ace, and you a five, he a three, you a two, and he a four, he scores five for the sequence. *Flush* is when the cards are all of one suit, and reckons for as many points as there are cards. A knave of the same suit as the turn-up card counts for one in any hand. If a knave be turned up, it counts two for the dealer. For full directions for playing the game, see *Chambers's Information for the People,* article "Indoor Amusements."

CRIB-BITING is a bad habit met with especially in the lighter breeds of horses, and those spending a considerable amount of leisure in the stable. The act consists in the animal seizing with his teeth the manger, rack, or any other such object, and taking in at the same time a deep inspiration, technically called *wind-sucking.* Crib-biting springs often from idle play, may be first indulged in during grooming, especially if the operation is conducted in the stall, and the animal be needlessly teased or tickled; is occasionally learned, apparently, by imitation from a neighbor; and in the first instance is frequently a symptom of some form of indigestion. Its indulgence may be suspected where the outer margins of the front teeth are worn and rugged, and will soon be proved by turning the animal loose where he can find suitable objects to lay hold of. It usually interferes with thriving and condition, and leads to attacks of indigestion. It can be prevented only by the use of a muzzle or throat-strap; but in those newly acquired cases resulting from gastric derangement, means must further be taken to remove the acidity or other such disorder.

CRICETUS. See HAMSTER.

CRICHTON, JAMES, surnamed the "ADMIRABLE," was a native of Scotland, where he was b. in 1551, or, according to others, in 1560. His father, Robert Crichton of Elliock, in the co. of Perth, was lord advocate of Scotland from 1561 to 1573. On the mother's side, C. was descended from the old Scottish kings, a circumstance of which he used to boast on the continent. He was educated at St. Andrews university. Before he reached his 20th year, he had, it seems, "run through the whole circle of the sciences," mastered ten different languages, and perfected himself in every knightly accomplishment. Thus panoplied in a suit of intellectual armor, C. rode out into the world of letters, and challenged all and sundry to a learned encounter. If we can believe his biographers, the stripling left every adversary who entered the lists against him *hors de combat.* At Paris, Rome, Venice, Padua, Mantua, he achieved the most extraordinary victories in disputation on all branches of human knowledge, and excited universal amazement and applause. The beauty of his person and the elegance of his manners also made him a great favorite with the fair; while, as if to leave no excellence unattained, he vanquished, in a duel, the most famous gladiator in Europe. The duke of Mantua, in whose city this perilous feat was performed, appointed him preceptor to his son, Vincentio di Gonzago, a dissolute and profligate youth. One night, during the carnival, C. was attacked in the streets of Mantua by half-a-dozen people in masks. He

pushed them so hard that their leader pulled off his mask, and disclosed the features of the prince. With an excess of loyalty which proved his death, C. threw himself upon his knees, and begged Vincentio's pardon, at the same time presenting him with his sword. The heartless wretch plunged it into the body of his tutor. Thus perished, in the 22d year of his age, the "Admirable Crichton."

What measure of truth there may be in the hyperbolical eulogies of his biographers, it is impossible to determine, as C. left no writings by which they might have been judged.

CRICKET (*gryllus; acheta* of some naturalists), a genus of orthopterous insects, of the section *saltatoria* (in which the hinder legs are long, very strong, and formed for leaping), allied to locusts and grasshoppers, and the type of a family *gryllidæ* (or *achetidæ*). The wings are folded horizontally, and form, when closed, a slender thread-like acumination beyond the wing-covers. It is supposed to be by friction of the wing-covers against each other, and from a peculiarity of their structure, that the males produce the stridulous sound which makes these insects so well known. The antennæ are long and thread-like, inserted between the eyes. The best known species is the HOUSE C. (*G. domesticus*), which is about an inch long, with antennæ of almost an inch and a half, of a pale-yellowish color, mingled with brown. It is widely distributed over Europe, particularly the south, and is common in Great Britain. Its very frequent abode is in nooks and crevices of houses, and it sometimes burrows in the mortar; the neighborhood of the fire is very attractive to it, particularly in winter; and its merry note has, accordingly, become associated with ideas of domestic comfort and cheerfulness. Without the heat of fire, it becomes dormant, or nearly so, in winter. It remains quiet during the day, but is lively and active at night, issuing forth to seek its food, which consists both of animal and vegetable substances. Bread-crumbs are very acceptable to it; and for the sake, apparently, both of food and warmth, it very much frequents bakehouses. The larvæ are wingless, the pupæ have mere rudimentary wings.—The FIELD C. (*G. campestris*) is larger, blackish, with the base of the wing-covers yellowish, feeds on herbs and roots, makes a louder noise than the house C., and is not unfrequent in some parts of England, but very rare in Scotland.—A species of C. (*G. megacephalus*) found in Sicily, makes a noise loud enough to be heard at the distance of a mile.—The MOLE C. (*gryllotalpa*) will be noticed in a separate article.

CRICKET (of doubtful derivation), a well-known game, is of very ancient date. The author of the *Cricket Field*—one of the best manuals on the subject—believes it to be identical with "club-ball," a game played in the 14th c.; it went originally by the name of "handyn and handoute." C. is a truly national English game. There is hardly a town, village, or school, that does not own its C. ground, and military authorities hold it in such estimation as a healthy recreation, that soldiers are encouraged to occupy their leisure time in its pursuit. Of late years C. has been introduced largely into Scotland and Ireland, and is rapidly becoming naturalized all over the world. The requirements for carrying on the game are—1st, a piece of level turf an acre or two in extent; 2d, a sufficient number of players to form two sides of eleven each, for *double* wicket, and a lesser number for *single* wicket; 3d, for double wicket (the mode in which the game is usually played), two bats, two sets of wickets and bails, and a ball. When a match is to be played between two "elevens," the first thing to be done is to "pitch" the wickets. *Wickets* consist of six wooden stumps, 27 in. high, and are placed in the ground in sets of three, at a distance of 22 yards apart. On the top of each set of stumps are placed two small pieces of wood, called *bails* The rival sides next toss for first "innings," and the director of the side that is to go in first, places two of his men at the wickets as batters; while a bowler, wicket-keeper, long stop, and fielders are placed in their several positions by the director of the opposite side. When these arrangements are satisfactorily made, and the markers or scorers are at their post, the umpires take their places, and the game begins. It may be well to mention here that the relative merits of rival sides are decided by the total number of *runs* made by each eleven batters during two innings—the side whose players score the most being, of course, victorious.

We may further premise that the bowler's object is to direct his ball, by a swift movement of the arm, towards the opposite wickets, at which one of the batsmen stands, and, if possible, to strike down the stumps or knock off the bails; while the object of the batsman, on the other hand, is to protect his wickets from the bowler's attack, by either stopping the ball when it reaches him (blocking), or driving it out to the field. And much of the beauty of the game depends upon the precision with which the bowler can direct ball after ball in a straight line for the wickets, and the corresponding skill displayed by a good batsman in guarding them.

We will now suppose the two batsmen to be at their places, the bowler at his, ball in hand, and the other players arranged in theirs: at a signal from the umpire the bowler cries "play!" and immediately after, *delivers* his first ball. If the batsman misses the ball, and it passes the wicket, the wicket-keeper stops it, and returns it to the bowler, who delivers another ball, and so on. When the batsman strikes the ball fieldwards, he immediately runs to the opposite wicket, passing his companion batsman, who crosses to his, and so on, till the ball has been returned by a fielder to the wicket-keeper or

bowler's hand. Thus, if the stroke be a long one, the striker may have time to run perhaps three times between the wickets before the ball is thrown up, when three "runs" are accordingly placed at his name by the scorers, on their sheet. If, however, the bowler or wicket-keeper receives the ball, and touches the wickets with it, before the advancing batsman has reached his "ground" or touches it with his bat, the striker is out, and another man takes his place. Besides, if a ball from a stroke of the bat be caught by one of the opposite party before it reaches the ground; or if in striking at a ball the striker hits down his wicket; or if he willfully prevents a ball being caught, or strikes it twice; or if any part of his person stops a ball which would otherwise have hit his wicket, the striker is out. It frequently happens that two skillful batsmen guard their wickets so effectually, and score so many runs, to one particular style of bowling, that a change either of the bowler, or style of bowling, is adopted by the other side. This change, say from swift to slow bowling, or *vice versâ*, generally produces the required results, and leads to the speedy retirement of the hitherto fortunate batsmen.

The wicket-keeper's place is a very important one, his principal duty being to stop with his hands every ball the batsman misses, it being allowable to make runs (byes) for balls that elude his grasp. Behind him stands the long stop, who is always on the outlook for balls that escape the wicket-keeper. The fielders, who are posted in various parts of the ground, ought to possess quickness of eye and foot, and skill in picking up with either hand a ball that is running, and instantly throwing it to the wickets. They must also be well skilled in catching balls. Much depends on their judgment of distance between the point at which the ball is picked up, and the wickets, as misconception of this may lead to overthrowing the ball, or throwing it short, while the batsmen are profiting by the error, and scoring additional runs. Fielders usually throw the ball to the wicket-keeper, who returns it slowly to the bowler; this saves the hands of the latter from being unsteadied by catching long balls.

At the end of every four bowls, the bowler, wicket-keeper, long-stop, and fielders, change places, and thus every four balls are delivered from alternate wickets; four balls constitute an "over," which it is the umpire's duty to reckon and announce.

We have said that each side is allowed *two* innings, but it sometimes happens that one side scores more runs in one innings than the other does in two; thus, A's side, we will suppose, goes in first, and its eleven men score 180; B's side then goes in, and scores, say, 80 the first innings, and 70 the next: in that case, A would be said to have won by an innings and 30 runs.

In England, there are many professional men who make a livelihood by playing matches with amateur clubs, and by instructing the latter in the art. The Marylebone club is the parliament of cricket, and its laws are recognized as the only genuine ode all over the world; and for skill and science, the "Eleven of all England," and the "United Eleven" (professionals), excel all other cricketers in the world. The attractions of C. are rapidly spreading. In America and Australia, the game is played to a large extent, and with skill almost equal to that of the English players. English elevens have crossed the ocean more than once to compete with the principal American and Australian clubs, and have returned to England covered with laurels. Good works on C. are *The Cricket Field* (Lond. Longmans), *Felix on the Bat*, and Lillywhite's *Guide to Cricketers* (Lond. Kent & Co.).

CRICKLADE, an agricultural t. and parliamentary borough, in the n. of Wiltshire, 7 m. s.e. of Cirencester, on the right bank of the Isis. The town of C. consists of one long street. The government is in a high-bailiff, appointed by the town. It has a considerable retail trade; and the market for fat cattle, held on the third Thursday of each month, is well attended. The parliamentary borough called C. includes, besides its own two parishes of St. Mary and St. Sampson, nearly 50 other parishes or parts of parishes, comprising a large and rich agricultural district, which returns two members to the house of commons. Pop. of parliamentary borough (1871), 43,622; of the town, 6,923.

CRIEFF—including the burgh of barony of C. and the burgh of regality of Drummond—a t. on the Earn, 17 m. w. of Perth. It is beautifully situated at the foot of the Grampians, near the entrance to the Highlands. Pop. (1871), 4,153. It has woolen manufactures, besides tanneries. The climate of C. makes it the resort of invalids in summer, and there is a superior hydropathic establishment, with accommodation for 200 visitors. It is eminent for its schools. St. Margaret's college was opened here in 1849, for the education of young ladies of the Episcopal communion. Near is the fine scenery of Glen Almond, with Trinity college, opened in 1847, for Scottish Episcopal students. Morrison's academy—built at a cost of £6,500, and endowed by Thomas Morrison, builder, Edinburgh, with £20,000—was opened in 1860. C. is the terminus of two branches of the Caledonian railway, and since the opening of the first in 1856 it has much improved. The greatest Scotch cattle-market stood here till 1770, when it was removed to Falkirk.

CRILLON, Louis de Berton des Balbes, surnamed "Le Brave," was b. at Murs, in Provence, in 1541. Under Francis of Lorraine, duke of Guise, then the model of military chivalry, he was trained for war, and, at the age of 16, was accounted an accomplished soldier. In 1558, he gave the first public proof of his valor at the siege of

Calais. Shortly after, he covered himself with glory at the capture of Guines. The whole army celebrated the praises of the young hero, who was introduced by duke Francis in flattering terms to Henry II. As a reward of his numerous heroic deeds, he obtained a multitude of church benefices, which he intrusted to the care of learned clerks. In the religious wars of the 16th c., he fought against the Huguenots, and distinguished himself at the battles of Dreux, Jarnac, and Moncontour. He was likewise present at the battle of Lepanto, in 1571, and, though wounded, was appointed to carry the news of the victory to the pope and the French king. In the atrocities of the St. Bartholomew massacre, C. had no part. In 1573, he took part in the siege of La Rochelle. In 1585, Henry III. made him knight of his orders. He continued faithful to his sovereign in his struggle with the Catholic league. Henry IV. found in him a sincere friend and adviser. After the peace with Savoy, C. retired to Avignon, and, after the fashion of a true Catholic warrior, ended his days "in the exercises of piety and penance," Dec. 2, 1615. The martial fire burned brightly in C., however, even in his last days; in proof of which, there is recorded the rather melodramatic story, that when listening at church one day to an account of the crucifixion, the old hero forgot himself, and, brandishing his sword, cried out, "Où étais tu, Crillon?" (Where wert thou, Crillon?)

CRIME, in its legal, as opposed to its moral or ethical sense, is an act done in violation of those duties for the breach of which the law has provided that the offender, in addition to repairing, if it be possible, the injury done to the individual, shall make satisfaction to the community. A private wrong, or civil injury, on the other hand, is an infringement on the rights of an individual merely, for which compensation to him is held, in law, to be a complete atonement. From this definition, which is that generally adopted by lawyers (Stephen's *Com.*, iv. p. 77), it is obvious that legal criminality is not a permanent characteristic attaching to an action, but one fixed upon it arbitrarily, from considerations of expediency. Without changing its moral character, the same action may, and very often is, a C. in one country or in one generation, and no C. in another country or a succeeding generation. Malice, or evil intention, however, is in all cases essential to the character of C., for, though there may be an immoral act which it is inexpedient to punish as a C., it can never be expedient to punish as a C. what is not an immoral act. But it is not necessary that the evil intention shall have had reference to the party injured. If the offender acted in defiance of social duty, and regardless of order, a C. has been committed, though it may not have been the particular C. which he intended. For example, it is murder if A kill B by mistake for C, unless the killing of C would have been justifiable, or excusable. The law can take no cognizance of a bare intention, which has not ripened into any sort of act. How far *attempts* to commit C. are punishable, is always a question of difficulty. The general rule seems to be, that if such acts can be unequivocally connected with the criminal intention, they are punishable, though not to the same extent as the completed crime. Pupils under seven years of age, and insane persons, as being incapable of design or intention, are regarded in the eye of the law as incapable of C.; but questions as to the responsibility of persons laboring under partial insanity are often surrounded with practical difficulties, which are positively insoluble. The defense of *compulsion*, or *vis major*, as it is called by lawyers, if completely established in fact, is generally sufficient in law. See COMPULSION. The subjection of a servant to a master, or of a wife or child to a husband or parent, will be no defense for the commission of an act of the criminality of which the offender was aware, unless it amount to compulsion. Magistrates acting *bonâ fide*, and soldiers acting under their officers in the ordinary line of duty, are not liable to a criminal charge. Extreme want is no excuse for a C. in law, though it furnishes a ground for an application for mercy.

In the technical language of the law of England, the term *offense* has a wider signification than C., the latter including only such of the former as are punishable by *indictment* (q.v.). Crimes are divided into *misdemeanors* (q.v.) and *felonies* (q.v.), the latter being a higher species of offense than the former.

CRIME'A (anciently, the Tauric Chersonese), a peninsula in the s. of Russia, forming the greater part of the government of Taurida, in lat. 44° 44′ to 46° 5′ n., long. 32° 30′ to 36° 35′ east. It is united to the mainland only by the very narrow isthmus of Perekop, between the Black sea and the sea of Azof, and separated from the isle or peninsula of Taman, on the e., only by the narrow strait of Yenikalé. The C. is thus almost surrounded by water—on three sides, by the Black sea, and on the fourth by the sea of Azof; while a trench, 70 ft. wide and 25 deep, across the isthmus of Perekop, cuts it off from the mainland. The C. is quadrilateral in shape, the four corners pointing to the four cardinal points in the compass; but a long narrow peninsula juts out on the e., which increases the extreme length of the territory from e. to w. to 190 m., the breadth being 110 miles. The whole extent of the C. is between 8,000 and 9,000 sq. miles. The coast is very much broken and indented, particularly on the side of the sea of Azof. The most easterly part of it is a mountainous peninsula, the seat of the ancient kingdom of Bosporus. From the strait of Yenikalé, through this minor peninsula and along the whole southern coast, a chain of mountains extends, which

may be regarded as a continuation of one of the chains proceeding from Mt. Caucasus. This southern district of the C. is very rich and beautiful. The mountains rise with steep slopes from the sea, whilst spurs and secondary chains extend northward, richly wooded, and with most beautiful intermediate valleys, gradually sinking into the uniform and desolate steppe which forms the northern and much greater part of the peninsula. The highest mountain is Tchatirdagh, i.e., the Tent mountain, *Mons Trapezus* of the ancients, which rises to a height of more than 5000 feet. It is a table-mountain, and has many great and deep chasms, in some of which the ice remains unmelted all the summer. The southern district of the C. is well cultivated, and is adorned by many country-seats of the Russian emperor and nobles, with parks and gardens surpassed by none in Europe. Tartar villages, mosques, and Greek convents are to be seen in most picturesque situations amongst the woods and rocks, with many ruins of ancient fortresses. The vegetation may almost be called subtropical; olive groves are frequent; the vineyards yield excellent grapes, and some of them excellent wine; and even oranges are produced. Grain of various kinds is produced abundantly, and silk, wax, and honey. Much attention is bestowed upon horses, oxen, and sheep, in which no small part of the wealth of the country consists. The northern part of the C. is in every way a contrast to the south, being little else than one waste uniform steppe, destitute of water and of wood, with a soil generally very unfit for agriculture, and with numerous salt-lakes and salt-marshes, some of which dry up in summer, and which seem to indicate that it was recently covered by the sea. The air is infected by exhalations from these marshes, and from the *Siwash* or *Putrid sea*, which is a portion of the sea of Azof, but is almost cut off from it by a narrow tongue of land called the peninsula of Arabat. In the summer and autumn, a most offensive and powerful smell arisess from the stagnant water, but the evaporation is often so complete that the Siwash is left dry, and horses can cross upon the hardened ground, where at other seasons vessels may sail. The capital of the C. is Simferopol (q.v.); the old Tartar capital is Baktshi-serai (q.v.), both situated in the interior. Sebastopol (q.v.) is situated in the s.w.; Kaffa and Kertch are situated in the s.e.; Perekop on the isthmus to which it gives its name, in the north. The C. is now directly connected with the Russian railway system, lines diverging to the s.e. coast and s.w. The small river Alma, on whose banks the first battle was fought between the Russian troops and the French and English invading army (20th Sept., 1854), falls into the Black sea, where the picturesque southern district approaches the northern steppe.

The population of the government of Taurida is (1870) 704,997, two thirds of whom are Tartars; the remainder are Russians, Germans, Greeks, etc. The chief features in the early history of the C. are given under the head Bosporus (q.v.). The Tartars conquered the territory in the 13th c., and converted it into the khanat of Krim Tartary. The Genoese under these rulers planted flourishing colonies here, which were destroyed by the Turks, who came into possession of the country in the 15th century. Russia finally subjected the C. in 1783. See RUSSIA.

CRIME'AN WAR, begun in 1853. As the French and Russian governments had taken sides in the contention between the Latin (or Roman) and Greek (or Russian) churches for exclusive possession of the holy sepulcher and other sacred places, the czar sent prince Menschikoff to Constantinople Feb. 28, 1853, as envoy extraordinary. In addition to the claims with regard to the holy places, he made certain demands respecting the protection of the Greek Christians in Turkey. As to the holy places, the sultan recommended a mixed commission, which decided in favor of the Greek church. The demands of Menschikoff with respect to the Greek Christians in Turkey were not acceded to, and the envoy left Constantinople May 21. Two weeks later, the sultan confirmed all the rights and privileges of the Greek Christians, and appealed to his allies. In June, the French and English fleets appeared. A week later the Russians crossed the Pruth into Moldavia. Diplomacy was then renewed, and a conference at Vienna was agreed to by all except the sultan, who demanded modifications which Russia refused. About the middle of Sept., 1853, four English and French war-vessels entered the Dardanelles, and on Oct. 5, the sultan declared war against Russia. The first real act of war occurred Oct. 23, when a Turkish fortress fired on a Russian flotilla. Nov. 1, Russia declared war against Turkey. Then followed in and around the peninsula of the Crimea a series of battles through about 26 months. The chief of them in the order of time were the battles of the Alma, Sept. 20, 1854, when the English, led by lord Raglan, and the French under marshal St. Arnaud, routed the Russians, who lost 5,000 men, of whom less than 1000 were prisoners; loss of the allies, 3,400. Sept. 25, the allies took Balaklava. Oct. 17, they began an unsuccessful siege of Sebastopol. The battle of Balaklava—with the celebrated charge of the light brigade—occurred Oct. 25. On Sept. 8, 1855, the French captured the Malakoff by assault, and the Russians, sinking their fleet, retreated from Sebastopol. There was little more of important fighting; peace was concluded Mar. 30, 1856, and July 9 the allies evacuated the Crimea. The losses of the allies in the entire campaign were—English, killed or died of wounds, 5,000; died of cholera, 4,244; from other diseases, 16,000; total, nearly 24,000, besides 2,873 disabled. The British public debt was increased more than $200,000,000. The French lost about 63,500 men; and the Russian loss has been estimated as much more than that of all the allies.

CRI'MEN REPETUNDA'RUM, the crime of accepting a bribe by a judge. See BARATRY, JUDGE.

CRIMINAL, one who has been convicted of a crime. A person indicted for a criminal offense is often called a culprit in England; and when undergoing trial in the court of justiciary in Scotland, he is spoken of as the panel, a word which has a different signification in England. See PANEL.

CRIMINAL CONVERSATION. See ADULTERY.

CRIMINAL COURTS. See JUSTICIARY, COURT OF.

CRIMINAL INFORMATION. See INFORMATION.

CRIMINAL LAW. See CRIME, PROSECUTION, PROSECUTOR.

CRIMP is the name given to an agent for supplying ships with seamen, just before a voyage; he receives so much per head for his trouble. This offensive name is applied to these persons, because in general they make use of untruthful representations and other unfair means to entrap sailors into service. Crimps are numerous in all large seaports, and are usually in league with publicans and prostitutes to deprive seamen of their wages. They also keep a sharp look-out for emigrants, and convey all who are simple enough to put faith in their statements to low lodging-houses in which they have an interest. The mere charge for lodging is often small, but the lodgers are cheated by provision-merchants and others who pay the C. a liberal commission on their custom. Fairly conducted, the C.'s business is no more objectionable than any other agency, and within recent years the system has been greatly improved by the operation of the "passengers' act" and "mercantile marine act," and especially by the appointment of registrars of seamen and government emigration agents.

CRIMSON. See RED COLORS.

CRI'NAN CANAL, THE, is an artificial water-communication 9 m. long, in the w. of Argyleshire, between loch Gilp, a branch of loch Fyne, and loch Crinan, in the sound of Jura, at the head of the peninsula of Cantire. It was constructed to avoid the circuitous passage of 70 m. round the Mull of Cantire, on the route from Glasgow to Inverness by the Caledonian canal. It is 24 ft. broad, and 12 deep, has 15 locks, and admits vessels of 200 tons. It was excavated in the end of last century, and cost £183,000. After a continuance of heavy rain in Feb., 1859, the three reservoirs supplying the canal with water (the highest being 800 ft. above the canal) burst, and a torrent of water rushed down the mountain-slope, washed away part of the canal banks, and filled the canal with débris and stones for upwards of a mile. Government repaired the damage at the cost of £12,000. The receipts of the canal and harbor during the year ending April, 1878, were £5,966—being £1585 in excess of the year's expenditure.

CRINED (Lat. *crinis,* the hair), a term in heraldry. When the hair of a man or woman, or the mane of a horse, differs in tincture from the rest of the charge, the object is said to be *crined,* of such a metal or color.

CRINGLES, short pieces of rope, with each end spliced into the bolt rope of a sail; commonly confining an iron or brass ring or thimble. Smaller ropes are passed through them, to aid in managing the sails.

CRINOI'DEÆ (Gr. lily-like), an order or family of radiate animals of the class *echinodermata* (q.v.), of which the recent species are few, but the fossil species so very numerous as to constitute great tracts of the dry land as it now appears. The C. have a central disk, in which is contained the digestive cavity, with two orifices, and from which arise arms or rays, five in number, but soon subdividing, so as at first sight to appear more numerous, and again subdividing into lateral appendages, either fin-like or filamentous, the disk as well as the rays and their subdivisions formed of a calcareous jointed skeleton, clothed with a fleshy integument, of which the fin-like expansions are formed, and which is thicker than in star-fishes, and contains imbedded in it the innumerable ovaries. The joints are also extremely numerous, and the subdivision of the rays often very great. The disk is composed of calcareous pieces and fleshy integument like the rays, as is also a stalk on which the whole is usually supported; the base, it is supposed, being fixed, and the disk and rays expanding like a flower. It appears probable that many of the fossil C. were permanently fixed in this manner, and this is supposed to be the case with the species of *pentacrinus* still existing, as the *P. caput Medusæ,* or Medusa's head of the West Indian seas; but others are fixed only when young, the disk and arms finally becoming detached from the stalk and moving freely in the sea, swimming in a manner analogous to that of the medusæ. This interesting fact was first discovered by Mr. J. V. Thompson, who found in the sea near Cork the stalked young of the *comatula rosacea,* a small but very beautiful species, and the only species of the C. found in the British seas. See ENCRINITES.

CRINOLINE (Fr., from Lat. *crinis,* hair) was the name originally given by the French *modistes* to a fabric made of horse hair, capable of great stiffness, and employed to distend women's attire; it is now applied in a general way to those structures of steel wire or hoops, by means of which women some years ago attained such overwhelming dimensions. This fashion of expansion is not new. The first name we find given to it is the *fardingale,* introduced by queen Elizabeth. Walpole, in his fancy description of her,

speaks of her "enormous ruff and vaster fardingale." The upper part of the body was incased in a cuirass of whalebone, which was united at the waist with the equally stiff fardingale of the same material, descending to the feet, without a single fold, in the form of a great bell. Gosson mentions the fardingale in 1596, in his *Pleasant Quippes for Upstart Newfangled Gentlewomen.* In the end of the reign of James I., this fashion gradually declined, and was further tamed down by Puritan feeling in the time of Charles I. and Cromwell, till it quite disappeared. We next hear of it in 1711 as "that startling novelty the hoop petticoat," which differed from the fardingale in being gathered at the waist. Sir Roger de Coverley is made to say of his family pictures: "You see, sir, my great-great-grandmother has on the new-fashioned petticoat, except that the modern is gathered at the waist; my grandmother appears as if she stood in a large drum, whereas the ladies now walk as if they were in a go-cart." Hogarth, in his night-scene in "Marriage à-la-Mode," introduces on the floor a hoop of the time of George II.; and about 1744, hoops are mentioned as so extravagant, that a woman occupied the space of six men. An elongated oval form also came into fashion, raised at each side to show the high-heeled shoes, causing caricaturists to say that a lady looked like a donkey carrying its panniers. These hoops were of whalebone, with canvas over them, having capacious receptacles on each side for articles of convenience. In 1780, we find hoops of cane used, being advertised to "out-wear the best sort of whalebone." About the year 1796, hoops had been discarded in private life, but were still the mode at court, and never had been seen in more full-blown enormity, continuing so to the time of George IV., when they were abolished by royal command.

We now come to the development of this fashion about the middle of the present century; which began with C. in its original and proper sense, first in the form of the inelegant "bustle" in the upper part of skirt, then the whole petticoat. Instead of the hair fabric, some used, for economy, cotton, thickly corded and starched. At length, about 1856, people were startled by the question: "Have you heard that Miss So-and-so actually wears a hoop?" and it became apparent that the fashion of queen Anne's time had returned upon us, only that the structure was somewhat lighter and more pliant; being usually composed of a series of horizontal small steel hoops, held together either by vertical bands, or by being sewed into a kind of petticoat. Unlike former times of hoops and fardingales, the fashion descended even to maid-servants, so that where the dining-room was small, table-maids have been known to give warning, because they could not clear the space between the table and the fire; and the newspapers were continually announcing "Accident from Crinoline," or "Lady burned to Death from Crinoline." The *Spectator* dealt out much cutting though playful raillery on the hoops of his day, but apparently with little effect; and equally unavailing were the satires of *Punch* and other caricaturists of the 19th century against the hideous fashion of crinoline. The hoops were sometimes made with a circumference of four and even five yards. At last, after indignation and ridicule had for years assailed the monstrosity in vain, and when people had given over speaking about it, the inflation began about 1866, without any apparent cause, to collapse; and rushing to the opposite extreme, ladies might be seen walking about as slim as if merely wrapt in a morning-gown or bathing-dress. The sole relic of this kind of expansion now to be seen is a structure of lappets, called a pannier, projecting behind, immediately below the waist.

But women, it would seem, can never rest contented without adding, in one direction or another, to their proper dimensions; for the former C. was soon supplanted by great cushions or pads of frizzled hair, applied chiefly to the back of the head, and covered over by the natural hair or by artificial tresses. Such a cushion was known as a *chignon* (Fr., the neck or neck-hair). The side tresses were swelled out by smaller rolls, called, we believe, rats and mice. This fashion was not new, but was now carried to greater extravagance than ever before; the head being sometimes rendered three times its natural size.

CRI'NUM, a genus of bulbous-rooted plants of the natural order *amaryllideæ*, having long tubular flowers, the segments of the perianth hooked at the apex, the stamens straight and inserted into the tube, and a three-celled capsule. It contains a considerable number of species, natives of different tropical and subtropical countries, generally with umbels of large and beautiful flowers, some of them amongst the most admired ornaments of our hot-houses. *C. amabile*, an Indian species, is much esteemed for its fragrance as well as its beauty, and flowers about four times a year. All the species require a rich open soil, plenty of room for their roots, and the frequent removal of suckers.—The bulbs of *C. Asiaticum* are powerfully emetic, and are used in some parts of the east in cases of poisoning.

CRIS-CROSS ROW. See CHRIST-CROSS ROW.

CRISIS (Gr. a judgment, from *krino*, I judge), a name used by the ancient physicians to denote the rapid or sudden determination of an acute disease in the direction of convalescence or of death. It was opposed in signification to lysis (*luo*, I relax), which denoted the gradual subsidence of the symptoms noticed in most chronic and in some acute diseases. The doctrine of crises was closely bound up with that of a *materies morbi*, or material of disease in the blood, which was presumed to be undergoing changes, during the whole course of the malady, tending to an evacuation of some kind from the

system in the form of a critical discharge (*apostasis* or *abscess*), which, when observed, was supposed to contain the matter of disease in a state of *coction*, and to be the direct cause of the sudden relief of the patient. Thus, according to the character and seat of the critical discharge, it was common to speak of a C. by sweating, by diarrhea, by expectoration, by urine, by parotid swellings, etc.; and no C. was considered regular that was not attended by some symptom of this kind. Another curious doctrine associated with that of crises, was the belief in certain days as ruling the beneficent or injurious, the complete or incomplete character of a crisis. The seventh, fourteenth, and twentieth (according to some, the twenty-first) days of the disease were regarded as eminently critical; less so, but still favorably critical, were the third, fifth, eleventh, and seventeenth; the fourth day was the *indicator* of a complete C. on the seventh; the sixth day was the *tyrant*, notorious for unfavorable crises; the second, eighth, tenth, thirteenth, and the rest were non-critical. Few physicians now attach much importance to critical days, but the doctrine of crises and of a *materies morbi* is still taught, with various modifications, in our medical schools and text-books.

CRISPIN, a saint and martyr, was descended from a noble Roman family. About the middle of the 3d c., under the reign of Diocletian, he, along with his brother Crispianus, fled from Rome into Gaul, where he worked as a shoemaker in the town which is now called Soissons, and distinguished himself by his exertions for the spread of Christianity, as well as by his works of charity. According to the legend, his benevolence was so great that he even stole leather to make shoes for the poor! From this, charities done at the expense of others have been called Crispinades. In the year 287, he and his brother suffered a most cruel martyrdom. Both brothers are commemorated on the 25th Oct. King Crispin, as he is called, is the universally recognized patron saint of shoemakers, and is represented with dramatic effect in the ceremonial processions of the "gentle craft." There is an amusing but scarce book about shoemakers, entitled *Crispin Anecdotes*.

CRISPIN, KNIGHTS OF SAINT, a society of shoemakers organized in Wisconsin, in 1866, to protect the interests of workingmen against employers, regulate wages, and sustain unemployed and sick members and their families. It has extended to other parts of the country and comprises a large membership.

CRITHMUM. See SAMPHIRE.

CRITIAS, an Athenian orator and poet, one of the thirty tyrants. He was a political agitator and disturber of the peace, and became so troublesome that he was banished by the people. Returning to Athens he was made ephor by the oligarchical party, and was one of the most cruel and unscrupulous of the thirty who in 404 B.C. were appointed rulers of the Lacedæmonians.

CRITICISM, the act and art of passing judgment according to a right standard upon any literary, artistic, philosophical, or mechanical work, and pointing out its merits and defects. It is the outgrowth and aid of literature and art; valuable in proportion as it is intelligent, impartial, thorough, and free from prejudice and passion. Criticism was exercised in ancient times by men of the highest eminence, among whom were Aristotle, Horace, and Quintilian. Some of the greatest critics of modern times in England were Dryden, Pope, Johnson, Coleridge, Hazlitt, Mackintosh, Hallam, Brougham, and Macaulay. Boileau, Voltaire, Saint-Beuve, and Taine may be reckoned among the eminent critics of France; while Germany has had a host, among whom should be mentioned Lessing, Goethe, Schlegel, and Kant. There was but a narrow field for criticism in the United States during the first fifty years after the revolution, but it has widened rapidly since. The earliest workers in this field were prof. Andrews Norton and prof. Levi Frisbie, of Cambridge, Willard Phillips, Samuel Gilman, and Richard H. Dana. Among those of a later day may be mentioned William Ellery Channing, Francis Gray, Edward and Alexander Everett, John G. Palfrey, George Ripley, George Bancroft, William H. Prescott, prof. Francis Bowen, James Russell Lowell, Charles Norton, Edwin P. Whipple, and George S. Hillard. In the department of theological and biblical criticism Moses Stuart, Charles Hodge, Bela B. Edwards, and Edwards A. Park have distinguished themselves. In recent years the number of critics in various departments has greatly enlarged, and much of their work is of a high order.

CRI'TO, a friend of Socrates, who assisted the philosopher with material aid, arranging for his escape from prison. He was a writer on philosophy, but none of his works are extant.

CRITOLA'US, commander of the Achean army in the battle of Scarphea, 146 B.C. He was defeated by Metellus, and is supposed to have committed suicide.

CRITTENDEN, a co. in e. Arkansas on the Mississippi river, intersected by the Memphis and Little Rock railroad; about 800 sq.m.; pop.'80, 9,415—7,518 colored. The land is low and subject to inundations; corn and cotton are the chief productions. Co. seat, Marion.

CRITTENDEN, a co. in w. Kentucky on the Ohio river, bounded on the s.w. by the Cumberland; 420 sq.m.; pop.'80, 11,688—1152 colored. The soil is good. Coal, iron, and lead are found. The chief productions are corn and tobacco. Co. seat, Marion.

CRITTENDEN, JOHN JORDON, 1786–1863; b. Ky., a U. S. senator from that state. He was a lawyer of great ability. In 1841, he was appointed attorney-general by president Harrison, but he resigned when Tyler became president. In 1842, he was sent to the senate. In 1848, he resigned and was chosen governor of Kentucky. When Fillmore was president, he was again attorney-general, and in 1855, he was again sent to the senate. In the war of the rebellion, he was one of the few southern statesmen who stood firmly by the union. His last public speech was in opposition to a conscription bill then before congress.

CRITTENDEN, THOMAS LEONIDAS, b. Ky., 1819; son of John J.; a lawyer. He served with distinction on gen. Taylor's staff and under gen. Scott in the Mexican war. When Taylor became president, he appointed Crittenden consul at Liverpool. He served in the union army during the war of the rebellion, rising to brevet maj. gen. of volunteers.

CRIVEL'LI, CARLO, Cavaliere, a Venetian painter of the 15th c., said to have studied under Jacobo del Fiore. He introduced agreeable landscape backgrounds, and was particularly fond of giving fruits and flowers as accessories. It was thought that he was of the same family as the painters Donato and Vittorio Crivelli.

CRÖA'TIA, a kingdom forming part of the Austrian empire. Along with Slavonia it forms one of the administrative divisions of the kingdom of Hungary, and their joint pop. is (1869) 1,164,806; their area, 8,757 sq. miles. C. lies to the n.e. of the Adriatic, and borders on one side with Turkey. It is traversed by low chains of mountains, in the s. proceeding from the Julian Alps, and in the n. from the Carnic Alps. These mountains are generally covered with forests, and the chains are separated by very fertile valleys. The principal rivers are the Save and its affluent the Culpa, the Drave and its affluent the Mur. Some of the valleys, especially in the s., are quite shut in, so that many of the streams have to make their way through subterranean channels. The climate much resembles that of the neighboring parts of Hungary, the more southern situation being counterbalanced by the greater elevation. The inhabitants are mostly of Slavonic race and language. The religion of C. is that of the Roman and Greek churches. The Croatians are warlike, but the name *Croats* is employed to designate light-cavalry regiments in the imperial army, in which Magyars and others are mingled with true Croatians. Grain, chestnuts, wine, and gall-nuts are amongst the principal exports of Croatia. The keeping of cattle is neglected. The wood of the great forests, although much of it is admirably adapted for shipbuilding, is turned as yet to little account. The *Litorale* or coast district contains valuable marble quarries. The capital of C. is Agram (q.v.). C. with its *Litorale* and Slavonia (q.v.) formerly formed a crown-land, at the head of the administration of which was the ban (q.v.) of Croatia.

C. was, in the earliest historic times, inhabited by the Pannonians, who were conquered by the Romans under Augustus, and the country made a province of Illyria. During the irruptions of the northern nations into the Roman empire, C. suffered a variety of vicissitudes. In 640, the Croats, Chrovats, or Horvats, migrated into it from the Carpathian mountains, and gave it its present name. In the 14th c., having previously been in some measure incorporated with Hungary, C. was more completely united with that kingdom, and passed with it in the beginning of the 16th c. to the Austrian house of Hapsburg. In the end of the 16th c., the Turks conquered a portion of it, now known as Turkish Croatia. The city of Fiume was declared in 1797 to be a constituent and integral part of the kingdom of Hungary; and after the termination of the French wars, Fiume remained united to Hungary till 1848. The Croatians long entertained a feeling of hostility to the Magyars, which manifested itself in 1848 and 1849 in a manner very unfavorable to the cause of the Hungarian revolution. The wise policy of Austria, however, in recognizing the legal rights of the kingdom of Hungary, has had a good effect in allaying this feeling. See MILITARY FRONTIER.

CROCHET (a French word signifying a hook), a species of handiwork, which may be described as an extensive system of looping by means of hooks made for the purpose. You take a hook of a size proportioned to the fineness of the cotton or wool employed, and begin by making a chain of loops. You then turn, and with your hook still in the last loop, begin the double process of catching the thread through each loop of the chain, and also through that in which your hook is, and thus form another chain attached to the first, and so on. This is called simple or plain crochet. Endless varieties of patterns may be formed, and lightness and elegance attained, by twisting the thread one or more times in taking up the loop, and open work is formed by passing one or more loops. This work may be made round by beginning with a very few loops, joining the first to the last, and then proceeding to take several loops through one, and so widening on. C. has this advantage over knitting, that by drawing the last loop, and leaving it wide, there is no fear of the work running down as happens when knitting-needles slip. Shades of the same color, and varieties of colors in wool as well as in silk, are used for this work. In white cotton C. can be made available, from large bed-quilts to delicate lace-like edgings. See numerous small books describing and giving patterns of crochet.

CROCKER, a co. in Iowa, on the border of Minnesota, recently set off; area about 500 sq. miles. Co. seat, Greenwood Center.

CROCK'ETS, in Gothic architecture, are projecting leaves, flowers, or bunches of foliage, used to decorate the angles of spires, canopies, pinnacles, etc. The varieties of C. are innumerable, almost every kind of leaf and flower being copied for the purpose. C. only appear in pyramidal and curved lines, never in horizontal ones.

CROCKETT, a co. in w. Tennessee formed since 1870. It is in a cotton-growing region. The Memphis and Ohio railroad passes through. Co. seat, Alamo. Pop.'80, 14,103.

CROCKETT, DAVID, 1786–1836; a native of Ky., famous for eccentricities. He was a good specimen of the unlearned backwoodsman, was a great hunter, and possessed a rare fund of humor, mingled with common sense. He served under Jackson in the war against the Creek Indians. In 1827, and twice afterwards, he was elected to congress, where his oddities of dress and address made much sensation. But refined civilization was irksome to him, and he was among the first of Americans to strike for the independence of Texas. He was one of the defenders of the Alamo, where, with half a dozen others, he was butchered by Santa Anna after the surrender. Crockett's well-known axiom was: "Be sure you are right, then go ahead!"

CROCODILE, *Crocodilus*, a genus of saurian reptiles, the type of the family *crocodilidæ;* which some naturalists have erected into a distinct order of reptiles (*loricata*), on account of the square bony plates with which their bodies are covered, instead of the scales of the other saurians—the greater solidity of the skull—the lungs not descending into the abdomen—and the approach which they make to mammalia and birds in the structure of the heart. The heart has two auricles and two ventricles; but a mixture of arterial and venous blood takes place at some distance from the heart, so that the hinder part of the body receives an imperfectly aërated blood, which, however, is supposed to be further aërated in the surface of the peritoneum, two curious openings admitting the water, in which these animals ordinarily live, into the internal cavity of the abdomen. The *crocodilidæ* may be described as lizard-like in form, with a great gape, indicative of their characteristic voracity, and with the tail flattened at the sides, so as to become a powerful organ of propulsion in water. The fore-feet have five toes, the hind-feet four, the three inner ones only being armed with claws: the feet are more or less webbed. Each jaw has a single row of numerous large teeth, which are conical and directed backwards; planted in distinct sockets, and becoming hollowed at the base, to admit the crowns of the new and larger teeth which are to succeed them as the animal increases in size. Small ribs are attached to the vertebræ of the neck, which give it a peculiar stiffness, and make it difficult for the animal to turn; and persons pursued by crocodiles may therefore make their escape by rapid turning. The eggs of the *crocodilidæ* are hard, and small in comparison with the size ultimately attained by the animal itself. The females of some, if not of all the species, guard their eggs, and take care of their young; although the eggs, buried in the sand or mud, are hatched by the heat of the sun alone. The *crocodilidæ* swallow stones, apparently to assist digestion. They prey on fishes and warm-blooded animals; most of them seem to prefer food in a state of incipient putrefaction, and they are even said to hide their prey, and to return to it when it has reached this state. Some of the larger kinds do not scruple to attack man.—All the *crocodilidæ* are large reptiles; they are found in fresh waters and estuaries in the warm parts of the world; none are found in Europe, nor, as far as is yet known, in Australia. They are divided into gavials, crocodiles, and alligators (the latter including caymans).—The true crocodiles are found both in the old world and the new. The muzzle is not slender and elongated, as in the gavials, but oblong and flattened; the teeth are very unequal in size, the long fourth teeth of the lower jaw fitting into *notches* of the upper, not into pits, as in alligators. To this genus belongs the C. of the Nile (*C. vulgaris*), which abounds also in many other rivers of Africa. It is of a bronzed green color, speckled with brown, lighter beneath, and is sometimes 30 ft. long. It often seizes human beings for its prey. In Park's *Travels*, an instance is recorded of a negro, one of his guides, who was thus seized in the Gambia, and escaped by thrusting his fingers into the crocodile's eyes. The ancient Egyptians held it sacred, and being exempted from all danger on the part of man, it became more bold and troublesome. The individuals particularly selected as the objects of idolatrous worship were tamed, and took part in religious processions. *Souchis* was the name of the deified individual, the C. god.—The DOUBLE-CRESTED or INDIAN C. (*C. biporcatus*), is very abundant in many parts of Asia, in rivers and estuaries, and is also dangerous to man. The smaller marsh C. (*C. palustris*), abundant in stagnant waters in the same regions, flees from man, and often seeks to hide itself in the mud, into which it thrusts at least its snout, then remaining contented, as if in perfect safety. Crocodiles often bury themselves in the mud in droughts, and so abide till rain falls.—The names C. and alligator are often indiscriminately used in popular language.

CRO'CUS, a genus of plants of the natural order *iridaceæ*. The species have much general similarity, and are natives chiefly of the s. of Europe and of the east. Several have been described as British, but are rather naturalized than native. Saffron (q.v.) is the produce of *C. sativus*. Some of the species are much cultivated in gardens for the beauty of their flowers, particularly those which, as *C. vernus* and *C. luteus*, flower very early in spring. The saffron C. and some other species flower in autumn. The flowers

of one or two species are fragrant. It is necessary frequently to take up C. roots and plant anew, on account of the manner in which the corms multiply. See CORM.

CROCUS OF ANTIMONY is the oxysulphide of antimony (q.v.).

CROCUS OF MARS is the finely divided red oxide of iron.

CRŒSUS, the last king of Lydia, succeeded his father, Alyattes, in 560 B.C. He made the Greeks of Asia Minor his tributaries, and extended his kingdom eastward to the Halys. From his conquests, his mines, and the golden sand of the Pactolus, he accumulated so much treasure, that his wealth has become proverbial. He gave himself up to a life of pleasure and sumptuous extravagance, and is said to have deemed himself the happiest man in the world, and to have been displeased when Solon, on a visit to his court, told him that no man should be called happy till his death. He soon found how uncertain was a happiness such as his; for his beloved son Atys was killed while hunting, and there was left to him only one son, who was dumb; and having engaged in war with Cyrus, he was totally defeated, his kingdom conquered, and himself made prisoner, and condemned to be burnt (546). At the funeral pyre, his repeated exclamation of "O Solon!" drew on him the attention of the conqueror, and the reason of it being known, his life was spared, and he was treated with great kindness. Cyrus gave him for a residence the city of Barene, near Ecbatana, and is said to have consulted him in his military undertakings, a statement which, if true, indicates that C. by no means lacked native ability. Herodotus informs us that he accompanied Cambyses, the son of Cyrus, to Egypt, and while there, incurred great danger by the boldness with which he condemned, on one occasion, the cruel conduct of the Persian king. The time of his death is unknown.

CROFT (Ang. Sax. *croft*), a piece of land connected with a humble kind of dwelling, whose inhabitant, the renter of the land, is called a crofter, and this method of letting small pieces of land, either for tillage or the rearing of cattle, is known as the crofting system. This kind of petty farming, of which there were at one time many examples in Scotland, more particularly in the highlands, is now very generally given up as inexpedient. See AGRICULTURE, FARM, SPADE-HUSBANDRY.

CROFT, WILLIAM, 1677–1727; an English musical composer, organist in the chapel royal. He published *Musica Sacra, or Select Anthems on score for two, three, four, five, six, seven, and eight voices; to which is added the Burial Service as it is occasionally performed in Westminster abbey.*

CRO'GHAN, GEORGE, 1791–1849; b. Ky.; graduate of William and Mary college. He served on the frontier in the war of 1812, and was distinguished as an aid to gen. Harrison. He served as a col. in the war with Mexico.

CRO'IA, or CRO'JA, a t. of Upper Albania, European Turkey, 45 m. s.e. of Scutari. It is situated on a mountain spur, rising about 500 ft. above the plain, and its strong position is defended by a castle. It is the chief town of the Mirdites, a nearly independent Roman Catholic people. Pop. 6,000. The famous Scanderbeg was born here.

CROIX, STE. (or SANTA CRUZ), in English, *Holy Cross* or *Holyrood*, or, somewhat barbarously, *St. Cross*, an island, the most southerly and extensive of the Virgin group, is the principal Danish possession in the West Indies. With an area of about 100 sq.m., it contains about 25,000 inhabitants, being generally cultivated like a garden.—St. C. is also the name of a river, otherwise known as the Schoodie, and also as the Passamaquoddy, which falls into Passamaquoddy bay, on the w. side of the entrance of the bay of Fundy. It is the boundary throughout between the state of Maine and the province of New Brunswick, having been so defined, from its mouth to its source, by the international treaty which recognized the independence of the United States. The St. C. is about 55 m. long, its lowest 12 m. being navigable for large vessels.

CRO'KER, JOHN WILSON, an English politician and *littérateur* of considerable notoriety, was b. at Galway, in Ireland, Dec. 20, 1780. Having been educated at a school in Cork, and at Trinity college, Dublin, he entered Lincoln's inn as a law-student in 1800, and was called to the Irish bar two years afterwards. His first literary attempt was a satire on the Irish stage, which exhibited much caustic cleverness. This was in 1803; and in 1805, he published another equally clever satire on the city of Dublin, entitled *An Intercepted Letter from Canton.* Both productions proved a great success, running through several editions. In 1807, he issued a treatise on the *State of Ireland, Past and Present*, which brought him into some notice, and, in the same year, he was elected member of parliament for Downpatrick. A warm defense in parliament, in 1809, of the duke of York, charged with corrupt administration at the horse guards, helped C. in the same year to the office of secretary to the admiralty, a post which he held for 20 years. He was one of the founders of the *Quarterly Review*, and contributed many of the most violent party articles to its pages, as well as a large number of those bitterly personal and grossly abusive reviews which were wont to disfigure that periodical. As "Rigby," allowance being made for the satire, his character is not badly hit off by Disraeli, in *Coningsby.* In parliament, C. steadily opposed the reform bill in all its stages, and its enactment ended his parliamentary career; but on all questions relative to the promotion of the fine arts, he was much ahead of the great majority of the com-

mons. He took an active part in the establishment of the Athenæum club, and rendered good service to literature by his annotated edition of Boswell's *Johnson*, and his publication of the *Suffolk Papers*, and lord Hervey's *Memoirs of the Court of George II.* His *Stories from the History of England for Children*, supplied Scott with the idea of *Tales of a Grandfather*. C. died Aug., 1857.

CROKER, T. CROFTON, a popular author and collector of Irish stories and legends, was b. in Cork, Jan. 15, 1798. He early devoted himself to the collection of legends and songs of the Irish peasantry; and in 1824, he published his *Researches in the South of Ireland*, characterized by a happy blending of humor and sentiment, with archæological learning. The work was followed by the *Fairy Legends and Traditions of the South of Ireland* (1825); *Legends of the Lakes* (1828); *Daniel O'Rourke*, a sort of Irish Münchhausen (1828); *Barney Mahoney* and *My Village* (1832); and *Popular Songs of Ireland* (1839). Of all these works, *Barney Mahoney* and *My Village* are the most original; the others partly consist of compilations; but all are marked by sound knowledge of their subjects, and a *con amore* style of writing. C. also edited *Memoirs of Joseph Holt, General of the Irish Rebels*, a very interesting work, which was published in 1838. He devoted much time, and rendered considerable service, to archæology, being member of many antiquarian societies. Through the influence of John Wilson Croker, a friend, but no relative, he, at the age of 21, obtained a clerkship in the admiralty, where he rapidly rose until he had £800 per annum. He retired from the admiralty in 1850, with a pension of £580, and died Aug. 8, 1854.

CROLY, Rev. Dr. GEORGE, an English poet, romance-writer, and preacher, of considerable reputation, was b. at Dublin, about 1785, and educated at Trinity college there. He entered the English church, and ultimately became rector of St. Stephen's, Walbrook, London. His first work was a poem, entitled *Paris in* 1815. From this time up to within a short period of his death, which took place Nov. 24, 1860, his pen was almost incessantly at work—on satire, comedy, tragedy, romance, tales, biography, magazine articles, and the weightier matters of religion. Few subjects came amiss to him, and he exhibited considerable talent in the treatment of most that he touched upon. His best known work is the romance of *Salathiel*. C. was also famous for his eloquence as a pulpit orator.

CRO'MARTY, a parliamentary burgh and seaport in the united counties of Ross and Cromarty, on a low peninsula between the Moray and Cromarty firths, on the s. side of the entrance into the latter, and 18 m. n.n.e. of Inverness. It is irregularly built, and its older streets and lanes are in the homely Flemish architecture prevalent in the old towns of the n. of Scotland. The harbor admits vessels of 400 tons, and the bay has excellent anchorage for wind-bound vessels. Pop. '71, 1481. It has manufactures of ropes, sacking, sailcloth, beer. The chief industry is the herring and white fisheries. C. has declined much since the rise, on the n. side of Cromarty firth, of Invergordon, which is more contiguous to the important districts of Easter and Wester Ross. C. unites with Kirkwall, Wick, Dingwall, Dornoch, and Tain in returning a member to parliament. In the vicinity of C. are a lighthouse and coast-guard station, and within 2 m. are some caves, and an arch, called Macfarquhar's Bed, in the old red sandstone, which rises in some parts 250 feet. Near C. are the remains of ancient chapels and camps. Hugh Miller, in whose memory a monument has been erected in the neighborhood, was a native of Cromarty.

CROMARTY FIRTH, a landlocked inlet of the North sea, on the n.e. coast of Scotland, just n.w. of the Moray firth, and inclosed by parts of the counties of Cromarty and Ross. It forms a noble harbor 18 m. long, running s.w., 3 to 5 m. broad, and 5 to 35 fathoms deep. It receives several rivers, the Conan, entering at its upper end, being 35 m. long. The entrance to C. F. is by a strait between two high wooded cliffs or headlands, the North and South Sutors of Cromarty, only 1¼ m. across, with 12 to 30 fathoms of water, and with the Three Kings reef, about half a mile off land. Near the firth are the towns of Dingwall, Invergorden, and Cromarty. The largest fleet could ride safely sheltered in this fine sheet of water. In the old red sandstone, near the mouth of the firth, Hugh Miller discovered the fossil fishes *pterychthys, osteolepis*, etc.

CRO'MARTYSHIRE, a co of the n. of Scotland, intimately connected, geographically and politically, with Ross-shire, and consisting of ten detached portions in the interior, and along the northern borders of Ross-shire. Area, 344 sq.m., or under an eighth of Ross-shire. See ROSS AND CROMARTY.

CROMDALE, a village on the e. bank of the Spey, Inverness-shire, at which was fought the battle of C., May 1, 1690, between a small remnant of the adherents of the house of Stuart, who kept in arms after the death of viscount Dundee, and the forces of king William, in which the latter were victorious. This encounter has been rendered famous by a song, entitled *Haughs of Cromdale*, which, however, presents a lamentable confusion of historical events.

CROME, JOHN, 1769–1821; an English landscape painter, son of a weaver. He was apprenticed to a sign painter, and after long effort became a teacher of drawing. His works represent the familiar scenery of his native country.

CRO'MER, a seaport and watering-place on the n. coast of Norfolk, 21 m. n. of Norfolk. It stands on the top of one of the highest cliffs of the coast. Nearly all the old town, called Shipden, with one of the churches, was swept away by the sea about the year 1500. The sea is still gaining on the land, and some houses have been destroyed by it within present memory. In 1825, some cliffs, 200 ft. high, fell into the sea. Seamen call C. bay the Devil's Throat, from its dangers to navigation. Vessels have to load and unload on the open beach. C. has fisheries for crabs, lobsters, herrings, and mackerel. Pop. of parish '71, 1423.

CROMLECH. It has been common among British archæologists, until lately, to apply this name to a rude structure of two or more unhewn stones, placed erect in the earth, and supporting a larger stone, also unhewn. According to its etymology, however, cromlech (Celt. *crom*, circle, and *lech*, a stone) is the proper term for circles of erect stones like Stonehenge (see STANDING STONES); and the name *dolmen* (Celt. *daul*, a table; *maen*, a stone) is now considered more appropriate for what used to be called a cromlech. Monuments of the kind above described, whether we call them dolmens or cromlechs, are known among the common people by other names, such as "the giant's grave," "the giant's bed," "the giant's quoit," "the fairies' table," "the devil's table," "the raised stone," "the old wives' lift," "the hag's bed," and the like.

Cromlechs are found in England, Wales, Scotland, Ireland, the Channel isles, France, Spain, Germany, Denmark, and some other countries of Europe; in Hindustan and elsewhere in Asia; and in America. They are generally without any inclosure; but occasionally they are fenced round with a ring of unhewn stones. In a good many instances, cromlechs have been discovered in the heart of earthen mounds or barrows. In such cases, the rude chamber or inclosure of the C. is found to contain sepulchral remains, such as skeletons or urns, together with weapons or ornaments generally of stone or bone, fragments of pottery, and bones of animals. Similar remains have been found in the chambers of cromlechs not known to have been at any time covered by barrows. These facts have led modern archæologists to believe that the C. was a sepulchral monument. The theory of the older antiquaries, that the C. was a Druidical altar, is without any foundation in what has been recorded of the Druidical worship by trustworthy writers. In a C. found under a barrow in Derbyshire, a skeleton and fragments of urns were discovered, along with Roman coins of several emperors.

Among the more remarkable cromlechs in England are Kit's Coty house in Kent, Wayland Smith's cave in Berkshire (commemorated by sir Walter Scott in *Kenilworth*), and Chun Quoit in Cornwall. The weight of the flat stone in this last C. is estimated at about 20 tons. In the marquis of Anglesey's park at Plas Newydd, in Wales, there are two cromlechs close beside each other: in the larger, five erect stones support a flat stone about 12 ft. long, 10 ft. wide, and from 3½ ft. to 4½ ft. thick. Cromlechs are comparatively rare in Scotland. The best among the well-ascertained examples is perhaps that called "The Auld Wives' Lift," near Craigmeddan castle, in the parish of Laldernock, in Stirlingshire: the recumbent stone, a mass of basalt, is 18 ft. long, 11 ft. wide, and 6 or 7 ft. thick, and the two stones which support it are of nearly the same size. It may be doubted if the partial elevation of the "Witch's stone" at Bonnington Mains, near Ratho, in the co. of Edinburgh, has not been produced by natural causes. Among the Irish cromlechs, one of the most striking is that of Kilternan, about 6 m. from Dublin: the recumbent stone, which rests upon six blocks, is 23½ ft. long, 17 ft. wide, and 6½ ft. thick. A cromlech called "The Broadstone," in the co. of Antrim, is surrounded by a circle of standing stones, or erect unhewn pillars. A C. in the Phœnix park, Dublin, was discovered in 1838 in removing a large barrow: specimens of the sepulchral remains found in it are shown in the museum of the royal Irish academy. See DOLMEN.

CROMPTON, SAMUEL, whose invention of the spinning-mule entitles him to rank as one of mankind's greatest benefactors, was b. at Firwood, Bolton, Lancashire, Dec. 3, 1753. Bolton, in those days, was nearly inaccessible, and so bleak and barren that agriculture was not followed further than to supply the wants of the population. All the farmers had looms in their houses, and their families were occupied in spinning and weaving. C.'s father, who was a small farmer, lived at the Hall-in-th'-Wood, a picturesque old mansion near Bolton. He died at an early age, leaving a wife, and a son (the subject of our memoir), and two daughters. Like his father, C. was brought up to the loom and the farm. His mother, a woman of great energy, perseverance, and stern independence, struggled hard to give him and her daughters the best education the district afforded. When he was old enough, he assisted her in the farm, and wove; going to Bolton at night to complete his education in mathematics, etc. At the age of 21, he was so much annoyed at the difficulties in getting yarn to weave, that he set to work to invent a spinning-machine which should produce better yarn than Hargreaves', one of which his mother possessed. For five years he labored to realize his idea, sitting up late at night to overcome the successive difficulties, and resuming his labor for daily bread early in the morning. At length he succeeded in framing a machine which produced yarn of such astonishing fineness, that the house was beset by persons eager to know how such wonderful and desirable yarn could be made. He was rendered miserable. All kinds of devices were tried to gain admission; even ladders were placed

against his windows. His machine was such that if a mechanic saw it, he could carry away the leading features of it. He could not leave the house for fear of his discovery being stolen from him. He had spent every farthing he had in the world upon its completion; he had no funds wherewith to have obtained a patent, and it is doubtful whether a patent would have altered his fate. When he was thus almost driven to desperation, one of the manufacturers went to him and persuaded him to disclose the invention to the trade, under the promise of a liberal subscription. Inexperienced in the world, he agreed to this. The machine was exhibited, but all that he got was about £60. This money was not paid to him at the time, but he had to travel for many miles round the country to collect it. Some refused to pay, though he showed them their signatures. He set manfully to work with his machine, determined to make the best he could of his ill-luck. In the course of time, he saved money enough to begin manufacturing on a small scale, but not till his rivals had nearly 20 years' start of him in the business. Then his wife died, leaving him a large family. Efforts were made to obtain for him a national reward. Five thousand pounds was all he obtained, and he returned to Bolton almost broken-hearted. Misfortune upon misfortune overtook him till he died, June 26, 1827. Some idea may be formed of the vast services he has rendered to the world, and especially to his native land, by the fact that his is by far the most used of all spinning-machines. In 1811, the number of spindles on C.'s principle was 4,600,000, while there were only 310,500 of Arkwright's, and 155,880 of Hargreaves'. At the present time, it is conjectured that there are 25,000,000 of C.'s spindles at work. Yet this great genius was never noticed by his king, and the appointments under the factory acts to which his descendants might have aspired, have been filled by the relatives or nominees of her majesty's ministers. For a complete account of this great improver of the cotton manufacture, we refer to the *Life of Crompton*, by Mr. G. French, 1880.

CROMWELL, Henry, 1628–73; second son of the great protector, and, at the age of 16, a soldier in the parliamentary army. In the Barebone parliament he sat as one of the six Irish members. In 1655, he was sent to Ireland as a maj.gen., and was subsequently made lord-deputy. His latter years were passed as a farmer. His great-grandson, the last representative of the house of Cromwell, died in 1821.

CROMWELL, Oliver, was born at Huntingdon, April 25, 1599. His father was the younger son of sir Henry Cromwell of Hinchinbrook, and a substantial country gentleman, not likely to have been a brewer, as some of Oliver's earlier biographers assert. By his mother, genealogists trace Oliver's descent from the royal house of Stuart. Of the boy Cromwell's early life, little or nothing is actually known. What is clearly ascertained is that, after having been at school in Huntingdon, he went to Cambridge, and entered himself of Sidney-Sussex college, April 23, 1616. He had but short time for study here, his father dying in the June of the year following, when he returned home to take the management of his father's affairs. The stories of his wild life about this time appear to have no better foundation than the calumnies of royalists. In Aug., 1620, C. married the daughter of sir James Bourchier, a gentleman of landed property in Essex, who had also a residence in London. This fact is pretty conclusive as to C.'s social position being much above what his enemies have described it. C. now became intimately associated with the Puritan party, among whom he was soon distinguished alike for his earnestness and sagacity. In 1628, having been elected by the borough of Huntingdon, C. made his first appearance in parliament. He had but time to make a short blunt speech about the encouragement of the "preaching of flat popery at Paul's Cross" by the bishop of Winchester, when the infatuated king unceremoniously dispatched him and his fellow-commoners to their homes. C. returned to the fen-country, not much impressed in favor of kingcraft by his visit to London; and for the next eleven years devoted himself assiduously to the pursuit of farming by the Black Ouse river and the Cam, first at Huntingdon, then at St. Ives, and finally at Ely—making himself famous, not by political agitation, but by an effectual resistance to certain unjust schemes of the king in council for the drainage of the fens. In 1640, he was sent to parliament as member for the town of Cambridge. His appearance at this time was by no means prepossessing. Sir Philip Warwick describes him in "a plain cloth suit, which seemed to have been made by an ill country tailor; his linen was plain, and not very clean; and I remember a speck or two of blood upon his little band, which was not much larger than his collar. His hat was without a hat-band; his stature was of a good size; his sword stuck close to his side; his countenance swollen and reddish; his voice sharp and untunable; and his eloquence full of fervor;" and courtly sir Philip adds: "It lessened much my reverence unto that great council, for this gentleman was very much hearkened unto." When all hope of reconciliation between king and parliament failed, through the perfidy of the former, C. was among the first to offer of his substance to aid in defense of the state. In July, 1642, he moved in parliament for permission to raise two companies of volunteers in Cambridge, having been careful to supply the necessary arms beforehand at his own cost. In the following month, C. seized the magazine in Cambridgeshire, and prevented the royalists from carrying off the plate (valued at £20,000) in the university there. As captain of a troop of horse, C. exhibited astonishing military genius; and against the men trained by himself—"Cromwell's

Ironsides"—the battle-shock of the fiery Rupert, which at the beginning of the parliamentary struggle none else could withstand, spent itself in vain. Soon promoted to the rank of col., and then to that of lieut.gen., C., in the fight of Winceby, on the bloody field of Marston (July 2, 1644), and in the second battle of Newbury (Oct. 27, 1644), bore himself with distinguished bravery; but, owing to the backwardness of his superiors, the results of these victories to the parliamentary cause were not so great as they might reasonably have been. C. thus complained in parliament of the backwardness of his superiors, Essex and Manchester: "I do conceive if the army be not put into another method, and the war more vigorously prosecuted, the people can bear the war no longer, and will enforce you to a dishonorable peace." Hereupon, the "self-denying ordinance"—an act excluding members of the houses of parliament from holding command in the army—was passed; but C.'s services were considered of such importance to the common weal, that they were exceptionally retained. Of the new model army, Fairfax was appointed gen., C. serving under him as lieut.gen. of the horse, and in this capacity he commanded the right wing of the parliamentary army at Naseby, June, 1645, and acquitted himself so well there, that the king's forces were utterly ruined. The royalists in the west were now speedily reduced. Bristol was stormed; everywhere the royal cause was failing; and Charles himself, reduced to the last extremity, in May, 1646, escaped from Oxford in disguise, and threw himself into the arms of the Scotch army at Newark (May 5, 1646), by whom he was shortly given up to the parliamentary commissioners. The source of the strife now fairly within their grasp, the parliament and the army, in the former of which the Presbyterian, and in the latter the Independent, element predominated, became jealous of each other's power. With his usual sagacity, C. perceived that the advantage would lie with that party who held possession of the king's person, and with ready decision he had him removed from the hands of the commissioners into those of the army, June, 1647. Some of the leading Presbyterians were now turned out of parliament by the army, and Independency, with C. at its head, was gradually obtaining the ascendency. The king still remained with the army, and with his usual duplicity, negotiated with both parties, not without hope that out of their mutual dissensions might arise advantage to himself. On the 11th Nov., 1647, the king made his escape from Hampton court. Two days after, he was in custody of col. Hammond in the isle of Wight. At this time the country was in a critical condition. The Welsh had risen in insurrection, a Scotch army was bearing down from the n. with hostile intent, and Rupert, to whom seventeen English ships had deserted, was threatening a descent from Holland, not to speak of the rampant royalism of Ireland. Prompt measures alone could prevent anarchy and inextricable confusion, and C. was not afraid to employ them. Pembroke had to surrender, and at Preston Moor the Scotch were utterly defeated. On the return of the army to London, the Presbyterians, who were still blindly temporizing with the king, to the number of more than 100, were driven out (Dec., 1648), by the process known in history as "Pride's purge." Then that which C. thought could alone end the strife, happened. In Jan., 1649, the king was tried, condemned, and executed. The abolition of the house of lords followed speedily, and C. became a prominent member of the new council of state; and in the army, though still only lieut.gen., he had really much more influence than the commander-in-chief. The royalists being still strong and rebellious in Ireland, C. went thither in Aug., with the title of lord-lieutenant, and commander-in-chief of the army there; and ere nine months had passed, he had subdued the country so far, that it might be safely left to the keeping of his son-in-law, Ireton. C.'s measures for crushing the Irish rebels were indeed severe, and even sanguinary, but, nevertheless, peace and prosperity followed in a degree unknown before in the history of that unhappy country. Affairs in Scotland now claimed C.'s attention. Scotch commissioners had been negotiating with Charles II. at Breda, had urged him to come among them and take the covenant, and they would crown him king over them at least, and do what force of arms could do to make him king of England also. Charles arrived in the n. of Scotland on the 23d June, 1650; three days thereafter, Cromwell—Presbyterian Fairfax having refused to fight against the Presbyterian Scotch—was appointed commander-in-chief of all the parliament forces. On the 15th of July, Charles Stuart had signed the covenant, and was fully accepted as king. On the 3d Sept. following, C. routed the Scotch army at Dunbar. Charles, with what force remained, and other accessions, afterwards marched southward, and had penetrated to Worcester, when C. came up with him, and utterly overthrew the royalists on the anniversary of the battle of Dunbar. This battle placed C. avowedly at the head of public affairs in England, and to write his biography from this time until his death, would be to write the history of the commonwealth. The Long parliament had now degenerated into the Rump—had become, in truth, an oligarchy, given to long and useless discussions about mere technicalities—intolerable to the country alike for the extraordinary power it possessed, and for the weak, pusillanimous way in which it exercised it. C., therefore, dissolved the Rump, 20th April, 1653, and henceforth he alone was ruler in England. He immediately summoned a parliament of 140 persons, 138 of whom assembled on the 4th July, but he found it necessary to dissolve it on the 12th Dec.; its one great work having been the legal investiture of C. with the supreme power and the title of lord protector, a position upon which the principal foreign powers

hastened to congratulate him. C. now acted in a very arbitrary manner, so far as his parliaments were concerned, calling them and dismissing them at pleasure; but his home policy, notwithstanding, was just and liberal towards the mass of the people, and conducive to the prosperity of the country; while his foreign policy was such as to secure England a position among nations more commanding than any she had ever occupied before. Under C.'s rule, swift retribution followed any indignity or injury to Englishmen, no matter by whom or where perpetrated; and religious persecutors on the continent, in terror, stayed their bloody swords on the stern summons of the lord protector. He died Sept. 3, 1658, the anniversary of some of his most important victories. C. was buried in Westminster abbey; but on the 30th Jan., 1661 (the anniversary of the death of Charles I.), his grave, along with those of Ireton and Bradshaw, were broken open, the coffins dragged to Tyburn, where the moldering bodies were hanged, and then thrown into a deep hole under the gallows, while their heads were set upon poles on the top of Westminster hall. Such was the sacrilegious brutality of the king and clergy (for the deed was done by their authority) towards England's greatest ruler. It was long a fashion with historians, content to rely upon the calumnies and falsehoods of royalist writers, to represent C. as a monster of cruelty and hypocrisy—a man with a natural taste for blood, who made use of religious phraseology merely to subserve his own ambitious ends; but after the researches of Carlyle and Guizot, the eloquence of Macaulay, and the clear statement and sound sense of Forster, such a view can no longer be upheld. C.'s religion was no mere profession, it was the very essence of the man; by nature, he was not a blood-shedder, and when necessity demanded the grim exercise of the sword, he unsheathed it with reluctance. Never was a religious man less of a bigot; he would not, in so far as his iron will could effect his purpose, permit any one to be persecuted for religious opinions. He delivered Biddle, the founder of English Unitarianism, out of the hands of the Westminster divines. He would have even given the despised and persecuted Jews the right hand of citizenship. He grasped power, and dispensed with the formality of parliaments, only because he sought to promote, in the speediest possible manner, the prosperity, happiness, and glory of his native land.

CROMWELL, RICHARD, son of Oliver Cromwell, lord protector of England, was b. at Huntingdon, Oct. 4, 1626. In early life, he was noted chiefly for his indolence and love of pleasure, qualities that united him more closely to the cavaliers than to the party of earnest men of which his father was the chief. When Oliver attained the dignity of lord protector, he called his son from the obscurity of a country-house, and his field-sports, to have him elected for the counties of Monmouth and Southampton, appointed him first lord of trade and navigation, and made him chancellor of Oxford. In none of these capacities did Richard C. exhibit any aptitude; and his failure as protector, to which high office (being the eldest surviving son) he succeeded, on the death of his father, Sept., 1658, was still more conspicuous. With a mediocre intellect, and no energy, hardly a friend in the army, and the first parliament he called against him, the result could not be otherwise than it was—his demission (April, 1659)—little more than seven months after he had assumed the sceptre of the commonwealth. He retired to Hampton court, from whence parliamentary stinginess and pressing creditors soon drove him to the continent, where he resided for a considerable period. At length, returning to England, he had a house provided for him at Cheshunt, near London, where he resided in strict privacy until his death, in 1712.

CROMWELL, THOMAS, an eminent English statesman and ecclesiastical reformer, of the reign of Henry VIII., was b. near London in very humble circumstances, his father being a blacksmith, about 1490. After receiving but a very meagre education, he went to the continent, and became clerk in a factory at Antwerp, where he devoted his spare time to the acquisition of languages, in which he became very proficient. In 1510, he went to Italy, where he appears to have resided until about 1517, when he returned to England; and, after some time, was received into the household of Wolsey. That prelate, speedily recognizing his abilities, made him his solicitor and chief agent in all important business. As a member of the house of commons, C. warmly and successfully defended the fallen minister, his master, against the bill of impeachment—proof enough that he was not the heartlessly ambitious man that his enemies have represented him. Henry, admiring his chivalry, and appreciating his talent, made him his own secretary; knighted him in 1531, and made him a privy-councillor. Honors rapidly flowed in upon him; partly in consequence, it is said, of his having suggested to Henry the desirableness of throwing off the papal yoke altogether—an idea which suited well with the king's impetuous nature—but chiefly, no doubt, on account of his great abilities. In 1534, he had become chief secretary of state, and master of the rolls; in the following year, he was made visitor-general of English monasteries—which he afterwards suppressed in such fashion as to obtain for himself the designation of *malleus monachorum* —and keeper of the privy seal in 1536. In 1539—to pass over a variety of minor tokens of royal approbation—he had risen to be earl of Essex—having had some thirty monastic manors and estates given to him to keep up the dignity of his title—and lord chamberlain of England. C. took the leading part in establishing the doctrines of the reformation, though he seems to have done so less on religious than on political grounds. The destruction of the pope's authority, and the establishment of the supremacy of the

king in England, were what he labored to effect; and with this view he promulgated the articles of the new faith, had English bibles placed in the churches, and the youth of the nation taught the creed, the ten commandments, and the Lord's prayer; and ordered the removal of all images from the altar. In this matter of ecclesiastical polity, he has, says Mr. Froude, in the third volume of his *History of England*, "left the print of his individual genius stamped indelibly, while the metal was at white heat, into the constitution of the country. Wave after wave has rolled over his work. Romanism flowed back over it under Mary; Puritanism, under another even grander, Cromwell, overwhelmed it. But Romanism ebbed again, and Puritanism is dead, and the polity of the church of England remains as it was left by its creator." In all that concerned the state, in its vastest and most complicated foreign relations, as well as in the smallest matters of sanitary reform at home, C. took an active personal interest. But the stern, almost savage manner in which, in the carrying out of his policy, he disposed of all who opposed him, led to many and loud complaints, which damaged somewhat his popularity with the king. In order to retrieve his lost ground, he was zealous in promoting the marriage of Henry with Anne of Cleves, from whom, on account of her known Lutheran tendencies, he expected strong support. The success of his efforts in this matter proved the utter ruin of C., for the king, early conceiving a strong aversion to his unlovely queen, extended that dislike to the minister who had so strenuously promoted the marriage. Complaints against C. poured in thicker and faster, and the royal ear was not unwilling to listen now. Charges of malversation and treason were made, and he was arrested and thrown into prison (10th June, 1540); a bill of attainder was quickly drawn up, and passed the two houses of parliament with little difficulty; and on the 28th July following, C. laid his head on the block on Tower hill. A statesman of undoubted genius, he saw what was best for his country, and did it—not certainly in a way commending itself to the judgment of the present time—but, perhaps, among the best and only sure modes that could be devised in his age. He was undoubtedly unscrupulous, and very haughty towards the high; but the poor and weak found him easily accessible, and, when wronged, a warm defender; and though he was rapacious, the hungry had, nevertheless, to thank his generosity for many a meal.

CRONOS, in Greek mythology, a son of Uranus and father of Jupiter, Neptune, Ceres, and Juno. He is usually identified with the Roman Saturn.

CRONSTADT (Hungarian, *Brasso*), a t. of Transylvania, romantically situated amid the East Carpathians, at an elevation of 2,000 ft. above the sea. Lat. 45° 36′ n., long., 25° 33′ east. It consists of an inner town, surrounded by walls, and of three pretty extensive suburbs, the population being (1869) 27,766. The center town, which dates from the 13th c., is well and regularly built, and contains some handsome buildings, the chief of which is a Gothic Protestant church, built in the 14th century. This part is almost exclusively inhabited by Saxons. The suburbs, surrounded with gardens and orchards, with here and there the hoary ruins of some old castle, or the sloping roofs of some modern villa, rising above the trees, have a pleasant and picturesque appearance. The suburbs are chiefly occupied by Wallachs and Magyars. Linens, cottons, coarse woolens, hosiery, paper, etc., are manufactured here in considerable quantities. C. was the first town in Transylvania where a printing-press was established, and the first issues from it were the *Augsburg Confession*, and the works of Luther.

CRONSTADT, a strongly fortified seaport, about 20 m. w. of St. Petersburg, on a narrow calcareous island of about 5 m. in length, at the narrowest part of the Gulf of Finland, and over against the mouth of the Neva. Lat. (of cathedral) 59° 59′ 46″ n., long. 29° 46′ 38″ east. C. is at once the greatest naval station and the most flourishing commercial port of Russia. It was founded by Peter the great in 1710, the island having been taken from the Swedes by him in 1703. Its fortifications, which protect the approach to St. Petersburg, have been an object of great attention to the Russian government. The batteries are very numerous, defending every part of the channel by which vessels can enter. They are built of granite, and armed with the heaviest ordnance. The place, indeed, was considered by the British admiral who reconnoitered it during the Russian war of 1854–55, so impregnable that it would have been utter madness to make any attempt upon it. C., which is the seat of the Russian admiralty, has three harbors: the east, intended for vessels of war, and capable of accommodating 30 ships of the line; the middle harbor, where vessels are fitted up and repaired, and which is connected with the former by a broad canal; and the west or merchant's harbor, for the merchant shipping, with capacity for 1000 vessels; all are admirably defended. Not only the trade of St. Petersburg is conducted through this port, but that of a great part of the interior of Russia, which is connected with it by navigable rivers and canals. C. contains many well-built houses; the population in summer amounts, with the garrison of about 20,000 men, to 45,000 or 50,000; in winter it is much less.

CROOK, belonging to musical instruments, such as the French-horn or trumpet, is a circular tube, which fits into the end of the instrument next the mouthpiece, for the purpose of making the pitch of the instrument suit the key of the music; the notes of the parts for these instruments being always written in the natural key of C, with the name of the key of the piece marked in letters.

CROOK, GEORGE, b. Ohio, 1828; graduated at West Point in 1852. In the civil war he became maj.gen. of volunteers, and was in active service during the whole period. In 1873 he was made a brig.gen. in the regular army.

CROOK, SHEPHERD'S. See PASTORAL STAFF.

CROOKED ISLAND, one of the Bahamas, contains 160 sq.m. and about 630 inhabitants. It lies to the s.e. of Long island, of which the n.w. extremity forms nearly the middle point of the chain. In common with some others of the group, it is valuable chiefly for its salt. In the exportation of this article, C. I. appears to stand third in order, its share counting about 12,000 bushels annually. The Bahama salines are all the more important from the fact that, for the curing of fish, salt obtained by solar evaporation is preferred to that procured from mines.

CROOKED LAKE, a handsome sheet of water in w. New York, about 18 m. long by 1 to 1½ wide, lying in a deep valley, and surrounded by vineyards.

CROOKS, GEORGE RICHARD, D.D., b. Philadelphia, 1822; graduated at Dickinson college in 1840 and joined the Methodist ministry, traveling and preaching in the western states. He subsequently occupied pulpits in Philadelphia, New York, and Brooklyn. In conjunction with Dr. McClintock and with prof. Schem he produced text books for Greek and Latin, and a Latin-English lexicon. In 1860 he was selected to be the editor of the *Methodist*, a weekly newspaper then established in New York.

CROP, or OUT-CROP, is the edge of a stratum where it rises to the surface, or, as the miners say, comes out to the day. The line of out-crop of a bed along a level surface is called its *strike;* it is described by its relations to one or other of the points of the compass.

CROPSEY, JASPER FRANK, b. N. Y., 1823; distinguished as a landscape painter. In 1847, he visited Italy, where he painted "The Pontine Marshes" and other pieces. Some of his works are "The Backwoods of America," "Autumn on the Hudson River," "Richmond Hill," "Niagara Falls," "Peace," "War," and "The Sibyl's Temple."

CROQUET, an open-air game, in which two or more players endeavor to drive wooden balls, by means of long-handled mallets, through a series of arches set in the ground according to some pattern. The player who first makes the complete circle of the hoops or arches wins the match; but during the progress of the game, each player may have the progress of his ball retarded by his adversaries, or assisted by his allies; and these friendly aids and hostile attacks constitute the chief interest of croquet. Although generally spoken of as a modern game, it seems to be really a revival with modifications of the sport with a mallet and ball which was popular in England in the days of the Stewarts, and gave the name Pall Mall to localities in various towns in England as well as on the continent (see BALL). The name (It. *palla*, a ball, and *maglio*, a mallet; Fr. *palemaille*), suggests an Italian origin; but the game was early in vogue in France, and thence passed into England, probably in the beginning of the 17th century. Blount's *Glossographia* describes the game as quoted in the article BALL, and gives figures of the mallets. This game seems to have gone out of fashion early in the 18th century. Who resuscitated it in its modern form, and how it got the name of croquet, are questions that have not been answered. Since 1850, C. has been a favorite game, and was for a time the most prevalent of all summer amusements, though latterly its charms have been shared by lawn-tennis, rink-skating, etc. One advantage of the game is that the two sexes can join in it on equal terms.

A *croquet-ground* should be a well-rolled level grass plat or lawn, not less than thirty yards long by twenty yards wide; a full-sized croquet-ground measures forty yards by thirty yards. The boundaries of the ground should be well defined, either by a raised walk or a trench. The game may be very well played on an ordinary cricket-field, or in an inclosed meadow. The grass plats in the squares of large towns have been very generally appropriated to croquet. Croquet can also be played upon a well-rolled gravel ground, or upon the sea-shore, where the sands are hard and dry. Hardness is essential, so as to prevent the ball from sinking into the ground.

THE IMPLEMENTS used in croquet are mallets, balls, posts (or sticks), and hoops (which are called indifferently hoops, wires, or arches). To these are sometimes added a cage, or a pair of tunnels; or hoops, tunnels, and cage may be all employed in the same game. The progress of each player may be marked with either clips or a marking-board.

The mallets should be light and handy; with ash shafts, and boxwood or ash heads. The heads of the mallets are of various shapes—as the dice-box, which is the most common shape; the plano-convex, the hammer-head, and the cue-shape. The last, which came latest into use, has a flat end and a pointed end; the latter, like a billiard-cue, being tipped with leather. The head of the mallet should be from four inches to four and three quarters in length, by not more than two inches and three eighths at its greatest diameter, so that the center of the mallet-head should correspond to the center of the ball. The handle or shaft should be from two feet nine inches to three feet in length. Next the head there should be a ring or rings of paint, corresponding in color or number to the player's ball, and the series of colors on the starting and turning pegs.

The balls are made of box or beech, thoroughly well turned and seasoned. Boxwood is generally preferred, but a ball composed of cocoa-nut fiber and india-rubber, which is very pleasant to play with, has also been used. These balls are perfectly round, are made of the correct size and weight, and are known as "Nicholson's patent compound croquet balls." The proper size of the balls is three inches and five eighths in diameter. Where wooden balls are employed, they should be kept rubbed with linseed oil when out of play.

A full set of croquet balls consists of eight. In order to determine the order of play, these are either severally painted, in whole or in part, blue, pink, black, yellow, brown, orange, green, and red; or distinguished by bearing a different number of stripes of the same color, four of them having from one to four red stripes, and the other four from one to four blue stripes.

The pegs are two or three in number, according to the particular style of game played. They are each about 2 ft. in height, round in shape, pointed at the lower end like a cricket stump, and painted in rings corresponding to the colors of the balls—the top line blue, and then pink, black, etc. When the numerical distinction of the balls is adopted, the pegs are painted in rings alternately of red and blue.

The hoops (wires or arches) are from six to ten in number, according to the plan of the game played. On the grounds of the All England club at Wimbledon, the hoops are only one eighth of an inch larger than the balls, but in private play they are usually much wider. They should not, however, be more than six inches in width. The hoops are made of galvanized iron, or iron painted white, and are either round or flat at the top; a hoop with the crown at right angles to the legs is to be preferred. When set, the crown of the hoop should be at least twelve inches clear of the ground. By having the hoops painted white or galvanized, they are easily distinguished in an imperfect light.

The tunnels are made of wood or iron, smaller than the hoops, with flat sides. When used, the player is sometimes restricted to one way of running them. They merely add to the difficulties of the game, and are not very popular or essential.

The cage consists of an additional pair of white hoops placed crosswise in the ground, either with or without a suspended bell at their junction.

Clips or disks of tin, marked with the several colors, are sometimes used to mark the game by being hung on the hoops as each player passes through; but many players do without the clips altogether. In the place of the clips, a *marking-board*, the same in principle as the pool-board in billiards, is often used.

Terms used in the Game.

In croquet, as in other games, there are various terms employed, which, to the uninitiated, often sound strange and meaningless. We mention the most indispensable.

Roquet (pronounced *rokay*).—The word is used to denote that when both balls are "in play," the striker's ball is caused by a blow of the mallet to hit another which it has not before hit in the same turn since making a point. The making a roquet gives the striker the privilege of croqueting (pronounced *krokaying*) the ball struck. A second roquet, without a point in the interval, does not count; but it may be made for the purpose of driving away an opponent's ball, cannoning, etc.; the striker's turn ending there, unless by the same stroke he make a point, or roquets another ball, which he has not previously struck during the round, and since making a point.

Croquet.—When one ball has roqueted another, the striker's ball is placed in contact with the one roqueted, the striker then hitting his own ball with the mallet. The non-striker's ball, when moved by a croquet, is called the *croqueted ball*. The striker is not allowed to put his foot upon the ball, as was formerly the case in what was known as *tight croquet*.

A loose croquet is made in three ways: first, by the striker placing his ball close to the one he has roqueted, and striking the former, in a line passing through the axis of each —by which plan the striker's ball remains almost stationary while the other flies forward; secondly, by the player striking the ball at any angle, so as to drive the balls in opposite directions. This is called a "splitting croquet." And lastly, by touching the roqueted ball slightly, with as little movement in the player's ball as need be. This last stroke is called "taking two turns off" the roqueted ball. In any case the latter must be sufficiently moved to satisfy the umpire as to the fairness of the stroke.

A rolling croquet is made by placing the two balls in juxtaposition as before, and the player striking his own ball in such a way as to make it follow after the ball struck. This is also called a "following stroke," and is made by striking your ball high; while in a *tight croquet*, you hit your ball below its center, and with a sudden drawback motion of the hand, as in making the screw in billiards. Considerable judgment is required to make the croquet in such a way as to assist your own game and encumber that of your opponent by one and the same stroke.

The side stroke is made by raising the mallet to the shoulder, and hitting your ball full in the center.

The straight stroke is made with the mallet held straight to the axis of the ball, perpendicularly in front of the body.

Spooning is simply pushing the ball, which is considered unfair. The test of a spoon is that it makes no noise. The umpire must decide, on being appealed to, whether the ball is a *spoon* or a *tap*.

When a ball has been roqueted, the striker takes up his own ball, and places it close to the roqueted ball. He then makes his croquet as above described.

In play.—A ball is said to be "in play" as soon as it has run the first hoop; and it remains in play till it makes a roquet, when it is

In Hand.—The ball being "in hand," cannot score till it has made a croquet, after which it is again "in play;" but unless it makes a point, it continues "in hand" to the ball or balls it has croqueted for the remainder of its turn. When it has made another point, it is "in play" again to all the balls, as at the beginning of its turn.

Dead Ball.—A ball is said to be "dead" when it has run all the hoops "in order," and has struck the winning-peg.

In Order.—This term is used to signify the hoops, tunnels, cages, pegs, etc., in their regular order of play, according to the plan or arrangement adopted in placing them in the ground. When a player has made the complete round of the hoops in their proper sequence, he is said to have made his "tour" or "round" of play. The striker's hoop or peg *in order* is the one he has next to make. The game is won by the side or player succeeding in first driving the balls through the hoops, in order, to the turning-peg, and then back again to the winning-peg.

The starting and winning peg is the stake from which the play in the game proceeds. *The turning-peg* is the stake placed at the other extremity of the hoops, directly opposite the starting-peg; and round which the player must strike his ball before he makes the return-route.

To dismiss a ball is to strike it to a distance. *Running a hoop* is when a ball is struck fairly through the hoop next in order of play. *Rueing a hoop* is the failure of a ball to reach the hoop aimed at. The player who misses his first hoop is by some players known as a *booby*. *Ricochet* is the striking of a player's ball against two balls in succession. This stroke, which is sometimes called the double roquet, is precisely similar to the cannon in billiards. *A wired ball* is one which cannot be croqueted, by reason of the leg of the hoop intervening. *A rover* is a player who has made the complete tour of the hoops "in order," and elects to remain in the game to assist his side and encumber their adversaries.

The Points of the Game.

The points reckoned are: 1, Running a hoop; 2, running a tunnel or cage; 3, striking a peg; each in the regular order of play.

1. A hoop is said to be "run" when a ball has fairly passed through it while in play. A ball is considered to have "passed its hoop" if it cannot be touched by a straight stick—as the handle of a mallet—laid on the ground parallel to the hoop on the side whence the player struck.

2. In running a tunnel, the ball must pass completely through; and in running a cage, the same test may be applied as for the hoop. Where a bell is suspended—as in the Eglinton game—it must be rung before the point can be scored by the player.

3. The peg must be fairly hit, so that the blow may be heard, or the peg be seen to be moved from its position.

The player is not compelled to play for a roquet or point. It is sometimes better play for him to strike his ball towards a particular spot, so that on his turn coming round he may make his hoop the more easily. But, of course, he is liable to be roqueted by a succeeding player.

The Game.

The game of croquet may be played by any number of players not exceeding eight—four on each side. It is common, indeed, when two players engage in a match, for each to have two balls. The committee of secretaries from various croquet clubs, which drew up the now universally recognized Conference Code of Laws, recommend the game where there are two players on each side in preference to any other. The hoops being set according to one of the plans following, or in any other way decided on by the players, the game commences by the choosing of "sides." The players, for distinction's sake, take balls and mallets of opposite colors—those on one side choosing, say, blue, black, brown, or green; those on the other, the light balls—pink, yellow, orange, or red. This done, the players address one another as pink, brown, etc., according to the color of their balls. When the balls are marked by different numbers of rings, one side takes the balls with red rings, the other those with blue rings, the players being then addressed as one red, three blue, etc.

The player whose ball is nearest the top of the peg—according to any succession of colors that may be adopted or determined on—starts from a mallet's length of the *starting-peg*, and endeavors to strike his ball through the first hoop. If he fail in "running his hoop," he must wait till his turn comes round again; his ball, meanwhile, remaining on the ground to be struck (roqueted) or croqueted by any of the succeeding players. If, however, the player succeed in making his first hoop, he goes on to strike his ball through the second hoop, and so on till he fail; which, from the peculiar angles or lines

of direction between the hoops, he will probably do at his third hoop. The other colors then play in their order. It is unnecessary to follow all their strokes; but let us suppose that orange, whom we will make a lady, is just passing through her second hoop, blue, pink, black, yellow, and brown lying in various positions, in the neighborhood of the third and fourth hoops, one or other of which they are severally desirous of threading. Orange, having passed her ball through a hoop, is entitled to another hit. Carefully calculating her distance, she strikes her partner, yellow, gently, just impelling that ball towards the mouth of the hoop, through which yellow has to pass. The same stroke brought orange nearly below the third hoop, which a long stroke would enable it to pass. Like passing a hoop, striking another ball—friend or foe—gives another turn; consequently, orange has a choice before her. She may aim for the third hoop, and, as she is a good player, probably passes it; but the distance is considerable, and any pebbles or slight irregularity in the ground may cause her ball to diverge from the direction in which it was struck. On the other hand, as there are several balls in her vicinity, she prefers to work her way to the hoop by successive strokes among her neighbors, distributing favors as she goes. Blue, an enemy, lies nearest, still anxious for his third hoop. A gentle tap with the mallet brings orange against him. This entitles her either to another free stroke or to a croquet. She chooses the latter, and to perform it, selects a spot as unfavorable as possible for blue. The turning peg seems suitable; she lifts her ball, places it at the side of blue farthest from the turning-peg, and bringing down the mallet with a sharp stroke upon her own ball, sends her azure enemy flying over the lawn in the direction of the turning-peg, and even beyond it; while her own ball advances a comparatively small distance. Having croqueted, she is entitled to another turn. She similarly croquets pink; but pink being a friend, she croquets him through his hoop and well up for his fourth hoop. Black escapes orange's attention, and she, after croqueting pink, passes the hoop herself, by so doing acquiring another turn; and as she has passed a hoop between, she may again aid yellow or pink, or pass on to her other hoops herself, as she pleases. With the aid thus obtained from other balls, a good player may sometimes pass the whole round of hoops without being once stopped.

When a player has passed all the hoops on the one side, he makes his way round the turning-peg, and proceeds to run the hoops on the other side, in the contrary direction, but with the same restrictions and methods as before. Having passed through the last hoop, he may proceed to strike the starting-peg, which is also the winning-peg. By doing so, he is out, or "dead," and of course can play no more. If, however, he be a good player, he may considerably benefit his friends, and annoy his enemies, by becoming a "rover," and traveling about from hoop to hoop, aiding his partners against their foes. Of course, if a rover be a clever player, the opposite side will do their best to strike his ball against the winning-peg, and so stop his further ravages. On the other hand, if he be an awkward croqueur, it is best to let him live, as his side cannot win, though all his partners be out, so long as he can be kept afield.

This description, with the aid of the rules and definitions of terms, will, we fancy, enable anybody to play croquet without much trouble.

Each side should use a captain or leader to conduct the game; and it is also well that an umpire, who thoroughly understands the theory and laws of croquet, should be selected to decide disputed points.

The Arrangement of the Hoops.

Various plans for the placing of the hoops have been adopted by croquet players; but the general principles of the game are the same in all cases, whatever the shape of the ground or the disposition of the arches. The following is the original plan, and the easiest way of setting out the hoops; and a clever player *may* make the entire round without stopping:

To set out the hoops in this fashion, drive in the starting-peg (which is also the winning-peg), and set the first hoop in a straight line from it at a distance of 12 feet. Set the second hoop 10 ft. farther on; then draw a diagonal line of 20 ft. and set up the third hoop, with the fourth hoop 10 ft. distant in a straight line, and the fifth hoop 10 ft. farther. Then draw another diagonal of 20 ft., and set up the sixth hoop immediately opposite the second; carry the seventh hoop 10 ft. back in a straight line, and fix the turning-peg 12 ft. back, to correspond with the starting-peg. Afterwards, complete the other side in precisely the same way. Thus, the order of play will be from the starting-peg to hoop 1, and so on to the turning-peg, and thence back to the winning-peg. The perfect lines show the onward march of the balls, and the dotted lines their return. This arrangement is carried through all the diagrams here given. Of course the distance from hoop to hoop must be greatly governed by the space of the ground; but the proportions here indicated should be generally observed. A tape or line marked in feet or yards will be found of great assistance in setting out the hoops.

In small grounds, one of the hoops between the pegs may be dispensed with, only six hoops being then required.

Sometimes ten hoops are placed in a circle, with a cage in the middle, which arrangement makes the game rather more difficult; sometimes two extra pegs are added; in fact, the variety of figures which may be improvised by an ingenious captain is almost

endless. But whatever the number of hoops, pegs, etc., and whatever the arrangement adopted, the main elements of the game are the same.

Laws of Croquet.

The following rules are those known as the Conference Code, drawn up by a meeting of the secretaries of various clubs, and the recognized standard in all public games:

1. *Mallets.*—There shall be no restriction as to the number, weight, size, shape, or material of the mallets; nor as to the attitude or position of the striker; nor as to the part of the mallet held, provided the ball be not struck with the handle, nor the mace stroke used.

2. *Size of Balls.*—The balls used in match-play shall be 3⅝ in. in diameter.

3. *Choice of Lead and of Balls.*—It shall be decided by lot which side shall have choice of lead and of balls. In a succession of games the choice of lead shall be alternate, the sides keeping the same balls.

4. *Commencement of Game.*—In commencing, each ball shall be placed on the starting spot. The striker's ball, when so placed and struck, is at once in play, and can roquet another, or be roqueted, whether it has made the first hoop or not.

5. *Stroke, when taken.*—A stroke is considered to be taken if a ball be moved in the act of striking; but should a player, in taking aim, move his ball accidentally, it must be replaced to the satisfaction of the adversary, and the stroke be then taken. If a ball be moved in taking aim, and then struck without being replaced, the stroke is foul (see Law 25).

6. *Hoop, when run.*—A ball has run its hoop when, having passed through from the playing side and ceased to roll, it cannot be touched by a straight-edge placed against the wires on the side from which it was played.

7. *Ball driven partly through Hoop.*—A ball driven partly through its hoop from the non-playing side cannot run the hoop at its next stroke if it can be touched by a straight-edge placed against the wires on the non-playing side.

8. *Points counted to Non-striker's Ball.*—A ball driven through its hoop, or against the turning-peg, by any stroke not foul, whether of its own or of the adverse side, counts the point so made.

9. *Points made for Adversary's Ball.*—If a point be made for an adversary's ball, the striker must inform his adversary of it. Should the striker neglect to do so, and the adversary make the point again, he may continue his turn as though he had played for his right point.

10. *The Turn.*—A player, when his turn comes round, may roquet each ball once, and may do this again after each point made. The player continues his turn so long as he makes a point or a roquet.

11. *Croquet imperative after Roquet.*—A player who roquets a ball must take croquet, and in so doing must move both balls (see Law 25). In taking croquet, the striker is not allowed to place his foot on the ball.

12. *Ball in Hand after Roquet.*—No point or roquet can be made by a ball which is in hand. If a ball in hand displace any other balls, they must remain where they are driven. Any point made in consequence of such displacement counts, notwithstanding that the ball displacing them is in hand.

13. *Balls roqueted simultaneously.*—When a player roquets two balls simultaneously, he may choose from which of them he will take croquet; and a second roquet will be required before he can take croquet from the other ball.

14. *Balls found touching.*—If at the commencement of a turn the striker's ball be found touching another, roquet is deemed to be made, and croquet must be taken at once.

15. *Roquet and Hoop made by same Stroke.*—Should a ball, in making its hoop, roquet another that lies beyond the hoop, and then pass through, the hoop counts as well as the roquet. A ball is deemed to be beyond the hoop if it lies so that it cannot be touched by a straight-edge placed against the wires on the playing side. Should any part of the ball that is roqueted be lying on the playing side of the hoop, the roquet counts, but not the hoop.

16. *Pegging out.*—If a rover (except when in hand) be caused to hit the winning-peg by any stroke of the same side, not foul, the rover is out of the game, and must be removed from the ground. A rover may similarly be pegged out by an adverse rover.

17. *Rover pegged out by Roquet.*—A player who pegs out a rover by a roquet loses the remainder of his turn.

18. *Balls sent off the Ground.*—A ball sent off the ground must at once be replaced 3 ft. within the boundary, measured from the spot where it went off, and at right angles to the margin. If this spot be already occupied, the ball last sent off is to be placed anywhere in contact with the other, at the option of the player sending off the ball.

19. *Ball sent off near Corner.*—A ball sent off within 3 ft. of a corner is to be replaced 3 ft. from both boundaries.

20. *Ball touching Boundary.*—If the boundary be marked by a line on the turf, a ball touching the line is deemed to have been off the ground. If the boundary be raised, a ball touching the boundary is similarly deemed to have been off the ground.

21. *Balls sent off and returning to Ground.*—If a ball be sent off the ground, and

return to it, the ball must be similarly replaced, measuring from the point of first contact with the boundary.

22. *Balls sent within 3 feet of Boundary.*—A ball sent within 3 ft. of the boundary, but not off the ground, is to be replaced as though it had been sent off; except in the case of the striker's ball, when the striker has the option of bringing his ball in, or of playing from where it lies.

23. *Boundary interfering with Stroke.*—If it be found that the height of the boundary interferes with the stroke, the striker, with the sanction of the umpire, may bring in the balls a longer distance than 3 ft., so as to allow a free swing of the mallet. Balls so brought in must be moved in the line of aim.

24. *Dead Boundary.*—If, in taking croquet, the striker send his own ball, or the ball croqueted, off the ground, he loses the remainder of his turn: but if by the same stroke he make a roquet, his ball, being in hand, may pass the boundary without penalty. Should either ball, while rolling after a croquet, be touched or diverted from its course by an opponent, the striker has the option given him by law 26, and is not liable to lose his turn should the ball which has been touched or diverted pass the boundary.

25. *Foul Strokes.*—Is a player make a foul stroke, he loses the remainder of his turn, and any point or roquet made by such stroke does not count. Balls moved by a foul stroke are to remain where they lie, or be replaced at the option of the adversary. If the foul be made when taking croquet, and the adversary elect to have the balls replaced, they must be replaced in contact as they stood when the croquet was taken. The following are foul strokes:—(*a*) to strike with the mallet another ball instead of or besides one's own, in making the stroke; (*b*) to spoon—i.e., to push a ball without an audible knock; (*c*) to strike a ball twice in the same stroke; (*d*) to touch, stop, or divert the course of a ball when in play and rolling, whether this be done by the striker or his partner; (*e*) to allow a ball to touch the mallet in rebounding from a peg or wire; (*f*) to move a ball which lies close to a peg or wire by striking the peg or wire; (*g*) to press a ball round a peg or wire (crushing stroke); (*h*) to play a stroke after roquet without taking croquet; (*i*) to fail to move both balls in taking croquet; (*k*) to croquet a ball which the striker is not entitled to croquet.

26. *Balls touched by Adversary.*—Should a ball when rolling, except it be in hand, be touched, stopped, or diverted from its course by an adversary, the striker may elect whether he will take the stroke again, or whether the ball shall remain where it stopped, or be placed where, in the judgment of the umpire, it would have rolled to.

27. *Balls stopped or diverted by Umpire.*—Should a ball be stopped or diverted from its course by an umpire, he is to place it where he considers it would have rolled to.

28. *Playing out of Turn, or with the Wrong Ball.*—If a player play out of turn, or with the wrong ball, the remainder of the turn is lost, and any point or roquet made after the mistake. The balls remain where they lie when the penalty is claimed, or are replaced as they were before the last stroke was made, at the option of the adversary. But if the adverse side play without claiming the penalty, the turn holds good, and any point or points made after the mistake, are scored to the ball by which they have been made (that is, the ball is deemed to be for the point next in order to the last point made in the turn), except when the adversary's ball has been played with, in which case the points are scored to the ball which ought to have been played with. If more than one ball be played with during the turn, all points made during the turn, whether before or after the mistake, are scored to the ball last played with. Whether the penalty be claimed or not, the adversary may follow with either ball of his own side.

29. *Playing for Wrong Point.*—If a player make a wrong point it does not count, and therefore (unless he have, by the same stroke, taken croquet, or made a roquet), all subsequent strokes are in error, the remainder of the turn is lost, and any point or roquet made after the mistake. The balls remain where they lie when the penalty is claimed, or are replaced as they were before the last stroke was made, at the option of the adversary. But if the player make another point, or the adverse side play, before the penalty is claimed, the turn holds good: and the player who made the mistake is deemed to be for the point next in order to that which he last made.

30. *Information as to Score.*—Every player is entitled to be informed which is the next point of any ball.

31. *State of Game if disputed.*—When clips are used, their position, in case of dispute, shall be conclusive as to the position of the balls in the game.

32. *Wires knocked out of Ground.*—Should a player, in trying to run his hoop, knock a wire of that hoop out of the ground with his ball, the hoop does not count. The ball must be replaced, and the stroke taken again; but if by the same stroke a roquet be made, the striker may elect whether he will claim the roquet or have the balls replaced.

33. *Pegs or Hoops not upright.*—Any player may set upright a peg or hoop, except the one next in order, and that must not be altered except by the umpire.

34. *Ball lying in a Hole or on Bad Ground.*—A ball lying in a hole or on bad ground may be moved with the sanction of the umpire. The ball must be put back—i.e., away from the object aimed at—and so as not to alter the line of aim.

35. *Umpires.*—An umpire shall not give his opinion, or notice any error that may be made, unless appealed to by one of the players. The decision of an umpire, when appealed to, shall be final. The duties of an umpire are—(*a*) to decide matters in dis-

pute during the game, if appealed to; (*b*) to keep the score, and if asked by a player, to disclose the state of it; (*c*) to move the clips, or to see that they are properly moved; (*d*) to replace balls sent off the ground, or to see that they are properly replaced; (*e*) to adjust hoops or pegs not upright, or to see that they are properly adjusted.

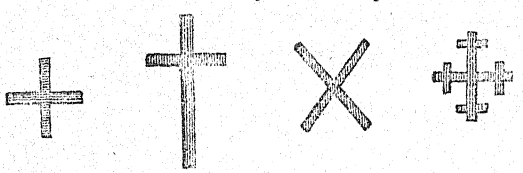
36. *Absence of Umpire.*—When there is no umpire present, permission to move a ball, or to set up a peg or hoop, or other indulgence for which an umpire would be appealed to, must be asked of the other side.

37. *Appeal to Referee.*—Should an umpire be unable to decide any point at issue, he may appeal to the referee, whose decision shall be final; but no player may appeal to the referee from the decision of an umpire.

PARLOR CROQUET.

During winter evenings, or in wet weather, the lovers of croquet may play at the game within doors, either in a large play-room or on a table. Sets of implements for various parlor and table games akin to the croquet of the lawn, are now produced by various makers. The hoops for parlor croquet are set on feet, so that they will stand straight and firm. All the rules of ordinary croquet are observed; while for the other games, rules are given with each set of implements.

CRO'SIER, a staff surmounted by a cross, which is carried before a bishop on solemn occasions. It is about 5 ft. long, is generally made of tin, and is hollow. Crosiers are generally gilt, and are often richly ornamented. The C. differs entirely from the pastoral staff, with which it is often nevertheless confounded—the latter having a circular head, in the form of a crook.



CROSBY, HOWARD, D.D., LL.D., b. New York, 1826; graduated at the university of New York, and at present its chancellor or president. From 1851 to 1859, he was professor of Greek, and subsequently held the same chair in Rutger's college. He was ordained in 1861, and became pastor of the First Presbyterian church in New Brunswick, New Jersey. Since 1863, he has been pastor of the Fourth avenue Presbyterian church, New York. He has been for several years the president and the most active member of the society for the prevention of crime, making resolute fight against illegal liquor-shops. Besides a great many sermons and addresses, he has published *Lands of the Moslem; Notes on the New Testament; Social Hints for Young Christians; Jesus, His Life and Works, as Narrated by the four Evangelists; Thoughts on the Decalogue;* and an edition of the *Œdipus Tyrannis*, of Sophocles. In 1879, he delivered the "Lyman Beecher" course of lectures in the Yale divinity school.

CROSS. The C. was a common instrument of capital punishment among the ancients; and the death of the C. was esteemed so dishonorable that only slaves and malefactors of the lowest class were subjected to it by the Romans. It was customary to proclaim the name and offense of the person crucified, or to affix a tablet (*album*) to the C., on which they were inscribed. Malefactors were sometimes fastened on a simple upright stake, and so left to die, or they were impaled upon it, and to this upright stake the Latin name *crux* was originally and more strictly applicable; but very generally a cross-piece (*patibulum*) was added to the stake, to which the arms of the criminal were tied, or to which his hands were nailed. When the cross-piece was fastened at right angles below the summit of the upright stake, the C. was called *crux immissa;* when the cross-piece was fastened at right angles across the top of the upright stake, the C. was *crux commissa;* and when it was formed of two beams crossing one another obliquely, it was *crux decussata.* The C. was erected without the gates of towns, but in places of frequent resort. The person crucified often lived for days upon the cross. The death of Christ by crucifixion, led Christians to regard the C. with peculiar feelings of reverence, and to make use of the sign of the C. as a holy and distinguishing sign. The custom of *crossing,* in honor and commemoration of Christ, can be traced back to the 3d century. The emperor Constantine, after obtaining the victory over Maxentius, through the influence—as he believed—of the sign of the C., caused crosses to be set up in public places and upon public buildings; and the veneration of the C. increased, particularly after the *Invention of the C.*, or finding of the alleged true C. of Christ in Jerusalem by the empress Helena. See CROSS, INVENTION OF. The desire for relics was gratified, and numberless portions of the true C. were given away, without its being diminished. Iconoclasts and others contended in vain against the prevalent worship of the C.; and the *crucifix* (q.v.), a C. with an image of the Saviour affixed to it, was honored more than any other image. The sign of the C. is made not only by Roman Catholics, but by the members of the eastern churches also; there are, however, distinctive differences in the manner in which it is made. It is admitted by the Lutherans as a commemorative sign of the atoning death of Christ, but by many Protestants is rejected as a human invention in worship, and as tending to superstition. It was very generally used during the middle ages, and still is among the less enlightened peasantry in some Roman Catholic countries, as a sort of charm, or as affording some security, like an amulet against all evil, and particularly against evil spirits and witchcraft.

It appears that the sign of the C. was in use as an emblem, having certain religious and mystic meanings attached to it, long before the Christian era; and the Spanish conquerors were astonished to find it an object of religious veneration among the natives of

Central and South America. Be this as it may, it was early adopted as a symbol by Christians, with express reference to the central fact of their religion, and it has been extensively used as an ornament in Christian architecture, and in the ground-plan of churches (q. v.). The C. of the resurrection is opposed to the C. of the passion, by ecclesiastical writers. It is a lance, headed by a C. instead of a pike, and carrying a banner upon which a C. is depicted. It is the C. held by the paschal lamb, and carried at the head of religious processions. The large C. always placed over the entrance of the main chancel of a church, was called the *rood* or *holy rood*.

The forms given to crosses in art are endless; but the two leading types are the Latin C., or *crux immissa*, supposed to be that on which Christ suffered, and the Greek C., both of which are subject to many fantastic variations. The Greek C. forms the well-known C. of St. George, which, adopted from the legends of that hero, was the national ensign of the English previous to the union with Scotland. The C. of St. Andrew differed entirely in form from the Latin or Greek cross. This C., or *crux decussata*, consisted of two shafts of equal length crossed diagonally at the middle, as in the annexed cut. According to the legend, this was the form of C. on which St. Andrew, the national saint of Scotland, suffered martyrdom. As the Scottish ensign, it is now blended with the C. of St. George in the Union Jack.

Greek Cross. Latin Cross. St. Andrew's Cross. Crosslet.

Many very beautiful crosses exist in England, upon the points of gables of churches, on gravestones, and in other situations, as also in heraldry. Among these, the C. most commonly seen is call the *C. crosslet*. In this figure, as seen in the annexed cut, the extremities are intersected, so as to make several small crosses. When employed in ecclesiastical architecture, the figure is usually carved in a florid or highly decorative style. When the C. crosslet is pointed at the lower extremity instead of being crossed, it is in heraldry said to be fitched, or *fitchée*. It is of frequent use in blazon.

Sanctuary, boundary, or *monumental crosses*, as they are called, consist of an upright flat pillar or obelisk, covered with sculptured devices, and set in a socket level with the ground. Occasionally, they appear to have marked boundaries, but more frequently were monuments over the graves of heroes, kings, bishops, etc. In some instances, they probably marked the verge of a sanctuary. The older of these crosses are said to be Scandinavian or Danish, and such are known as *runic crosses*, the term *rune* signifying a superstitious invocation. We are told that the island of Iona at one time possessed 360 crosses, but all are now destroyed or dispersed except one, called St. Martin's cross, standing in the grounds of the cathedral. It is a column of compact mica schist, 14 ft. high, 18 in. broad, and 6 in. thick, and is fixed in a pedestal formed out of a massive block of red granite, about 3 ft. high. In connection with certain ancient religious houses in Ireland, there were some very fine crosses of this kind; the most gigantic and impressive which still exist being that of St. Luke's in the county of Louth.

Memorial crosses are those which were erected in memory of some beloved object, or in commemoration of some event of local importance. In England, there are some superb crosses of this kind; they are popularly called *Norman crosses*. This species of C. resembled a Gothic turret set on the ground, or on a base of a few steps, and was decorated with niches for figures and pinnacles. The best known examples are those erected by Edward I. (1290) in memory of his queen, Eleanor; being placed on the spots where the body rested in its funereal progress to Westminster. The crosses at Waltham, Cheapside, and Charing were of the number. Those at Cheapside and at Charing are destroyed, but the C. at Waltham, though now much decayed, remains as a testimonial of the affection and piety of the greatest of the Plantagenets.

Town or *market crosses* were erected as stands to preach from, or in commemoration of events regarding which it was deemed proper to evoke pious feelings. As these structures were incorporated with or surmounted by a crucifix, the term *cross* was so indelibly associated with them that it survived the religious character of the fabrics. "The general intent of market-crosses was to excite public homage to the religion of Christ crucified, and to inspire men with a sense of morality and piety amidst the ordinary transactions of life."—Milner's *History of Winchester*. The earliest examples of this kind consisted, probably, of tall crucifixes of wood, such as are still seen by the waysides in some continental countries. Afterwards, stone shafts would be substituted; and according to the increase of market revenues, or progress of taste, these town crosses assumed that imposing character which they latterly possessed. Of the larger ornamental crosses of this kind, there are some striking specimens in England. We may refer to that at Cheddar in Somersetshire, and that at Malmesbury in Wiltshire, both are open vaulted structures, with a commodious space beneath, as a refuge for poor market-folks during rain, and surmounted with a kind of Gothic turret. At Chichester, Bristol, and Winchester, the market-crosses, while similar in form, are of a higher architectural quality. See Britton's *Architectural Antiquities*. Adjoining St. Paul's in London, stood Paul's C., a structure which we read of as early as 1259, in the reign of

Henry III. It was essentially a town-preaching C., and is associated with some interesting occurrences in history. Before this C. the unfortunate Jane Shore was forced to do penance in the reign of Richard III., to whose malice she was made a victim. This event was followed by Dr. Shawe's infamous sermon, attempting to bastardize the children of Edward, and eulogizing Richard, who was present on the occasion. In front of this C. sat cardinal Wolsey, to hear fulminations against Luther; and about ten years later, by order of Henry VIII., preachers here delivered sermons in favor of the reformation. At this C., queen Elizabeth attended to hear a thanksgiving sermon for the defeat of the Spanish Armada. Here, sermons continued to be delivered until 1643, when, with other so-called relics of popery, the C. incurred the displeasure of the Puritans, and was demolished by order of parliament. Whatever was the original form of Paul's C., it was in later times a plain pulpit-like fabric of wood, covered with lead, and was provided with seats for an audience. This inoffensive and really useful preaching C., which we could wish had been spared, stood on the n. side of the church, a little to the e. of Cannon Alley.

Scotland offers no specimens of memorial or Norman crosses, though, perhaps, we should make an exception in favor of the Scott monument, at Edinburgh, which is essentially a Norman C. of a gigantic order. See SCOTT, SIR WALTER. As regards the market-crosses of Scotland, they never attained to that elaborately ornate character which distinguishes such crosses as those of Chichester and Winchester. Yet the Scottish town-crosses had some distinguishing features. The more simple kind consisted of a shaft of stone, generally octangular in shape, and 12 or more feet in height. At top was an ornamental capital, which bore a dial and vane, or the figure of a unicorn. The shaft sprang from the top of a graduated flight of circular or octangular steps. A specimen of this species of C. is seen in the market-place of Melrose. The grander market C. consisted of a tall stone shaft, such as just described, but instead of steps, it sprang from the center of an imposing sub-structure. This structure was circular, hexagonal, or octagonal, and from 10 to 16 ft. high. The top formed a platform, which was surrounded with an ornamental stone parapet, and was reached by a stair inside. The sides of the building were decorated with pilasters, and bore various heraldic and other devices. Such were the crosses of Edinburgh, and such is the renovated C. of Aberdeen, the sides of which, however, are open. Losing their religious character, the Scottish market-crosses were employed for royal and civic proclamations, and as places where certain judicial writs were executed. The general removal of these ancient and interesting structures has been often matter of lamentation. The oldest C. of Edinburgh, which was the scene of a number of incidents connected with Scottish history, stood in the center of the High street, nearly opposite the entrance to the Parliament Square. It was removed in 1617, to make way for a royal pageant, the procession of James VI., on his first visit to Edinburgh after his removal to England. A new market-cross was then erected a short way further down the street, on the s. side. It consisted of an octangular sub-structure 16 ft. across, with a handsome stone shaft of about 20 ft. in height; its removal in 1756, by the civic authorities, is indignantly referred to by Scott in his poem of *Marmion*. Since its removal, royal proclamations, etc., are made on the site, which for such purposes is technically the market-cross of Edinburgh. With better appreciation of objects of archæological interest than prevailed in the 18th c., the shaft, or cross proper, was re-erected in 1869 within the railings of St. Giles. W. C.

CROSS, a co. in e. Arkansas, on St. Francis river; 625 sq. m.; pop. '80, 5,051—1790 colored. It is level, and in some parts swampy, but fertile; producing corn, cotton, etc. Co. seat, Wittsburg.

CROSS, in heraldry. If we assume the art of blazon to have originated in connection with the Crusades, it will not surprise us to find the symbol of the Christian faith so frequently introduced into the escutcheons of ancient and noble families everywhere in Europe. It is one of the honorable ordinaries, and, indeed, from its sacred character, is esteemed by heralds as the most honorable charge. Its form varies so much that Ménestrier counts 42 crosses; La Colombière, 72; and Guillim, 39. Most of the architectural crosses occur in heraldry, along with many others.

CROSS, INVENTION OF THE, the name given in the Roman Catholic church to a festival which commemorates the finding of the alleged true C. of our Saviour, and which is celebrated on the 3d of May. The empress Helena, the mother of Constantine the great, out of a desire of visiting the holy places, undertook a journey to Palestine in 326, though she was then near 80 years of age; and being animated with a great desire of finding the C. on which our Saviour suffered, she was so well directed, it is said, in the search which she instituted, that the C. was found, and with it the crosses of the two thieves; but the title being found separate from the C., a miracle readily determined which was the proper object of reverence. An order of friars, founded in honor of the invention of the cross, and carrying in their hand a staff, on the top of which was a C., received the name of *croisiers* (Fr. *croix*, cross), corrupted into *crouched* or *crutched* friars. They came to England in the 13th c., and had monasteries in London, Oxford, and Ryegate.—The festival of the *elevation of the cross* (14th Sept.) commemorates its re-erection in Jerusalem by the emperor Heraclius in 628, after it had been carried away by the Persians.

CROSS, THE ORDER OF THE, originally a spiritual order of knighthood, which sprang up in Palestine in the time of the Crusades, and was then called the *Bethlehemite order*. After the commencement of the 13th c., the knights of this order adopted the monastic life, settling chiefly in Austria, Bohemia, Moravia, Poland, and Silesia. Pope Gregory IX. confirmed the order in 1328. Its principal seat is now in Bohemia, and its members generally hold ecclesiastical preferments or professorships in the university of Prague. They are distinguished by a C. of red satin, with a six-pointed star under it, and are sometimes called *stelliferi*.

CROSS, THE SOUTHERN, the most conspicuous constellation in the southern hemisphere, situated near the Antarctic circle, and therefore never visible to our latitude. It consists of four bright stars, to which the fancy, aided by Christian associations, readily gives the cruciform shape. The two brilliant stars which mark the summit and foot of the C. have nearly the same right ascension. The constellation, therefore, is almost perpendicular when passing the meridian, and these two stars act as pointers to the Antarctic pole.

CROSS, VICTORIA. The peculiarities of this decoration, which was instituted on the termination of the Crimean campaign in 1856, are, that it may be granted to a soldier of any rank, and for a single act of valor. The C. of the legion of honor, as was felt during the Crimean campaign, served a purpose in the French army which was served by none of our decorations, and it was in imitation of it that the Victoria C. was founded, with the inscription "For Valor," and which can be given to none but those who have performed, in presence of the enemy, some signal act of valor or devotion to their country. The general distribution of the crosses earned in the Crimean war took place in Hyde Park on the 26th June, 1857. The recipients were 62 in number. The Victoria cross is in the form of a Maltese cross, and is made of bronze. In the center is the royal crown, surmounted by the lion, and below, on a scroll, the words, "For Valor." The ribbon is blue for the navy, and red for the army. On the clasp are two branches of laurel, and from it the cross hangs, supported by the initial "V." The decoration is accompanied by a pension of £10 a year.

CROSSBILL, *Loxia*, a genus of birds of the family *fringillidæ*, much resembling bullfinches, linnets, etc., except in the bill, which is altogether singular; the two mandibles —which are rather long, thick at the base, and much curved—crossing each other at the points, when the bill is closed. In different individuals, even of the same species, the upper and lower mandibles are found variously directed to the right and left. This conformation was rashly characterized by Buffon as "an error and defect in nature, and a useless deformity;" whereas, it is an admirable adaptation to the wants and habits of the birds, and other peculiarities of their structure beautifully correspond with it—the bill being articulated to the head in such a manner that the mandibles are capable not merely of vertical but of lateral motion, and muscles of extraordinary power, in comparison with the size of the bird, being provided for moving them. The result of all this is, that the crossbills readily obtain their principal food, the seeds of firs and pines, by tearing up the cones. They bring the points of the mandibles together—which they can do so as to pick up a very small seed—and insert them into the cone, when a powerful lateral movement widens the opening quite sufficiently, and the tongue, which terminates in a singular movable scoop, formed of a bone articulated to the *os hyoides*, or ordinary bone of the tongue, is inserted to detach the seed. The power of the bill is such that it can be employed in its lateral movements to tear wood to pieces, and crossbills in confinement seem to take a mischievous pleasure in so employing it, and by this means, and pulling at wires, soon destroy any ordinary cage. An apple is cut to pieces almost in an instant, in order that its seeds may be reached; and flocks of these birds sometimes do great mischief in orchards. Only three species are known, all of which have been found in Britain, although only one, the common C. (*L. curvirostra*) is of frequent occurrence. It sometimes occurs in considerable numbers, but in most years is scarcely to be seen. It is a native of Europe, Asia, and North America, dwelling chiefly in pine forests, and extending as far n. as they do, not dreading the coldest climates.

CROSS BILL IN CHANCERY is a suit brought by the defendant against the plaintiff in the original suit, for the purpose of setting up some claim or defense which could not be maintained in the original suit.

CROSS-BOW. See ARBALEST, ARCHERS AND ARCHERY.

CROSS BREEDING. See BREEDING.

CROSS BUNS, a small cake specially prepared for Good Friday, and in many towns of England cried about the streets on the morning of that day as "hot-cross buns." *Bun*, means simply a round cake—properly, a lump, being from the same root as *bunion*, Ital. *bugno*, a bump or knob; allied is the Gael. *bonnach;* a cake, a *bannock*. Good-Friday buns were appropriately marked with the cross, and hence the name. The origin of the practice is obscure. Most probably it is a relic of some heathen observance, to which the early church gave a Christian significance. At Chelsea, there were formerly two celebrated bun-houses, besieged on Good Friday from morning until night by hundreds of eager purchasers, but they have long since disappeared.

CROSS CROSSLET. See CROSS.

CROSSE, ANDREW, a remarkable experimenter on electricity, b at Fyne court, in the Quantock hills, Somersetshire, June 17, 1784, was educated at Bristol and Brasenose college, Oxford, and in 1805–6, settled on his paternal estate, where he began to devote himself to the study of electricity. Happening on one occasion to examine a cavern near his residence, he found reason to conclude that the crystallizations on the walls and roof were partially, at least, the effect of the operation of this subtle agency. In 1807, he commenced experiments with the view of forming artificial crystals by electricity. He took home some of the water which dropped from the roof of the cave, and exposed it to the action of a voltaic battery for ten days, when he found crystals of carbonate of lime forming on the negative platinum wire. C.'s endeavors to form crystals of various sorts were very successful. After 30 years of quiet research, during which period he remained totally unknown to the learned world, he obtained no less than 24 minerals, crystals of quartz, arragonite, carbonates of lime, lead, and copper, besides more than 20 other artificial minerals. Explaining his discoveries at the meeting held by the British association for the advancement of science, at Bristol in 1836, he received high praise from its most distinguished members. On this occasion, he also expressed his belief that every kind of mineral would yet be formed by the ingenuity of man. But his most startling discovery occurred a few months after. While experimenting with some highly caustic solutions, out of contact with atmospheric air, there appeared, as if gradually growing from specks between the poles of the voltaic circuit, certain animals of the genus *acarus*. C. never affirmed that he had developed animal life out of inorganic elements, but simply that under certain physical conditions he could make acari appear, and not otherwise. The "discovery" made a great noise at the time. The possibility of the fact was, of course, denied by all those persons who "take the high *priori* road," and have made up their minds as to what facts alone are possible; but Faraday declared that he had seen, during the same year, similar appearances in his own electrical experiments. C. was accused of "impiety," and of being "a reviler of our holy religion," and although a very pious man, was actually compelled to defend himself against such pitiable charges. It is humiliating to state that, in spite of his defense, various honors to which he was justly entitled, were lost to C. in consequence of his discovery. C. also invented a method of purifying sea-water by electricity, improved wines, spirits, and cider by the same process, and showed that it might be usefully applied to vegetation. He died July 6, 1855. An excellent memoir of him was published by his widow (1857).

CROSS-EXAMINATION. The examination of a witness by the party against whom he was adduced. In England, the following are the principal rules affecting cross-examination: 1. The witness may be cross-examined on the whole case, and not merely on the points on which he had been examined in chief. 2. Leading questions may be put in cross-examination. 3. Irrelevant questions may often be put, but if for the mere purpose of impeaching the witness's credit, they are inadmissible. 4. For the purpose of impeaching the character of the witness, he may always be asked whether he has been guilty of a crime, but he is not always bound to answer. 5. Evidence may be brought to contradict the answer given on cross-examination, on relevant facts, but not on irrelevant, unless the irrelevant fact be the conviction of the witness of a felony or misdemeanor. 6. A witness may be cross-examined as to any previous statement made by him relative to the trial (except matter of mere opinion as to the merits of the case), and evidence may afterwards be brought to contradict him. See EVIDENCE.

CROSS KEYS, in Rockingham co., Va., where a battle occurred (June 8, 1862) between the union forces under Fremont and the confederates under "Stonewall" Jackson. The contest was indecisive, and the losses were about equal—over 1000 killed and wounded on each side.

CROSSOPO'DIA, a genus of annelids determined from markings on the surface of Silurian slates. Nothing exhibiting structure has been observed—the surface of the slate is not even darkened by the organisms, which the markings show to have been nereid-like worms of some 6 in. in length. The extraordinary length, "probably many yards," which was ascribed to this animal, has been shown by Alexander Bryson to be founded on a confusion of the body with the track formed by the passage of the creature through a crisp rather than a slimy mud, the track having been filled up with dry blown dust, which gives it an appearance and structure different from those of the surrounding matter.

CROSWELL, EDWIN, 1797–1871; b. N. Y.; for many years a leading democratic editor. He began his journalistic career on the *Catskill Recorder*, a journal established by his father. In 1823, he became sole editor of the *Albany Argus*, remaining in that position 31 years, in partisan warfare with his whig rival, Thurlow Weed. Croswell was one of the foremost of political editors and managers.

CROSWELL, HARRY, D.D., 1778–1858; b. Conn.; a journalist and clergyman. He was editor of *The Balance*, a federalist paper in Hudson N. Y., and of the *Wasp*, a less creditable publication, in which he published a libel on Jefferson. He was sued, and his defense by Alexander Hamilton was the last forensic effort of that great lawyer.

In 1814, he took orders, and became rector of Trinity church, New Haven. He was the author of several devotional works.

CROTALA'RIA (Gr. *krotalon*, a rattle), a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, deriving its name from the inflated pods in which the seeds rattle when ripe. The species are numerous; annual, perennial, and shrubby plants, natives of the warm parts of the world. Many of them have long, straight, slender stems and branches, and some of these yield valuable fiber, particularly *C. juncea*, the sunn (q.v.), or sunn hemp of India, an annual species, the fiber of which is now an important article of commerce. JUBBULPORE HEMP, also an important fiber, and regarded as stronger than sunn, is the produce of *C. tenuifolia*, a perennial species about 9 ft. high, a native of the s. of India, which, when growing in abundant space, throws out many branches; but when sown thick, grows with little branching. *C. burhia*, which naturally grows in very arid places, is also cultivated in Sinde for its fiber; and that of *C. retusa* is employed in the Madras presidency. *C. juncea* is also often sown in India, to be used in a young state for feeding cattle.

CROTA'LIDÆ, a family of venomous serpents, agreeing with *viperidæ* in their general form and appearance; in their large head, which is broad behind and has a short muzzle; in their short tail; and in having long fangs in the front of the upper jaw, which is destitute of other teeth; but differing from them in having a large pit—the use of which is not known—on each side of the face between the nostril and the eye; and in having the tail terminated by a sort of horny spine or by a rattle. Many of the most dangerous serpents of the warm parts of Asia and America belong to this family, which receives its name from the rattlesnakes (q.v.) (Gr. *crotalus*, a rattle) of America, and contains also the genera *trigonocephalus, craspedocephalus, lachesis*, etc.

CROTCH, WILLIAM, a distinguished musical composer, was b. at Norwich in 1775. His musical genius was quite as precocious as that of the great Mozart. When little more than three years old, it is said that he could play *God save the King* almost throughout with chords, and the accuracy of his ear was such that he could detect in a moment what note was struck, and in what key the music was composed. When only 22, C.'s abilities were so much appreciated that he was appointed professor of music in Oxford university, the degree of doctor of music being conferred upon him. In 1822, he obtained the principalship of the royal academy of music. C. composed a large number of pieces for the organ and piano, as well as many vocal pieces. He was author of *Elements of Musical Composition and Thorough Bass*, and *Styles of Music of all Ages*, 3 vols. He died Dec. 29, 1847.

CROTCHET. See MUSIC.

CROTON, a small river in Dutchess, Putnam, and Westchester cos., N. Y., supplying water for the city of New York. Its length is about 60 m., and it empties into the Hudson near Peekskill.

CRO'TON, a genus of plants of the natural order *euphorbiaceæ*, having male and female flowers generally on the same plant; the male flowers with five petals; the female flowers with three styles, which are either forked or divided into many branches; the capsules 3-celled, with one seed in each cell. The species are numerous, mostly tropical or subtropical trees or shrubs, a few herbaceous. Some of them possess in a very high degree the acrid properties so characteristic of the order to which they belong. Among these, the most important is the PURGING C. (*C. tiglium*), a small tree, a native of India and the more easterly tropical parts of Asia. The leaves are extremely acrid; the wood in a fresh state is a drastic, and in a dried state, a more mild purgative; and the seeds (*C. seeds* or *tilly seeds*) are an extremely powerful drastic purgative, formerly much employed in Europe, but latterly disused on account of violence and uncertainty of action, although still valuable as yielding C. oil (q.v.). They are oval, or oval-oblong, about the size of field-beans. So great is their acridity, that dangerous effects have ensued from working for some hours with packages of them. The oil is obtained mostly by expression, and partly by treating the cake with alcohol.—The wood and seeds of *C. pavana* are employed in some parts of the east in the same way as those of *C. tiglium;* and the wood is supposed to be the *lignum pavanæ* or *pavanæ* of commerce. Other species possess similar properties.—Very different are the properties of the species which yield cascarilla (q. v) and copalche (q.v.) barks, to which a great resemblance exists in the barks of a number of species, natives chiefly of America.—Other species are still more aromatic, and some delightfully fragrant, containing in great abundance a thickish, balsamic sap. The sap of *C. gratissimus* is much employed as a perfume and cosmetic at the cape of Good Hope; that of *C. organifolium* is used in the West Indies as a substitute for balsam of copaiva; that of *C. balsamiferum*, also West Indian, furnishes *eau de mantes* by distillation; and the balsamic sap of some South American species is dried and used as incense.

CROTO'NA, or CROTON, a Greek colony in s. Italy, founded probably about 700 B.C., by Spartans and Achæans. It is said that in 510 B.C., the colony sent 100,000 men into the war with Sybaris, and overcame three times that number of their enemies. The colony seems to have vanished as rapidly as it rose. Crotona was celebrated as the seat of the school of Pythagoras

CROTON AQUEDUCT. See AQUEDUCT.

CROTON OIL is of an unctuous consistence, and varies in color from a pale yellow to a dark reddish-brown or deep sherry color. It is not miscible with water, but dissolves in alcohol and in ether. It has an acrid taste, and an unpleasant but characteristic odor, and is a powerful purgative, one drop of the pure oil being a sufficient dose. When rubbed upon the skin, it produces rubefaction and pustular eruption, and thereby tends to relieve some affections of the internal organs. It is used either by itself in the unmixed state, or diluted with olive oil, soap liniment, alcohol, etc. It is not to be employed except with caution.

CROTON RIVER. See NEW YORK.

CROTOPHAGA (Gr. tick-eater), a genus of birds of the order *scansores*, or climbers, allied to trogons and toucans, and of which some of the species are known by the names ANI and KEELBIRD, the former from their cry, the latter from the high, blade-like ridge which surmounts the short, much compressed, arched bill. The tail is fan-shaped. *C. ani*, often called the SAVANNA BLACKBIRD, is common in the West Indies and warm parts of America, inhabiting savannas and open pastures, particularly those which are occupied by cattle or horses, and feeding chiefly on insects, partly also on berries. It uses the sharp ridge of the bill in opening out earth, dung, etc., in search of insect prey. It often perches on the backs of horses or cattle, to feed on ticks, and may be seen clinging to a cow's tail; the important service which it renders being apparently well appreciated.

CROUP, a severe and fatal disease of infants, known from a remote period, but first scientifically described by Dr. Francis Home in 1765, as a suffocative affection of the breathing, depending upon the formation of a false membrane or fibrinous deposit on the mucous membrane of the windpipe or larynx (q.v.). It is proper to remark that the inflammatory disease described by Home has been frequently confounded with a purely spasmodic affection of the larynx, the asthma of Millar, or *laryngismus stridulus* of Dr. Mason Good; and also with diphtheria (q.v.), in which a false membrane is formed on the pharynx and palate, as well as in the larynx. C., in the more restricted sense, begins with symptoms resembling catarrh (q.v.), but differing in the greater degree of feverishness and hoarseness. In a short time, the respiration becomes difficult and noisy; a very peculiar hissing sound is heard accompanying the drawing of each breath; the cough is harsh and brassy; the countenance is injected, the expression very feverish and anxious, the voice entirely lost, or very much altered. This state is soon followed by one of suffocation, unless the little patient is relieved by expectoration, which, however, frequently takes place in the midst of vomiting or coughing, a quantity of membranous shreds being brought up from the windpipe along with glairy mucus, and sometimes streaks of blood. In the worst cases, the spasms of ineffectual coughing, and the constantly increasing obstruction to the breathing, are most painful to witness; and a period of tossing, extreme suffering, and anxiety is succeeded either by gradual insensibility, or by convulsions, which are very soon followed by death. True C. is rarely seen after the age of puberty, and is rather uncommon before the termination of the first year of life. It may occur, however, at any age, and has essentially the same characters as are above described. It is supposed to be due in some measure to endemic (q.v.), and partly also to epidemic (q.v.) causes. It is most common in cold and moist climates and seasons, and in low-lying, but exposed situations. The variations in its prevalence, however, are by no means fully explained. The treatment of C. requires to be very active and decided, and yet free from rashness. In cases of highly inflammatory type, and in robust children, it may be proper to take blood from the arm, or to place one or more leeches (according to the age of the child) over the top of the breast-bone. An emetic should also be given as soon as possible, composed of a full dose of tartar-emetic or of ipecacuanha, or both together. Some prefer sulphate of copper given in repeated doses; in America, a preference is given to alum and honey mixed into a paste, and given in tea-spoonful doses. The emetic may be repeated, if necessary, every 2 or 3 hours, and the child should at intervals be placed in the warm bath. It needs hardly be added that medical advice should be procured without a moment's delay, whenever it is within reach, for the disease is one of extreme danger, and almost all the most effective remedies require experienced hands for their safe administration. In extreme cases, tracheotomy (q.v.) has been resorted to with success.

CROW, *Corvus*, a genus of birds, the type of the family *corvidæ* (q.v.). The largest species of this genus is the raven (q.v.). The rook (q.v.) also belongs to it. Besides these and the jackdaw (q.v.), there are two other species found in Britain, the COMMON or CARRION C. (*C. corone*), and the ROYSTON C. or HOODED C. (*C. cornix*). They differ from one another chiefly in color, the carrion C. being black, the hooded C. gray, with black head, throat, wings, and tail. The hooded C. is also rather larger than the carrion C., which, in size, nearly agrees with the rook, but which may readily be distinguished from that species by having the base of the bill and the upper part of the throat not naked and rough, but closely feathered. The name hooded C. is derived from the appearance of the black head, contrasted with the gray body, but in some parts of Scotland is, without any show of reason, popularly transferred to the carrion C., under

the form *hoody*. Both of these species have habits much more resembling those of the raven than of the rook; they seldom or never associate in flocks, and not only prefer carrion to worms, insects, or vegetable food, but watch and attack very weak animals, such as young lambs. On this account, a premium is in many places given for their destruction, and gamekeepers relentlessly pursue them on account of their robbing nests, from which they take either the eggs or the helpless young. Their own nests are built in trees, or if these are not to be found, among high rocks. They both occasionally frequent the sea-coast, feeding on shell-fish, etc. Both are widely distributed over Europe and the northern parts of Asia.—The C. of North America (*C. Americanus*) is very similar to the carrion C., but rather smaller, and, after the breeding season is over, congregates into great flocks: it is also partially migratory, great numbers from the more northerly parts moving to the s. on the approach of winter. Its habits are otherwise intermediate between those of the carrion C. and the rook.—The FISH C. (*C. ossifragus*) frequents the coasts and southern rivers of the United States, feeding chiefly on fish, which it catches with great dexterity. It also sometimes assails gulls, and compels them to disgorge their prey.—The JABBERING C. (*C. Jamaicensis*) of the Blue mountains of Jamaica is remarkable for the resemblance of its voice to human speech, which some of the other species of this genus, as the raven, it is well known, can be taught to imitate. Sir J. E. Tennent gives an interesting account of the small glossy C. of Ceylon (*C. splendens*), which frequents the towns, feeding on offal, and boldly entering rooms through open windows, to snatch some morsel from the dinner-table. Habits of pilfering are more or less prevalent among the different species of crow.—The RED-LEGGED C. is the chough (q.v.).—The name CARRION C. is given in America to the BLACK VULTURE. See VULTURE.—The PIPING C. of New South Wales is a baritah (q.v.).

CROWBERRY, or CRAKEBERRY, *Empetrum nigrum*, a small procumbent shrub, of the natural order *empetraceæ*, a native of the northern parts of the world, abundant in the moors of Scotland and the n. of England. The order consists of a few heath-like shrubs, which, however, are regarded as having a botanical affinity to *euphorbiaceæ* (spurges, etc.), with small unisexual flowers in the axils of the leaves, the fruit a small berry seated in the persistent calyx. The berries of the C. are nearly black, surround the branches in crowded clusters, and each contain 6 to 9 bony seeds and a watery acidulous juice, which is sometimes felt to be not unrefreshing; but they are generally little esteemed. A fermented or vinous liquor is prepared from them in some northern countries. They are a favorite food of game. *E. rubrum*, a native of the vicinity of cape Horn, differs little from the northern plant, except in having red berries. The berries of the camarinheira (*corema alba*) are employed in Portugal for the preparation of an acidulous liquor, which is used as a drink in fevers.

CROWFOOT. See RANUNCULUS.

CROWLAND, or CROYLAND, an ancient t. in the s. of Lincolnshire, on the Welland, in a low flat district in the Fens, 48 m. s.s.e. of Lincoln. There once existed here a large abbey, built about 1200, and there still exist the remains of a church founded by king Ethelwald in 716. At the confluence of the Welland and the Nene, there is a curious triangular bridge, built probably in the 14th c. on the site of an older one erected about 860. Ingulfus, the historian, was abbot of Croyland. Pop. '71, 2,459.

CROWN (Lat. *corona*, Wel. *crwn*, and Gael. *cruinn*, round). Crowns were originally garlands of leaves; and in this form they have probably been used as an ornament for the head by almost every people. They were much used by both the classical nations on joyous and on solemn occasions. Among the Greeks, the C. (*stephanos*) was sometimes used as an emblem of office, as in the case of the archons; sometimes as an ornament for the heads of the victors in the public games; and sometimes as a mark of distinction for citizens who had merited well of their country. Crowns of the latter class were made at first of twigs of laurel, but latterly of gold. The Romans made use of crowns to a greater extent than the Greeks, chiefly as rewards for valor. The most highly prized was the *corona obsidionalis*, which was bestowed by a beleaguered garrison or army on the general who rescued them. It was made of grass or wild-flowers, gathered from the place which had been inclosed by the enemy. Next in order was the *civic C.*, a garland of oak-leaves and acorns, which was given as a reward to any soldier who had saved the life of a Roman citizen in battle. For the soldier who wore it, a place next to the senators was reserved at the public spectacles, and both the senate and the assemblage rose up on his entrance. Not only he, but his father and paternal grandfather were free from all public burdens; and the person whose life he had saved was bound ever after to show him the duty which a son owes to a father. The civic C. is sometimes used in heraldry.

Another of the Roman crowns was the *corona muralis*, which was bestowed on him who first scaled the wall of a besieged city. It was a golden ring surmounted with turrets or battlements. It is often used in modern heraldry.

The *corona triumphalis*, which was of three kinds, was bestowed upon a general when he obtained a triumph.

But there was a totally different class of crowns, which were not honorary, but emblematical, and which were not regulated by law, like the former ones, but by custom.

Of these, the most important were: 1. The *corona sacerdotalis*, worn by the priests and bystanders when engaged in sacrifice, with the exception of the *pontifex maximus*. It was sometimes of olive leaves, sometimes of ears of corn, and sometimes of gold. 2. *Corona funebris* or *sepulchralis*, with which the dead was crowned, a custom which prevailed both among the Greeks and Romans. A law of the twelve tables provided that if any one had been crowned while living, the C. should be placed on his head when carried out to burial. Crowns were also placed on the bier, and scattered from the windows under which the procession passed. In Greece, these crowns were commonly of parsley. 3. *Corona convivialis*. The custom of wearing wreaths on festive occasions, which, like most of the Roman customs, was derived from Greece, is supposed to have originated in the habit of tying a woolen fillet round the head, to mitigate the effects of intoxication. As luxury increased, they were made of such flowers and shrubs as were supposed to prevent intoxication, roses, violets, myrtle, ivy, and even parsley. 4. *Corona nuptialis*, or bridal-wreath, made of flowers plucked by the bride herself, and not bought, which was of bad omen. Amongst the Romans, it was made of verbena. 5. *Corona natalitia*, a chaplet suspended over the door of the vestibule in which a child was born.

Several other classical crowns are mentioned in the very elaborate article on the subject in Smith's *Dictionary*, to which we have been indebted for much of the preceding information.

As the emblem of sovereignty in modern Europe, the C. was borrowed rather from the diadem (q.v.) than the crowns of antiquity. This decoration was originally oriental. Alexander the great adopted it from the kings of Persia; and Antony assumed it during his luxurious intercouse with Cleopatra. According to some, its adoption for the gods originated in the fillet, which was assigned to Bacchus for the purpose mentioned as that which led to the use of the convivial crown. In modern states, crowns were of very various forms, till heralds devised a regular series of them to mark the various gradations of sovereignty, from that of the emperor down to what are now called the coronets of counts and barons. The pope also had his triple crown. See TIARA. So entirely was the C. regarded as the symbol of sovereignty, that the word came often to be used as synonymous with the monarchy—a sense in which we still speak of the C. of England, and the domains and possessions of the crown.

The crowns of kings and emperors are closed above, whilst the coronet of a noble is merely an open circlet surrounding the head; hence, *to close the C.* has been the ambition of princes desirous of shaking off the authority of feudal superiors, and assuming a complete sovereignty.

The royal C. of Great Britain is a circle of gold enriched with stones and pearls, and heightened with four crosses pattée, and four fleurs-de-lis alternately. From these rise four arch-diadems, adorned with pearls, which close under a mound, ensigned with a cross pattée. The C. used at the coronation of queen Victoria was adorned in accordance with the taste of the present time.

The coronet of the prince of Wales is a circle of gold, set round with crosses pattée and fleurs-de-lis, but has only one arch, decorated with pearls, surmounted with a mound and cross, and bordered with ermine. In addition to his coronet, the prince of Wales has a cognizance consisting of three ostrich feathers, argent, quilled or, enfiled with a prince's coronet of the last, with an escrol azure, whereon are the German words *Ich dien* (I serve). For the traditionary origin of this badge, see PRINCE OF WALES.

The younger sons and brothers of the sovereign wear as coronet a circle of gold, bordered ermine, heightened with fleurs-de-lis, crosses pattée, and strawberry leaves alternately. Nephews of the blood-royal have strawberry leaves on their coronets, where the sons and brothers have fleurs-de-lis. Princesses-royal have a circle of gold, bordered with ermine, and heightened with crosses pattée, fleurs-de-lis, and strawberry leaves alternately. For the coronets of the different orders of nobility, see their *titles*.

THE CROWN is a term often employed to signify the state, and the matters under control of the executive authority. Thus, in the interests of the state there are C. ministers, C. lawyers, C. officers, C. lands, etc.—the term, in no instance, having any special connection with the sovereign personally. In Scotland, certain high crimes are technically called pleas of the crown. These are four in number—murder, robbery, rape, and wilful fire-raising—and fall within the jurisdiction of the high court of justiciary. Likewise, in Scotland, there is a functionary styled C. agent. He is a practicing law-agent or solicitor, who, under the lord advocate and his deputies, takes charge of criminal proceedings. His duty is to receive from the procurators-fiscal of the different counties the precognitions which they have taken, and to lay these precognitions before the lawyers for the crown, that they may determine whether there is ground sufficient to call for a prosecution. He also expedes indictments and criminal letters, and otherwise discharges the duties of an agent in preparing and assisting in the conduct of trials before the high court of justiciary, which are generally superintended or conducted by the solicitor-general. The appointment of the C. A. is with the lord advocate, and ceases with the administration.

CROWN DEBTS. It is a prerogative of the crown to take precedence of all other creditors, and in England, to recover its debts by a summary process called an *extent*. By 33 Henry

VIII. c. 39, this preference is given over all creditors who have not obtained judgment for their debts before the commencement of the crown's process; and the act 6 Anne, c. 26, extended the law of England in this respect to Scotland. The rule in Scotland, however, was limited to movable or personal property, and the crown has no privilege over a subject in a competition for heritage. It obtains, however, as opposed to the landlord's hypothec (q.v.). Mercantile sequestration has no effect against the crown. The sanctuary of Holyrood house affords no protection to the king's debtor. See EXTENT, EXCHEQUER.

CROWN GLASS, used for windows chiefly, and composed of 100 sand, 35 potash, and 35 chalk; nearly a silicate of soda and lime.

CROWN and HALF-CROWN, English gold coins first issued in 1527. In 1551, they were made of silver. The crown is worth $1.25 in United States currency.

CROWN IMPE'RIAL. See FRITILLARY.

CROWN LANDS. The demesne lands of the crown are now contracted within narrow limits, having been almost entirely granted away to subjects. King William III. so impoverished the crown in this manner, that an act was passed, 1 Anne, c. 7, s. 5, the effect of which and of subsequent statutes is, that all grants or leases from the crown of royal manors, or other possessions connected with land, for a period exceeding 31 years, are void. At a much earlier period (1455, c. 41), a Scottish statute had rendered the consent of parliament necessary to the alienation of the property of the crown; but neither it, nor the subsequent statutes, which were passed with a similar object, succeeded in checking the practice. The superintendence of such property as still belongs to the crown is now vested in commissioners appointed for the purpose, called the commissioners of woods, forests, and land revenues. See WOODS AND FORESTS.

CROWN POINT, a post village in the state of New York, on the w. side of lake Champlain, about 75 m. n. of Albany. Being within the basin of the St. Lawrence, it formed part of French Canada. With the view of bridling the English on the s., it was made the site of a fort famous in the American war, but of which the ruins only now remain. The immediate neighborhood is now a township of (1870) 2,449 inhabitants.

CROWN PRINCE, the heir-apparent of the German throne, The title is used also in Sweden.

CROWN SOLICITOR, the solicitor to the treasury, who, in state prosecutions in England, acts as solicitor for the crown in preparing the prosecution. In Ireland, there are crown solicitors attached to each circuit, whose duties correspond in some degree to those of the procurators-fiscal (q.v.) and crown agent in Scotland. See CROWN. In England, there are no analogous officers, and prosecutions are consequently conducted by solicitors appointed either by the parish, or by private parties bound over by the magistrates to prosecute. But in cases of great importance to the public, such as unusual or monstrous crimes, it is of frequent occurrence that the solicitor to the treasury takes charge of the case and instructs counsel.

CROWN-WORK, in fortification, is formed to strengthen a weak front, or to occupy ground which might facilitate the enemy's operations. It consists of two faces inclined to each other at an angle, with a bastion in the middle, and half-bastions at the two ends; and it is connected with the main body of the work by two long sides. Both of these works are entirely beyond the main ditch of the place, but each has also a ditch of its own.

CROWS, or ABSAROKA, a tribe of Indians living around the Yellowstone and other Rocky mountain rivers; supposed to number something more than 3,500. They have been generally at peace with the whites; are expert hunters and warriors, and considerably advanced in civilization. They are tall, well built, and very proud of their wonderfully long hair. Catlin gives a picture of a chief whose hair swept the ground when he stood erect.

CROW'S-FEET, in siege operations. See CALTHROP.

CROW-STONE, the top stone of the gable end of a building. See CORBIE STEPS.

CROW WING, a co. in Minnesota, on the Mississippi river, intersected by the Northern Pacific and the St. Paul and Pacific railroads; 590 sq.m.; pop. '80, 2,318—69. Co. seat, Crow Wing.

CROYDON (Fr. *croie dune*, chalk-hill), a t. in the n.e. of Surrey, on the London and Brighton railway, 10¼ m. s. of London bridge. It lies on the edge of the chalk and plastic clay, near the Banstead downs, at the source of the Wandle. C. was one of the first towns in England to grapple effectually with the question of the economical disposal of town-sewage. In 1868, owing to the rapid growth of the town, new waterworks were completed. The water, which is of great purity, is obtained from an artesian well. There are 7 railway stations at C., from which about 200 trains are despatched daily. Pop. '71, 55,652. The archbishops of Canterbury had a palace here till 1750. This palace is now a factory, and the summer seat of the archbishops is now at Addington, 4 m. e. of Croydon. About a m. s. of C. is Addiscombe house, at one time the

residence of the first earl of Liverpool, but purchased by the East India company in 1809. When enlarged by other buildings, it became a military academy, at which cadets were educated for the artillery and engineer services of the company. At a later date, the infantry cadets also received their professional education there. In 1858, when the government of India was transferred from the company to the crown, Addiscombe academy was transferred in like manner, and became the royal military college. This college no longer exists; the buildings were demolished in 1863; and the site has been covered with streets of villas. C. has one of the finest Gothic churches in the county.

CROZET ISLANDS, a volcanic group to the s. of the Indian ocean, lie between Kerguelen's land on the e. and prince Edward's islands on the w., about midway between Patagonia and New Zealand. The most easterly link of the chain is in lat. 46° 27′ s., and long. 52° 14′ east.

CRU'CIAN, *Cyprinus carassius*, a fish of the same genus with the carp (q.v.), from which it differs in the want of barbules at the mouth, in the much greater depth of body, and in the almost square tail. It attains a considerable size. It inhabits lakes, ponds, and slowly flowing rivers, in the n. of Europe and of Asia. It is called *karussa* in Sweden. It exists in the Thames, although rare, and is called the *German carp*, but has perhaps been introduced. It is an excellent article of food. The introduction of the C. into some of the waters of the northern parts of Britain seems particularly desirable.

CRU'CIBLES are vessels employed for the heating and fusing of glass, metallic ores, etc., and are generally made of materials capable of resisting high temperatures, such as fire-clay, black-lead, porcelain, platinum, and silver.

CRUCI'FERÆ (Lat. cross-carrying), an important natural order of exogenous plants, including about 1600 known species, and corresponding with the class *tetradynamia* of the Linnæan system. See BOTANY. The flowers have a calyx of four sepals, which fall off after flowering; and a corolla of four petals, which are placed in the form of a cross—whence the name C.—and alternate with the sepals. There are six stamens; four long ones in opposite pairs, and two short ones between the pairs of long ones. The ovary is superior, and there are two stigmas. The fruit is either long and podlike (a *silique*), or a short and roundish *pouch* (*silicule*); one-celled, or (usually) spuriously two-celled, by the parietal placentæ (see PLACENTA) meeting in the middle, and forming a kind of dissepiment (q.v.); and contains either one seed, or many in a single row. Linnæus divided his class *tetradynamia* into the orders *siliquosa* and *siliculosa*, according to the form of the fruit, and these may also be regarded as forming sub-orders of this natural order; but another division has more recently been adopted, founded on the character of the cotyledons (q.v.), and the manner in which the radicle is folded upon them (cotyledons *accumbent*, *incumbent*, or *conduplicate*). The general character of the order is antiscorbutic and stimulant, with more or less acridity. It contains many plants extensively cultivated for the food of man and of domestic animals, or valuable in medicine, as kale (cabbage, cauliflower, broccoli, colewort, etc.), turnip, rape, radish, cress, horse-radish, scurvy grass, mustard, sea-kale, gold of pleasure, etc. The dye-stuff called woad is produced by a plant of this order. It includes also a number of garden-flowers highly esteemed for their beauty and fragrance, as wallflower, stock, rocket, etc. The pungency and acridity of the C. seems to depend on a volatile oil, or on different volatile oils of very similar character, present in very various degree in different species, or in the same species under different circumstances, and in different parts of the same plant. This diversity is very well illustrated in the common turnip; in the different qualities of the root, as to sweetness and acridity, in different soils or seasons, and in the difference between the flesh and the rind. The seeds of the C. contain a fixed oil, which is extracted from some (rape, colza, in Europe; *myagrum sativum* and *erysimum perfoliatum* in Japan), to be used as a lamp-oil and in the arts, and the oil-cake is valuable for feeding cattle. The plants of this order belong mostly to the temparate parts of the world, and particularly abound in Europe. Comparatively few are found within the tropics.

CRU'CIFIX (Lat. *crux*, the cross, and *figo*, I fix), a cross with the effigy of Christ fixed to it. The principal C. in Roman Catholic churches stands in the center of the high-altar. It overtops the tapers, and is only removed at the elevation of the host. In well-appointed churches, the altar crucifix is generally either of gold or silver. Crucifixes are used in Lutheran churches, and in Prussia they are often made of Berlin iron. The C. first began to take the place of the plain cross in the time of Constantine, but it was never publicly acknowledged by the Greek church, and did not come into general use in the east till towards the end of the 8th century. It was not till the Carlovingian age that it became general in the Latin church. On the earlier crucifixes, Christ is represented as alive, with open eyes, and generally clad, and fastened with four, not three nails. In later times, all these circumstances varied. Christ was often represented as dead, naked, except a cloth round the loins, and fastened with three nails; i.e., the two feet fastened together by one nail. The earlier artists usually represented the figure of Christ as haggard, and his countenance as sorrowful in the last degree; but latterly the custom was introduced of representing him as the ideal of human beauty, and of throwing into his countenance an expression of rapture and heavenly joy. See CROSS.

CRU'DEN, ALEXANDER, was b. at Aberdeen, 31st May, 1700, and educated at Marischal college, with a view to the church, but having exhibited decided symptoms of insanity, he was for some time placed in confinement. On his release, he left Aberdeen, and after spending several years as a tutor, settled in London in 1732, first as a corrector of the press, and afterwards as a book-seller. In 1737, appeared his *Complete Concordance of the Holy Scriptures of the Old and New Testament*, a really great work, which has laid divines especially under deep obligations to the laborious author. The book was dedicated to queen Caroline, who graciously promised to "remember him," but unfortunately died a few days after. C. now relapsed into insanity, and his friends were obliged to remove him to a private asylum, where he appears to have been harshly treated. On his recovery, he published an account of his sufferings. For the next fifteen years he acted as a corrector of the press, but, in 1753, he had again to be put under restraint, but only for a few days. C. now believed himself divinely commissioned to reform the manners of the world, and styled himself Alexander, *the corrector*. He went about the country exhorting the people to keep holy the Sabbath day, etc. He also petitioned the king for the honor of knighthood, and the parliament to constitute him by act, "the corrector of the people," hoping by such honors to influence the people more effectually. Several other foolish things were done by C. in the course of his life, but he also performed many virtuous and benevolent actions, which shed a pleasing light over his melancholy career. C. died at Islington, Nov. 1, 1770. There have been many editions and abridgments of C.'s concordance published both in Britain and America. One of the best known is that of Chalmers (London, 1813; 10th ed., 1824).

CRUGER, the name of a prominent Dutch family of New York. JOHN was a slave-trader, a successful merchant, mayor of New York in 1759, and a member of the first provincial congress. JOHN HARRIS, nephew of John, was a British officer. After the war of independence he fled to England, and his property was confiscated. HENRY, brother of John Harris, was a member of the English parliament, and with Burke opposed harsh treatment of the American colonies.

CRUIKSHANK, GEORGE, one of the most gifted of English pictorial satirists, was b. in London, Sept. 27, 1792. His father was a native of Aberdeenshire, and the son of a person who had fought for prince Charles Stuart at Culloden. C. at first thought of the stage as a profession; but some of his sketches having come under the notice of a publisher, he was induced to engage in the illustration of children's books and songs. When about twenty years of age, a publication, called *The Scourge*, afforded scope for the display of his satiric genius, and from that time forth he has continued to pursue with remarkable success this his true vein. His illustrations for Mr. William Hone's political squibs and pamphlets attracted much attention, and sent some of them through no less than fifty editions. But these political caricatures, many of which were personal, were not altogether to C.'s taste. Nor, indeed, in this narrow party field did he find verge enough for the full exhibition of his rich fund of humor and depth of moral sarcasm. He consequently abandoned this style about 1824. In *Points of Humor*, and the designs for *Grimm's German Tales*, *Tom Thumb*, *Peter Schlemihl*, *Punch and Judy*, *My Sketch-book*, *Boz*, *Oliver Twist*, and the *Comic Almanac*, his comic genius first found ample manifestation; while in his *Sunday in London*, his *Gin-shop*, *The Upas Tree*, and especially *The Bottle*, he showed himself a moral teacher possessed of a grim Hogarthian earnestness and force. *The Bottle* consisted of a series of eight large-sized plates representing the various stages in a drunkard's career; and through the instrumentality of the temperance societies, as well as on account of its own merits, the work has had an enormous circulation. C. latterly devoted himself to oil-painting; and in his pictures, "Dressing for the Day," "A Runaway Knock," "Tam o' Shanter," and "Disturbing the Congregation," he combines humor and artistic skill. To these may be added the "Fairy Ring," and the "Merry Wives of Windsor." His latest production in oil-painting was a large picture, "The Worship of Bacchus." The list of his works amounts to 5,500. He died 1st Feb. 1878.

CRUIKSHANK, or CRUICKSHANKS, WILLIAM, 1745–1800; a Scotch anatomist, author of a number of medical works, the most valuable of which is one on *Insensible Perspiration*.

CRUISER is a small war-vessel, employed chiefly in watching an enemy by sailing about in a suspected latitude, or in any other defined portion of sea.

CRUITHNE' (Lat. *Cruithnii*, *Cruthini*), the name given, from the 6th to the 9th c., to a people who inhabited the southern half of the co. of Antrim, and the greater part of the co. of Down, and at one time established themselves also in the co. of Meath, in Ireland. They were otherwise called Dalaradians, and their country, Dalaradia. Their name of C. is supposed to be derived from the Celtic *cruit*, color, and to have been applied to them because they painted or tattooed their skins. It is the name by which the Irish called the Picts of Britain, of whom, indeed, the Irish C. are believed to have been a branch. See DALARADIA and PICTS.

CRUIVES AND ZAIRES are contrivances erected upon rivers in Scotland for the purpose of catching salmon. They are of great antiquity, and consisted of a "kind of hedge formed by stakes driven into the ground, the interstices being filled with brush, and the

mode of capturing salmon being similar to those employed by bag and stake nets;" the earliest statute now in force, the 11th of the first parliament of James I. (1424), being entitled, "Of Cruives, Zaires, and Satterdaies Slop." This act is interpreted by 1477, c. 73, "Anent cruives," and both acts refer to an "old statute made by king David," requiring that "ilk heck of the foresaidis cruves be three inch wide." The existing arrangement, by which the stakes or hecks which prevent the passage of the larger fish must be so far apart as to permit the young salmon or fry to pass through freely, is thus as old as the time of the great founder of our Scottish monasteries and cathedrals. The Saturday's slop or opening is effected by drawing up the hecks to the height of an ell from the bottom of the river, in which position they must remain from Saturday evening at sunset till Monday morning at sunrise. C. and Z. are prohibited in those parts of a river in which the tide ebbs and flows. The fisheries act of 1862 left the law regarding C. untouched. See SALMON.

CRUSADE, CHILDREN'S. One of the strange spasmodic fevers of the middle ages. In 1212, a peasant boy in France began to preach a crusade of boys only. Although strong measures were taken to suppress the movement, it went on; and it is stated that more than 30,000 boys embarked at Marseilles for the holy land, expecting miraculous aid in reaching Palestine and converting the Moslems. By shipwreck and capture and sale into slavery, the venture came to a disastrous end. Two similar crusades, each of 20,000 children, were undertaken in Germany; one army crossing the Alps at Mont Cenis, and the other at a more westerly point. All ended miserably.

CRUSADES is the name given to the religious wars carried on during the middle ages between the Christian nations of the west and the Mohammedans. The first of these was undertaken simply to vindicate the *right* of Christian pilgrims to visit the holy sepulchre. On the conquest of Palestine, however, the *object* of the C. changed, or at least enlarged, and the efforts of the subsequent crusaders were directed to the rescue of the whole land from the Saracens, who had repossessed themselves of it. From an early period in the history of the church, it was considered a pious act to make a pilgrimage to the holy sepulcher, and to visit the various spots which the Saviour had consecrated by his presence. When Palestine was conquered by the Arabs in the 7th c., that fierce but generous people respected the religious spirit of the pilgrims, and allowed them to build a church and a hospital in Jerusalem. Under the Fatimides of Egypt, who conquered Syria about 980 A.D., the position both of the native Christian residents and of the pilgrims became less favorable; but the subjugation of the country, in 1065, by brutal hordes of Seljuk Turks from the Caucasus rendered it intolerable. These barbarians, but recently converted to Mohammedanism, were nearly as ignorant of the Koran as of the Scriptures. They hardly knew their fellow-religionists, and are said to have wreaked their vengeance on the Mussulmans of Syria, as well as on the Christians. The news of their atrocities produced a deep sensation over the whole of Christendom. The first to take alarm were, naturally enough, the Byzantine monarchs. In 1073, the Greek emperor, Manuel VII., sent to supplicate the assistance of the great pope, Gregory VII., against the Turks, accompanying his petition with many expressions of profound respect for his holiness and the Latin church. Gregory—who beheld in the supplication of Manuel a grand opportunity for realizing the Catholic unity of Christendom—cordially responded; but circumstances prevented him from ever carrying the vast designs which he entertained into execution, and the idea of a crusade died gradually away. It was, however, revived by his successor, Urban II., an able and humane man, whose sympathies were kindled by the burning zeal of Peter the hermit, a native of Amiens, in France, who had made a pilgrimage to the holy land, witnessed the cruelties perpetrated by the Turks, and was now traversing Europe, preaching everywhere to crowds in the open air, and producing the most extraordinary enthusiasm by his impassioned descriptions of how pilgrims were murdered, robbed, or beaten; how shrines and holy places were desecrated; and how nothing but greed restrained the ruffian Turks (who made the Christians pay heavy taxes for their visits to Jerusalem) from destroying the holy sepulcher, and extirpating every vestige of Christianity in the land. As soon as the feelings of Europe had been sufficiently heated, Urban openly took up the question. Two councils were held in 1095. At the second, held at Clermont, in France, a crusade was definitely resolved on. The pope himself delivered a stirring address to a vast multitude of clergy and laymen, and as he proceeded, the pent-up emotions of the crowd burst forth, and cries of *Deus vult* (God wills it) rose simultaneously from the whole audience. These words, *Deus vult*, by the injunction of Urban, were made the war-cry of the enterprise, and every one that embarked in it wore, as a badge, the sign of the cross; hence the name *crusade* (Fr. *croisade*, from Lat. *crux*, a cross).

First Crusade.—From all parts of Europe, thousands upon thousands hurried at the summons of the pope to engage in the holy war. "The most distant islands and savage countries," says William of Malmesbury, "were inspired with this ardent passion. The Welshman left his hunting, the Scotchman his fellowship with vermin, the Dane his drinking-party, the Norwegian his raw fish." It is said that in the spring of 1096, not less than 6,000,000 souls were in motion towards Palestine. This, however, must be a huge exaggeration. What we do know positively is, that previous to the setting out of the great hosts of European chivalry, four armies—if disorderly and anarchic

multitudes, the mere dregs and refuse of Christendom, deserve that name—amounting in all to 275,000 persons, had departed for Palestine. The first consisted of 20,000 foot, and was commanded by a Burgundian gentleman, Walter the penniless. It marched through Hungary, but was cut to pieces by the natives of Bulgaria, only a few, among whom was Walter himself, escaping to Constantinople. The second, consisting of 40,000 men, women, and children, was led by Peter the hermit. It followed the same route as its predecessor, and reached Constantinople greatly reduced. Here the two united, crossed the Bosporus, and were utterly defeated by the Turks at Nice, the capital of Bithynia. A third expedition of a similar kind, composed of 15,000 Germans, led by a priest named Gottschalk, was slaughtered or dispersed in Hungary; which also proved the grave of the *fourth*, a terrible horde, consisting of about 200,000 wretches from France, England, Flanders, and Lorraine, who had swept along through Germany, committing horrible ravages, especially against the Jews, whom they murdered without mercy. *Now*, however, the real crusaders made their appearance: the gentry, the yeomanry, and the serfs of feudal Europe, under chiefs of the first rank and renown. Six armies appeared in the field, marching separately, and at considerable intervals of time. Their respective leaders were Godfrey of Bouillon, duke of Lorraine; Hugh the great, count of Vermandois, and brother of Philippe, king of France; Robert Curthose, duke of Normandy, the son of William the conqueror; count Robert of Flanders; Bohemond, prince of Tarentum, son of the famous Guiscard, under whom was Tancred, the favorite hero of all the historians of the crusade; and lastly, count Raymond of Toulouse. The place of rendezvous was Constantinople. The Greek emperor, Alexius, afraid that so magnificent a host—there were in all not less than 600,000 men, exclusive of women and priests—might be induced to conquer lands for *themselves*, cajoled all the leaders, excepting Tancred and count Raymond—into solemnly acknowledging themselves his liegemen. After some time spent in feasting, the crusaders crossed into Asia Minor (accompanied by the unfortunate Peter the hermit). Here their first step was the siege and capture of Nice, the capital of sultan Soliman, 24th June, 1097. This monarch was also defeated by Bohemond, Tancred, and Godfrey, at Dorylæum. Baldwin, brother of Godfrey, now crossed into Mesopotamia, where he obtained the principality of Edessa. After some time, the crusaders reached Syria, and laid siege to Antioch. For seven months the city held out, and the ranks of the besiegers were fearfully thinned by famine and disease. Many even brave warriors lost heart, and began to desert. Melancholy to relate, among the list of cowards was the poor enthusiast who had planned the enterprise. Peter was actually several miles on his way home when he was overtaken by the soldiers of Tancred, and brought back to undergo a public reprimand. At length, on the 3d of June, 1098, Antioch was taken, and the inhabitants were massacred by the infuriated crusaders, who were in their turn besieged by an army of 200,000 Mohammedans sent by the Persian sultan. Once more famine and pestilence did their deadly work. Multitudes also deserted, and escaping over the walls, carried the news of the sad condition of the Christians back to Europe. But again victory crowned the efforts of the besieged. On the 28th June, 1098, the Mohammedans were utterly routed, and the way to Jerusalem opened. It was on a bright summer morning (1099) that 40,000 crusaders, the miserable remnant of that vast array which two years before had laid siege to Nice, obtained their first glimpse of Jerusalem. The emotion was intense, the scene sublime. On the 15th of July, after a siege of rather more than five weeks, the grand object of the expedition was realized. Jerusalem was delivered from the hands of the infidel. Eight days after the capture of the city, Godfrey of Bouillon was unanimously elected king of Jerusalem. His kingdom, at first comprising little more than the mere city of Jerusalem, was gradually extended by conquest until it included the whole of Palestine. A language resembling Norman French was established, a code of feudal laws drawn up—Jerusalem was erected into a patriarchate, and Bethlehem into a bishopric. The best part of Asia Minor was restored to the Greek empire, while Bohemond became prince of Antioch. For nearly fifty years the three Latin principalities or kingdoms of the east—Edessa, Antioch, and Jerusalem—not only maintained themselves against the attacks of the Mohammedans of Egypt and Syria, but greatly increased in size, power, and wealth. At Jerusalem were founded the two famous orders of the Knights Hospitallers of St. John and the Knights Templars.

Second Crusade.—In 1144, the principality of Edessa was conquered by the emir of Mosul, and the Christians slaughtered. His son, Noureddin, advanced to destroy the Latin kingdoms of Syria and Palestine. Europe once more trembled with excitement. A second crusade was preached by the famous St. Bernard, abbot of Clairvaux, in Champagne; and early in 1147, two enormous armies, under the command of Louis VII., king of France, and Conrad III., emperor of Germany, marched for the Holy Land. Their united numbers were estimated at 1,200,000 fighting men. The expedition nevertheless, proved a total failure. The Greek emperor, Manuel Comnenus, was hostile; and through the treachery of his emissaries, the army of Conrad was all but destroyed by the Turks near Iconium, while that of Louis was wrecked in the defiles of the Pisidian mountains. After a vain attempt to reduce Damascus, the relics of this mighty host returned to Europe.

Third Crusade.—The death-blow, however, to the kingdom of Jerusalem, and the power of the crusaders, was given, not by Noureddin, but by Salah-Eddin, commonly

called Saladin, a young Kurdish chief, who had made himself sultan of Egypt, and who aspired to the presidency of the Mohammedan world. He invaded Palestine, took town after town, and finally, in Oct., 1187, compelled Jerusalem itself to capitulate, after a siege of 14 days. The news of this led to a third crusade, the chiefs of which were Frederick I. (Barbarossa), emperor of Germany, Philippe Auguste, king of France, and Richard *Cœur-de-Lion*, king of England. Barbarossa took the field first in the spring of 1189, but accidentally lost his life by fever caught from bathing in the Orontes. His army, much reduced, joined the forces of the other two monarchs before Acre, which important city was immediately besieged. In vain did Saladin attempt to relieve the defenders; and after a beleaguerement of 23 months, the place surrendered. But the crusaders were not united among themselves. Philippe soon after returned to France; and Richard, after accomplishing prodigies of valor, which excited the admiration of the Saracens, concluded a treaty with Saladin, by which "the people of the west were to be at liberty to make pilgrimages to Jerusalem, exempt from the taxes which the Saracen princes had in former times imposed." This, as has been previously noticed, was *all* that had been claimed by the *first* crusaders. On the 25th of Oct., 1192, Richard set sail for Europe.

Fourth Crusade.—Crusading unfortunately now became a constituent of the papal policy; and in 1203, a fourth expedition was determined upon by pope Innocent III., although the condition of the Christians was by no means such as to call for it. It assembled at Venice; but how entirely secular crusading had become, will be seen from the fact, that the army never went to Palestine at all, but preferred to take possession of the Byzantine empire. The leader of this host of *pseudo-crusaders*, Baldwin, count of Flanders, was seated on the throne of the east in 1204, where he and his successors maintained themselves for 56 years.

Fifth Crusade.—This was commanded by Frederick II., emperor of Germany. It began in 1228, and terminated in a treaty between that monarch and the sultan of Egypt, by which Palestine was ceded to Frederick, who, after being crowned king of Jerusalem, returned to Europe, leaving his new possessions in a state of tranquillity.

Sixth Crusade.—In 1244, a new race of Turks burst into Syria, and once more the Holy Land fell into the hands of these ferocious barbarians. Jerusalem was burned and pillaged. In 1249, Louis IX. of France (St. Louis) headed a crusade against them, but was utterly defeated, and taken prisoner by the sultan of Egypt. By the payment of a large ransom he obtained his liberty and that of the other prisoners. On his return to Europe he was regarded as a sort of martyr in the cause of Christ.

Seventh Crusade.—This also was primarily undertaken by St. Louis, but he having died at Tunis in 1270, on his way to Palestine, prince Edward of England, afterwards Edward I., who had originally intended to place himself under the command of St. Louis, marched direct for Palestine, where his rank and reputation in arms gathered round him all who were willing to fight for the cross. Nothing of consequence, however, was accomplished; and Edward soon returned to England, the last of the crusaders. Acre, Antioch, and Tripoli still continued in the possession of the Christians, and were defended for some time by the Templars and other military knights; but in 1291, Acre capitulated, the other towns soon followed its example, and the knights were glad to quit the country, and disperse themselves over Europe in quest of new employment, leaving Palestine in the undisturbed possession of the Saracens.

Effects of the Crusades.—While we cannot help deploring the enormous expenditure of human life which the C. occasioned, it is impossible to overlook the fact that they indirectly exercised a most beneficial influence on modern society. They secured for humanity certain advantages which it is difficult to see could have been otherwise obtained. M. Guizot, in his *Lectures on European Civilization*, endeavors to show their design and function in the destinies of Christendom. "To the first chroniclers," he says, "and consequently to the first crusaders, of whom they are but the expression, Mohammedans are objects only of hatred: it is evident that those who speak of them do not know them. The historians of the later crusades speak quite differently: it is clear that they look upon them no longer as monsters; that they have to a certain extent entered into their ideas; that they have lived with them; and that relations, and even a sort of sympathy, have been established between them." Thus the minds of both, but particularly of the crusaders, were partly delivered from those prejudices which are the offspring of ignorance. "A step was taken towards the enfranchisement of the human mind." Secondly, the crusaders were brought into contact with two civilizations, richer and more advanced than their own—the Greek and the Saracenic; and it is beyond all question that they were mightily struck with the wealth and comparative refinement of the east. Thirdly, the close relationship between the chief laymen of the west and the church occasioned by the C., enabled the former "to inspect more narrowly the policy and motives of the papal court." The result was very disastrous to that spirit of veneration and belief on which the church lives, and in many cases an extraordinary freedom of judgment and hardihood of opinion were induced—such as Europe had never before dreamed of. Fourthly, great social changes were brought about. A commerce between the east and west sprang up, and towns—the early homes of liberty in Europe—began to grow great and powerful. The C., indeed, "gave maritime commerce the strongest impulse it had ever received." The united effect of these

things, again, in predisposing the minds of men for a reformation in religion, has often been noticed. Other causes undoubtedly co-operated, and in a more direct and decisive manner, but the influence of the C. in procuring an audience for Luther, cannot be overlooked by the philosophic historian.

CRUSCA, ACADEMIA DELLA. See ACADEMY.

CRU'SENSTOLPE, MAGNUS JAKOB, 1795–1865; a Swedish historian, author of *History of the Early Years of the Life of King Gustavus IV., Adolphus; The House of Holstein-Gottorp in Sweden;* and other works.

CRUSHERS, or BRUISERS, are implements used for reducing to small fragments corn, beans, linseed, oil-cake, and other similar hard food of horses, oxen, or hogs, in order that it may be more thoroughly subjected to the action of the gastric juice, and that no part of it may pass through the animal undigested. Seeds which enter the stomach with their husk or outer pellicle unbroken, often resist its powers, so that they contribute nothing to nourishment; and this is the case to a very large extent with corn given to old horses; but mastication is never so perfect, however good may be the condition of an animal's teeth, that the previous crushing of hard food will not be found useful. C. are of different kinds, and those intended for oil-cake are somewhat different from those suitable for grain; but the essential part generally consists of toothed, grooved, or otherwise roughened cylinders, revolving so as to bruise the food either against each other, or against a fixed plate of similar roughness.—CLOD-CRUSHER is the name of an agricultural implement, which may be generally described as a toothed or roughened roller; and will be found noticed, with its uses, in the article ROLLER.

CRU'SIUS, CHRISTIAN AUGUST, 1715–75; a German theologian, professor of theology at Leipsic. Two of the great objects of his life were to place philosophy on a thoroughly satisfactory basis for the future, and to bring philosophical conclusions into harmony with orthodox theology. His system was not successful, but it had a few enthusiastic supporters.

CRUSTA'CEANS, *Crustacea,* a class of articulated animals, agreeing with insects, arachnida, and myriapoda in having articulated limbs; but differing from them in important respects, and particularly from all of them in the adaptation of the organs of respiration to an aquatic life, even those of them which live on land being generally inhabitants of damp places, and breathing by a kind of gills. Some of the lowest and minute aquatic C., indeed, are not provided with gills; but the aëration of the blood is supposed to take place through the surface of the body.

The C. derive their name from the hard armor which in most of them covers the whole body, forming for it that sort of frame-work which is sometimes, not very correctly, called an external skeleton; and which, in those of highest organization, is very complex in its structure, and contains a large amount of calcareous matter—carbonate and phosphate of lime, so that it is in its substance intermediate between shell and bone—whilst in many of the lower and smaller kinds it consists principally of *chitine,* and corresponds more nearly in its nature with the integuments of insects. The body of a crustacean is composed of rings (see ARTICULATA), generally 21 in number, and the crustaceous covering corresponds with it in this respect; the rings, alike of the body and its armor, being in some cases very distinct, whilst in others some of them in a great measure coalesce or are consolidated together, of which the thorax of a crab affords an excellent example. The first seven rings are regarded as forming the head; the next seven, the thorax; and the remainder the abdomen, corresponding with the head, thorax, and abdomen of insects. The crustaceous covering is considered as a peculiar epidermis, having beneath it a true skin, from which it is an inorganic exudation; and, like the epidermis, it is cast off from time to time, that its place may be supplied anew, as the growth of the animal requires more room for the internal soft parts. In this *moulting,* or casting of the shell, the animal divests itself of its covering not in separate parts, but in one piece, including the coverings of the limbs, and even of the antennæ, although the membranes which connect the hard plates are split and torn. A period of apparent sickness precedes and agitation accompanies the process; and the thick muscular parts of the limbs of crabs and lobsters become soft and flaccid, so as to be much more easily extricated from their hard coverings. The loss of a limb, which sometimes takes place on such an occasion, and is otherwise a frequent occurrence, is easily repaired, for a new one grows in its stead; but it is a curious circumstance that in order to this reproduction, the limb must be broken off at a particular joint, the second from the body, thus leaving only a short stump; and when a limb is broken elsewhere, the animal itself exercises the remarkable power of throwing it off by this joint.

The principal organ of locomotion in many C., as in the lobster, shrimp, etc., is the abdomen, terminating in fan-like appendages; by bending the abdomen suddenly down under the thorax, they dart *backwards* in the water. The limbs—which are connected with the thoracic rings—are, in some, organs of swimming; those of others are used for walking at the bottom of the water or on dry ground. Some have what are called *false legs* or *pro-legs* attached to the abdomen, often very different from the thoracic legs. The legs of some are fitted for burrowing. The first pair of legs is not unfrequently transformed into a pair of powerful claws or pincers—the last joint but one being pro-

longed so as to oppose the last joint, which becomes attached as to the side of it; and these are used for seizing and tearing food. The limbs of the first thoracic rings are, in many C., organs still more intimately connected with the mouth, and have received the name of foot-jaws, the transition from the true mandibles and maxillæ to the organs of locomotion being often very gradual. The mouth of some small parasitic C. is, however, formed for sucking, and not for tearing and masticating food. The digestive organs are very simple in all; there is a short but capacious gullet, a large stomach, and a straight and simply intestinal tube. The pyloric region of the stomach, however, is furnished with a remarkable apparatus of hard tubercles or sharp teeth for grinding or tearing food, supplementary to the external organs of the mouth. Almost all of the C. feed on animal food, and they are very voracious. A few feed on vegetable food. The nervous system of C. agrees generally with that of insects, and exhibits many gradations of division and concentration. C. in general, appear to possess all the five senses. Their eyes are either simple (stemmatic), aggregate (consisting of several stemmata under a common cornea), or compound. The compound eyes are often on foot-stalks. The gills are variously placed; in the internal cavity, under the *carapace*—the enlargement of the plate of a single ring, which covers the thoracic rings in crabs, etc.; on the thoracic limbs; on the abdominal or false legs, etc. The heart is always in the middle line of the body, is of various form, and distributes the blood by a number of trunks through the system; but the blood returns to venous *sinuses*, from which, and not from the heart, it is sent into the gills, and it is not until after its aëration in the gills that it comes to the heart again; not, however, without being mixed with venous blood which has not undergone the same aëration. The sexes are distinct in most of the C.; and they are all oviparous. A sort of incubation of the eggs takes place, in order to which they are carried under the abdomen or under the thorax of the female, attached to the false legs or to some of the thoracic appendages. It has recently been discovered, contrary to former belief, that C.—or at least many of them—undergo metamorphoses; and the curious creatures known by the name *zoea* have been found to be the young of crabs.

The greater number of C. are marine: some inhabit fresh waters, running or stagnant; comparatively few are terrestrial.

Cuvier divided C. into two sections, *malacostraca* and *entomostraca;* the former section containing the orders *decapoda, stomapoda, læmodipoda, amphipoda,* and *isopoda;* the latter the *branchiopoda* and *pœcilopoda*. Another division has been more recently proposed by Milne Edwards, and very generally adopted into *xyphosura* (the genus *limulus* alone), having a mouth destitute of jaws, and for which legs perform the office of jaws; *maxillosa,* or masticating C.; and *edentata,* or suctorial crustaceans.

CRUST OF THE **EARTH.** It having once been believed by geologists that the interior of our globe is in a state of fusion from heat, they have given the name of crust of the earth to the external solid covering. Man has been able to penetrate but a short way into the crust, and he cannot safely reason on his observations made at or near the surface, regarding the condition of the crust to a greater depth than a few miles, at the most 10—all beyond is little more than guess-work. The materials of the crust are not thrown confusedly together, but distinct mineral masses are found to occupy definite spaces, or to exhibit a certain order of arrangement. All these may be classified in reference either to their origin, which is aqueous (see AQUEOUS ROCKS) or igneous (q.v.); or to their relative age, as primary (q.v.), secondary (q.v.), and tertiary (q.v.).

CRUVEILHIER, JEAN, 1791–1874; a French anatomist educated in the university of Paris, where he became professor of anatomy, on which science he published three works. He was commander of the legion of honor.

CRUVELLI, SOPHIE, Baroness Vizier, b. 1824; a German singer, having a soprano voice of great strength and purity, and in her day the most popular of vocalists. On marrying baron Vizier, in 1856, she left the stage.

CRUYS, CORNELIS, the founder of Russian maritime power, was b. June 14, 1657. He was a rear-admiral in the Dutch service when czar Peter the great, noticing his abilities, pursuaded him to go to Moscow. There he arrived Oct. 15, 1698, and was received with great splendor, and soon appointed vice-admiral. His services to Russia were of various kinds; to him it owed its first dockyards, canals, and charts, the organization of its navy, and its victories over Sweden and Turkey in 1708–1710. After a short period of disgrace, C. was received back to favor. He died in 1727, possessor of an imperial domain in Kexholm, and owner of the island Birken in Finland. It is in memory of him the white flag with the blue cross (Dutch, *kruis*) still floats from the Russain men-of-war.

CRY'OLITE is a double fluoride of aluminium and sodium (NaF,Al_2F_3), and is important as a source of the metal aluminium (q.v.).

CRYOPH'ORUS (Gr. *kryos,* cold, and *phero,* I carry) is an instrument consisting of a glass tube with a bulb at both ends. A little water is present in one of the bulbs, and when the second bulb, containing only water-vapor, is placed in a freezing mixture, the vapor condenses, which causes more vapor to rise from the water in the first bulb. The

result of this vaporation from the first bulb is the abstraction of much heat, and ultimately the remaining water passes into a frozen state.

CRYPT (Gr. *krypto*, I hide), a vault under a church, either entirely or partly under ground. Crypts do not generally extend beyond the limits of the choir or chancel, and they are often of much smaller dimensions. Crypts were formerly used as chapels, and provided with altars and the other furniture requisite for the celebration of religious services; and they were also very frequently used as places of sepulture. It sometimes happens that a new church has been erected over the C. belonging to the old one. One of the largest crypts in England is that under Canterbury cathedral; but there are few finer specimens of the C. any where than that under Glasgow cathedral, which has been recently freed from rubbish and restored. Crypts seem to have originated in the customs of the early Christian ages. The tombs of the martyrs were first used as churches; and then churches were built above them.

CRYPTO-CALVINISTS, a name given to Melanchthon and those who agreed with him in wishing to unite the Lutherans and Calvinists, and especially in his supposed leaning towards the Calvinistic view of the Lord's Supper as shown in the difference between the original and the altered Augsburg confession. The former said: "The body and blood of Christ are truly present in the Lord's supper in the form of bread and wine, and are there distributed and received by the communicants: therefore the opposite doctrine is rejected.' In the latter, the last clause is omitted. Luther did not approve the alteration, but tolerated Melanchthon's change of doctrine. Many, however, called him a Crypto-Calvinist. The truth seems to have been that he did not consider that either opinion was a sufficient bar to communion with Christ, and therefore thought that both of them ought to be allowed. The controversy was becoming violent before his death, but afterwards it broke out with great virulence, and continued with alternate success on each side for 50 years; during which time frequent attempts were made to suppress the Calvinistic opinions by imprisoning their leading advocates, and, at last, in 1611, by the execution of chancellor Nicolas Crell.

CRYPTOG'AMOUS PLANTS (Gr. *kryptos*, concealed, and *gamē*, marriage) are those which have no true flowers, and no known male or female organs of fructification, and whose seeds, called *spores*, consist only of a single cell, and contain no embryo, but germinate indifferently from any point; and which Jussieu therefore designated *acotyledonous plants* (q.v.). The name C. P. was invented by Linnæus, and the *cryptogamia* form a class of his sexual system, very distinct from all the rest. See BOTANY. Many C.P. have no leaves; some have not even a root, and those which are lowest in organization consist only of a single cell. Many are parasitic. Many look as if dead in a dry atmosphere, and are revivified by rain. They are the lowest in organization of the vegetable kingdom, and are divided into *filices* (ferns), *marsileaceæ*, *lycopodiaceæ* (club-mosses), *equisetaceæ* (horse-tails), *musci* (mosses), *hepaticæ*, *lichens*, *fungi*, *characeæ*, and *algæ*.

CRYPTOG'RAPHY, the art of secret writing, more commonly called the art of writing in cipher (from Arabic *sifr*, void), has been in use from an early date in correspondence between diplomatists and others engaged in important affairs requiring secrecy. In modern times, it has been the subject of learned care to lord Bacon, the ingenious marquis of Worcester, Dr. Wallis, bishop Wilkins, Thicknesse, Falconer, Blair, etc. In our own history, it has at no time been in greater requsition than during the civil war, and among the politicians of the 17th century. And even now, when there is happily less need for mystery among our statesmen, the need for a perfectly undecipherable mode of secret communication has again had to be looked for, in order that information may pass by the electric telegraph without being understood by the officials in connection with the apparatus.

One of the most simple methods of C. is to use, instead of each letter of the alphabet, a certain other letter at a regular interval in advance of it in that series. Such was a mode of secret writing used by Julius Cæsar. As a variety upon this plan, the alphabet is used invertedly—*z* for *a*, *y* for *b*, *x* for *c*, and so on. Or while the first seven letters are represented by the second seven, the next six may be represented by the last six. And many other variations may be adopted. But for all modes like these, there are modes of decipherment far from difficult. It is only necessary, in general, to bear in mind certain peculiarities of the language presumed to be used. Say it is the English. We readily remember that *e* is the most frequent letter; that *ea* and *ou* are the double vowels which most frequently occur; that the consonants most common at the ends of words are *r*, *s*, and *t*; etc. We also know how a single letter must be either the pronoun *I* or the article *a*; how *an*, *at*, and *on* are the most common words in two letters; how *the* and *and* are the most frequent words in three letters, etc. By taking advantage of these few obvious principles, a tolerably skilled decipherer will read almost any such piece of cryptographic writing in five minutes. The *Times* newspaper often gives, in its advertising columns, correspondence on delicate subjects, even assignations for elopements, written in this manner, the writers of which are of course little aware how open their secrets thus become to society.

Politicians and important personages conducting affairs of difficulty became long ago sensible of the necessity of using ciphers of greater abstruseness. The celebrated letter of Charles I. to the earl of Glamorgan, in which he made some condemning con-

cessions (elsewhere denied) to the Catholics of Ireland, was composed in an alphabet of 24 short strokes variously situated upon a line. Other letters by the same monarch are to appearance a mere series of numbers of two and three figures, divided by semicolons. In such cases, it was necessary that the two parties in the correspondence should have previously concerted what words each number was to represent. Bacon devised what he thought a not easily penetrable cipher, in which he employed only *a* and *b*, arranging each of these in groups of 5, in such collocations as to represent all the 24 letters. Thus, *aabab ababa babba* conveyed the word *fly*. The great philosopher thought that preconcertment would here be necessary; but in reality any clever modern decipherer would have found no difficulty in reading any long letter composed in such a manner The unfortunate earl of Argyle, when preparing his expedition against the tyrannical government of James II., used a mode of secret writing which consisted in setting down the words at certain intervals, which he afterwards filled up with other words, making on the whole something intelligible, but indifferent. In our day, such a mode would not have been found proof against the ingenuity of those who have studied the means of decipherment. There are many other modes of secret writing, which it does not seem necessary to detail, as the art has become little more than a matter of curiosity. One of the ablest and amplest treatments of the subject is an article by Dr. William Blair in *Rees's Cyclopædia*. See also *Chambers's Journal*, No. 506 (Second series), under "Secrets Exposed," and Nos. 87 and 115, under "Cryptographs."

CRYPTOGRAPHY (*ante*), secret writing, or writing to understand which the recipient must know the key. Such modes of communication have been in use from the earliest times. The Lacedæmonians, according to Plutarch, had a method which has been called the scytale, from the staff employed in constructing and deciphering the message. When the Spartan ephors wished to forward their orders to their commander abroad, they wound slantwise a narrow slip of parchment upon the staff so that the edges met close together, and the message was then added in such a way that the center of the line of writing was on the edge of parchment. When unwound, the scroll consisted of broken letters; and in that condition it was dispatched to its destination; the general to whose hands it came deciphering it by means of a staff exactly corresponding to that used by the ephors. Polybius has enumerated other methods of cryptography. The art was in use also among the Romans. Upon the revival of letters, methods of secret correspondence were introduced into private business, diplomacy, plots, etc.; and as the study of this art has always presented attractions to the ingenious, a curious body of literature has been the result. John Trithemius, the abbot of Spanheim, was the first important writer on cryptography. His *Poligraphia*, published in 1500, has passed through many editions, and has supplied the basis upon which subsequent writers have worked. It was begun at the desire of the duke of Bavaria; but Trithemius did not at first intend to publish it, on the ground that it would be injurious to public interests. The next treatises of importance were those of John Baptist Porta, a Neapolitan mathematician, who wrote *De Furtivis Literarum Notis*, 1563; and of Blaise de Vigenere, whose *Traité des Chiffres* appeared in Paris in 1587. Lord Verulam proposed an ingenious system of cryptography on the plan of what is called the double cipher; but while thus lending to the art the influence of his great name, he gave an intimation as to the general opinion formed of it and as to the classes of men who used it; for when prosecuting the earl of Somerset in the matter of the poisoning of Overbury, he urged it as an aggravation of the crime that the earl and Overbury "had ciphers and jargons for the king and queen and all the great men—things seldom used but either by princes and their ambassadors and ministers, or by such as work or practice against or, at least, upon princes." Other eminent Englishmen were afterwards connected with the art. John Wilkins, subsequently bishop of Chester, published in 1641 an anonymous treatise entitled *Mercury, or The Secret and Swift Messenger*, a small but comprehensive work on the subject, and a timely gift to the diplomatists and leaders of the civil war. The deciphering of many of the royalist papers of that period, such as the letters that fell into the hands of the parliament at the battle of Naseby, has by Henry Stubbe been charged on the celebrated mathematician, Dr. John Wallis, whose connection with the subject of cipher-writing is referred to in the Oxford edition of his mathematical works, 1689; as also by John Davys. Dr. Wallis states that this art, formerly scarcely known to any but the secretaries of princes, etc., had grown very common and familiar during the civil commotion, "so that now there is scarcely a person of quality but is more or less acquainted with it, and doth, as there is occasion, make use of it." Subsequent writers on the subject are John Falconer, *Cryptomenysis Patefacta*, 1685; John Davys, *An Essay on the Art of Deciphering in which is inserted a Discourse of Dr. Wallis*, 1737; Philip Thicknesse, *A Treatise on the Art of Deciphering and of Writing in Cipher*, 1772; William Blair (the writer of the comprehensive article "Cipher" in Rees's Cyclopædia), 1819; and C. von Marten, *Cours Diplomatique*, 1801, a fourth edition of which appeared in 1851. Perhaps the best modern work on this subject is the *Kryptographik* of J. L. Kluber, who was drawn into the investigation by inclination and official circumstances. In this work the different methods of cryptography are classified. Amongst others of less merit who have treated on this art, may be named Gustavus Selenus (i.e. Augustus, duke of Brunswick), 1624; Cospi, translated by Niceron in 1641; the marquis of Worces-

ter, 1659; Kircher, 1663; Schoot, 1665; Hiller, 1682; Comiers, 1690, Baring, 1737; Conrad, 1739, etc.

Schemes of cryptography are endless in their variety. Bacon lays down the following as the "virtues" to be looked for in them: "that they be not laborious to write and read; that they be impossible to decipher; and, in some cases, that they be without suspicion." The principles are more or less disregarded by all the modes that have been advanced, including that of Bacon himself, which has been unduly extolled by his admirers as "one of the most ingenious methods of writing in cipher, and the most difficult to be deciphered, of any yet contrived."

The simplest and commonest of all ciphers is that in which the writer selects in place of the proper letters certain other letters in regular advance. This method of transposition was used by Julius Cæsar. He, "per quartam elementorum literam," wrote *d* for *a*, *e* for *b*, and so on. There are instances of this arrangement in the Jewish rabbis, and even in the sacred writers. An illustration of it occurs, Jeremiah xxv. 26, where the prophet, to conceal the meaning of his prediction from all but the initiated, writes Sheshach instead of Babel (Babylon), the place meant: i.e., in place of using the second and twelfth letters of the Hebrew alphabet (*B*, *b*, *l*), counting from the beginning, he wrote the second and twelfth (*sh*, *sh*, *ch*), counting from the end. To this kind of cipher-writing Buxtorf gives the name Athbash (from *a*, the first letter of the Hebrew alphabet, and *th* the last; *b*, the second from the beginning, and *h*, the second from the end). Another Jewish cabalism of like nature was called Albam; of which an example is in Isaiah vii. 6, where Tabeal is written for Remaliah. In its adaptation to English this method of transposition, of which there are many modifications, is comparatively easy to decipher. A rough key may be derived from an examination of the respective quantities of letters in a type-founder's bill, or a printer's "case." The decipherer's first business is to classify the letters of the secret message in the order of their frequency. The letter that occurs oftenest is *e;* and the next in order of frequency is *t*. The following groups come after these, separated from each other by degrees of decreasing recurrence: *a, o, n, i, r, s, h; d, l; c, w, u, m; f, y, g, p, b; v, k, x, q, j, z*. All the single letters must be *a*, *I*, or *O*. Letters occurring together are *ee, oo, ff, ll, ss*, etc. The commonest words of two letters are (roughly arranged in the order of their frequency) *of, to, in, it, is, be, he, by, or, as, at, an, so*, etc. The commonest words of three letters are *the* and *and* (in great excess), *for, are, but, not*, etc.; and of four letters: *that, with, from, have, this, they*, etc. Familiarity with the composition of the language will suggest numerous other points of value to the decipherer. He may obtain other hints from Poe's tale called *The Gold Bug*. As to messages in the continental languages constructed upon this system of transposition, rules for deciphering may be derived from Breithaupt's *Ars Decifratoria*, 1737, and other treatises.

Bacon remarks that though ciphers were commonly in letters and alphabets, yet they might be in words. Upon this basis codes have been constructed, classified with words taken from dictionaries being made to represent complete ideas. In recent years such codes have been adapted by merchants and others to communications by telegraph, and have served the purpose not only of keeping business affairs private, but also of reducing the excessive cost of telegraphic messages to distant markets. Obviously this class of ciphers present greater difficulties to the skill of the decipherer. Figures and other characters have been also used as letters; and with them ranges of numerals have been combined as the representatives of syllables, parts of words, words themselves, and complete phrases. Under this head must be placed the dispatches of Giovanni Michael, the Venetian ambassador to England in the reign of queen Mary, documents which have only of late years been deciphered. Many of the private letters and papers from the pen of Charles I. and his queen, who were adepts in the use of ciphers, are of the same description. One of that monarch's letters, a document of considerable interest, consisting entirely of numerals purposely complicated, was in 1858 deciphered by prof. Wheatstone, the inventor of the ingenious crypto-machine, and printed by the Philobiblon society. Other letters of like character have been published in the *First Report of the Royal Commission on Historical Manuscripts*. In the second and subsequent reports of the same commission, several keys to ciphers have been catalogued, which seem to refer themselves to the methods of cryptography under notice. In this connection also should be mentioned the "characters" which the diarist Pepys drew up when clerk to sir George Downing and secretary to the earl of Sandwich and to the admiralty, and which are frequently mentioned in his journal. Pepys described one of them as "a great large character," over which he spent much time, but which was at length finished, 25th April, 1660; "it being, says he, "very handsomely done and a very good one in itself, but that not truly alphabetical."

Shorthand marks and other arbitrary characters have also been largely imported into cryptographic systems to represent both letters and words—commonly the latter. This plan is said to have been first put into use by the old Roman poet Ennius. It forms the basis of the method of Cicero's freedman, Tiro, who seems to have systematized the labors of his predecessors. A large quantity of these characters have been engraved in Gruter's Inscriptiones. The correspondence of Charlemagne was in part made upon marks of this nature. In Rees's Cyclopædia, specimens were engraved of the cipher used by cardinal Wolsey at the court of Vienna in 1524, of that used by sir Thomas

Smith at Paris in 1563, and of that of sir Edward Stafford at Madrid in 1586; in all of which arbitrary marks are introduced. The first English system of shorthand—Bright's *Characterie*, 1588—almost belongs in the same category of ciphers. A favorite system of Charles I., used by him during the year 1646, was made up of an alphabet of twenty-four letters, which were represented by four simple strokes varied in length, slope, and position. This alphabet is engraved in Clive's *Linear System of Shorthand*, 1830, having been found amongst the royal manuscripts in the British museum. An interest attached to this cipher from the fact that it was employed in the well-known letter addressed by the king to the earl of Glamorgan, in which the former made concessions to the Roman Catholics of Ireland.

Complications have been introduced into ciphers by the employment of "dummy" letters—"nulls and insignificants," as Bacon terms them. Other devices have been introduced to perplex the decipherer, such as spelling words backwards, making false divisions between words, etc. The greatest security against the decipherer has been found in the use of elaborate tables of letters arranged in the form of the multiplication-table, the message being constructed by the aid of preconcerted key-words. Details of the working of these ciphers may be found in the treatises named in this article. The deciphering of them is one of the most difficult tasks. A method of this kind is explained in the Latin and English lives of Dr. John Barwick, whose correspondence with Hyde, afterwards earl of Clarendon, was carried on in cryptography. In a letter dated 20th Feb., 1659–60, Hyde, alluding to the skill of his political opponents in deciphering, says that "nobody needs to fear them" if they write carefully in good ciphers." In his next he allays his correspondent's apprehenness as to the deciphering of their letter: "I confess to you, as I am sure no copy could be gotten of any of my cyphers from hence, so I did not think it probable that they could be got on your side of the water. But I was as confident, till you tell me you believe it, that the devil himself cannot decipher a letter that is well written, or find that 100 stands for sir H. Vane. I have heard of many of the pretenders to that skill, and have spoken with some of them, but have found them all to be mountebanks; nor did I ever hear that more of the king's letters that were found at Naseby, than those which they found deciphered, or found the ciphers in which they were writ were deciphered. And I very well remember that in the volume they published there was much left in cipher which could not be understood, and which I believe they would have explained if it had been in their power."

An excellent modification of the key-word principle was constructed by the late admiral sir Francis Beaufort; it has been recently published in view of its adaptation to telegrams and post-cards. Ciphers have been constructed on the principle of altering the places of the letters without changing their powers. The message is first written Chinese-wise upward and downward, and the letters are then combined in given rows from left to right. In the celebrated cipher used by the earl of Argyle when plotting against James II., he altered the position of the words. Sentences of an indifferent nature were constructed, but the real meaning of the message was to be gathered from words placed at certain intervals. This method, which is connected with the name of Cardan, is sometimes called the trellis or card-board cipher. The wheel-cipher, which is an Italian invention, the string-cipher, the circle-cipher, and many others, are fully explained, with the necessary diagrams, in the authorities named above—more particularly by Kluber in his *Kryptographik*. [The substance of the above is from *Encyclopædia Britannica*, ninth edition.]

CRYSTAL ISLANDS. See CORAL ISLANDS.

CRYSTALLINE LENS. See EYE, *ante*.

CRYSTALLINE ROCKS, a name given to all rocks, having a crystalline structure. They are found belonging to every division of the crust of the earth, but are especially abundant in the most ancient azoic rocks; the greater proportion of intruded igneous rocks also possess this structure. When attempting in the laboratory to produce crystals, it is known that the building material must exist in a fluid condition, and this is obtained either by heating to fusion or by solution. It has been asserted that all C. R. have been produced under similar circumstances; and no one can doubt that lavas and more ancient rocks having a similar origin, have assumed this structure while solidifying from a condition of igneous fusion, while rock-salt is as certainly obtained from a saturated solution of salt. There are, however, many rocks, such as some fossiliferous limestones, in which this structure occurs, where it is not possible to conceive of their being in either condition. It is known that crystallization takes place in solid material, as in the axles of railway carriages, or in the crystals of pyrites in the chalk, where the iron has been gathered from the surrounding material while in a solid state. We know not what is the force that induces such a change in solid materials; it may be called metamorphic or molecular action, but these are names that mean nothing, and simply hide our ignorance. That such a force, inducing crystalline structure in atmorphous masses, has been and is now at work on the solid strata of the earth, cannot be doubted.

CRYSTALLOGRAPHY. A crystal is a piece of matter that, by the action of molecular forces, has assumed a definite geometrical form of some kind, with plane faces. There is a great variety of crystalline forms, each form being characteristic of one or

more substances; and C. is the science which classifies the forms and shows the relations that subsist among them. The great majority of substances are capable of undergoing the process of crystallization, the exceptions being principally complex organic substances which tend to assume a globular or spherical form approaching that of organized structures. The most favorable condition for the crystallization of any substance is from its solution in water or other liquid. A liquid usually dissolves more of a salt when warm than when cold; and when a warm saturated solution is allowed to cool, a portion of the salt deposits itself in crystals. This process is that which is generally followed in the crystallization of saline substances. A second process resorted to in the case of the metals, such as bismuth, antimony, etc., and sulphur, is to fuse the material in a vessel, and when it is cooled down, so as partially to solidify the mass, the crust is broken through, and the liquid still remaining is poured off, when a net-work of crystals is obtained. A third method is to vaporize the substance, which on condensation resolves itself into crystals. Examples of this class are the formation of snow crystals from the water-vapor in the atmosphere, and the minute black crystals of iodine obtained by allowing its vapor to condense in a cold vessel or on a cold surface.

Many circumstances affect the crystallizing power of substances. Thus, water may be cooled down below its freezing or crystallizing point (32° F.), provided it be kept perfectly still, without becoming solid; but on subsequent agitation, it instantly crystallizes. Similarly, a hot saturated solution of sulphate of soda, or glauber salt, if cooled down in a still place, does not crystallize, but immediately does so when the liquid is agitated, or a fragment of any solid substance is introduced into it. The size of the crystals obtainable from any fluid depends much on the rate of cooling, and the state of commotion of the liquid. The more slowly the solution cools down, and the more quietly the process of crystallization is allowed to proceed, the larger are the crystals obtained; whilst, when the liquid is rapidly cooled, and agitation is kept up, the crystals are comparatively small, and generally not completely formed. The reason of this will be at once apparent, for a large crystal is constructed of a multitude of smaller crystals, built up regularly so as to constitute a compound crystal of the same form as the more minute crystalline atoms; and when a liquid is cooled slowly in a state of rest, only a few minute crystals are produced at first, and these are gradually built round on all sides by successive layers, till large, well-defined crystals are the result; while, when the liquid is rapidly lowered in temperature, and especially when agitation is kept up, numerous minute crystals are formed at once, and do not adhere together. In either case, the liquid from which the crystals have separated is called the *mother-liquor*, and is a saturated solution of the salt.

The external forms of crystals amount to several thousands, but they may all be regarded as belonging to six different systems.

The *regular system* (otherwise called the *cubic*, *octohedral*, *tesseral*, *tessular*, *spheroidal*, or *equi-axed system*) is characterized by having three axes or straight lines passing through the same point, of equal lengths, and placed at right angles to each other. The best illustration of this system is the cube or hexahedron, which has six square faces or planes, and the three equal axes terminate in the center of each of the square faces. The planes or squares are symmetrically arranged, so that each is perpendicular to one axis, and parallel to the other two. The crystals have each six square faces, with twelve equal edges, and eight equal angles. Examples of substances which crystallize in the form of the cube or hexahedron, are—common iron pyrites (FeS_2), common salt, or the chloride of sodium (NaCl), fluor spar (CaF), galena, or the sulphuret of lead (PbS), and the metals gold, silver, platinum, and copper. Another important crystalline form belonging to the regular system is the octohedron, where the terminations of the axes are in the angles of the crystals. It has eight faces, all of which are equilateral triangles, and twelve edges, with six angles, each of which has four faces. The diamond (C), alum, zinc-blende (ZnS), sal ammonia C. (NH_4Cl), magnetic iron ore (Fe_3O_4), fluor spar (CaF), and chrome iron ore are examples. There are various secondary forms belonging to this system, derivable from the cube and octohedron, such as the rhombic dodecahedron, which has twelve faces, and is the form in which the garnet crystallizes.

The *square prismatic system* (known as the *pyramidal*, *tetragonal*, or *quadratic system*) has three axes placed at right angles to each other, of which two are of equal length, but the third may be longer or shorter. To this belong the *right square prism*, in which the lateral axes terminate in the center of each side face, and the perpendicular axis, is longer than the two lateral axes; and the *right square-based octohedron*, which resembles two pyramids placed base to base, and having eight faces, which form isosceles triangles. Examples of substances which crystallize in this system are yellow prussiate of potash, native binoxide of tin, zircon, apophylite, calomel, etc.

The *right prismatic system* (otherwise known as the *right rhomboidal*, or *rectangular prismatic system*) is characterized by having three axes, all of unequal or different lengths, but placed at right angles to each other. The *right rhombic prism* and the right *rhombic-based octohedron*, are forms included in this class, and examples of materials which crystallize in this form are sulphur, arsenical iron pyrites, nitrate of potash, sulphate of potash, sulphate of baryta (heavy spar), topaz, arragonite, etc.

The *oblique prismatic system* (*oblique rhomboidal*, or *rectangular prismatic*) has three axes, which may be all of unequal lengths, two of which are placed at right angles to

each other, whilst the third axis is so inclined as to be perpendicular to one of the two axes, and oblique to the other. To this belong the *oblique rhombic prism* and the *oblique rhombic-based octohedron.* Many salts crystallize in this form, such as green vitriol (sulphate of iron), borax, sulphate of soda, carbonate of soda, phosphate of soda, realgar (native bisulphuret of arsenic), etc.

The *doubly oblique prismatic system* has three axes of unequal length, which intersect obliquely with each other. The forms are very irregular, which render them very puzzling to make out satisfactorily. Nitrate of bismuth, sulphate of copper, sulphate of manganese, quadroxalate of potash, and pyrotartaric acid, are examples.

The *rhombohedral,* or the regular *hexagonal system,* is known by the presence of four axes, three of which are in the same plane, and inclined to each other at an angle of 60°, whilst the remaining fourth axis is perpendicular to the three. To this belong the *regular six-sided prism* and the *rhombohedron.* Examples of this system are calcareous spar, ice, quartz or rock crystal, nitrate of soda, beryl, arsenic, antimony, and apatite.

CRYSTALLO'MANCY, a mode of divination by means of transparent bodies, at one time very popular. A precious stone, crystal globe, or other transparent object, was employed, but a beryl was deemed most effective. In using it, the operator first muttered over it certain formulas of prayer, and then gave it into the hands of a youth or virgin—none others were pure enough to discern its revelations—who beheld in it the information required. Sometimes the desiderated facts were conveyed by means of written characters on the crystal; sometimes the spirits invoked appeared in the crystal to answer the questions asked.

CRYSTAL PALACE, the edifice in London in which the world's fair was held in 1851, designed by sir Joseph Paxton, and built chiefly of glass and iron, with floors of wood. Its length was 1851 ft.; its area 21 acres. The visitors numbered more than 6,000,000. A permanent structure of this kind was built, 1854, at Sydenham, 8 m. from London. Its cost was £1,450,000; and in its vast collections all departments of art and science was represented. A crystal palace on a smaller scale, erected in New York, 1853, was used for exhibitions and great concerts; but after five years was destroyed by fire—a disaster from which it had been thought secure.

CSAB'A, a t. of Hungary, 7 m. s.s.w. of Bekes. It is well built; some of the houses are even very elegant. It has a trade in grain, wine, and cattle. The women are also noted for their skill in making sacks and mattresses. Pop. of township (1869), 30,022.

CSANÁD', a co. of Hungary; 640 sq.m.; pop. '69, 95,847. It is very level and fertile, but unhealthful. Productions, wheat, wine, tobacco, and fruit. Chief town, Mako.

CSANAD', the name of two towns in Hungary, both situated on the Marös, the one with a pop. of (1869) 4,013, and the other with a pop. of (1869) 5,386, who are engaged in agricultural pursuits.

CSAT, or CSATH (MEZO), a market-t. of Hungary, near the Theiss, in the district Borsod, and about 15 m. s.e. of Miskolcz. Pop. '69, 4,979.

CSERVEN'KA, a t. of Hungary, in the co. of Upper Bacs, on the Franzens canal, about 130 m. s. of Pesth. Pop., which is German (1869), 6,877.

CSO'KONAI, MIHALY VITEZ, 1773–1805; a Hungarian poet, educated in Debrecsin, and while very young appointed to the professorship of poetry. He was soon deprived of the place because of his immoral habits. He died after a dozen years of wretched existence. His works have been published.

CSOMA DE KÖRÖS, ALEXANDER, a Hungarian scholar and traveler, whose name in his own language is written Köröse Csoma Sandor, was b. about 1790 at Körös in Transylvania, and educated first at the college of Nagy-Enyed, and subsequently at Göttingen, where he devoted himself with great zeal to the study of the oriental tongues. The dream and inspiration of his boyhood was the hope of one day discovering the original home of his Magyar ancestors; and as he grew up, it became the single thought and passion of his life. In 1820, he set out on his visionary pilgrimage. After a year's interval, his friends got a letter from him, dated Teheran, in which he expressed his conviction that the object of his search would speedily be obtained. Leaving Teheran, he wandered n.e. through Little Bokhara, and at length reached Thibet, where he spent about four years (1827–30) in the Buddhist monastery of Kanam, studying Thibetan. He soon discovered that there was little connection between that language and his native one, but still he hoped to make use of his researches, and set out for Calcutta. Here he learned, to his dismay, that the literature of Thibet was simply a translation from the Sanscrit—a language he might easily have acquired a knowledge of at home. His whole labor seemed to have been in vain. Fortunately for C. de K., the library of the Asiatic society of Bengal contained upwards of 1000 volumes in Thibetan which no one could catalogue. C. de K. undertook and successfully executed the task. By the great Anglo-Indian scholars, Prinsep, Wilson, and others, he was very generously treated. He next prepared, at the expense of the government, a Thibetan grammar and dictionary (Calcutta, 1834), which was the first really accurate and valuable European work on the subject. It is still a standard treatise, and has been the guide of all good scholars since. C. de K. wrote many articles on Thibetan literature in the *Asiatic Researches,* but still

haunted, as of old, by the hope of discovering the early home of the Magyars, he once more set out on an expedition to the western confines of China, but died on the 11th April, 1842, at Darjeeling, a sanitary station for the British troops in Sikkim, 318 m. n. of Calcutta.

CSON'GRAD, a co. in Hungary, intersected by the Theiss; 1280 sq.m.; pop. '72, 207,585. It is level, with a fertile soil, producing wheat, corn, hemp, tobacco, and fruits. Chief town, Szegedin.

CSON'GRAD, a market-t. of Hungary, situated on a neck of land at the confluence of the Theiss and the Körös, 70 m. s.e. of Pesth. The inhabitants (1869), 17,356 in number, are chiefly engaged in the rearing of cattle, and the cultivation of the vine.

CTEN'OID FISHES, an order of fishes, according to a classification proposed by Agassiz (see FISHES), characterized by *ctenoid* scales, i.e., imbricated scales, generally rounded or ovoid, with teeth or sharp projections on their hinder margin. The name is from the Greek *kteis* (gen. *ktenos*), a comb. The scales of C. F. are horny or bony and unenameled. There are sometimes numerous rows of teeth or little spines, sometimes only one row, the rows successively wearing off as new ones are formed in the enlargement of the scale. Living C. F. are numerous, fossil ones comparatively few. Perches, flounders, and turbot may be mentioned as examples.

CTENOPH'ORÆ, jelly fishes, of which about 70 species are enumerated by Agassiz. He says: "When active it hangs out a pair of most remarkable appendages, the structure and length and contractility of which are equally surprising, and exceed in wonderful adaptation all I have ever known among animal structures. Two apparently simple and irregular threads hang out from the opposite side of the sphere. Presently these appendages may elongate, and equal in length the diameter of the sphere, or surpass it, and increase to 2, 3, 4, 5, 10, and 25 times the diameter of the body, and more and more; so much so, that it would seem as if these threads had the power of endless extension and development. But as they lengthen they appear more complicated; from one of their sides, other delicate threads shoot out like fringes, forming a row of beards like that of the most elegant ostrich feather, and each one of these threads itself elongates until it equals in length the diameter of the whole body, and bends in the most graceful curves." A common species on the Atlantic coast is of a beautiful rose color, reaching a length of 3 or 4 in., and often so plentiful as to tinge large spaces in the sea with a rosy hue.

CTE'SIAS, a Greek physician and historian of the 5th c. B.C., author of a number of books, among which were histories of which abridgments are extant. The most important of his books was a history of Persia, but it is now generally discredited.

CTESIB'IUS, a Greek who lived about 250 years B.C., was b. at Alexandria, and was famous for his inventions in mechanics. We owe to him and his pupil Hero Alexandrinus, the pump, the bent siphon, and also the discovery of the elastic force of air, and its application as a motive power.

CTES'IPHON, now Al-Madain, was a city of Assyria, on the eastern bank of the Tigris, the common winter residence of the Parthian kings, and finally the capital of the Parthian kingdom. Its ruins still attest its former magnificence.

CTES'IPHON, an Athenian orator in the 4th c. B.C. He proposed the presentation of a golden crown to Demosthenes for his sacrifices in his country's cause.

CUBA, the largest of the Antilles, and most important transmarine possession of Spain, stretches in n. lat. from 19° 50′ to 23° 9′, and in w. long. from 74° 8′ to 84° 58′. It has a length of rather more than 750 m., and an average width of 50 m., its area being about 45,700 sq. miles. It is larger than Ireland, and less than England. The surface is mountainous at the s.e. coast, where the Sierra Maestra, rising in some places to an elevation of 8,000 ft., runs from cape de Cruz to cape de Mayzi. In the central part of the islands there are rugged hilly districts between Santa Clara and Puerto Principe, and also n.w. of Trinidad. What remains of the country, although undulating, consists chiefly of well-watered plains, which everywhere support a luxuriant vegetation. Rocky reefs and muddy shallows beset about two thirds of the coast. In some localities, however, the sea is deep to the very shore, offering many excellent havens, and those, too, situated on the busiest thoroughfares of the western hemisphere; the chief of these being Havana, the admirable situation of which makes it the emporium of Central America. A somewhat elevated water-shed crosses the island in the direction of its length, and as the streams run at right angles to it, they are necessarily short. There is in C. no distinction of dry and rainy seasons, and there are showers every month. Hurricanes are less frequent than in the other West India islands, but they sometimes do occur, and cause wide-spread desolation. One which swept over C. in the middle of Oct., 1870, caused the loss of 2,000 lives. Another occurred in the end of Sept., 1873. Earthquakes are frequent. The cultivated portions of C. produce in abundance sugar, tobacco, maize, rice, yams, bananas, coffee, and all the products of the tropics; while in the districts left in a state of nature are reared countless herds of cattle. Sugar is, however, the chief product of the island; and all over the western districts the traveler sees vast level or undulating tracts covered with cane-fields, and factories employed in crushing, boiling, and refining the sugar.

Since the close of the late American war, the Cuban sugar-trade has been immensely increased, and the quantity exported in good years has recently been valued at the prodigous sum of 15, or even 20 millions sterling. Fifteen per cent of this sugar goes to England, and 75 per cent to the United States. The exportation of tobacco forms still a large item of the exports from Cuba. The chief imports consist of flour, salted fish, manufactured goods, hardware, machinery.

The enormous development of Cuban commerce cannot be accounted for either by the enterprise of the inhabitants or to good government—and least of all to the latter, for the Spaniards have done nothing for C. but to make it supply Madrid with the largest possible revenue. It is due to the great demand for sugar in America, and the monopoly C. now enjoys of slave-labor.

The pop. of C., in 1872, was 1,370,211, of whom 730,750 were whites, about 34,000 Chinese and Hindu coolies, and 605,461 blacks, or colored people of negro origin. Of the blacks, 225,938 were free, and 379,523 were slaves. Of the whites, about 600,000 were creoles, or natives of the island; while 120,000 were "peninsulares," or natives of Spain. The slaves of pure blood alone have the strength necessary to do the hard work of the sugar estates, and the prosperity of the island is dependent on them. Although the creoles and the "peninsulares" are of the same origin, the difference between them is most striking. They can be distinguished at a glance in the streets of Havana. The creoles are feeble and indolent, even when they are children of parents born in Spain. The Cuban Spaniards, on the other hand, are a sturdy and energetic body of men. Recruited from the north-eastern parts of Spain, they go to C. as adventurers, chiefly to find employment as traders and mechanics, but obtain the greater share of the wealth of the island. There are upwards of 200,000 adult male creoles, and half that number of Spanish Cubans; but the latter—all men—through the large volunteer force, which they almost exclusively recruit, and the favor of the Spanish government, which distrusts the creoles, have absolute control over the government of the island, which is administered in a manner scandalously unjust. They treat the creoles with a scorn and contempt only exceeded by the hatred, mixed with fear, with which the latter regard the dominant population. "Cuba for the Cubans," is the watchword of the creoles, whose most anxious desire is to be rid of the adventurers, who have secured for themselves the best share of the wealth of the island. If they could secure this object, they believe that even with emancipation they would be in a better position than now, and accordingly they manifest sympathy for the negroes, and join with them in opposition to the "peninsulares."

C. is divided into three intendencias—the western, middle, and eastern In the first, there were (1872) upwards of a million of inhabitants. It includes Havana with 200,000 inhabitants, Matanzas with 36,000, Cardenas with 13,000, and several other towns connected by railways. The middle division, which extends eastward to the n.e. corner of the Great bay and the Boca de Nuevitas, has only a pop. of 75,000, 30,000 of whom live in the capital, Puerto Principe. The eastern division has 249,000 inhabitants; the capital is Santiago, with a pop. of 37,000. The chief towns of the western division are connected by railways, and it is well settled and prosperous, the great sugar factories and tobacco plantations, which constitute the wealth of the island, lying there. The middle and eastern divisions are very partially cultivated, and, owing to civil war, are becoming much less productive than they were. Many of the land-owners of the eastern part of the island have sold their slaves to those of the Havana district, and have migrated to Jamaica and the United States.

In 1492, C., which is often spoken of as the "pearl" or "queen of the Antilles," was discovered by Columbus during his first voyage. In 1511, the island began to be permanently colonized, becoming, within ten years, the base of all the various operations against Mexico. While, in the first quarter of the present century, every continental portion of Spanish America established its independence, C. remaining like Puerto Rico, faithful to the mother country, largely profited by the intestine broils of the revolted provinces, for, when the old Spaniards were expelled in mass from the mainland, many of them naturally took refuge in the still loyal islands, enriching them with their capital, and energy, and skill. C. has long been coveted by other nations. In 1762, Havana was captured by a British armament, but was restored in the following year. During the present age, the island has been an object of cupidity to the United States—a cupidity checked more powerfully by jealousy on the part of France and England than by Spain's own resources; and, in fact, it has been twice attacked—in 1850 and 1851—by individual Americans without success. They were commanded by a Spaniard by the name of Lopez, who, being taken prisoner, was executed as a traitor. The termination of the American war had an unexpected effect on the position of Cuba. The island had been coveted because it was the only market from which slaves could be imported into the southern states, and this trade was at an end. This was not, however, the only effect of the war. It destroyed the production of sugar in the southern states, and C. supplied the want. Great interests were created in New York which favored the perpetuation of slavery in C., and its existence as an independent state, or a dependency of a foreign power, became more desirable for the Americans than its annexation. The Spanish revolution of 1868, when queen Isabella was driven from the throne, effected another change in Cuban politics. The Madrid ministry, in 1870, passed a measure

known as the Moret law, from Senor Moret y Prendergast, the colonial minister at the time, which declared that every slave at the age of 60 should become free—and emancipated all the unborn offspring of slaves. This law never was enforced, its publication even having been prohibited by the "peninsulares;" and the Madrid government have never been in a position to enforce it or any other measure which meets the disapproval of the "loyal party" in Cuba. Instead of doing so, it has accepted their alliance, and aided them by sending troops to crush the creole and negro insurrection, which broke out in 1868. The struggle was carried on with varying success, and often with unexampled ferocity, for ten long years. It was not till the spring of 1878, that Martinez Campos, partly by military energy, partly by terms of compromise, succeeded in quelling the rebellion. He offered pardon to rebels laying down their arms, and restoration of confiscated property. See *The Pearl of the Antilles*, by A. Gallenga (Lond. 1873). For a picturesque description of Cuban life and manners, see another work also called *The Pearl of the Antilles*, by W. Goodman (1873). See also *The Mambi-land*, by James J. O'Kelly (1874).

CUBA (*ante*), "the ever-faithful isle," as it has been called by the Spaniards, has a remarkable history. Discovered by Columbus on his first voyage to the new world, and regarded by him at first as a part of the western continent, it was not long before the docile harmless race of Indians who inhabited it were overrun and reduced to slavery by the Spanish adventurers, who gained great wealth by their unpaid toil. Las Casas, the Roman Catholic apostle to the Indians, seeing that they were rapidly being exterminated by cruelty, was moved by compassion to appeal to the home government for their protection. Cardinal Ximenes, the Spanish regent, sent three monks to the island to correct the abuses complained of; but they did not accomplish much, and Las Casas procured for himself the appointment of "universal protector of the Indians." Finding it impossible, even with this additional authority, to check the cruelties which he deplored, and having observed in St. Domingo that the negroes had shown a capacity for endurance superior to that of the Indians, this humane missionary, in order to save the former from the swift extermination that threatened them, proposed that men and women of the latter race should be imported to take their places in the mines and cane-fields. The colonists were not slow to act upon this suggestion, and thus negro slavery, by sanction of religious authority, gained a foothold in the western world, which it did not lose until the slave power in the United States was overthrown in the war of 1861–65. The Indians of Cuba, however, did not escape the extermination which Las Casas was so anxious to avert, while the negroes were subjected to cruelties that checked their natural increase and made it necessary to recruit their numbers by constant importations. There was a period between the substantial extirpation of the Indians and the introduction of the negroes when the planters did not prosper, but the African slave-trade revived their drooping fortunes. Meanwhile Havana was twice destroyed by the French. In 1762, it was captured by the English, who retained possession for only one year; but prior to this date 60,000 slaves had been introduced, and they were imported at the rate of 1,000 annually for the next 25 years. The slave-trade up to this time had been a monopoly, but now, all restrictions being removed, importations rapidly increased. The whole number of slaves introduced into the island from that day to the present must be immense, for they die off with great rapidity. Even now the trade has hardly ceased. British statistical writers, making up their reports from authentic data, say the number imported between 1817–42 was 335,000; and between 1842–52, 45,000.

The government of the island has always been autocratic, being lodged in a captain-general, receiving his appointment from the home government, and therefore in no way responsible to the people over whom he rules. In the 18th c., there were two insurrections, both of which were suppressed, and twelve of the leaders in the last (1723) were hanged. Printing was introduced about 1724. From 1790, and onwards, under a captain-general named Las Casas (probably of the same family as the missionary before mentioned), the island enjoyed great prosperity. Tranquillity was preserved during the bloody revolution of St. Domingo; newspapers were established, and industry promoted. When the royal family of Spain was deposed by Bonaparte in 1808, Cuba took the side of the crown and made contributions of money and soldiers to sustain it. Since that day, the captain-generals have for the most part adopted the course which promised to advance their own particular interests, with only a subordinate regard for the powers at Madrid. By a royal order, ratified 1836, the captain-general was empowered to rule at all times as if the island were in a state of siege. At the same time a military commission was appointed, which took cognizance of offenses in general, and particularly of those involving disloyalty. The slave-trade was nearly suppressed by captain-general Valdez in 1845–47, but an increased demand for sugar soon afterwards revived it, and it was carried on more extensively than ever before.

The situation of the island is exceedingly favorable to commerce, while the extraordinary fertility of its soil and the nature of its products give it unrivaled advantages. A range of mountains extends through the island from e. to w., with streams flowing to the sea from each side. Some of the elevations reach a height of 8,000 feet. Another range skirts a part of the southern coast for about 200 miles. Between the mountains lie fertile valleys. On the s. side, from Jagua to point Sabina, the land is a continuous

swamp for 160 miles. The rivers number over 250, but they are generally small, the only one that is navigable being the Cauto, which empties near Manzanillo. On this river, during the present civil war, several battles have been fought. The river Ay is broken by picturesque falls, some of them nearly 200 ft. high. Mineral springs, mostly of a sulphurous character, abound. Gold, silver, iron, copper, quicksilver, lead, antimony, arsenic, magnesia, copperas, and other metals exist, but not under conditions which render mining profitable. Rock salt abounds on both the n. and s. coasts. Marble and jasper of fine quality are found in some places. The average temperature of the island is about 77°. The mercury rarely rises higher than 100° or falls below 50°. The average in the hottest month is 82°, in the coldest 72°. The seasons are but two, the rainy and the dry; the former being in May or June and ending in Nov. In the dry season, dews are abundant. Thunder storms are violent from June to Sept. Earthquakes are frequent on the eastern side. The healthfulness of the climate is affirmed by some and denied by others. Yellow fever often prevails in the towns on the coast, but is unknown in the interior. The forests abound in woods of the hardest kind, among which may be mentioned lignum-vitæ, ebony, rosewood, and mahogany. The fruits are those generally found in the tropics, the pine-apple and the banana being prominent. Of the sweet potato there are several varieties, while cassava and Indian corn are raised for home consumption. Wild beasts are few and small, the wild dog being the most prominent. The indigenous birds number 200 species, some of which display a beautiful plumage. Birds of prey are hardly known. Of fishes there are more than 600 species. Turtles abound, oysters are small and poor, alligators are common, and snakes are few and mostly harmless. Among the insects are the tarantula, the scorpion, the sand-fly, a dozen varieties of mosquito, an ant which destroys all living vegetable matter, 300 varieties of the butterfly, and as many more of flies. The inhabitants of Cuba are mostly of Spanish or African descent. At first none but Castilians were allowed to settle, but now all classes of Spaniards are found upon the island. They are, however, separated from each other in the social scale, the pure Castilian blood asserting its superiority. The offspring of foreigners, of whatever color, are called creoles, between whom and the Spaniards there is a feeling of caste that is almost insurmountable. The Spaniards hold all the offices and regard themselves as a privileged race. The trade of the island is mainly in their hands, while the creoles are generally planters or land-owners. The island embraces three military departments—the western, the central, and the eastern. Owing to the disturbed state of affairs, no reliable census of the inhabitants has been taken since 1862, when (including 34,000 Chinese) they numbered 1,359,438; of whom nearly 765,000 were whites, over 222,000 free colored, and more than 368,000 slaves. It is believed that the population has rather fallen off than increased since this enumeration was made. On June 23, 1870, Spain enacted a law emancipating all slaves who should be born after that date, and also all those who had attained the age of 60 years; but the slaveholders have been powerful enough to prevent the enforcement of the act. The Chinese imported from 1847 to 1873, numbering over 50,000, have also been virtually reduced to slavery and treated with great cruelty. The chief industry of Cuba is the raising of sugar and tobacco. Coffee, formerly raised for exportation, is now produced for home consumption. Cotton is cultivated to a small extent. Oranges and pine-apples are the only fruit for exportation. The mulberry is raised for silkworms with success. Cattle-raising is carried on to a large extent. In the 18th c., the business of ship-building was carried on extensively, the forests furnishing an abundance of the best timber; but the mother country, desiring a monopoly of the business for herself, imposed restrictions which led to its discontinuance. Havana, the capital, is a city of over 200,000 inhabitants. There are a dozen smaller cities, as many towns, and over 300 villages and hamlets. The disturbed condition of the island during the last 12 years has had a most unfavorable effect upon business, diminishing the production of the great staples and reducing trade in the same degree. During the first four years of the civil war, from 1868 to 1871, the average annual production of sugar and molasses was over 7,122,000 tons. The total exports of the island in 1870 were valued at $82,600,666; those of 1871, at $71,251,440. The exports are generally undervalued, but it is officially known that those received in the United States in 1872 amounted to $14,751,956.

The educational system of Cuba was at first conformed to that of Spain, but it has been changed for local reasons. Innocent XIII., with the approbation of Spain, established the royal and pontifical university of Havana in 1772. The Franciscans had previously instructed classes in philosophy and theology in their convent. In 1842, the university, which had been administered by the Dominican friars, became a national establishment, and the study of the natural sciences was introduced; but in 1863, under the ministry of gen. Concha, the system of instruction was assimilated to that of Spain, and philosophical studies reduced to very narrow limits. There are two colleges for the clergy—one at Havana, the other at Santiago de Cuba. The expenses of education in the higher branches are defrayed from the general revenue; those of primary education by the town councils. The statistics are not recent, but, according to the latest reports, there were over 200 public schools, of which less than 100 were for girls. The number of private schools was 245. The pupils numbered 22,200 of both sexes, of whom 21,000 were white, and 1200 were colored. Less than one half of the white pop

ulation (excluding the Chinese) can read and write. In 1868, there were 39 newspapers published on the island, 21 of them in Havana, 5 in Santiago de Cuba, 3 in Matanzas, and the others in places of less importance.

Until within a comparatively recent period, land communication between the different parts of the island was difficult; but railroads have been built between the capital and several of the most important towns, with an aggregate length of about 400 miles. The whole population, with the exception of a portion of the foreign residents, is Roman Catholic. An archbishop, residing at Santiago de Cuba, rules the eastern, and a bishop at Havana, the western diocese. The revenues of the island are derived in part from duties on importations, and in part from taxation: formerly they exceeded expenditures by a considerable sum annually; but the civil war has put the balance on the other side of the ledger. While slavery existed in the United States, there was a strong desire among a large portion of the people of this country for the annexation of Cuba. To accomplish this end, the supporters of slavery plotted from time to time, proposing now to wrest the island from Spain by filibustering operations, and now to purchase it. But Spain would not sell, and filibustering did not prosper. In 1848, president Polk, through the American minister at Madrid, without any constitutional authority whatever, offered $100,000,000 for it; but the offer was promptly rejected by Spain. Indeed, Spain was always as determined not to sell as American politicians were anxious to buy. The United States more than once gave Spain to understand that she would not permit the island to be transferred to any nation but herself, one reason for this being that if it should fall into the hands of England or France, the slaves might be emancipated, and so the island become a center of anti-slavery influences inimical to the existence of slavery in the southern states. In 1849, after the failure of the Lopez expedition, which had been mainly if not wholly organized on American soil, president Fillmore refused to unite with England and France in guaranteeing the possession of the island to Spain. In 1854, during the presidency of Franklin Pierce, when the government was almost wholly under slaveholding influences, three American ambassadors at European courts, Buchanan, Soule, and Mason, met in conference at Ostend, and joined in a manifesto, in which it was claimed that if Spain should refuse to sell the island to the United States, and the slaves there should be set free, the latter power would have a right to seize and annex it. Fortunately the slavery question, as connected with the national government, assumed from this time forward an aspect which made the execution of this semi-official threat an impossibility. The Spanish revolution of 1868 led to a revolt in Cuba, which had in view the independence of the island and the abolition of slavery. The republican home government gave no countenance to this movement, but sent money and troops to resist it. The war has been bloody and cruel. In 1870, the United States, having no longer any desire to conserve the interests of slavery, tendered its good offices in behalf of peace, proposing the sale of the island to the Cubans; but Spain declined the offer. It is believed that Spain has sent no less than 100,000 soldiers to Cuba to aid in suppressing the insurrection. Up to Aug., 1872, 13,600 Cubans had been killed in battle, while 43,500 prisoners had been put to death. In the first three years of the war, Spain expended therein over $73,000,000. The expenditures, both in men and money, since that time, have not been very large, and there has been official proclamation of the end of the rebellion, yet the war continues, with no definite prospect of termination.

CUBA'GUA, an island in the Caribbean sea, off the n.e. coast of Venezuela, in South America, is situated in the department of Maturin, between Margarita and the mainland, about 30 m. n. of the town of Cumana.

CUBE, a solid with six square faces, each of which is parallel to the one opposite to it. It is a form of frequent occurrence in nature, especially among crystals. See CRYSTALLOGRAPHY. In arithmetic, the C. of a number is the product of its multiplication three times by itself. This use of the term arises from the circumstance that the solid contents of a C. may be expressed by the third power of the number which expresses the length of one of its edges. Thus, if the edge of a C. be a line of 4 in., its solid contents are equal to 64 cubic inches. Conversely, the C. root of a number is that number which, multiplied three times by itself, produces the first number. See DOUBLING THE CUBE.

CU'BEBS, or CUBEB PEPPER, the dried berries of *cubeba officinalis* and other species of *cubeba*, a genus of climbing shrubs of the natural order *piperaceæ*, very closely allied to the true peppers, but distinguished at once by the contraction and elongation of the berries at the base, so that they appear to be stalked, upon which account C. are sometimes called *piper caudatum*, or tailed pepper. *Cubeba officinalis* is a native of Penang, Java, New Guinea, etc., and is said to be extensively cultivated in some parts of Java. Its spikes are solitary, opposite to the leaves, and usually produce about fifty berries, which are globular, and when dried, have much resemblance to black pepper, except in their lighter color, and the stalk with which they are furnished. *Cubeba canina*, a native of the Sunda and Molucca islands, is supposed also to yield part of the C. of commerce, and the berries of *C. Wallichii* possess similar properties. C. are less pungent, and more pleasantly aromatic than black pepper; they are used in the east as a condiment, but in Europe chiefly for medicinal purposes; they act as a stimulant, and are sometimes found

useful in cases of indigestion, also in chronic catarrhs, and in many affections of the mucous membrane, particularly those of the urino-genital system. C. contain a principle called *cubebine*, analogous to that contained in pepper (*piperine*). C. appear to have been known in Europe from ancient times. In 1305, Edward I. granted to the corporation of London the power of levying a toll of one farthing on every pound of C. passing over London bridge.

CU'BICAL NI'TER is a commercial name applied to the nitrate of soda ($NaONO_5$). See SODA.

CUBIC EQUATIONS. A cubic equation containing but one unknown quantity, is one in which the highest exponent of the quantity in any term is 3. Every such equation can be reduced to the general form $x^3+px+q=o$, in which the co-efficient of x^3 is 1, and that of x^2 is zero. Every cubic equation of this form has three roots, all of which may be real, or one only may be real, and the other two imaginary. The roots will all be real, when p is essentially negative, and $\frac{p^3}{27} > \frac{q^2}{4}$ numerically. One root only will be real when p is essentially positive, or when it is negative, and $\frac{p^3}{27} < \frac{q^2}{4}$ numerically. If p is essentially negative, and $\frac{p^3}{27}=\frac{q^2}{4}$, two of the roots are equal. When one of the roots only is real, the equation may be solved by the following formula, known as Cardan's formula:

$$x=\sqrt[3]{-\frac{q}{2}+\sqrt{\left(\frac{q^2}{4}+\frac{p^3}{27}\right)}}+\sqrt[3]{-\frac{q}{2}-\sqrt{\left(\frac{q^2}{4}+\frac{p^3}{27}\right)}}.$$

When the roots are all real, this formula fails to give their values. Methods of solving C. E. are to be found in most books on trigonometry and algebra. They are all troublesome. The reader will find the theory of their solution admirably discussed in Young's *Theory of Equations*. See also EQUATIONS.

CU'BIT (Lat. *cubitus*), a measure employed by the ancients, equal to the length of the arm from the elbow to the tip of the middle finger. The C. of the Romans was about 17⅝ in., and that of the Hebrews, 22 in., but its length is now generally stated at 18 English inches.

CUCA. See COCA, *ante*.

CUCKING-STOOL. See DUCKING-STOOL.

CUCKOO, *Cuculus*, a genus of birds of the order of climbers (q.v.); the type of a family, *cuculidæ*, which contains a large number of species, mostly confined to the warmer regions of the globe, although some of them are summer visitants of cold climates. The beak is compressed and slightly arched, and the tail long and rounded, the wings rather long, the tarsi short, two toes directed forwards, and two backwards, the outer hind toe capable of being brought half round to the front. The feet are thus adapted for grasping and moving about upon branches, rather than for climbing, and the long tail is much used by many of the species for balancing the body, as they hop from branch to branch in the thick tropical woods which they frequent. The name C. is derived from the note of the male of the common C. (*cuculus canorus*), which, although monotonous, is always heard with pleasure, being associated with all that is delightful in returning spring. A similar name is given to the bird in many languages. The C. is a very widely diffused bird; it is found in India and in Africa, and migrates northwards in summer, even to Lapland and Kamtchatka. It appears in Britain in April, and all except the young birds are believed to migrate southwards again before the middle of August. It frequents both cultivated districts and moors. There is no pairing or continued attachment of the male and female, and the female, after having laid an egg on the ground, deposits it, *with her beak*, in the nest of some other smaller bird, leaving the egg to be hatched and the young one to be fed by the proper owners of the nest. The egg of the C. is very small for so large a bird, being not larger than the skylark's, and the number she will lay is uncertain; but the young one soon acquires size and strength enough to eject from the nest any eggs which may remain in it, or unfortunate young birds, the true offspring of its foster-parents, and it seems restless and uneasy till this is accomplished. It works itself under them, and then jerks them out by a motion of its rump. Its back at this early age exhibits a peculiar depression between the shoulders, so that an egg or a young bird can easily be got to lie upon it; but this depression soon disappears, and along with it the singular instinct with which it is supposed to be connected. The hedge-sparrow, the yellow-hammer, the pied wagtail, and the meadow pipit, are among the birds most frequently selected by the C. as its substitutes in incubation and the care of its young. A pair of meadow pipits usually accompany the C. wherever it goes. The reason of this curious fellowship has not been ascertained.—Among the *cuculidæ* of North America, one of the most interesting is the yellow-billed American C., sometimes called from its note the *cow-cow* or *cow-bird* (*coccyzus Americanus*). It is among the rarest of British birds. It does not lay its eggs in the nests of other birds, but builds and hatches for itself—exhibiting, however, a remark-

able peculiarity in laying its eggs at such long intervals, that a very evident difference of age appears among the young in the same nest.

CU'CUMBER, *Cucumis*, a genus of plants of the natural order *cucurbitaceæ*. The common C. (*C. sativus*), distinguished by heart-shaped, acuminately pentangular leaves, which are rough with hairs approaching to bristles, and oblong fruit, is a native of the middle and s. of Asia, and has been cultivated from the earliest times. Its fruit forms an important article of food in its native regions, the s. of Europe, etc., and an esteemed delicacy in colder countries, where it is produced by the aid of artificial heat. Many varieties are in cultivation, with fruit from 4 in. to 2 ft. long, rough, smooth, etc. Young cucumbers are much used for pickling, and are called *gherkins*. The C. is cultivated in fields even in the s. of England, for the supply of the London market; but in the northern parts of Britain, the aid of a hot-bed is required even to produce fruit fit for pickling. The C. requires a sunny situation, and a free rich soil.—To this genus belong other species valued for their edible fruit. *C. anguria* is a West Indian species, with fruit about as large as a pullet's egg, much esteemed as an ingredient in soups. The SNAKE C. (*C. flexuosus*) grows to a great length, and is similar in quality to the common cucumber. *C. serotinus* is cultivated in Turkey, *C. macrocarpus* in Brazil; the CONOMON (*C. conomon*) is much cultivated in Japan. The melon (*C. melo*), water-melon (*C. citrullus*), chate (*C. chate*), and kaukoor (*C. utilissimus*), are noticed in the article MELON; the species yielding colocynth, in the article COLOCYNTH.—The DUDAIM (*C. dudaim*) is very generally cultivated in gardens in the east for the fragrance of its fruit, which, however, is almost tasteless. It is supposed that this plant is sometimes meant in the Old Testament, where the English version has *mandrake*.—The SPIRTING C., SQUIRTING C., or WILD C., which yields the drug called elaterium (q.v.), belongs to an allied genus.

CUCUMBER TREE, an American forest tree of the magnolia species, growing in nearly all the states. The fruit, which looks like a cucumber, when macerated in spirits makes a bitter tonic drink. The timber is light and useful for boat-building.

CUCURBITA'CEÆ, a natural order of exogenous plants, consisting chiefly of herbaceous plants, natives of the warmer regions of the globe, having succulent stems which climb by means of lateral tendrils. There are some shrubby species. The fruit (*pepo*) is peculiar; it is more or less succulent, has a thick fleshy rind, and the seed bearing parietal placentæ either surrounding a central cavity, or sending prolongations inwards. The seeds are flat and ovate, embedded in a sort of pulp, which is either dry of juicy.—This order contains about 300 species, very many which yield fruits much used for food in warm climates, and some of them are cultivated in colder regions as articles of luxury. The fruit of some attains a very large size. To this order belong the cucumber, melon, gourd (of many kinds), pumpkin, squash, vegetable marrow, bottle gourd, etc. The young shoots and leaves of many species are also used as pot-herbs; and the roots of some abound in a bland fecula, and are edible, as those of *momordica dioica* and *bryonia umbellata*, East Indian plants. Yet acridity is a prevailing characteristic, of which the spirting cucumber (see ELATERIUM) of the s. of Europe, and the common bryony (q.v.) are examples. These are not without their use in medicine, but still more important is the colocynth (q.v.).—Among the more interesting species of this order is *hodgsonia heteroclita*, a gigantic species, which is found in the Himalaya mountains, ascending to an elevation of 5,000 feet. The seeds of some C. are used as almonds, and yield oil by expression, as those of *telfairia pedata*, an African plant. *Bryonia dioica* is the only British species, and does not extend to Scotland.

CUD'BEAR, a dyestuff similar to archil (q.v.) and litmus (q.v.), and obtained in the same manner from lichens by the action of ammoniacal liquids. It is chiefly employed as a purple-dye for woolen yarn, but the color is rather fugitive. The name C., or C. LICHEN, is often appropriated to one particular species of lichen, *lecanora tartarea*, which is abundant on rocks in the highlands of Scotland and in the Alpine and northern districts of Europe, and from which the dyestuff C. is usually obtained by maceration for ten or twelve days in urine, with water and chalk. The name is a corruption of *Cuthbert*, and is derived from that of Dr. Cuthbert Gordon, under whose management the manufacture of this dyestuff was begun in Leith about the year 1777, by Mr. Macintosh of Glasgow. The species of the genus *lecanora* are crustaceous lichens, with a flat uniform *thallus*, and unstalked *shields*. *L. tartarea* forms a thick, granulated, and tartareous grayish-white crust, with scattered yellowish-brown shields. It is sometimes called *white Swedish moss*, being largely imported from Sweden.

CUDDALORE', the chief t. in the southern division of Arcot (q.v.), is one of the few seaports on the Coromandel, or e. coast of Hindustan. It is situated on the estuary of the southern Pennaur, a considerable tributary of the bay of Bengal, being in lat. 11° 43′ n., and long. 79° 50′ east. It is 15 m. to the s. of Pondicherry, and 100 to the s. of Madras. Though the river itself is beset by a bar, which admits only vessels of moderate size, yet there is good anchorage off shore at the distance of a mile and a half. The site is not more than 5 ft. above high-water mark; but notwithstanding this apparently insalubrious position, the climate is said to be peculiarly healthy. C. was at one time a place of great strength; and in that respect it was frequently an object of

contention in the wars which, during the latter half of the 18th c., so long desolated this neighborhood. In 1758, it was taken by the French from the English, who had held it for 77 years; and, after various intermediate vicissitudes, it was finally ceded to its original possessors in 1783. Pop. '71, 40,290.

CUD'DAPAH, the district mentioned in the following article, extends in lat. from 13° 12′ to 16° 19′ n., and in long. from 77° 52′ to 79° 48′ e., containing 8,367 sq.m., and '71, 1,351,194 inhabitants. Sloping towards the bay of Bengal, the country ranges, in its general elevation above the sea, between 1182 and 450 feet. C. is traversed in its length from n. to s. by numerous parallel ridges, which constitute a part of the eastern Ghauts—some of the peaks rising 3,500 ft. above the sea level. The maximum, mean, and minimum temperatures are said to be respectively 98°, 81°, and 65° F. In the hot season, the climate is understood to be peculiarly prejudicial to European constitutions. The most striking feature in the physical character of the district is the remains of diamond mines, now abandoned, and probably exhausted, situated about 7 m. from the capital. C. was ceded to Britain in 1800; and in 1846 it was the scene of serious disturbances, occasioned by an unwise interference on the part of government with the prescriptive titles to landed property.

CUDDAPAH, a native t. with a military cantonment in the presidency of Madras, from which it lies about 140 m. to the n.w. It stands, at the height of 507 ft. above the sea, near the right or s. bank of the northern Pennaur, which flows into the bay of Bengal. Lat. 14° 32′ n., and long. 78° 52′ east. The native town itself claims notice merely as the capital of the district of its own name; and the military cantonment, pleasantly overhanging the Bogawanka, an auxiliary of the Pennaur, contains barracks for Europeans, and spacious lines for sepoys. Pop. '71, 16,275.

CUDDY was a name first applied in East India trading ships to a cabin under the poop, where the men messed and slept. The same name afterwards given to the only cabin in very small vessels, and sometimes to the cooking-room.

CUDWEED, the popular name of many species of plants of the genera *gnaphalium, filago,* and *antennaria,* belonging to the natural order *compositæ,* sub-order *corymbiferæ,* the stems and leaves of which are more or less covered with a whitish cottony down; and the heads of flowers consist, in great part, of dry involucral scales, and may be kept for a long time without undergoing much apparent change, so that they may be reckoned among *everlasting flowers* (q.v.). The cudweeds are small plants of very unpretending appearance, some of them common in Britain. *Antennaria dioica* is very frequent in dry mountain pastures. It is sometimes called cat's-foot. Its heads of flowers, from the appearance of which it derives this name, were formerly officinal, and were employed as an astringent in pectoral diseases.

CUD'WORTH, RALPH, D.D., an illustrious English divine, was b. in 1617 at Aller, in Somersetshire, and admitted pensioner of Emmanuel college, Cambridge, in 1630, where he took his degree of M.A., and became an eminent tutor. About 1641, he was presented to the rectory of North Cadbury, in Somersetshire; and in 1644, upon taking his degree of B.D., maintained two theses, in which can be discerned the germs of his *Intellectual System.* In the same year he was appointed master of Clare hall, Cambridge, and in 1645, regius professor of Hebrew; after which he began to apply himself assiduously to the study of Jewish antiquities. In 1651, he took his degree of D.D.; in 1654, he was chosen master of Christ's college; in 1662, appointed to the vicarage of Ashwell; and in 1678, installed prebendary of Gloucester. He died at Christ's college, July 26, 1688.

C.'s *magnum opus,* entitled *The True Intellectual System of the Universe,* was published in 1678. It is a work of great learning, acuteness, and loftiness of thought; but some, at the time, fancied that C. exhibited too much impartiality in stating the atheistic arguments. Dryden said "that he raised such strong objections against the being of a God and Providence, that many thought he had not answered them." Lord Shaftesbury and Bayle were of this opinion also. The accusation of impartiality—a rare offense in those contentious days—is not likely to lessen our admiration of Cudworth. The philosophy to which he was attached was that of Plato, and, in consequence, he estimated highly the writings of the Alexandrian school, to which his own bear some resemblance. The obloquy to which his adventurous studies exposed him, does not seem to have greatly affected him. Besides *The Intellectual System,* C. left in MS. *A Treatise concerning Eternal and Immutable Morality,* which was published by Dr. Chandler, bishop of Durham, in 1731, and forms, or was intended to form, the second part of *The Intellectual System;* also a discourse *On Liberty and Necessity; On Moral Good and Evil;* a discourse *On the Creation of the World and the Immortality of the Soul;* etc. These MSS. are now in the British museum.

CUEN'CA, a city of Spain, at the confluence of the Jucar and Huecar, about midway between Valencia and Madrid. It is romantically situated on a rocky eminence, 3,400 ft. above the level of the sea, and is surrounded by hills. It appears to have derived its name (Lat. *concha,* a shell) from its position and appearance. Ford says it is "indeed a hill-girt *shell.*" The town is of Moorish origin. The streets are narrow and crooked. The chief buildings are the cathedral, the bishop's palace, and a fine bridge over the

Jucar (erected in 1523), connecting the city with the convent of San Pablo. C. was once celebrated for arts, literature, and industry, but its glory has now quite departed. It suffered much during the Peninsular campaign. Pop. 7,200.—C. gives name to a mountainous, well-watered province, yielding excellent timber, honey, wine, and grain, with good pasture, and various minerals, including iron, coal, copper, and silver. Area about 12,000 miles. Pop. '70, 238,731.

CUENCA, a city of Ecuador, in South America, stands on a wide plain or table-land, 8,640 ft. above the level of the sea. It is 85 m. s.s.w. of Quito, the capital of the republic; in lat. 1¼ s., its proximity to the equator, however, being largely neutralized, with regard to climate by its altitude. Pop. estimated at 30,000. It possesses a cathedral and a university.

CUE'VA DE VE'RA, a t. of Spain, in the province of Granada, 42 m. n.e. of Almeria. It is situated on a plain on the right bank of the Almanzor, near its entrance into the Mediterranean. It is generally well built, and its streets regular. The principal edifices are an old Moorish castle, and the parish church in the Doric style. C. has manufactures of hardware, earthenware, and of wine and oil; and a large number of persons are employed in mines in the vicinity. Pop. 10,500.

CUFFEE, PAUL, 1759–1818; a negro sea-captain, b. of an Indian mother, who accumulated a fortune in seafaring life. He was a member of the society of Friends. He was among the first to encourage the colonization of his people in Sierra Leone.

CUFFEE, PAUL, 1775–1812; an Indian of the Shinnecock tribe, on Long island, N. Y.; long employed as a preacher by the New York missionary society.

CUFIC WRITING. See KUFIC WRITING, *ante*.

CUICHUNCHUL'LI, *Ionidium parviflorum*, a Peruvian plant of the natural order *violaceæ*, half-shrubby, with minute leaves, possessing very active emetic and purgative properties, and said to be a certain remedy for *elephantiasis tuberculata*, a reputation which, if even partially well founded, ought to recommend it to the particular attention of the benevolent and humane. Other species of *ionidium* share the same name, properties, and reputation. One of them was formerly supposed to yield ipecacuanha, and its root is still known as white ipecacuanha. See IPECACUANHA.

CUIRASS, as its name (Fr. *cuir*, leather) implies, was originally a jerkin, or garment of leather for soldiers, so thick and strong as to be pistol-proof, and even musket-proof. The name was afterwards applied to a portion of armor made of metal, consisting of a back-plate and breast-plate hooked or buckled together; with a piece jointed to the back called a *culet* or *garde de reines*.

CUIRASSIERS', in the time of queen Mary, were heavy horsemen wearing body-armor over buff-coats. They carried swords and pistols, and the reins were strengthened with iron chains. In modern armies, the name is often given to the heaviest cavalry. Napoleon's 12 regiments of C. attracted much attention during his wars. The first rank of Russian C. are armed with lances. The only C. in the British army (wearing the cuirass) are the life guards (red) and horse guards (blue); and in these the cuirass is now regarded rather as a matter of show than of use.

CUISSARTS, among ancient armor, were worn by troopers. They consisted of small strips of iron-plate laid horizontally over each other round the thigh (Fr. *cuisse*), and riveted together.

CUJA'CIUS, properly JACQUES DE CUJAS, or CUJEUS, one of the most distinguished jurists of the 16th c., b. in 1522, was the son of a tanner of Toulouse. After studying law, he was appointed teacher of the same at Cahors (1554), and in the following year, by the recommendation of the chancellor L'Hopital, gained the chair of law in the university of Bourges. In 1557, he become a professor at Valence. After several changes, he returned to Bourges in 1577, where he resided till his death, Oct. 4, 1590.

His great reputation as a jurist was founded on his study of original MSS. of the Roman laws, and on his classical treatment of these authorities. He had in his library 500 MSS. on Roman law, and by his emendations contributed greatly to remove the obscurities of jurisprudence. A complete collection of his works was edited by Fabrot (10 vols., Par. 1658), and has since been republished frequently. Uhl has edited separately C.'s *Animadversiones et Observationes*. C.'s daughter made herself notorious by her immoralities. See Spangenberg's *C. und seine Zeitgenossen* (Leip. 1822).

CUL'DEES, or KELDEES, (Celt. *Ceile-De*; Lat. *colidei, culdei, calledei, keldei, keledei*), the name given in the British islands to an ancient order of ecclesiastics. The word seems to be of Celtic origin, and in the Irish language signifies an "attendant of God." Giraldus Cambrensis, writing towards the end of the 12th c., when the order still flourished, interprets the name in one place by the Latin word *cœlicola*, i.e., "worshiper of heaven;" and in another by *cœlebs*, i.e., "single," or "unmarried." Boece and Buchanan, in the 16th c., translate it *cultores Dei*, i.e., "worshipers of God."

There is some uncertainty as to the first appearance of the order. There is no trace of it in the works of Adaman, of Bede, of Alcuin, or of any other ecclesiastical historian of the 8th or 9th century. An abbot and bishop of the n. of Ireland, who compiled a metrical calendar of Irish saints about the year 800, was known in his own time as

"Ængus the Ceile-De." But it has been questioned whether the title was not used rather to denote his great personal piety, than to describe his ecclesiastical character. The four masters, again, in their *Annals of Ireland*, compiled about the year 1636, record certain great wonders wrought by a Ceile-De in the year 806. But no such event is recorded in the ancient chronicles from which the four masters compiled their work, and Irish antiquaries think that the passage must therefore be rejected as apocryphal. But in Irish annals of undoubted authority, it is chronicled that, in the year 919, "a Ceile-De came across the sea westward to establish laws in Ireland;" in other words, as Irish archæologists conjecture, to bring the Irish into conformity with the rule for canons which had been enacted in 816, at the council of Aix-la-Chapelle. The annals of Ulster record that, in 920, Armagh was plundered by Godfrey, son of Ivor, the Dane, but that he spared the oratories with the C. and the sick. The C. of Armagh, who thus appear in the beginning of the 10th c., survived till the beginning of the 17th century. Archbishop Usher, who died in 1655, writes that they continued until within his own memory. They were secular priests or canons, about 12 in number, living in community, under the rule of a prior, who—after the beginning of the 13th c., when the metropolitan cathedral of St. Patrick was remodeled after the English fashion—officiated as precenter, his C. being the clerks or choir. The antiphonary or service-book, with the musical notation, from which they sang, is still preserved in the library of Trinity college, Dublin; and its calendar records the deaths of several of their number, one of them so lately as the year 1574. The prior seems generally to have been a pluralist, it having been formally ruled in 1448, after an appeal to Rome, "that the priory of the college of secular priests, commonly called Culdees, being a simple office, and without cure of souls, is not incompatible with a benefice." The C. of Armagh, dissolved at the reformation in 1541, were resuscitated for a brief space in 1627. Their old possessions—among which were 7 town-lands containing 1423 acres, 7 rectories, and 4 vicarages—were, in 1634, bestowed upon the vicars choral of the cathedral, who still enjoy them.

There were at least 7 other houses of C. in Ireland, viz., at Clonmacnois, Clondalkin, Devenish, Clones, Popull, Monanincha, and Sligo.

If tradition could be trusted, the first appearance of C. in Scotland should be placed about the middle of the 9th century. A leaf of the register of St. Andrews, written about 1130, relates that Brude, the son of Dergard, the last king of the Picts (who ceased to reign about 843), gave the island, since called St. Serf's Inch, in Lochleven, to God, St. Servan and the Culdee hermits serving God there. They were governed by an abbot; and about the year 1093, during the rule of abbot Ronan, they gave up their island to the bishop of St. Andrews, on condition that he should find them in food and raiment. They had grants of lands or immunities from all the kings of the Scots who reigned between 1039 and 1153, the roll of these royal benefactors being headed by the renowned Macbeth (1039–56) and his wife Gruoch, the daughter of Bodhe. They had a grant of a church from each of the three bishops who ruled the see of St. Andrews between 1040 and 1093; and about 1120, they had a grant of lands from one of the sons of king Malcolm Canmore and St. Margaret—Ethelred, earl of Fife, and hereditary lay-abbot of the Culdee monastery of Dunkeld. A few years afterwards, the bishop of St. Andrews gives their island, and all their possessions, including their church vestments and their books, to the newly founded canons regular of St. Andrews, in order that a priory of that rule might supplant the old abbey of C. in St. Serf's Inch. About 1140, the bishop's grant was enforced by a charter from king David, in which it was ordered that such of the C. as chose to live canonically and peacefully under the new canons should remain in the island. "If any one of them refuse so to do," says the king, "my will is, and I command, that he be expelled from the island." We hear no more of the Culdee hermits of Lochleven. The canons regular who came in their place continued till the reformation, and we are indebted to one of their priors, Andrew Wyntoun, who died about 1429, for a valuable metrical chronicle of Scotland. A catalogue of the books of the Culdee abbey, when it was bestowed upon the canons regular of St. Andrews, about 1140, has been preserved. The number of volumes was not quite twenty. They were—a pastoral, a gradual, a missal, some of the works of Origen, the sentences of St. Bernard (who was still living), a treatise on the sacraments, in three parts, a part of the Bible, a lectionary, the Acts of the Apostles, the gospels, the works of Prosper, the books of Proverbs, Ecclesiastes, and Canticles, a gloss on the Canticles, a work called *Interpretationes Dictionum*, a collection of sentences, a commentary on Genesis, and a treatise on the exceptions from ecclesiastical rules.

The C. of St. Andrews were of more importance, and not perhaps of less antiquity, than those of Lochleven. The death of an abbot of St. Andrews is chronicled by the Irish annals in 747. It is not said that he was a Culdee; but in 944, when Constantine, the king of Scots, exchanged his crown for a monk's cowl, it is recorded that he became "abbot of the Culdees of St. Andrews." No more is heard of them till about the middle of the 12th century. A priory of canons regular had now been planted beside them, and from its records we learn that in the church of St. Andrew, such as it then was, there were thirteen C., holding their office by hereditary tenure, and "living rather according to their own pleasure and the traditions of men, than after the rules of the holy fathers;" that some few things of little importance they possessed in common; that

the rest, including what was of most value, they held as their private property, each enjoying what he got from relatives and kinsmen, or from the benevolence granted on the tenure of pure friendship, or otherwise; that after they became C., they were forbidden to have their wives in their houses, or any other women of whom evil suspicion could arise; that the altar of St. Andrew was left without a minister, nor was mass celebrated there except on the rare occasion of a visit from the king or the bishop, for the C. said their own office after their own way in a corner of the church. The attempt to supplant the C. by canons regular, which had succeeded at Lochleven, was repeated at St. Andrews, but failed. The C. kept their own church—St. Mary's, or the Kirk of the Heugh—and had a voice along with the canons regular in the election of the bishop. Their abbot disappears about the middle of the 11th c.; and soon afterwards their "prior" exchanges that title for the name of "provost." Their distinctive character was gradually passing away; before the end of the 14th c., they lose their share in the election of the bishop; their name of Culdee is heard no more; their church, about the same time, takes the name of the King's chapel-royal; and henceforth there remains nothing to distinguish them from the secular priests of other collegiate churches.

The C. of the church of St. Mary at Monymusk, in Aberdeenshire, appear to have been founded by the bishop of St. Andrews towards the end of the 11th century. In the beginning of the 13th c. they are found making claim to be regarded as canons regular. The claim was resisted by the bishop of St. Andrews, and in 1211, after an appeal to Rome, the dispute was settled by a compromise, which provided that there should be thirteen C. at Monymusk, of whom one—to be chosen by the bishop from a list of three presented by the other C.—should be the master or prior; that they should have a refectory, a common dormitory, and an oratory, but no cemetery; that they should not adopt the monastic or canonical life or rule without leave of the bishop; and that when he came to Monymusk, he should be received by the C. in solemn procession. Before this agreement is 50 years old, the name of C. disappears from Monymusk, and their house is recognized as a priory of canons regular.

C. are found at Abernethy, in Strathearn, about 1120. In the end of that century, their possessions appear to have been divided between their hereditary lay-abbot (the founder of the noble family of Abernethy) and the prior and C. by whom the burden of the ecclesiastical offices was borne. In 1273, they were transformed into canons regular. The same partition of the Culdee revenues which appears at Abernethy, is found also at Brechin. A layman, who is abbot only in name, inherits a large share of the Culdee patrimony, and transmits it to his descendants, who soon lose even the name of abbot. The prior and his C., meanwhile, are absorbed into the chapter of the new bishopric, founded at Brechin by king David I., about 1145; in less than a hundred years, the name of C. disappears, and the chapter is one wholly of secular canons. The same silent change of C. into secular canons, which took place at Brechin during the 13th c., took place also at Dunblane, at Dunkeld, at Lismore, at Rossmarky, and at Dornoch. C. are found in the bishop's chapter at each of these places in the 12th c.; they disappear before the end of the 13th c., leaving the chapter one of secular canons. At Dunkeld, as at Brechin and at Abernethy, great part of the Culdee revenues was held by a lay-abbot, whose office was of such mark as to be hereditary in the royal family. The father of "the gracious Duncan," and the son of St. Margaret, were Culdee abbots. If a tradition of the 16th c. can be received as authority for what passed in the 12th c., the C. of Dunkeld were married, like the priests of the Greek church, but lived apart from their wives during their period of service at the altar.

C. are found holding land at Monifeith, near Dundee, about 1200; and there was a lay-abbot of Monifeith; but there is nothing to show whether he was or was not a Culdee. The C. of Muthill, in Strathearn, appear with their prior in charters of the beginning of the 13th century. Nothing more is known of them. Jocelin of Furnes, in his Life of St. Kentigern, or Mungo, written about the year 1180, relates that the disciples of that saint at Glasgow, in the 6th c., had all things in common, but lived each in his own hut, whence they were called "solitary clerks," and more commonly "Culdees." C. appear as one of the ecclesiastical fraternities of Iona in the year 1164; and the faint vestiges of a circular building (about 15 ft. in diameter) called "Cothan Cuildich," or the Culdee's cell, are still shown in the island.

Only one or two traces of C. have been observed in England. The canons of St. Peter's, at York, were called C. in the reign of Æthelstan (924–31); and a charter of Æthelred, in the year 1005, speaks of the canons of the English cathedrals generally as *cultores clerici*. The term is of doubtful import, and the charter itself is not beyond suspicion.

Of the C. in Wales, we have only one notice. Giraldus Cambrensis, writing about 1190, describes the island of Bardsey, on the coast of Caernarvon, as inhabited by "most devout monks, called celibates or Culdees."

Such is a concise recapitulation of all that is certainly known of the Culdees. Before their history was ascertained, opinions were held regarding them which now find few if any supporters among archæologists. It was believed that they were our first teachers of Christianity; that they came from the east before corruption had yet overspread the church; that they took the Scripture for their sole rule of faith; that they lived under a form of church-government approaching to presbyterian parity; that they rejected prel-

acy, transubstantiation, the invocation of saints, the veneration of relics, image-worship, and the celibacy of the clergy; and that they kept their simple worship and pure doctrines undefiled to the last, and were suppressed only by force and fraud, when the Roman Catholic church triumphed over their older and better creed. For all this, it is now clearly seen that there is no foundation. There is no reason to suppose that the C. differed in any material point of faith, discipline, or ritual from the other clergy of the British islands and western Christendom. Their name was their only peculiarity.

The best account of the Irish C. is given in a dissertation by the Rev. Dr. Reeves, in the *Proceedings of the Royal Irish Academy* for 1860. The best account of the Scottish C. is given in Mr. Grub's *Ecclesiastical History of Scotland*, vol. i. pp. 226–43 (Aberd. 1861). The opinions formerly held regarding the Scottish C. will be found in Selden's preface to the *Decem Historiæ Anglicanæ Scriptores*, reprinted in his *Opera*, vol. ii. pp. 1129–46; sir J. Dalrymple's *Collections concerning the Scottish History* (Edin. 1705); and the late Rev. Dr. Jamieson's *Historical Account of the Ancient Culdees* (Edin. 1811). The opinions of these writers are controverted in bishop Lloyd's *Historical Account of Church Government*, chap. vii.; Goodall's *Preliminary Dissertation* and bishop Russell's *Supplement*, prefixed to Keith's *Catalogue of Scottish Bishops* (Edin. 1824); Pinkerton's *Inquiry into the Early History of Scotland*, vol. ii. pp. 270–73 (edit. 1814); and Chalmers's *Caledonia*, vol. i. pp. 434–39 (Lond. 1807). On the subject of the C. generally, reference may be made to Lanigan's *Ecclesiastical History of Ireland*, vol. iv.; to the dissertation by J. van Hecke in the *Acta Sanctorum Octobris*, vol. viii.; and to Skene's *Celtic Scotland*, vol. ii.

CUL-DE-SAC, a street or alley with an opening at only one end, easy therefore of entrance, but not for exit; thence any close, confined, uncomfortable place.

CUL'EMBORG, CUL'EMBORG, or KUIL'ENBURG, a t. of the Netherlands, situated on the left bank of the river Leek, 12 m. n.w. of Tiel. C. has three divisions, of which the inner town is the oldest and most important. It has a Reformed, a Lutheran, a Roman Catholic church, a synagogue, and a fine orphan-house. It has steamboat communication, and is a station of the railway from Utrecht to 's Hertogenbosch. C. has several factories. In olden times, the "Dominion of Culemborg" formed a county; and its independence, both of the Roman empire and the states of Holland, secured it the singular privilege of offering an asylum to fugitives from Holland for debt. Pop. '75, 6,543.

CULIACAN', a t. of the Mexican confederation, stands on a river of its own name, which, flowing towards the s.w., enters the gulf of California near its mouth. It occupies a fertile tract in the department of Sinaloa, being about 90 m. to the s.e. of the city so called. It is estimated to contain 7,000 inhabitants.

CULILAWAN BARK, also called CLOVE BARK, a valuable aromatic bark, the product of the *cinnamomum culilawan*, a tree of the same genus with the cinnamon (q.v.) tree, growing in the Molucca islands. It comes to market in pieces of various length, almost flat, thick, fibrous, covered with a white epidermis, reddish-yellow inside, and has an odor resembling that of nutmeg and cloves, and a pungent taste. It is useful in cases of indigestion, diarrhea, etc.—Another variety of C. B. is believed to be the produce of *cinnamomum xanthoneurum;* and a very similar bark, called SINTOC BARK, is obtained from *C. sintoc.*

CUL'LEN, a royal, parliamentary, and municipal burgh and seaport in the n. of Banffshire, 12 m. w.n.w. of Banff. It is built on the w. slope of an eminence overlooking the sea, and at the mouth of the Cullen Burn. Pop. '71, 2,056. A third of the inhabitants of the town are engaged in the cod, ling, haddock, skate, herring, and salmon fisheries. C. contributes with Elgin, Banff, Peterhead, Inverury, and Kintore in returning one member to parliament. The chief exports are cured fish, oats, potatoes. Some linen is made. The marquis of Montrose burned C. in 1645.

CULLEN, PAUL, D.D., Cardinal, b. in Ireland, 1803; educated in Rome; made cardinal, 1866. He is the first man of Irish birth who has been made a cardinal since the reformation.

CULLEN, WILLIAM, a well-known physician of the last century, and one of the most celebrated professors of medicine in the universities of Edinburgh and Glasgow, was born at Hamilton, in Lanarkshire, on the 15th day of April, 1710. His father was factor to the duke of Hamilton, and was possessed of a little landed property in the parish of Bothwell; he appears to have brought up two of his sons to the learned professions, and to have himself received a legal education. William C. received the first part of his education at the grammar-school of Hamilton, and afterwards began his medical studies in Glasgow by an apprenticeship, and by attending literary classes in the university. At this time (about 1727), it does not appear that there was any systematic medical teaching in Glasgow university, though the medical school of Edinburgh was just rising to the height of its fame, under the auspices of the first Monro. C.'s master in the art, however, Mr. John Paisley, was a liberal and enlightened man, having a valuable library, of which the pupil may be presumed to have made good use. In 1729, having completed for the time his medical education, he was appointed surgeon to a merchant-ship, trading to the West Indies; and from this time till 1734, he was actively engaged in learning his profession practically in various situations, but without accept-

ing any permanent responsibility. He next spent two additional winter-sessions in Edinburgh in the regular study of medicine, and was one of the founders of that important students' association—since called the royal medical society—the object of which was, and is, the advancement of the medical knowledge of the members by periodical discussions on subjects of interest connected with medical study. In 1736, he commenced practice at Hamilton, and very soon was largely employed, having secured from the first the influence and friendship of the duke of Hamilton and of other persons of distinction. Soon after, he became acquainted with William Hunter, afterwards the celebrated anatomist and obstetric professor, and brother of the still more celebrated John Hunter. See HUNTER, JOHN and WILLIAM. The three years passed by Hunter under Cullen's roof formed the beginning of a life-long friendship, although after Hunter went to London, it is probable that they never again met. In 1740, C. took the degree of doctor of medicine in the university of Glasgow; in 1741, he entered into partnership with a surgeon, with the view of confining himself to a physician's practice; in 1744, he responded to the invitation of a number of families in Glasgow, and took a house in that city, an object which it is probable he had in view some years before, but which he was prevented from carrying out by the friendship and liberal patronage of the duke of Hamilton, who died in 1743. Various circumstances indicate that during the seven years passed in practice in Hamilton, C. was diligently preparing, not only for the practice, but also for the teaching, of his profession; and accordingly, he had no sooner settled in Glasgow, than we find him engaged in giving a course of lectures, in regard to which his correspondence with William Hunter sufficiently shows that it was successful, and deserved success. Up to this period, though professorships of medicine, and of anatomy with botany, existed in the university, no lectures were delivered in either medicine or botany; and it seems certain that to C. that university owes the real commencement of its medical school; for in one or two years succeeding 1746, he made arrangements with the several professors to lecture on the theory and practice of physic, on botany and the materia medica, and finally on chemistry, being assisted in these last departments by Mr. John Carrick, who also acted as assistant to the professor of anatomy. In botany, C. seems to have lectured in Latin, but in the other departments he adopted the English language as the vehicle of expression, an innovation of great importance, which permitted him to adopt a more familiar style of lecturing than had hitherto been in use. One of his original hearers records that "in the physic class, Dr. Cullen never read lectures, but only used notes; in the chemistry, he sometimes read, but very seldom."*

He was supported by the university by votes amounting to £136 for the chemical laboratory, and £20 annually for keeping it in repair. As a chemist, he does not appear to have made any notable discovery; but he imbued the minds of his pupils with large and liberal views of a science then very imperfectly studied, and was beyond all doubt the means of raising up the great reputation of Dr. Black, by turning his thoughts to the subject of latent heat, which he prosecuted so successfully by a series of conclusive and most original experiments. In 1751, after somewhat prolonged negotiations, C. was placed, through the influence of the duke of Argyle, for the first time in his rightful position as a professor in the university of Glasgow, in room of Dr. Johnstone, the professor of medicine. But by this time it had begun to be apparent that an opening both for teaching and practice existed in Edinburgh, and lord Kames, whose knowledge both of general science and of Edinburgh society placed him in a favorable position for judging of the chances of success, made several attempts to attract the rising and ambitious Glasgow professor to the metropolis; in which design, however, he was not successful till four years afterwards, when C. was elected by the town-council joint professor of chemistry with Dr. Plummer, who had fallen into bad health, and who died about a year afterwards. In 1757, his ever-active mind found a new direction in adding to his duties as professor of chemistry the teaching of clinical medicine in the royal infirmary, a duty up to this period performed by Dr. Rutherford only, the professor of medicine and botany. The clear-sightedness and practical sagacity which he brought to this work at once fixed his position as a teacher and as a physician. Probably, also, the fact of his having to give bedside instruction at this period opposed itself to the natural tendency of his mind to give everything a systematic form, and weeded his method of practice of an immense quantity of the scholastic rubbish which appears prominently in all the medical learning of that age. He became a decided favorite with the students, and not less so with his patients; and in 1760, was applied to by the former to undertake the lectures on materia medica, in consequence of the death of Dr. Alston during the session. This duty he performed so well, that his lectures were surreptitiously printed from the notes of a pupil, and had a considerable circulation. On the resignation of Dr. Rutherford, it was reasonably expected that C. would have been transferred from the chemical chair to that of the practice of physic, for which he had shown so decided an aptitude; but personal views interfered, and Dr. John Gregory was appointed to the practical chair. In 1766, C. was, however, placed in the chair of institutes of medicine, vacant by the death of Dr. Whytt; and Black, now the greatest chemical discoverer of the age, was brought to Edinburgh from Glasgow to fill C.'s place as professor of chem

* Thomson's *Life of Cullen*, vol. i. p. 25.

istry. In 1773, C. was at last transferred to the chair of the practice of physic, the duties of which he had for some years performed alternately with Dr. Gregory, the latter taking part in return alternately with C. in the lectures on the theory or institutes of medicine.

The rest of Dr. C.'s biography is simply a record of continued success as a teacher and a practitioner. His popularity with his students, and even his scientific reputation at one time threatened to be seriously diminished by the brief but noisy episode of the Brunonian system (see BROWN, JOHN, M.D.). In 1778, C. became the proprietor of Ormiston hill, a small but prettily situated property about 8 m. w. of Edinburgh, where he passed as much time as his professional duties would allow in improving his little estate, and renewing his long-dormant knowledge of, and love for, rural affairs. "I have got upon my hobby," he writes to a friend; "my amusement is a little farm, and a little pleasure-ground. . . . I have done a great deal, but it is all leveling work; other people cannot know what earth has been moved, but I have had some amusement in the turning of every shovelful." It was a becoming end to a life of usefulness. He had here the leisure and the enjoyment of life which were required to wean him from the too exclusive pursuit of his profession; and while his love of science never chilled, and was even made subservient to the adornment of the retreat of his old age, he was somewhat withdrawn from the heat and the strife of the world into the purer air of domestic retirement. C. died on the 5th Feb., 1790, having nearly completed his 79th year, and having been actively engaged in teaching and consulting practice till within a few months of his death. His most important works are the *First Lines of the Practice of Physic* (Edin. 1777); *Synopsis Nosologiæ Methodicæ*, 1785; *Institutions of Medicine*, 1777; *A Treatise of the Materia Medica*, 1789. Their characteristics are great clearness of expression, with remarkable soundness of judgment and common sense, rather than striking originality, or a rapid advance into new regions of thought. But he was eminently the man for his time, which was distracted and confused by a host of baseless theories, and by many of those "false facts" which C. himself said were more numerous than even false theories. Amid this farrago, he sought his way towards the truth with remarkable impartiality, and infinite candor as regards the opinions of others. His fame as one of the greatest of teachers has survived the memory of his professional success, and even the credit of his far-famed systematic nosology. His writings have been collected in 2 vols., 8vo., by Dr. John Thomson (Edin. 1827), by whom also a life was commenced, the first volume of which was published in 1832. This biography was continued by his son, and finally completed in a second volume by Dr. Craigie, in 1859.

CULLE'RA, a fortified maritime t. of Spain, on the Mediterranean, at the mouth of the Jucar, in the province, and 23 m. s.s.e. of the town, of Valencia. C. is irregularly built, but clean; has an old castle, several churches, schools, convents, a hospital, extensive barracks, etc. From its position, it is considered a place of great military importance. It stands on the outskirts of an agricultural district, "an Eden of fertility," and the inhabitants are mostly engaged in agriculture, cattle-rearing, fishing, and the production of oil and wine. A considerable coasting-trade is carried on with France and the Mediterranean. Pop. 8,500.

CULLO'DEN, or DRUMMOS'SIE MOOR, a desolate level table-land, now partly cultivated, in the n.e. of Inverness-shire, 6 m. e.n.e. of Inverness, near the Moray firth. It is memorable as the scene of the total defeat, on 16th April, 1746, of the Highland army under prince Charles Stuart by the royal troops under the duke of Cumberland, and the extinction of the hopes of the house of Stuart to regain the English crown. Green mounds and a monumental cairn mark the spots where the battle was fiercest, and where many of the slain lie buried.

CULLUM, GEORGE W.; b. N. Y., 1809; graduate of West Point, 1833. He retired from active service in 1874, holding the rank of maj.gen.

CULM, in botany, the peculiar cylindrical hollow and jointed stem of grasses (q.v.).

CULM, a popular name of anthracite (q.v.), in very general use in some parts of England, and occurring in many scientific works. In some districts of South Wales, the C. obtained from the pits in a broken and crumbling condition, is used as fuel, being made up into balls, with one third of its bulk of wet viscid clay. It burns without flame, producing a strong and steady heat, well adapted for cooking.

CULMINA'TION, an astronomical term, signifying the passage of a star across the meridian. The star is then at the highest point (*culmen*) of its course: hence the name. The sun culminates at midday, or 12 o'clock, apparent solar time—which seldom agrees exactly with mean time, as shown by a watch or clock. The full moon culminates at midnight. The time of C. of a fixed star is always exactly midway between the times of its rising and setting; in the case of the sun, moon, and planets, it is only nearly so.

CUL'NA, a t. of India, in the British district of Burdwan, presidency of Bengal, 47 m. n. of Calcutta, on the right bank of the Hooghly. The town contains a vast number of temples, is a station of the free church (Scotland) mission, and has a flourishing English school. It is a place of considerable trade, rice, grain, silk, and cotton being

the chief articles of commerce; and of late years, the traffic has greatly increased, in consequence of its being found a convenient station for steamers plying between Calcutta and the upper provinces. C., in 1871, had 27,336 inhabitants, the chief part of whom are from different parts of the country carrying on trade here.

CUL'PA (Lat. fault, crime, blame). By the Roman jurists, C. was recognized as existing in three degrees, *C. lata*, gross carelessness or omission, which was regarded as equivalent to dole; *C. levis*, that degree of negligence into which a person attentive to his own affairs may be supposed occasionally to fall; and *C. levissima*, that still more slight degree of negligence which is in some degree incident to human nature, and may be fallen into by even the most prudent and sharp-sighted. Where a contract contemplates the mutual benefit of both parties, the middle degree of diligence is all that either is bound to exercise, and the neglect of this is *C. levis*, or C. simply. Where one party only is benefited, he is bound to exercise the utmost diligence, the neglect of which is *C. levissima*, whilst the other party has done enough if he avoids *C. lata*, or gross and excessive negligence. These distinctions of the Roman law have been adopted by the law of Scotland.

CULPABLE HOMICIDE. See HOMICIDE and MURDER.

CULPEPER, a co. in n. Virginia, between the Rapidan and Rappahannock rivers, intersected by the Orange, Alexandria, and Manassas railroad; 673 sq.m.; pop.'80, 13,408—6,623 colored. Agriculture is the main business. Co. seat, Fairfax.

CULPEPER, JOHN, an early English emigrant to the Carolinas who led an incipient rebellion, was tried for treason, but was acquitted because there had been really no government to rebel against. In 1680, he laid out on paper the plan of the city of Charleston.

CULPEPER, or COLEPEPPER, THOMAS, Lord, d. 1688; one of the grantees and a governor of the colony of Virginia. He administered the office chiefly for his own gain, being shrewd and unscrupulous to the last degree.

CULPRIT, in English law, is a prisoner accused, but not tried. After trial, if not acquitted, he becomes a convict.

CULROSS', a parliamentary and municipal burgh and seaport in a detached part of Perthshire, on the n. shore of the firth of Forth, 6 m. w. of Dunfermline, and 22 n.n.w. of Edinburgh. It is a place of great antiquity. As early as the 6th c., it was the seat of the monastery of St. Serf, who afterwards became the patron saint of the town, where his yearly festival was kept till about the close of the 18th century. Ængus the Keldee, an Irish martyrologist, who wrote about 800 A.D., describes it as lying in Strathearn between the Ochils and the sea of Gindan, i.e., the firth of Forth. It stands on the face of a hill rising from the shore. The parish church preserves some remains of the conventual church of a Cistercian abbey, founded in 1217, on a commanding site in the higher part of the town. Close beside it is the fine old residence of C. abbey, founded by the Bruces of Carnock and Kinloss about the end of the 16th c., remodeled about the middle of the 17th c., and towards the end of the 18th occupied by the father of the late lord Dundonald, who here made experiments in extracting tar from coal for preserving ships' bottoms, and gas for illuminating purposes. At the e. end of the town are the ruins of a chapel, built about the beginning of the 16th c., in honor of St. Kentigern or Mungo, who is said to have been born here about the year 500, and to have been here educated by St. Serf. C. has various charitable institutions, and carries on some damask weaving. In the 16th c. it was famous for the manufacture of salt and the export of coal. Its once extensive shipping traffic is now gone. Pop. '71, 467. It returns one member to parliament with Sterling, Dunfermline, Inverkeithing and South Queensferry. From James VI.'s time, up till the beginning of the century, coal-mines were worked here far under the firth of Forth.

CULTIVATED PLANTS—those plants which, either for their usefulness or their beauty, have been to some considerable extent, and not merely as objects of curiosity, cultivated by man—belong to natural orders widely different from each other, and scattered throughout almost all parts of the vegetable kingdom. The prevalence of particular qualities in particular natural orders, indeed, causes us to find groups of C. P. in some of them, as the *cerealia* or corn-plants among grasses; but with these are botanically associated other species—usually far more numerous—to which no great value has ever been attached, or which are objects of interest to the botanist alone. It may be that, in some instances, the original preference of certain species was accidental, and that their present superiority over certain others is merely owing to the improvements effected by cultivation; but we are no more entitled to assume that this has been ordinarily the case, than that man has in his selection exhausted, or nearly exhausted, the resources of nature. Some plants are known to have been cultivated from the most remote historic ages; some have but recently become the objects of human care, which yet are deservedly esteemed; and, in some instances—e.g., sea-kale—these have not been introduced from regions newly explored, but are natives of the very countries which have been the seats of ancient civilization. Probably, in the earliest ages, plants useful for food alone were cultivated, and of these only a few kinds, as is still the case among savage tribes; it may perhaps be doubted whether plants yielding fiber for clothing and

cordage, or plants from which alcoholic beverages or narcotics could be procured, were most likely next to engage attention.—Of C. P., plants affording articles of human food are certainly the most important, as well as the most numerous class. See FOOD. Next to these may be ranked plants yielding fiber (q.v.). Other important classes of C. P. are those yelding alcoholic beverages, all of which, however, are also to be ranked among the plants yielding food (see FERMENTED LIQUORS); those yielding tea, coffee, cocoa, and other similar beverages, containing *caffeine* (q.v.), or some analogous principle; those yielding narcotics (q.v.), as tobacco and opium, some of which are and some are not cultivated also for other purposes; those yielding dye-stuffs (q.v.); those yielding medicines (see OFFICINAL PLANTS); those yielding fixed oils (see OILS), some of which are to be reckoned among plants valuable for food, on account of the use of their oils as articles of food, whilst they are also valuable on other accounts; those yielding fodder (q.v.) for cattle; those yielding timber (see TIMBER TREES); those employed for hedges (q.v.), etc. There are also many miscellaneous useful products of plants, and useful purposes to which they are applicable. Among the former are resins, turpentines, essential oils, gum caoutchouc, gutta-percha, bark for tanning, etc.; among the latter, the thatching of roofs, basket-making, and the supply of food necessary for useful insects, which leads to the cultivation of the white mulberry as the food of the silkworm, and of the cochineal cactus or nopal as the food of the cochineal insect. Many plants highly valued for their usefulness are still scarcely or not at all cultivated: this is the case particularly with many that yield medicines, for which the whole demand is not too great to be easily supplied by the plants growing wild, and with timber trees, the plantation of which only takes place in countries of very advanced civilization. The number of plants cultivated for their usefulness is continually increasing, as well as of those cultivated for their beauty. The cultivation of flowers and ornamental shrubs and trees, although unquestionably less ancient than that of some of the plants most necessary for the supply of urgent wants, nevertheless dates from a remote antiquity, and has always existed in every country entitled in any measure to the credit of civilization. Some C. P. have from a very early period been very widely diffused, as has particularly been the case with some of the corn-plants; but others have been confined to particular regions through no necessity of climatic adaptation, but rather from want of intercourse among nations. Thus, some of the finest ornaments of our greenhouses and gardens, recently introduced into Europe, have been diligently cultivated from time immemorial in China and Japan, in which countries also many useful plants are cultivated still almost unknown in other parts of the world. The cultivation of useful aquatic plants is practiced in China to a degree unapproached in any other country.

The changes produced by cultivation present an interesting and difficult subject to the student of vegetable physiology. Increase of luxuriance and size is a result which might have been expected from abundant nutriment and favorable circumstances of growth; but the determination of the strength of the plant in its vegetation to particular parts, and their greater proportionate increase, is a more remarkable phenomenon, although of common occurrence, as is also the considerable modification of juices and qualities. To these effects of cultivation, perpetuated in the progeny of the plants, and increased from one generation to another, we owe many of the most useful varieties of cultivated plants. Our cabbages, turnips, carrots, etc., differ very much from the wild plants of the same species; there is little, for example, that is eatable or nutritious in the root of a wild turnip, and the acridity occasionally to be observed even in cultivation exists in it to a much greater degree. Wild celery is poisonous, or almost so. How far the effects of cultivation can be extended, is a question not yet decided in general, nor with reference to particular species.

CULTIVA'TION. The term includes all operations for preparing the soil for those crops which man specially selects for his use. The spade, the hoe, and the plow, have been the primary implements of C. among all nations as far back as their civilization can be traced. All these effect much the same end. By their means the soil is stirred and inverted, which keeps under the vegetation that is supplanted, and loosens the soil to admit of the roots of the sown plants to run through it. The harrow or rake, on the other hand, is employed to smooth the surface and cover the seed. To allow of the C. of the crops when they are growing, in many cases the seeds are planted or sown in rows. Cereals, for instance, are, with this view, often sown with a *drill* in rows from 6 to 9 in. apart; and the narrow rows are either cultivated by the *hand* or *horse hoe*. Again, turnips, potatoes, and other green crops, are sown at wider intervals, from 24 to 30 in., and are cultivated during their growth by horse-hoes of various descriptions. The implements used in C. will be best treated under their special names, and under the different crops the peculiarities of their cultivation will be considered. A few general principles, however, which ought to be kept in view in the C. of all crops, may be here stated.

The soil, in the first place, should be as completely inverted as possible, since it is an important object to smother or bury the surface-plants, and permit them to decay within the soil and yield food for the plants to be sown. In the second place, it should be rendered as loose and comminuted as possible; for earth in this state both allows an

excess of water to pass through it more easily, and it also retains a larger supply within it for the wants of vegetation when the weather is dry. Land that is tilled in autumn may be left open, rough, and cloddy, as the frost of winter will loosen and pulverize it by spring. In a dry and warm climate, the desired state of the soil is secured by abundant plowing, rolling, and other operations. In a wet and moist climate, these must be more sparingly resorted to, as a moderately rough-mold facilitates the draining away of excessive rains, and prevents the soil from becoming consolidated by such excess.

CULTIVA'TOR, a farm implement. See GRUBBER.

CULTRIROS'TRĒS (Lat. knife-billed or plowshare-billed), a tribe of birds of the order *grallatores;* distinguished by a long, thick, stout, and generally pointed and trenchant bill, and containing cranes, herons, bitterns, storks, adjutants, etc.

CUL'VERIN, among the earlier forms of cannon, was a very long gun. It was generally an 18-pounder, weighing 50 cwt.; the *demi* C. was a 9-pounder, weighing 30 cwt. A C. of especially large dimensions is still in existence at Dover castle, where it is known by the name of queen Elizabeth's pocket pistol.

CULVERT is the name given to an arched channel of masonry for the conveyance of water under-ground.

CU'MÆ, an ancient city on the coast of Campania, founded conjointly by colonists from Chalcis in Eubœa, and from Cymæ in Asia Minor. According to Strabo, it was the earliest of all the Greek settlements either in Italy or Sicily, but the precise date of its foundation is a matter of dispute. It soon attained to wealth and power, built several harbors or port-towns of its own, kept a tolerably large fleet, extended its influence over the native tribes of the neighboring territories, planted a colony at Neapolis (Naples), and for 200 years (700–500 B.C.) was indisputably the most important and civilized city in southern Italy. Subsequently, it was repeatedly but unsuccessfully attacked by the Etruscans and Umbrians. In 474 B.C., its ally, Hieron, king of Syracuse, defeated the combined fleets of the Etruscans and Carthaginians, who had attacked it by sea. Yet there can be no doubt that these conflicts both lessened its resources and weakened its influence, for in 420 B.C., the Samnites conquered the city, murdered or enslaved the most of the citizens, and forcibly married their wives and daughters. A Samnite colony was now established in C., which rapidly degenerated into a second-rate Campanian town. In 338 B.C., it was admitted to the Roman franchise, and from this period steadily adhered to the fortunes of Rome. In the second Punic war, Hannibal tried to capture it, but was repulsed by Sempronius Gracchus. Towards the close of the republic, it became the municipal capital of the district in which the Roman nobles had their villas and sea-coast residences. It continued to exist as a "quiet" place down to the close of the Roman empire, but reassumed a momentary importance during the wars of Belisarius and Narses. Its strong fortress, garrisoned by the Goths, was the last place in Italy that held out against the Byzantine army. Few remains of the ancient city exist.—C. is famous as the residence of the Sibyl (q.v.), whose cave—a vast subterranean grotto hewn out of the eastern side of the rock on which stood the citadel—is described by Justin Martyr, who visited it. It was destroyed by Narses in a vain attempt to undermine the fortress.

CUMANA, the department of which the below mentioned city is the capital, forms the most easterly section of the northern coast of the republic, touching the Orinoco on the s., and meeting Caracas on the west. Besides the capital, it comprises the city of Barcelona, and the towns of Cariaco, Carapano, Aragua, and El Pao. Pop. '73, 55,476.

CUMANA', the oldest European city in the new world, having been built by Diego Castelion in 1521, and originally named New Toledo. It is in the province of the same name, in Venezuela, South America, and stands at the mouth of the Manzanares, on the gulf of Cariaco, a long and narrow arm of the Caribbean sea. Lat. 10° 30′ n., and long. 64° 15′ w. Though it was almost entirely destroyed by an earthquake in 1853, yet in 1873 it numbered, including several suburbs, 9,427 inhabitants. It has a good roadstead, which is commanded by a fort on an adjacent height. It has but few edifices of any note, for the houses, in order to guard against the evil already mentioned, are generally low built. It carries on a tolerably large export trade in cattle, smoked meat, salt-fish, cocoa, and other provisions.

CUMANIA, GREAT and LITTLE, districts in Hungary. Great C. is a low plain subject to inundation, with a pop. of about 70,000. Little C. has an area of 1000 sq.m. and a pop. of about 85,000.

CUMBERLAND, a river, rises in Kentucky, United States, and after a course of 600 m., of which the lower half is navigable for vessels of 400 tons, enters the Ohio at Smithland from the left, a few miles above the point where the Tennessee also joins the Ohio from the same side.

CUMBERLAND, a co. in s. Illinois, intersected by the Embarras river and three or four railroads; 310 sq.m.; pop. '80, 13,762. Agriculture is the main business. Co. seat, Prairie City.

CUMBERLAND, a co. in s. Kentucky, on the Tennessee border; 375 sq.m.; pop. '80, 8,891—1565 colored. Productions agricultural. Co. seat, Burksville.

CUMBERLAND, a co. in s.w. Maine, on the ocean; traversed by several railroads, and bounded on the n.e. by the Androscoggin river; 990 sq.m.; pop. '80, 86,360. The soil is fertile and well cultivated. Co. seat, Portland.

CUMBERLAND, a co. in s.w. New Jersey, on Delaware bay; intersected by the West Jersey and Vineland railroads; 480 sq.m.; pop. '80, 37,694. Productions chiefly agricultural. Co. seat, Bridgeton.

CUMBERLAND, a co. in North Carolina, intersected by Cape Fear river; 1680 sq.m.; pop. '80, 23,836—11,244 colored. Lumber and turpentine are the staples. Co. seat, Fayetteville.

CUMBERLAND, a co. in s. Pennsylvania, in the Cumberland valley; traversed by three or four railroads; 545 sq.m.; pop. '80, 45,978. Productions agricultural. Co. seat, Carlisle.

CUMBERLAND, a co. in Tennessee; 700 sq.m.; pop. '80, 4,538—42 colored. It is hilly and mountainous. Co. seat, Crossville.

CUMBERLAND, a co. in central Virginia on the Appomattox and James rivers; 310 sq.m.; pop. '80, 10,430—7,419 colored. Productions mainly agricultural. Co. seat, Cumberland Court-house.

CUMBERLAND, the north-westmost co. of England, bounded n. by Scotland and the Solway firth, w. by the Irish sea, s. by Lancashire, e. by Westmoreland, Durham, and Northumberland. It is eleventh in size of the English counties; greatest length, 74 m.; greatest average breadth, 22; 75 m. of coast: area, 1523 sq.m.; $\frac{3}{4}$ being cultivated, and $\frac{1}{4}$ in mountain and lake. The surface is mountainous in the s.w. and e.; the middle consists of hills, valleys, and elevated ridges; and the n. and n.w. districts, including the vale of Carlisle, are low, flat, or gently undulated. The mountains in the s.w. are high, rugged, and sterile, with deep and narrow valleys, lakes, rivers, water-falls, and woodlands. The chief mountains are Sca Fell Pike, 3,166 ft.; Sca Fell, 3,100; Helvellyn, 2,055; Skiddaw, 3,022. From the latter are seen the German ocean and the Irish sea. The Pennine chain, the great backbone of the n. of England, skirts the n.e. border of C., and rises in Cross Fell, 2,901 feet. C. has 15 lakes, the largest one, Ullswater, being 9 m. by 1. Six of the chief water-falls are 60 to 156 ft. high. The chief rivers are the Eden, running 35 m. n.w. into the Solway firth; the Esk, running s. into the same; and the Derwent, which collects the water of six lakes and several tarns, and runs 33 m. n.w. and n. into the Irish sea. The great west or Carlisle and Lancaster railway route from Edinburgh to London, crosses the n.e. part of Cumberland.

The lake district, or nearly the s.w. half of C., consists of Silurian slates, with protrusions of granite and trap rocks, and with new red sandstone along the coast s. of St. Bees Head. In the n. is a semicircular strip of carboniferous limestone; then follow strips of coal strata and permian rocks; then the new red sandstone plain of Carlisle, with carboniferous limestone on the n.e., including a trap-dike 30 m. long, parallel to and on the e. side of the Eden, and crossing to the w. near Ainstable. C. abounds in mineral wealth—silver, copper, lead, iron, plumbago, gypsum, limestone, coal, slates, marbles, marl, and several of the more rare minerals.

In the mountainous parts, the climate is cold, wet, and variable, especially from July to Oct.; on the coast, it is mild. There is a fall of 50 in. of rain annually at Whitehaven, and of 68 at Keswick; while at some places among the mountains the fall sometimes reaches 100 inches. Half of the cultivated soil consists of dry loam. Much of the subsoil is wet clay. The chief crops are wheat, barley, oats, turnips, and potatoes. There are many small dairies. Many sheep and cattle are reared in the mountains. The estates are generally small, and farmed by the owners, or held under the lords of the manors by customary tenure. Many of the small or peasant proprietors have had their lands in their families for centuries, and have a high spirit of independence. There are manufactures of woolens—much being domestic—cottons, linen, earthenware, and glass. C. is divided into five wards or hundreds, 104 parishes, and nine poor-law unions. The chief towns are Carlisle, Cockermouth, Whitehaven, Workington, Maryport, Wigton, Penrith, Keswick, Egremont. Pop. '71, 220,253. In the same year the number of electors was 20,174. Its rental, in gross, was £1,236,929. C. returns eight members to parliament—four for the county, two for Carlisle, one for Cockermouth, and one for Whitehaven. C. formed part of Cumbria (q.v.). Many Roman relics have been found, such as altars, inscriptions, coins, instruments, utensils. During Saxon times, it was under Danish law. Henry III. united it to England. For three centuries before the union of England and Scotland, C. was the constant scene of war and devastation, from incursions of the English and Scotch into this, a debatable tract between the two kingdoms. It was again devastated in the civil wars of the 17th c., and in 1715 and 1745. C. had formerly several monasteries and hospitals; and on the borders, many towers or peel-houses; and it has still some old Norman and Gothic churches.

CUMBERLAND, a co. in Nova Scotia; 1600 sq.m.; pop. '71, 23,518. Agriculture, lumbering, and ship-building constitute the chief branches of industry. Chief town, Amherst.

CUMBERLAND, a township of Rhode Island, U. S., on Blackstone river, and Providence and Worcester railway, 10 m. n. of Providence, containing extensive manufactories of iron, machinery, cotton, boots and shoes, etc. Pop. '70, 3,882.

CUMBERLAND, a city of Maryland, U. S., on the left bank of the Potomac river, at the foot of the Alleghanies, the eastern terminus of the National road, and the western of the Chesapeake and Ohio canal, 179 m. w. by. n. from Baltimore. C. is a station on the Baltimore and Ohio railway. It contains county buildings, eight churches, three newspapers, flour-mills, etc. The C. semi-bituminous coal is supplied from this region. Pop. '70, 8,056; in '80, 10,666.

CUMBERLAND (*ante*), a city and seat of justice of Alleghany co., Md., on the n. branch of the Potomac, at the w. terminus of the Chesapeake and Ohio canal; pop. estimated at 13,000. The city is on the outer edge of the great coal basin of the same name, with which it is connected by the Cumberland and Pennsylvania railroad, and the Cumberland coal and iron company's road. The city has gas and water, and being 600 to 700 ft. above the river, is free from miasma. There are 16 churches, a Carmelite college, two academies, and many public and private schools. Among the manufactories are steel-rail mills, other railroad-bar mills, a blast-furnace, two iron foundries, steel works, cement mills, steam tanneries, locomotive works, railroad car and machine shops, flour mills, furniture works, etc.

CUMBERLAND, Dr. RICHARD, was b. in London, July 13, 1632. Educated at St. Paul's school and at Cambridge, he was appointed to the rectory of Brampton, Northamptonshire, in 1658; in 1667, to the living of All Hallows, Stamford; and in 1691, to the bishopric of Peterborough. C. was a man of great acquirements and piety. He was the author of several works, but he is now chiefly remembered on account of his *Inquiry into the Laws of Nature*, issued in reply to Hobbes; and his *Essay on Jewish Weights and Measures*. As an instance of his insatiable thirst for knowledge, it is mentioned that he learned Coptic after the age of 83. He died, Oct. 9, 1718.

CUMBERLAND, RICHARD, a dramatic writer and essayist, was b. on the 19th Feb., 1732, in the lodge of Trinity college, Cambridge. He was the great-grandson of the bishop of Peterborough, and grandson, by the mother's side, of Dr. Richard Bentley. He was placed at the public schools of Bury St. Edmunds and Westminster, and at the age of 14, was entered at Trinity college, Cambridge, where he took his degree in his 18th year, and two years after was elected fellow. Having been appointed private secretary to the earl of Halifax, he gave up his intention of entering the church, and passing through several subordinate offices, was appointed secretary to the board of trade, holding that office till 1782, when the board was suppressed. Having obtained a compensation allowance, C. retired to Tunbridge Wells. Here he devoted himself to literature, and wrote farces, tragedies, comedies, pamphlets, essays, and novels. Many of his comedies were successful at the time of their appearance, although they have not kept possession of the stage. C. is best known as an essayist, and as a translator from the Greek poets. His memoirs were published in 1806, and he died in 1811.

CUMBERLAND, WILLIAM AUGUSTUS, Duke of, second son of George II., was b. in 1721. He adopted a military career, was wounded at Dettingen in 1743, and defeated at Fontenoy by marshal Saxe in 1745. In 1746, he defeated the young pretender at Culloden. In 1747, he was again defeated by Saxe (at Lafeldt), and in 1757 had to surrender and disarm his army at Klöster-Zeven. On his return to England, he felt compelled to resign his commissions, and died in 1765. See *Life* (1776) and *General Orders of* 1745-47 (1876). The latter seems to show that his severity after Culloden has been exaggerated.

CUMBERLAND GAP, a pass through the mountains between Kentucky and Tennessee, an important strategic position in the war of the rebellion.

CUMBERLAND ISLAND, a large island with Davis strait on the e., Hudson bay on the w., Hudson strait on the s., and on the w. a small strait separating it from Cockburn island.

CUMBERLAND MOUNTAINS, a spur of the Appalachian chain, partly in s.e. Kentucky, though the main portion is in Tennessee. Its formation is coal, slate, and carboniferous limestone. It is a plateau in places nearly 2,000 ft. above tide, and nearly 50 m. in width, with steep descent on both sides. A few hills in the plateau rise 700 or 800 ft. higher. There are some valuable coal mines, and the main portion is well timbered with white ash, hickory, chestnut, etc.

CUMBERLAND PRESBYTERIANS, a religious denomination which sprang up in 1810 in the state of Kentucky in North America, in consequence of a dispute between the presbytery of Cumberland in that state, and the Kentucky synod of the Presbyterian church in America, concerning the ordination of persons who had not passed through

the usual educational curriculum, but whose services the presbytery regarded as demanded for the ministry by the exigencies of the times. In 1873, this church had 24 synods, 1100 ministers, and 125,000 members. Its doctrines agree with those of the other branches of the Presbyterian church, except that the doctrine of universal redemption is held, and the predestination of sin denied.

CUMBERLAND PRESBYTERIANS had their origin in a revival of religion which commenced about the opening of the present century in the south-western part of Kentucky, under the preaching of Rev. James McGready, a Presbyterian of Scotch-Irish descent, who had been educated at Jefferson college in western Pennsylvania. The revival, at first, was of slow progress, but soon received a great impulse and became one of the most important religious movements in the United States, as it did much to establish faith in Christianity among the people of the Mississippi valley. The number of congregations into which the converts were organized was so large that it was impossible to supply them with ministers educated in the thorough manner usually required by the Presbyterian church. Young men of good abilities and earnest piety were, therefore, selected and advised to prepare themselves by a shorter course. When they applied for licensure to the presbytery of Transylvania, exception was taken both to their limited education and their opinions concerning the doctrines of the atonement and the divine decrees. They were, however, licensed, and, soon after, were set off to the presbytery of Cumberland (formed by a division of the presbytery of Transylvania), and two of them were ordained by it. A commission was appointed by the synod to inquire into the action of the presbytery. Its first demand was that those who had been licensed or ordained should submit to a re-examination. This they refused to do, and were, therefore, prohibited from exercising their ministry until they complied with the demand. They who had been thus proscribed, and the members of presbytery who supported them, organized themselves into a council for the management of their own church and revival work. They sent a memorial to the general assembly, but that body sustained the synod, yet directed it to review its proceedings. On complying with the direction, the synod confirmed what had been done, and also dissolved the Cumberland presbytery, and reannexed its members to the presbytery of Transylvania. After a fruitless attempt at reconciliation, the two ministers who had been silenced, with one member of the last-named presbytery, formed themselves into an independent body, which they called the Cumberland presbytery, after the presbytery that had been dissolved. From that time the progress of the movement was much more rapid than its originators looked for; and though the churches starting from it spread both east and west, the local name, Cumberland Presbyterians, continued to be applied to them. In 1814, an edition of the Westminster confession and catechisms was published, altered to suit their system, which tries, it is said, to steer between Calvinism and Arminianism. It rejects the doctrines of eternal reprobation, limited atonement, and special grace, teaching that the operation of the Holy Spirit is co-extensive with the atonement. Other points of Calvinism, as the necessity of the Holy Spirit's work in regeneration, and the perseverance of the saints, are retained. Revivals and camp-meetings are earnestly advocated. In May, 1878, 26 synods were reported to the general assembly, extending from the lakes to the gulf, and from the Appalachian mountains to the Pacific, and comprising 112 presbyteries, 1315 ministers, 256 licentiates, 187 candidates, 2,347 congregations, 8,217 elders, 2,324 deacons, 106,250 communicants, 57,200 persons in Sunday-schools; the value of church property reported was $1,750,000, and the amount of contributions for the year, $280,000. The chief institutions of learning are the Cumberland university, Lebanon, Tenn. (founded in 1842, and having the leading law school of the south); college of West Tennessee; Waynesburg college, Pa.; Lincoln university, Ill.; Trinity university, Texas; and Cane Hill college, Arkansas. A separate organization of colored members of the denomination has been formed.

CUMBERLAND and TEVIOTDALE, Duke of, titles borne by the king of Hanover, a prince of the blood-royal of Great Britain, and first cousin of queen Victoria. He was born in 1819, and is now blind.

CUMBRAYS, or GREAT and LITTLE CUMBRAY, two small isles in the firth of Clyde, between Bute isle and Ayrshire, and included in the county of Bute. They consist of old red sandstone, with trap-dikes intersecting it. Great Cumbray lies 3 m. e. of Bute, is 3½ m. long by 2 broad, has a pop. of (1871) 1613, contains Millport and Newton villages, and is a great summer resort of the inhabitants of Glasgow. Little Cumbray lies nearly a mile to the s. of Great Cumbray, is one mile long by half a mile broad, and rises 780 ft.; it contains many caves, excavated by the sea in the stratified rocks. Pop. '71, 11.

CUMBRÉ, LA, the Spanish for top or height, is one of the principal passes across the Andes, on the high-road between Santiago in Chili and Mendoza in the Argentine republic. The altitude of its crest is 12,454 ft., fully one half higher than the pass of the Great St. Bernard in the Alps.

CUMBRIA, an ancient British principality, comprising Cumberland in England, and that part of Scotland which is now divided into the shires of Dumbarton, Ren-

frew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, and Dumfries. It was governed by its own kings—who had their seat at Dumbarton, Glasgow, and elsewhere—until about the middle of the 10th c., when it became a tributary principality held of the king of the English, by the heir of the king of the Scots. See the article BRETTS AND SCOTS.

CUM'BRIAN MOUNTAINS, a great knot of mountains, nearly 50 m. in length and breadth, in the n.w. of England, occupying part of Cumberland, Westmoreland, and Lancashire. This tract, the English lake district, has much of the physical character of Wales, and being unsurpassed in the British isles for picturesqueness and beauty, it is much frequented by tourists. The central and southern parts consist of Silurian, granite, and trap rocks, rising in lofty rugged mountains, which inclose deep valleys and large lakes. There are 25 mountain-tops upwards of 1500 ft. high, including Sca Fell Pike, 3,166 ft.; Sca Fell, 3,100; Helvellyn, 3,055; and Skiddaw, 3,022. Four passes cross these mountains at the height of from 1100 to 1250 feet. The deep valleys between the mountains contain 14 lakes, 1 to 10 m. long. The largest of the lakes are Windermere, Ulleswater, Conistone Water, Bassenthwaite Water, and Derwentwater. A semicircular strip of carboniferous limestone skirts the n. of the Silurian tract. On the higher C. M., snow lies six or eight months in the year, but on the neighboring coasts rarely above a few days. Many eminent persons have resided among the lakes, the beauty of which has inspired some of the finest writings of Wordsworth, Coleridge, Southey, prof. Wilson, De Quincey, Arnold, and Harriet Martineau.

CUMIA'NA, a t. of north Italy, in the province of Turin, 7 m. n. of Piñerolo, near the right bank of the Cisola. Pop. 5,700.

CUMING, a co. in n.e. Nebraska, crossed by the Omaha and Northwestern railroad; 400 sq.m.; pop. '70, 2,964. Agriculture is the chief business. Co. seat, West Point.

CUM'MIN, or CUM'IN, *Cuminum*, a genus of plants of the natural order *umbelliferæ*, containing only one known species (*C. cyminum*), a native of Egypt and the neighboring countries; an annual, with branched stem, much divided thread-like leaves, general and partial involucres resembling the leaves, umbels of small white or pink flowers, and fruit about two lines long. The fruit (seeds) has an odor resembling that of caraway, but stronger and less pleasant. It is employed as a carminative in many parts of the world; in Germany, it is often put into bread; in Holland, sometimes into cheese. It is also used in medicine, particularly with resin for discutient plasters, but its use is now chiefly confined to veterinary practice. It contains a peculiar volatile oil (*oil of cummin*). C. is cultivated in the s. and middle of Europe, India, etc. C. seed is brought to Britain mostly from Sicily and Malta.—The fruit of *lagœcia cuminoides*, another umbelliferous plant, a native of the Levant, is similar in its qualities and uses to that of cummin. The BLACK C. of the ancients is believed to be a species of *nigella* (q.v.). Both are perhaps included in the name C. in Scripture.

CUM'MING, JOHN, D.D., a popular preacher of the day, was b. in Aberdeenshire, 10th Nov., 1810; educated at King's college, Aberdeen, where he took his degree of M.A. in 1827, and, in 1833, was ordained to the Scotch church, Crown Court, Covent Garden, London, where he still officiates. His popularity as a preacher is very great, especially among "fashionable" circles. In 1837, C. made his first prominent appearance in public in connection with the voluntary controversy between Drs. Wardlaw and Chalmers. His views were strongly in favor of establishments. Since then he has figured prominently on the platform, particularly as the "champion" of the anti-popery class of Protestants. But the chief source of his popularity is his gift of apocalyptic interpretation. His exposition of the book of Revelation is not very convincing to men who are moderately impressed with the grandeur, complexity, and mystery of the divine Providence; but it is greatly relished, and greedily swallowed by that large portion of the community who love to see all things, even the "oracles of God," presented under melodramatic aspects.

C.'s works are very voluminous: the chief are *Voices of the Night; Voices of the Day; Voices of the Dead; Apocalyptic Sketches; Expository Readings in the Old and New Testament;* and *The Seventh Vial.*

CUMMING, ROUALEYN GORDON, 1820–66; the "lion hunter;" a Scotchman educated at Eton, who served in the English army in India. In 1843, he began his five years of a hunter's life in South Africa, where he had many remarkable experiences.

CUMMINGS, JOSEPH, D.D., LL.D.; b. Me., 1817; a Methodist preacher; in 1857, chosen president of the Wesleyan university at Middletown, Conn., from which position he retired a few years since.

CUMMINGTON, a t. in Hampshire co., Mass., on the Westfield river; pop. '80, 881. The poet William Cullen Bryant was born here.

CUMMINS, GEORGE DAVID, D.D., b. Del., 1822; graduated at Dickinson college; entered the Methodist ministry; took orders in the Episcopal church, 1845; rector of several Episcopal churches in Virginia, Washington, and Chicago. He was chosen

assistant bishop of Kentucky, 1866. In 1873, he resigned this position; and, withdrawing from the denomination, founded the reformed Episcopal church, of which he was made bishop, 1873. He was an earnest and eloquent preacher.

CUMMINS, MARIA S., 1827–66; b. Mass., known as a writer of works of fiction, among them, *The Lamplighter*, and *Mabel Vaughan*.

CUM'NOCK, OLD, a t. in the s.e. of Ayrshire, on the left bank of Lugar Water, and on the Glasgow and Dumfries railway, 16 m. e. of Ayr, in the middle of the district of Kyle. The pop., in 1871, was 4,041. It was once famous for the manufacture of wooden snuff-boxes, with "invisible wooden hinges," 2,500 to 3,500 being made yearly, but this business has for many years been almost wholly in the hands of the Mauchline manufacturers. Around old C. there is an abundant supply of good coal, and of rich iron ore. It has also manufactures of reaping and thrashing machines, and other agricultural implements. New Cumnock is a village 5 m. s. of old C., amid the high lands in the upper part of Kyle district. Pop. '71, 2,434. Near New Cumnock are found ironstone, antimony, smiths' and cannel coal, and plumbago.

CUMYN, CUMMING, or COMYN, a family which rose to great power and eminence in England and Scotland. It took its name from the town of Comines, near Lille, on the frontier between France and Belgium. While one branch remained there, and, in 1445, gave birth, in its old château, to the historian Philippe de Comines (q.v.), another followed the banners of William of Normandy to the conquest of England. In 1069, the conqueror sent Robert of Comines, or Comyn, with 700 horse to reduce the yet unsubdued provinces of the north. He seized Durham, but had not held it for 48 hours, when the people suddenly rose against him, and he perished in the flames of the bishop's palace. His nephew, William, became chancellor of Scotland about 1133, and, nine years later, all but possessed himself of the see of Durham. The chancellor's nephew, Richard, inherited the English possessions of his family, and acquired lands in Scotland. By his marriage with Hexilda, countess of Athol, the granddaughter of Donald Bane, king of the Scots, he had a son William, who, about 1210, became earl of Buchan by marrying the Celtic heiress of that great northern earldom. By this marriage, he was father of Alexander, earl of Buchan, who, by marrying a daughter of Roger de Quenci, earl of Winchester, acquired the high office of constable of Scotland, with great estates in Galloway, Fife, and the Lothians. By a previous marriage with a wife whose name has not been ascertained, William C. was father of Richard—whose son John became lord of Badenoch—and of Walter, who by marriage became earl of Monteith. By other marriages, the family obtained, for a time, the earldom of Angus and the earldom of Athol, so that, by the middle of the 13th c., there were in Scotland 4 earls, 1 lord, and 32 belted knights of the name of Cumyn. Within 70 years, this great house was so utterly overthrown that, in the words of a contemporary chronicle, "there was no memorial left of it in the land, save the orisons of the monks of Deer" (a monastery founded by William C., earl of Buchan, in 1219). The Cumyns perished in the memorable revolution which placed Bruce on the throne of Scotland. Their chief, the lord of Badenoch, had, in 1291, been an unsuccessful competitor for the crown, as a descendant, through king Donald Bane, of the old Celtic dynasty. His son, Red John C., was one of the three wardens of Scotland, and distinguished himself by his gallant resistance to the English. He fell under Bruce's dagger, before the altar of the Franciscan friars at Dumfries, in 1306; and his kindred went down, one after another, in the struggle to avenge him. John C., earl of Buchan, was defeated by Bruce in a pitched battle, near Inverury, in 1308, when his earldom was wasted with such relentless severity, that—we are told by the poet who sang the victories of Bruce—for sixty years afterwards, men mourned the desolation of Buchan. Such of the Cumyns as escaped the sword, found refuge, with their wives and children, in England, where, although they were so poor as to be dependants on the bounty of the English court, they married into the best families, so that, in the words of Mr. Riddel, "their blood at this day circulates through all that is noble in the sister kingdom, including the numerous and royal descendants of king Henry IV." The earl of Shrewsbury seems to be the representative of the lord of Badenoch, who was the head of the race.

CUNARD, Sir SAMUEL, 1787–1865; an English engineer, the founder of the Cunard line of ocean steamers plying between England and America. He was made a baronet in 1859.

CUNAX'A, a place in Babylonia, on the eastern bank of the Euphrates, about 45 m. n. from Babylon, noted for the battle fought there (401 B.C.) between Cyrus the younger and his brother Artaxerxes Mnemon, in which the former was killed.

CUNDINAMAR'CA, the central department of the United States of Colombia (formerly New Granada), has an estimated area of 79,000 sq. miles. The western portion is mountainous, intersected by luxuriant valleys; in the e. are vast plains. The state of C. is well timbered and rich in minerals, and produces all the crops grown in other parts of Colombia. The population appears to be equally divided between whites, aborigines, and half-breeds, and was in 1870 estimated to consist, exclusive of the Indians, of 409,600 souls. Bogota, the capital of the state of C., is also the capital of the

United States of Colombia (q.v.). C. derives its name from an old American goddess, and before the conquest of the land by the Spaniards was one of the chief regions of native civilization. There are still to be met with here ruins of old buildings, broken statues of the gods, and other monuments of a worship that has wholly passed away.

CUNDURAN'GO, a vine growing in n. South America, containing a strong bitter principle. It was at one time supposed to be valuable in the cure of cancer, and was sold in the United States at enormous prices. But it was worthless, and cargoes of it were used for fuel.

CUNEIFORM, cuneatic, wedge-shaped, arrow-headed (Fr. *tête-à-clou,* Ger. *keilförmig*), are terms for a certain form of writing, of which the component parts may be said to resemble either a wedge, the barb of an arrow, or a nail. It was used for monumental records, and was either hewn or carved in rocks and sculptures, or impressed on tiles and bricks. The first date that can be assigned to it is about 2000 B.C., and it seems to have died out shortly before or after the reign of Alexander the great. It appears to have been employed first in Assyria and Media, and to have thence spread over the whole of that vast portion of Asia which formed the Persian monarchy under the Achæmenidæ. For nearly 2,000 years after its extinction its very existence was forgotten. Although the immense ruins found all over that ancient kingdom, and principally those of splendid palaces and tombs, which, at a distance of about 12 m. from Shiraz, designate the site of ancient Persepolis, had at all times attracted the attention of eastern travelers, still no one seems to have dreamed that those strange wedges which completely covered some of them could have any meaning. It was Garcia de Sylva Figuëroa, ambassador of Philip III. of Spain, who, on a visit to Persepolis in 1618, first became possessed with the firm conviction that these signs must be inscriptions in some lost writing and, perhaps, language, and had a line of them copied. Amongst subsequent travelers whose attention was attracted to the subject, Chardin, after his return to Europe in 1674, published three complete groups of cuneiforms, copied by himself at Persepolis, together with a comparatively long and minute account of the mysterious character. He likewise declared it to be "writing and no hieroglyphs: the rest, however, will always be unknown." Michaux, a French botanist, sent, in 1782, an entire altar, found at Bagdad, to Paris, covered with inscriptions, and bearing a large wedge—evidently an object of worship—on its top. Ever since, the materials for the investigation of a subject, the high importance of which by that time was fully recognized, have been rapidly accumulating. Sir H. Jones, Ker Porter, Robert Stewart, sir W. Ouseley, Bellino, Dr. Schultz—up to Rich and Botta, Flandin, Rouet, Layard, Oppert, and, above all, Rawlinson, each in his turn brought back more or less valuable materials from his eastern travels; and, naturally enough, those explorers are among the foremost to engage in the study of the records they had brought to light.

Shrouded in comparative mystery though certain portions of these characters and the language they represent still be, it is highly interesting and instructive to notice the opinions first entertained of them by the wise and learned in Europe. In the transactions of the royal society of June, 1693, they first appeared from a copy made by Plowers, and they are held to be "the ancient writing of the Gaures or Gebres, or a kind of *telesmes*"—an expression no less unintelligible than the subject it tries to explain. Thomas Hyde, the eminent orientalist, declared them, in his learned work on the religion of the ancient Persians, which appeared in 1700, to be nothing more or less than idle fancies of the architect, who endeavored to show how many different characters a certain peculiar stroke in different combinations could furnish, and reproved the authors of all those "so-called Persepolitan inscriptions" very strongly for having misled so many wise men, and taken up so much of his own precious time. Witte, in Rostock, saw in them the destructive work of generations upon generations of *worms.* Generally, they were pronounced to be talismanic signs, mysterious formulæ of priests, astrological symbols, charms, which, if properly read and used, would open immense vaults full of gold and pearls—an opinion widely diffused among the native *savants.* The next step was to see in them a species of revealed digital language, such as the Almighty had first used to Adam. Lichtenstein read in some of them certain passages from the Koran, written in Cufic, the ancient Arabic character; in others, a record of Tamerlane; and was only surprised that others should not have found this, the easiest and clearest reading, long before him. Kæmpfer was not quite sure whether they were Chinese or Hebrew characters. That they were Runes, Oghams, Samaritan, Greek characters, were some of the soberest explanations.

It was Karsten Niebuhr who first showed the way, to the more sensible portion of the learned, out of this labyrinth of absurdities. Without attempting to read the character itself, he first of all established three distinct cuneiform alphabets instead of one, the letters of which seemed to outnumber those of all other languages together. The threefold inscriptions found at Persepolis he thus took to be transcripts of the same text in three alphabets, in a hitherto unknown language. Tychsen of Rostock (1798), and Münter of Copenhagen (1800), affirmed and further developed this conjecture. The latter went so far as to divide the characters and inscriptions into alphabetical, syllabic, and monogrammatical, and to assume two different languages—Zend for inscriptions of

a religious, Pehlvi for those of a political character. The real and final discovery, however, is due to Grotefend of Hanover, and dates from 1802. On the 7th of Sept. of that year, he laid the first cuneiform alphabet, with its equivalents, before the academy of Göttingen—strangely enough, in the very same sitting in which Heyne gave an account of the first reading of hieroglyphs. The process by which Grotefend arrived at that wonderful result is so supremely interesting, that we cannot omit to sketch it briefly. He fixed upon a Persepolitan inscription of what was called the first class, and counted in it thirty promiscuously recurring groups or combinations of cuneiforms. These groups he concluded to be letters, and not words, as a syllabarium of thirty words could not be thought of in any language. Then, again, a certain oblique wedge, evidently a sign of division, which stood after three, four, five, up to eight or nine such groups or letters, must show the beginning or end, not of a phrase, but of a word. Tychsen and Münter had already pointed out a certain combination of seven characters as signifying the royal title. Grotefend adopted this opinion. The word occurred here and there in the text, and after the first words of most of the inscriptions, twice; the second time with an appendage, which he concluded to be the termination of the genitive plural, and he translated these two words without regard to their phonetic value, "king of kings." He then, in comparing the words preceding the royal titles in two tablets, found them repeated in what he assumed to be a filial relation; thus: There were three distinct groups, words, or names, which we will call X, D, and H, and this is how they occurred: 1, X, king of kings, son of D., king of kings; 2, D, king of kings, son of H; but the 3, H, was *not* followed by the word king. H, therefore, must have been the founder of the dynasty. Now the names themselves had to be found. Grotefend, unlike his predecessors, had no recourse to philology, but to archæology and history. The inscriptions in question were by that time proved to belong to the Achæmenian dynasty, founded by Hystaspes = group H. He was followed by Darius, "king of kings, son of Hystaspes," or Darius Hystaspis = group D; he, again, by Xerxes, king of kings, son of Darius, king of kings = group X—and the problem was solved. It could not have been Cyrus and Cambyses, as the groups did not begin with the same signs (C); nor Cyrus and Artaxerxes, the first being too short for the group, the second too long—it could only be Darius, Xerxes, Hystaspes—of course, in the orthography of their, not of our time; and wherever in these names the same letters recurred, they were expressed by the same combinations of signs. A further proof of the correctness of the reading was furnished by a vase in Venice, bearing a cuneiform and a hieroglyphical inscription, which were both read at the same time independently: "Xerxes." Innumerable difficulties, however, remained, and remain, up to this moment. Grotefend had, after all, only read—and not altogether correctly—three names, which did not contain more than 12 letters—the rest being mere conjecture—and there were many more in this alphabet. The two other alphabets, with an infinite variety of letters, had hardly been properly approached yet. Moreover, the discovery of Grotefend was in itself so startling, so extraordinary and bold, that no one ventured to follow it up for the next 20 years, when H. Martin found the grammatical flexions of the plural and genitive case. We cannot now specify his further discoveries, or those of Rask, Burnouf, Lassen, Westergaard, Beer, Jacquet, and others who followed; we will only say, that they mostly secured for themselves fame and name by rectifying or fixing one or two letters. The last and greatest of investigators of this first alphabet is Rawlinson, who not only first copied, but also read, the gigantic Behistun inscription—containing more than 1000 lines—of which more anon.

We now proceed to give what may be called the results of the investigations of the cuneiform character in general, up to this present moment; but we must warn the reader beforehand, that though much has been done, more remains to be done, and that a few years may change the whole aspect of cuneiform studies.

Cuneiform writing, as we said before, was used for monumental records only, a cursive writing—from right to left—being used for records of minor importance. The inscriptions are mostly found in three parallel columns or tablets, and are then translations of each other in different alphabets and languages, called respectively Persian, Median, and Assyrian; the Achæmenian kings being obliged to make their decrees intelligible to the three principal nations under their sway, as in our days the shah of Persia would use the Persian, Turkish, and Arabic languages, in order that he might be understood in Bagdad and Teheran.

The first of the three, the Persian—first in so far as it always holds the place of honor—consists of 39 to 44 letters, and is the most recent of the three, the most ancient being the Assyrian. It is distinguished by the oblique stroke which divides its words, Its letters are composed of not more than five strokes or wedges placed side by side horizontally or perpendicularly, or both, never—with one exception—crossing each other. The language is pronounced by all investigators (save Gobineau), to be as near Sanscrit as possible, although not so refined, and to be the mother-language of modern Persian. It is only twice found by itself; all the other inscriptions are trilingual. The time of its use is confined to the years 570–370 B.C. The oldest instance of its employment is an inscription of Cyrus the great at Pasargadæ; the most recent that of Artaxerxes Ochus at Persepolis. The most important is that of Darius Hystaspis, in the great inscription of Behistun, which contains, besides genealogical records, a descrip-

tion of the extent of his power, the leading incidents of his reign, prayers to Ormuzd and the angels, and reference to the building of the palaces—the last two subjects generally forming the only contents of the other Persian inscriptions. The inscription of Artaxerxes Ochus is important, in so far as it traces his origin to the Achæmenidæ, through Arsames, grandfather of Darius. Most of these inscriptions occur at Persepolis, Behistun, Naksh-i-Rustam, and Hamadan.

The second kind is called the Median, because it takes the second place in the trilingual inscriptions, under the conquering Persians, but over the conquered Assyrians, and as the Medes stood somewhat in that relation to these two nations, that name was selected. Another name, "Scythic," has been proposed, or, by way of compromise. "Medo-Scythic," and the language—supposed to have been spoken by those innumerable Tartaro-Finnic tribes which occupied the center of Asia—has been pronounced to be a Turanian dialect. But the process of constructing out of such slender elements as Samojed and Ostiak words, a so-called "Scythic," is somewhat similar to the attempt of reconstructing Sanscrit from some detached and very doubtful French and English words. These inscriptions never occur by themselves (one instance again excepted), and being translations of the Persian records, about ninety names have been ascertained, and an alphabet of about 100 characters—combinations of a syllabic nature—has been established. The principal investigators of this character are Westergaard, De Saulcy, Hincks, Norris, and Oppert. Gobineau holds the language to be Huzvaresh, a mixture of Iranian and Semitic.

The third and most important is the Assyrian portion of the cuneiforms. The trilingual records gave the first clue to the deciphering of this character; but many original, more than a thousand years older, documents have since been found in Babylon, Nineveh, and other places near the Euphrates and Tigris, and even in Egypt. About 400 different signs have been distinguished on slabs, cylinders, barrels, prisms, of a phonetic, syllabic, and ideographic nature. Proper names are preceded by monograms, which give the same help to their readings as cartouches in hieroglyphics. Of those 400 signs, however, hardly one tenth are known for certain. Proper names were found varied to about five times, and the characters themselves are both homophonous (same sound expressed by various signs) and polyphonous (same sign with various sounds). Five and more dialects have been distinguished in the language, which is decidedly Semitic (Gobineau takes it to be simply Arabic); and these dialects are supposed to have belonged either to different tribes or subsequent periods. It is this alphabet about which the greatest uncertainty and confusion prevail, for endless subdivisions, and even certain assumed grammatical forms, do not constitute a certainty. There is, however, a hope of its eventually being fully deciphered. A few years ago, the Asiatic society submitted a cylinder of Tiglath-Pileser to four prominent investigators of the subject, and they independently read it nearly alike, with exception of the proper names, where they widely differed. As a proof of the enormous importance of this character for history, grammar, law, mythology, archæology, and antiquities generally, we will name some of the records of which Rawlinson, a few years ago, proposed the publication (now in progress): Chaldean legends (2,000–1500 B.C.); bricks from Kilehsergat, of the early kings of Assur (1273–1100), in a character approaching the cursive; annals of Tiglath-Pileser I. (1120 B.C.); annals of Sardanapalus, of Shamas, father to the biblical Pul, of the biblical Pul and Semiramis, his wife, of Sargon, Sennacherib, Assurbani-Pal, son of Esarhaddon; cylinder of Nebuchadnezzar; cylinders containing the notice of Belshazzar, etc.; besides syllabaries, vocabularies, mathematical and astronomical tablets, calendars and registers, and more than 1000 mythological tablets. Nay, if the Birs-Nimrud really stands on the foundations of the old tower of Babel, we might in the bricks excavated at these very foundations read the language spoken at the time "when the whole earth was of one speech."

As to the origin of the character, we will briefly state, in conclusion, that nothing certain is known, or is likely to be known for some time. It is not unlikely, however, that it was hieroglyphic, although neither the fishes nor the bees, which these letters are supposed to have been originally, seem to have more in their favor than the worms, which were said to be their unconscious authors. The following is the opinion of Rawlinson on this point: "That the employment of the cuneiform character originated in Assyria, while the system of writing to which it was adapted was borrowed from Egypt, will hardly admit of question. Whether the cuneiform letters in their primitive shapes, were intended like the hieroglyphs to represent actual objects, and were afterwards degraded to their present forms; or whether the point of departure was from the Hieratic, or perhaps the Demotic character, the first change from a picture to a sign having thus taken place before Assyria formed her alphabet, I will not undertake to decide; but the whole structure of the Assyrian graphic system evidently betrays an Egyptian origin. The alphabet is partly ideographic and partly phonetic, and the phonetic signs are in some cases syllabic, and in others literal. Where a sign represents a syllable, I conjecture that the syllable in question may have been the specific name of the object which the sign was supposed to depict; whilst in cases where a single alphabetical power appertains to the sign, it would seem as if that power had been the dominant sound in the name of the object."

In order to give the reader some idea of the appearance of the cuneiform character,

we subjoin the name of Darius (Dariyavas, Tariyavaus), written in the Persian, Scythic, and Assyrian alphabets:

Persian.

Scythic.

Assyrian.

For fuller information on this subject, see Rawlinson, *The Persian Cuneiform Inscription at Behistun deciphered and translated*, etc. (Journal As. Soc., 1846, etc.); *Grotefend, Erläuterungen der Keilinschriften aus Behistun* (Göttingen, 1854); Lassen u. Westergaard, *Ueber die Keilinschriften der ersten und zweiten Gattung* (Bonn, 1845); Hincks, *On the First and Second Kinds of Persepolitan Writing* (Transact. Roy. Ir. Soc., 1846); Norris, *Memoir on the Scythic Version of the Behistun Inscription* (Journ. As. Soc., 1853); Rawlinson, *A Commentary on the Cuneiform Inscriptions of Babylon and Assyria* (1850); Oppert, *Études Assyriennes* (Journal Asiatique, Paris, 1857); Rénan, *Critique*, etc. (Journ. d. Sav., Paris, 1859).

CUNEO. See CONI, *ante*.

CUNNINGHAM, ALLAN, poet and *littérateur*, was b. in 1785, at Blackwood, in Dumfriesshire. The circumstances of his parents were humble. At the age of 11, C. was taken from school, and apprenticed to a stone-mason. He worked faithfully at his calling; but his spare time, and his evenings, were given to song and the collection of traditions. He first appeared in print as a contributor to Cromek's *Remains of Nithsdale and Galloway Song*. These contributions, purporting to be ancient ballads, were entirely the composition of the ingenious and ambitious stone-cutter. The publication gained him the acquaintance of Hogg and sir Walter Scott. With the latter, "honest Allan" was always a prodigious favorite. On his removal to London, he became one of the best known writers for the *London Magazine*. He subsequently obtained a situation in Chantrey's studio as foreman, or confidential manager, and this office he held till his death. During his career, he wielded an indefatigable pen. He wrote novels, poems, and a drama. His principal prose works, apart from his fictitious narratives, are *Lives of the Painters*, a *Life of Burns*, and a *Life of Sir David Wilkie*. He died in London on 21st Oct., 1842. As a Scotch poet, he ranks, perhaps, after James Hogg. His songs, although disfigured by false taste, mannerism, and a superabundance of ornament, have true lyrical impulse and movement.

CUNNINGHAM, PETER, son of Allan Cunningham, the poet (q.v.) (b. 1816, d. 1869), is known in literature as the author of *Handbook of London; Life of Drummond of Hawthornden; Life of Inigo Jones; Modern London*, etc.; as the editor of various English classics; and as a frequent contributor to periodicals.

CUNNINGHAM, WILLIAM, D.D., a distinguished Scotch theologian, was b. in 1805, and ordained as a minister of the church of Scotland in 1830. He took a prominent part in the discussions previous to the disruptions in 1843, and was one of those who left the establishment to form the free church. In 1847, he became principal of the new (free church) college, Edinburgh. He died in 1861. He is the author of *Historic Theology in the Christian Church* (1862); *Reformers and Theology of the Reformation* (1862); and *Discourses on Church Principles* (1863).—See *Life of C.*, by Rainy and Mackenzie (1871).

CUNNINGHAMIA, a genus of trees of the natural order *coniferæ*, nearly allied in botanical characters to the true pines and firs, but in foliage having considerable resemblance to the araucarias. *C. sinensis* is an evergreen tree, with narrow ovato-lanceolate, stiff, and sharp-pointed leaves, common in China, but too tender for the climate of Britain.

CUP, DIVINATION BY, a mode of foretelling events, practiced by the ancient Egyptians, and still prevailing in some of the rural districts of England and Scotland. One of the eastern methods consisted in throwing small pieces of gold or silver leaf into a C. of water, in which also were placed precious stones, with certain characters engraved upon them. The infernal powers were then invoked, and returned answer, either in an intelligible voice, or by signs, on the surface of the water, or by a representation in the C. of the person inquired about. By the modern method, a person's fortune is foretold by the disposition of the sediment in his tea-cup after pouring out the last of the liquid. Few people now, however, even among the most ignorant, have implicit faith in the oracle.

CU'PAR-AN'GUS, a t. on the borders of Perthshire and Forfarshire, and partly in both, is situated on the left bank of the Isla, a tributary of the Tay, 12½ m. e. by n. from Perth, and 16 m. w.n.w. from Dundee. It lies between the Grampian and Sidlaw hills, in the center of the valley of Strathmore, and from its position in this valley it is popularly called "the capital o' the How." Pop. in 1871, 2,149. It has extensive linen manufactures, with a considerable traffic in timber. Near the town are the remains of two Roman camps, on one of which stand the ruins of a monastery, built in 1164 by Malcolm IV., and destroyed at the reformation. Recent excavations have exhumed numerous richly-carved tombstones in the grave-yard contiguous to the parish church, evidently those that had marked the graves of the ancient dignitaries of the monastery. The abbey revenue in 1562 was £1234 14*s.* 9*d.* in money, and 182 chalders of victual. The classic hill of Dunsinane is situated about 5 m. to the s.w. of Cupar-Angus, and the dilapidated castle of the "bold Pitcur," who fell in the battle of Killiecrankie, in 1689, is within a distance of 2 miles.

CUPAR-FIFE, a royal, parliamentary, and municipal burgh, and the co. t. of Fifeshire, near the middle of the peninsula of Fife, on the Eden, 9 m. from its mouth, 32½ m. n. of Edinburgh, and 14½ s. of Dundee. It lies in a beautiful vale, stretching e. and w., with a range of hills on the s., and a fertile country, with wooded eminences, on the north. It consists chiefly of two streets at right angles to each other. Pop. '71, 5,015. The chief manufactures are linens, bricks, and earthenware. It contributes, with St. Andrews, East and West Anstruther, Crail, Kilrenny, and Pittenweem, to return one member to parliament. A fortress of the Macduffs, thanes of Fife, once stood on a mound called the Castle hill, at the e. end of the town. In former times, religious shows, mysteries, or moralities, were acted on a green esplanade in front of the castle, still called the Play-field. There also was acted the *Three Estates*, a celebrated satire on the priesthood, which hastened the religious revolution, and was written by sir David Lindsay, whose estate of the Mount was near the town.

CU'PEL. See CUPELLATION.

CUPELLA'TION is the process of the separation of one metal from another (as lead from silver) by the use of a CUPEL highly heated in a muffle furnace. See ASSAY.

CUPID, one of the gods of the classic mythology, whose name in Latin signifies *desire*. The genealogy of this meddlesome divinity is rather confused. Sometimes he is represented as the son of Vulcan and Venus, or of Mars and Venus, while at other times the mythologists seem at a loss to name his father, and make him spring from the sea-foam, like Venus herself. As among the Greeks, the myth of Eros gave birth to numerous *erotes* or loves, so at Rome, also, that of C. originated a legion of cupids, who all possessed the same attributes as their prototype. Every one knows what these were: the bow, arrows, quiver, and wings. Often a bandage covered the eyes. The appearance was that of a chubby child, or youth with a malicious smile. His darts could pierce the fish at the bottom of the sea, the birds in the air, and the gods in Olympus. The immensity of space was his home, but, like his mother, he specially loved the flowery thickets of Cyprus.

CU'POLA (Ital., from the root of *cup*), a spherical vault, or concave ceiling, on the top of a building. Cupolas are hemispherical, or of any other curve, and often consist of glass, so as to form a window in the roof. See DOME.

CUPPING is the application of cups, from which the air has been exhausted, to the skin, with the object of causing congestion or excessive fullness of the cutaneous blood-vessels; and if it should be thought desirable to withdraw some blood, the skin may be cut or scarified, and the exhausted cups applied over the incisions, to favor its flow.

C. has been a part of surgical practice from the earliest times, and instruments for performing it have been found in use among the least civilized nations. Of old, the cups were either small horns, open at both ends, from which the air was withdrawn by suction at the narrow extremity, or glasses of various shapes, with a small hole in the bottom of each. This hole was plugged with wax, the air exhausted by heat, and when the operator wished to remove them, he withdrew the plug, and allowed the air to enter. The modern cups are of glass, with round or oval mouths, and closed bottoms. Some have small sockets for holding cotton wick in their interior.

The principal improvements have been in the methods of incising the skin. This used to be effected with a common lancet or narrow knife, with a short blade and convex edge, set in a long elastic handle, which the operator struck rapidly with his finger, so as to drive the blade 26 or 30 times into the skin.

This was so tedious an operation, that a number of similar blades were used at once. These are contained in a box, which has slits pierced in it corresponding to the number of blades; the latter can be caused to emerge at these slits by turning a handle, or more rapidly by setting free a spring, which causes them to revolve suddenly, and in doing so protrude at the slits more or less, according to the will of the operator. The operation is thus performed: The sacrificator, glasses, torch, spirits of wine, and a lighted candle are placed ready at hand; the part is sponged with hot water, so as to cause an increased flow of blood into it, then dried with a warm towel; the torch, previously saturated with the spirits of wine and lighted, is held for an instant in one of the glasses, which is now clap-

ped on to the skin. The number of glasses depends on the quantity of blood it is thought desirable to abstract; each one will probably withdraw from three to five ounces. When the skin under the glass has become red and swollen, the cupper removes it, applies the sacrificator, and as rapidly as possible again exhausts the air from the glass, and claps it on again. The blood will now flow into it; and when enough has been taken, the glass is removed, and some lint applied to the wounds. This apparently simple proceeding requires considerable skill, so that C. is practiced as a separate profession in large towns, and the medical boards of the public services require that candidates for their appointments should produce a certificate of having received special instruction in the art. The difficulties consist in regulating the depth of the cuts, for should they be either too deep or too shallow, the blood will not flow. If the glasses be completely exhausted of air, their rims hurt the patient, and the blood will not flow, and it has happened that arteries or large veins have been wounded by ignorant operators.

There are many modifications of the ordinary C. apparatus, but all on the same principle.

Dry C. is simply applying the cups as described, but not wounding the skin. The ancients had a high opinion of this method, as they believed the "noxious humors" were drawn forth of the body into the cups; and it need scarcely be added that extempore cups may be found in tumblers, finger-glasses, or any air-tight vessel with a smooth rim.

CU'PULE, *Cupula,* in botany, a sort of cup formed by a number of cohering bracts, and surrounding the fruit or the base of the fruit in certain plants; as the oak, in which it is the cup of the acorn, and the hazel, in which it is the husk of the nut.

CUPULIF'ERÆ (i.e., cupule-bearing), or CORYLACEÆ, a natural order of exogenous plants, consisting of trees and shrubs, natives of temperate climates. The leaves are alternate and furnished with stipules. The male flowers, and sometimes also the female flowers, are disposed in catkins (and this order is regarded by many botanists as a suborder of amentaceæ, q. v.); the stamens are 5 to 20, inserted into the base of scales or of a membranous perianth; the ovary is crowned by the rudiments of a persistent perianth, and surrounded by a cupule (q. v.) of various figure; there are several cells and ovules, but the greater part of the ovules are abortive; the fruit is a 1-celled nut, more or less inclosed in the cupule; the seed is usually solitary; the embryo large, with fleshy cotyledons and minute superior radicle.—This order contains many of the most important trees of Europe and America, including all the different kinds of oak, beech, chestnut, and hazel, the hornbeam, etc. Many species are also natives of tropical countries, but they are there only found at considerable elevations.

CUR (Welsh *cor,* a dwarf, anything small; *coravon,* a small river; *corgi,* a small dog), a name sometimes applied indiscriminately to small dogs of any kind not highly valued, and in this way often particularly appropriated to dogs of mongrel breed, but also used by naturalists as the common designation of many races, of which the terriers (q.v.) may be considered as the type; all of them of small size, and exhibiting in a high degree the capacity for domestication, along with activity and sagacity. These races are distributed over all parts of the world, and differ very considerably from each other, and are found domesticated even among very rude and savage tribes. The Pariah dog of India is reckoned among them, and exists in that country both in a wild and in a domesticated state; its body is more lank than that of the cur races of Europe, a character which is also in some measure exhibited by the dogs that haunt the streets of towns in Turkey, Persia, etc. The curs may, not improbably, have been the first domesticated dogs.

CURAÇA'O is the most important of the Dutch West India islands which lie near the northern coast of Venezuela, in the Caribbean sea. Pop (1st Jan., 1875)—Curaçao, 22,713; Bonaire, 4,370; Aruba, 5,383; Netherlands part of St. Martin, 2,959; St. Eustatius, 1750; and Saba, 1975. Entire pop. 39,150, all free. The capital of C. is Willemstad, a very handsome town situated on the bay of St. Anna, and having 13,000 inhabitants. The soil of C. and its dependent islands is less productive than that of other tropical lands. The exports are maize, beans, cattle, salt, phosphate of lime, red dyewood, charcoal, bricks, and fruits. Gold has to some extent been obtained by crushing. The stock consists of horses, asses, mules, cattle, sheep, goats, and swine. C. chiefly owes its prosperity to commerce with the neighboring islands and coasts. In 1874, C. was visited by 1318 ships measuring 261,195 tons. The island was discovered by Spain in 1527, taken by the Dutch in 1634, conquered by the English in 1807, and restored to Holland in 1815.

CURAÇOA' is a well-known and esteemed liquor, made either from the small oranges called C. oranges, or from orange-peel, by digesting in sweetened spirits, along with a little cinnamon, and often a little mace or cloves. The spirits used are generally reduced to about 56 under proof, and contain about 3½ lbs. of sugar per gallon. C. is often colored by digesting in it for a week or 10 days a little powdered Brazil wood, and mellowing the color by means of burned sugar.

CURAÇOA' ORANGES, small oranges which have fallen from the tree long before maturity. They have properties similar to those of orange-peel, but are more bitter and acrid, and are used for the same purposes.

CURARI, OURARI, WOORALI, or WOORARA, a celebrated poison used by some tribes of South American Indians for poisoning their arrows. It is by means of this poison that the small arrows shot from the blow-pipe (q.v.) become so deadly. The nature and source of this poison remained long unknown, the Indians being very unwilling to reveal the secret, which seems, however, to have been at last obtained from them by sir Robert Schomburgk, and it is now regarded as pretty certain that the principal ingredient is the juice of the *strychnos toxifera*, a tree or shrub of the same genus with that which yields nux vomica. See STRYCHNOS. It has a climbing stem, thickly covered with long spreading reddish hairs; rough, ovate, pointed leaves, and large, round fruit. The poison, when introduced into the blood, acts on the nervous system, and produces paralysis, with convulsive movements, and death ensues. It is supposed to be the most powerful sedative in nature. Artificial respiration is the most efficacious means of preventing its effects. It has been proposed to employ it in the cure of lockjaw and hydrophobia, and it has recently been asserted, as the result of experiment, that it can be very beneficially employed in the former disease. Like snake-poison, it is comparatively inert when taken into the stomach. See WOORALI.

CURAS'SOW, or HOC'CO (*Crax*), a genus of large gallinaceous birds of the family *cracidæ*, having a strong bill surrounded at the base with a skin—sometimes brightly colored—in which the nostrils are pierced, and the head adorned with a crest of feathers curled forward, which can be raised and depressed at pleasure. The species, which are not numerous, are natives of the forests of the warm parts of America. They congregate in flocks, and although they live much among the branches of trees, their habits greatly resemble those of domestic poultry. They are very unsuspicious of danger, until taught by severe experience; and are easily domesticated. The best known species (*C. alector*) is about the size of a turkey; its plumage is almost entirely black. It is abundant in the forests of Guiana. Its flesh is very good eating. It is kept in poultry-yards in South America, and was introduced into Holland at the close of last century, where it seemed completely acclimated, but the stock was lost amidst the troubles which ensued on the French revolution.

CU'RATE, literally, one who has the cure (Lat. *cura*, care) of souls, in which sense it is used in the church of England Prayer-book, "all bishops and curates." It is, however, generally used to denote the humblest degree in the church of England. A C., in this sense, is a minister employed by the incumbent of a church (rector or vicar), either as assistant to him in the same church, or else in a chapel of ease within the parish belonging to the mother church. He must be licensed and admitted by the bishop of the diocese, or by an ordinary having episcopal jurisdiction, who also usually appoints his salary. Any C. that has no fixed estate in his curacy, not being instituted and inducted, may be removed at pleasure by the bishop or incumbent. But there are *perpetual* curates as well as temporary, who are appointed where tithes are impropriate and no vicarage was ever endowed: these are not removable, and the impropriators are obliged to maintain them. In general, the salaries of curates, certainly the hardest-worked, and not the least devoted of the English clergy, are shamefully small, and reform in this matter is urgently required.

CURA'TOR TO A MINOR. See GUARDIAN.

CURB (in horses) consists of strain of the straight ligament which runs down the back of the hock; is most common in animals with straight small hocks and that conformation known as *sickle hams;* whilst like other strains it occurs from sudden and violent exertion, often proceeding in the lighter breeds from leaping or galloping in heavy ground, and in the heavier, from the effort of keeping back a load whilst going down a steep incline. Swelling appears on the inner and back part of the joint, generally causing lameness, which is most apparent in trotting, and, in slight cases, usually wears off after the animal has been out for ten minutes. Fomentations must first be used to allay the irritation and inflammation; when heat and tenderness disappear, cold applications will be advisable; when, after ten days, the enlargement still continues, a blister may be necessary; whilst, from the first, all work must be forbidden.

CURCAS. See PHYSIC NUT.

CURCU'LIO. See WEEVIL.

CUR'CUMA (Arab. *kurkum*), a genus of plants of the natural order *scitamineæ*, having the tube of the corolla gradually enlarged upwards, and the limb two-lipped, each lip three-parted. The species are stemless plants, with palmate tuberous roots, natives of the East Indies. The dried roots of some are the zedoary (q.v.) of the shops; the roots of others yield turmeric (q.v.); and some yield a kind of arrow-root (q.v.). The same species often yields both arrow-root and turmeric, the former being obtained from the young roots, the latter from the old.—*C. amada* is called MANGO GINGER. Its root when fresh has the smell of a mango, and in its qualities resembles ginger. It is a native of Bengal.

CU'RES, a t. of the Sabines, about 25 m. from Rome, on the Tiber, the birthplace of Tatius. The term *Quirites*, as applied to the Roman people, is supposed to have come from Cures. The town was destroyed by the Lombards near the close of the 6th century.

CURFEW (Fr. *couvre-feu*, cover fire). To William the conqueror is ascribed the introduction of the C. bell into England, the object of which was to warn the people to cover up their fires, and retire to rest. The time for ringing these bells was sunset in summer, and about 8 o'clock in winter; and certain penalties were imposed upon those who did not attend to the signal. The practice of ringing the C. bell, however, appears to have prevailed throughout Europe long before the era of the Norman conquest, its object being the laudable one of preventing fires, which, owing to houses being chiefly composed of wood, were then both frequent and destructive. The custom of ringing the C. bell at 8 or 9 o'clock is still continued in many parts of England, though its original significance is of course lost.

CU'RIA, in Roman history, the name of a division of a tribe in the constitution of Romulus. The tribes being 3 and the divisions 10, there were 30 curiæ. This division was a division of the populus to the exclusion of the plebs; and the assembly of the populus was called the *comitia curiata*. See COMITIA.

CU'RIA MU'RIA ISLANDS. See KOORIA MOORIA ISLANDS.

CU'RISCHES HAFF. See KURISCHES HAFF.

CUR'LEW, *Numenius*, a genus of birds of the order *grallatores*, and of the same family (*scolopacidæ*) with the snipe, woodcock, avocet, stilt, godwit, etc. The bill is long, slender, curved, and compressed; the face and head are feathered; the legs are slender, and part of the *tibia* is naked as well as the shank; the tail is short, and the folded wings extend about as far as the tail. The common C. (*N. arquata*), the *whaup* of the Scotch, is a bird of wide geographic distribution, being found in tropical, temperate, and arctic regions of the old world and in Australia. It is common in Britain, frequenting the sea-shores in winter, and elevated moors in summer. Its peculiar cry or whistle is among the well-known characteristics of many upland scenes. It feeds on worms, mollusks, and insects. Its long bill enables it to seek its food in marshy or boggy ground. It builds a slight nest of leaves or other dry materials, in some tuft of rushes or among long grass or heath, in which four eggs are laid. The C. is good eating.—The WHIMBREL (*N. phæopus*) is a smaller species of C., much resembling the common curlew. It is also very widely distributed in the old world; it frequently occurs on the shores of Britain, but seems to breed only in the most northerly moors. North America has several species of C., some of which extend their summer migrations to very northerly regions. The ESQUIMAUX C. (*N. borealis*) is sometimes seen migrating in dense flocks.

CURLING, a sport on the ice common in Scotland, where it is played by all classes of people in winter. Frozen-over lakes and rivers answer for the purpose, but under the auspices of C. clubs, artificial shallow ponds are maintained for the sake of this popular national sport, and these *bonspiels*, or set matches, are contested with immense spirit. The sport is regulated by a body of rules issued by a central association called the Caledonian Curling club, which has grand matches in which hundreds are engaged at least once, if possible, every winter. The remarkable and pleasing peculiarity of C. is, that it produces for the time a thorough mingling of ranks—peers, peasants, clergymen, farmers, country gentlemen, and tradesmen, all mingling hilariously and familiarly for the occasion. The sport belongs more particularly to the south-western division of Scotland. Latterly, it has migrated to England, Canada, and other countries where Scotsmen can find ice of sufficient strength and keenness. C. is played with flattish round stones, about 9 in. in diameter, prepared by stone-hewers, each stone weighing from 30 to 45 lbs. Each of the players has a pair. The stones are provided with handles, to enable the player to hurl them on the ice with the proper degree of force. As at bowls, the stones are hurled to an assigned point or mark. The game is as follows: Sides are made up, usually consisting of four against four, with a director styled *skip* for each; after which a certain length of ice, of from 30 to 40 yards in length, and 8 or 9 ft. across, is chosen. This is called the *rink*. Certain marks are then made at each end of the rink, consisting of several concentric rings, called *broughs*, and a center, called the *tee*. A certain number is game, usually 31, and the keenness displayed by rival sides in competing for victory, is perhaps without a parallel in any other pastime whatever. One on each side plays alternately. The chief object of the player is to hurl his stone along the ice, towards the tee, with proper strength and precision; and on the skill displayed by the players in placing their own stones in favorable positions, or in driving rival stones out of favorable positions, depends nearly all the interest of the game. At a certain distance from each of the tees, a score—the *hog-score*—is drawn across the ice; and any stone not driven beyond this mark, counts nothing, and is laid aside. In country places, a dinner composed of "beef and greens," the well known curler's fare, generally concludes the day's diversion, which, taking place when out-door labor is suspended, is felt to be no encroachment on rural occupations. For laws and

regulations of C., and general remarks on the game, see *Chambers's Information for the People*, article "Out-of-Door Recreations."

CUR'RACH, COURACH or COR'ACLE (Celt. *corwg, curach;* Lat. *curuca, carrocium, carabus*), the name given in the British islands to a canoe or boat, made of a slender frame of wood, covered with skins. Skiffs of this sort, as well as canoes hollowed out of the trunks of oaks, were in use among the Britons in the earliest times of which we have record. Julius Cæsar, who built some of them after the British model, tells us that the keel and gunwales were of light wood, and the sides of wicker, covered with hides. Similar descriptions of the C. are given by Pliny, Lucan, Solinus, Festus Avienus, Sidonius Apollinaris, and others. The first occurrence of the name seems to be in Gildas, who wrote in the 6th c.; he speaks of the C. as in use among the Scots and the Picts. A long voyage in the North sea, made in a C. during the same century, by one of the companions of St. Columba, is commemorated by Adamnan, who died in 704. In 878, three Irish missionaries sailed in a C. from Ireland to Cornwall; the voyage occupied seven days; and the size of the C. is indicated by the remark that it was one of two skins and a half. An old life of St. Patrick speaks of a C. "of one skin, with neither helm nor oar." The C. of a larger size had a mast and sail. The C. still continues to be used on the Severn, and on many parts of the Irish coast, especially on the shores of Clare and Donegal. The last C. known to have been used in Scotland is in the museum at Elgin. It was employed on the Spey, towards the end of last century. Shaw, whose *History of Moray* was published in 1775, when the C. had become rare, thus describes it: "It is in shape oval, near three ft. broad, and four long; a small keel runs from the head to the stern; a few ribs are placed across the keel, and a ring of pliable wood around the lip of the machine. The whole is covered with the rough hide of an ox or a horse; the seat is in the middle; it carries but one person, or, if a second goes into it to be wafted over a river, he stands behind the rower, leaning on his shoulders. In floating timber, a rope is fixed to the float, and the rower holds it in one hand, and with the other manages the paddle. He keeps the float in deep water, and brings it to shore when he will. In returning home, he carries the machine on his shoulders, or on a horse." One who figures in the *Dunciad*—Aaron Hill the poet—by showing the Strathspey Highlanders how to make their timber into a navigable raft, hastened the disappearance of the C. from Scotland. A description of the C., as still used in Ireland, will be found in the *Ulster Journal of Archæology*, vol. i. p. 32. A boat of bison skin, essentially the same with the British coracle, is in use among some of the Indians of North America.

CURRAGH, in Kildare co., Ireland, an open country long favored as a race-course, and place of meeting for the people. A camp was established there during the Crimean war capable of accommodating 10,000 men.

CUR'RAN, JOHN PHILPOT, a celebrated legal and parliamentary orator, b. at Newmarket in the county of Cork, Ireland, July 24, 1750; was educated at Trinity college, Dublin; and in 1773, having resolved to adopt the law as a profession, went to London and entered himself at the Middle Temple. Two years after, he was called to the Irish bar, where his humorous, flowery, and sarcastic speech secured him immediate success, which his attractive social qualities did much to extend. In 1782, he obtained a seat in the Irish parliament as member for Kilbeggan, his general policy being in unison with that of Mr. Grattan and the few other liberal members who were then in the house. In debate, C. was usually charged with the reply to opponents, for which important duty his ready speech and cutting retort admirably qualified him. But his sarcasm led him into several duels, in which fortunately little harm was done on either side. In 1788, he was in favor of the formation of Irish volunteers; and in subsequent years, he was constant and eloquent in his appeals to government to adopt a different policy towards Ireland, as that which it was pursuing was likely to drive the people to rebellion. Government gave no heed, and the rebellion of 1798 was the consequence. C. had retired from parliament before the Union, of which he was a warm opponent. He was appointed master of the rolls in Ireland in 1806, an office he held until 1813, when he resigned. He died in London, Oct. 14, 1817. C. is best remembered for his wit and gayety, of which many excellent examples are preserved in the various memoirs, recollections, etc., of him which have been published.

CURRANT, a name originally belonging to a small kind of grape (see CURRANTS), and transferred, in consequence of the similar size of the fruit, to many species of the genus *ribes*, the most important and almost the only genus of the natural order *grossulariaceæ*. The species known as *currants* are destitute of spines, and have the flowers in racemes: the spiny species are known by the name Gooseberry (q.v.). Among the fruit shrubs most generally cultivated in our gardens is the RED C. (*R. rubrum*), *grosseille* of the French, a native of woods and thickets in the s. of Europe, found also in some parts of Asia and of North America, perhaps rather a naturalized than a truly native plant in Britain. It has long been cultivated, although it does not appear that it had a place in the gardens of the ancient Greeks or Romans. The berries, besides being used for dessert, and to a much greater extent for pies, and for making jelly, are used also for making an agreeable and refreshing beverage, called in France *eau de grosseilles* (made of the juice of the fruit, water and sugar, strained, and iced), and a well-known

fermented liquor called *currant wine* (q.v.). The WHITE C. is a mere variety of the red, the result of cultivation, with fruit less acid, and more fit for dessert, generally also rather larger. There are many sub-varieties, and many intermediate shades of color. Both the red and the white currants are either trained or standard bushes, or against walls, the latter treatment producing larger and finer fruit, and both are sometimes trained on a n. wall, to retard their ripening till after the ordinary season. They grow readily, like the shrubs of this genus in general, from cuttings. The BLACK C. (*R. nigrum*), *cassis* of the French, grows in moist woods, and on the banks of streams in Europe and the n. of Asia. The fruit is much larger than the red C., and cultivation has lately produced varieties remarkable for size. There is a variety found in Russia with yellow berries. The black C. is not so much cultivated in Germany and Holland as the red, and is comparatively neglected even in England, but is to be found in almost every garden in Scotland. The jelly and preserve made from it are very useful for sore throats, as is also *black C. vinegar*, made in the same manner as raspberry vinegar. In Russia, the berries are gathered in large quantities in the woods, and dried in ovens, to be used in pies. They are tonic, and also slightly diuretic and sudorific. A liqueur, called *liqueur de cassis*, is prepared in France from the black C., the manufacture of which has recently acquired a great importance in the Côte d'Or and neighboring departments. The town of Dijon contains more than 30 manufactories, and produced recently, in one year, not less than 220,000 gallons, the wholesale price of which—of the best quality—was equal to 2*s.* 9*d.* per quart. Large tracts of land are planted with the black C. to supply the liqueur manufactories. It has very reasonably been suggested that the experiment of the introduction of this manufacture should be made in Scotland, and even in the Hebrides and Shetland islands, where the black C. perhaps grows as luxuriantly, and bears fruit as abundantly as in any part of the world. Many other species of C., producing berries somewhat similar to those of the species so extensively cultivated, and some of them probably deserving of attention and cultivation, are found in temperate and cold climates in almost all parts of the world. One with beautiful red berries, larger than the largest English red C., occurs on the Himalaya, at an elevation of 13,000 feet. The RED-FLOWERED C. (*R. sanguineum*), now so common as an ornamental bush in shrubberies, and trained on walls, producing in April a profusion of deep-red flowers in large drooping racemes, is a native of the n.w. of America, and was introduced into Britain in 1826. Its bluish-black, mucilaginous, insipid berries are not, as is popularly believed, poisonous. The GOLDEN C. (*R. aureum*), also a very ornamental shrub, from the same regions, has a tubular calyx and long golden yellow flowers. Its fruit, which is either yellow or black, and of fine flavor, is not freely produced in Britain. The name NATIVE C., or AUSTRALIAN C., is given in Australia to the berries of different shrubs, particularly the white berries of *leucopogon Richei*, of the natural order *epacridaceæ* (q.v.). The French naturalist Riche, who was attached to D'Entrecasteaux's expedition, mainly supported himself on these berries for three days, when he had been lost by his companions. Other fruits bearing the same name are produced by species of *coprosma* (nat. ord. *cinchonaceæ*), but they are very inferior.

CURRANTS, a small kind of raisin (*passulæ minores*), are the dried red or blue berries of a small-fruited seedless variety of the common vine, which is cultivated in the east, and especially in Greece. The name is derived from the city of Corinth, in the neighborhood of which they were first cultivated. They are very small, round, with a thin skin, without seeds, and very sweet. Those brought from the island of Zante are most esteemed. They are much used by bakers and cooks, entering into the composition of many kinds of cakes, puddings, etc. They are a principal article of export from Greece, and the failure of the crop is severely felt in that country; whilst an increase of the price of C. is regarded as a disagreeable occurrence by the housewives of Britain. C. are simply dried in the sun, on the ground, and then packed into barrels. In a few districts of Greece, a very sweet oily wine, called currant wine, is made from currants.

CURRANT WINE is made of the juice of red or white currants, to which is added about one pint of water for every four pints of berries employed. About a pound and a half of sugar is afterwards added to each pint of the liquor, a little spirits being generally also added, before it is set aside to ferment. A larger quantity of sugar is sometimes employed, and no water, and a stronger and sweeter C. W. is thus produced. Fermentation requires several weeks, and the wine is not fit for use for at least some months afterwards. Black C. W. is made in the same way from black currants, but the fruit is put on the fire in as small a quantity of water as possible, and heated to the boiling-point before it is bruised. C. W., well made, may fairly challenge comparison with many products of the grape.

CURRENCY means originally the capacity of being current, or, as Johnson defines it, "the power of passing from hand to hand." It is applied in practice to the thing that is so current, and generally to whatever, by being current among any nation or class of persons, serves as the money with which they buy commodities or pay their debts. It is necessary to be content with a practical explanation, without venturing on a scientific definition of the term, because, among the many disputed points in political economy, there is none productive of more exciting controversy than the proper regulation of the C.; and as the advocate of each theory is apt to define the term in the

manner best suited to serve his own ultimate conclusions, his adversaries generally deny that his definition is sound. Whether correctly or not, it is applied in practice to everything that is received for payment. It differs from the word money, in its general acceptation, in as far as it expresses only that which passes as money at some time or place referred to. The leading question among political economists regarding C. is, how far it should be restrained. The most effectual method of restraining it is by confining it to the precious metals. If it were law that none but a gold C. should be used in any country, and if, at the same time, there were no effort to tamper with this gold C., and give it an artificial value, the C. of that country would keep its value all the world over, because it has been paid for in commodities, and will be sold again whenever it is in excess of the needs of those who use it. But for this very reason it is a very expensive C., and therefore, ever since man's ingenuity was turned to trade, methods have been devised for superseding gold or the other precious metals by something cheaper. Unless, however, law or custom intervenes to give it efficiency, this cheaper material will only be worth its own intrinsic value. A five-pound bank of England note is worth so little in its intrinsic value as a picture upon thin paper, that such a value can hardly be expressed. It derives its power as C. from the obligation it fixes on a great rich corporation to make good its professed amount to the holder. We thus pass from a purely bullion C. to the next step of restraint, which is generally called a mixed currency. Here some maintain that no note should be issued unless the banker or other person issuing it has in his possession as much bullion as will pay it. Others say it is sufficient that he is bound to pay its amount in bullion on demand without his actually possessing the bullion throughout the whole period of the C. of the note. A third party, again, are for a C. entirely free of a metallic basis; they hold that naturally paper-money, passing from hand to hand, will represent transactions, and will therefore come in the end to be made good in some shape or other; and they further hold, that if some losses should thus occur, these will be more than compensated by the rapid increase of trade and enterprise, caused by a free trade in C., as it is termed—that is to say, by every man issuing his own notes or promises to pay to whoever will take them. This last and extreme class of "currency doctors," as they have been termed, have lately been losing influence, and disappearing from the contest. Through a succession of practical measures, reached with considerable caution, the English have come to a mixed C., resting on a compromise between the two classes of mixed C. above referred to. In the theory of the measures brought to completion under sir Robert Peel in 1844, it is admitted that, to a certain extent, a C. can be based on transactions and the property of those concerned in them, but that a limit must be drawn, to prevent the power of creating such a C. from running to excess, by the issue of notes which cannot be immediately made good by those who issue them. Accordingly, the several banks in existence were allowed to continue their note circulation, but they were permitted to increase it only on the condition of having bullion in their coffers to pay the additional notes issued by them. A C. which is not bullion, and is not worth its nominal value in bullion, is called a "depreciated currency." Before the resumption of cash payments, the notes of the bank of England had sunk to be worth but 16*s.* in the pound, as compared with gold. A depreciated C. may be created by a government calling notes or any other form of money a legal standard, and issuing a greater quantity of them than the real transactions of the country and the property passing from hand to hand require; or it may be created by private persons acting under laws by which the right of issuing a C. is not duly limited. This faculty which a C. has of being depreciated without being repudiated, is the real source of danger in all proposals for an unfettered C., or a free trade in the issue of money. If the bank-notes for which bullion cannot be immediately obtained were repudiated, there might be a natural check on over-issues; but it is their nature, on account of the difficulty of getting bullion for them, or the chance that it may never be got, that they pass at a discount or reduction of their value. Hence such a C. would be ever shifting; there would be no permanent standard, and the person incurring a debt before a depreciation which he pays afterwards would, in reality, be paying his creditor a dividend only. A depreciated C., however, is useful for small transactions. In the silver C. of this country, a pound is worth little more than four fifths of a sovereign. If a person due £100 could pay it in silver, he would get off with a dividend of from 16*s.* to 18*s.* in the pound; but by law, silver is not a legal tender for more than 40*s.* The copper C. is so far below its real value, that it has not been thought worth while to give it a permanent weight—the pence and half-pence now issued are little more than half the weight of those of former mintages; but they are only used as a medium for small sums, and the royal stamp is sufficient to establish a reliance on them.

CURRENCY (*ante*), that which is in circulation among a people, being given and taken as having value or as representing property. Any nation may create a currency at will, decree its nominal value, and enforce its acceptance among their subjects; though its real value will be subject to laws deeper and stronger than any statute. By common consent gold (and silver to some extent) is currency among nations. On extraordinary occasions currency has been issued in notes under the form of a loan to the government, to an enormous extent, as during the civil war in America, when the

obligations of the United States sold for only about 32 cents on the dollar. But all these notes, though so distrusted at the time, were really good for all that they promised, and are now recognized as such. See MONEY, *ante*.

CURRENT RIVER, a stream in Arkansas, length about 250 miles. It runs through a hilly region rich in minerals, though not much developed. It abounds in fish, and in some portions is navigable.

CURRENTS. See GULF STREAM, TIDES.

CURRIE, Dr. JAMES, best known for his valuable edition of Burns's works, long the basis of all subsequent editions, was b. in Dumfriesshire, May 31, 1756. He was at first educated for a mercantile life, but afterwards studied medicine at Edinburgh university; and settling in Liverpool in 1781, soon obtained a good practice. He contributed some excellent papers to medical journals, but his chief work in connection with his profession was *Medical Reports on the Effects of Water, Cold and Warm, as a Remedy in Febrile Disease*, the recommendations in which work have been followed with much success. The edition of Burns (introduced by a criticism on his writings), which he undertook solely for the benefit of the widow and children of the poet, was published in 1800, and realized £1400. C. died Aug. 31, 1805.

CURRITUCK, a co. in n.e. North Carolina, facing the Atlantic ocean; 200 sq.m.; pop. '80, 6,476. The soil is sandy and poor. Co. seat, Currituck Court-house.

CURRY, a co. in s.w. Oregon, on the Pacific ocean; intersected by Rogue river; 1500 sq.m.; pop, '80, 1208. Has a rough surface, but fertile soil. Co. seat, Ellensberg.

CURRY, DANIEL, D.D., b. N. Y., 1809; a graduate of Wesleyan university in 1827. In 1864, he was appointed editor in chief of the *Christian Advocate*, the recognized organ of the Methodist Episcopal church.

CURRY-COMB. A kind of scraper used for dressing horses. It consists of a number of iron plates notched on one edge to form rough teeth. These plates are fastened in parallel lines to an iron back, to which a handle is attached, and the horse is "curried" by scrubbing with the teeth.

CURRYING. See LEATHER.

CURRY POWDER, or CURRY PASTE, is a compound of turmeric and various spices; it is used to a large extent in India and elsewhere as a seasoning for a variety of dishes. One of the best receipts for the compounding of C. P. is, turmeric powder, 6 oz.; coriander seed powder, 8 oz.; black pepper, 4 oz.; fenugreek, 2 oz.; ginger, 2 oz.; cayenne pepper, ½ oz.; cummin seed, ½ oz. Another process is to mix turmeric powder, 5 oz.; coriander seed powder, 3 oz.; black pepper, 1 oz.; ginger, 1 oz.; cayenne pepper, 1 oz.; scorched mustard, 2 oz.; mace, 2 drams. And a third variety is obtained from turmeric powder, 8 oz.; coriander seed powder, 4 oz.; black pepper, 1 oz.; cayenne pepper, 1 oz.; scorched mustard, ½ oz.; mace, 1 dram; cinnamon, 1 dram; cardamoms, 2 drams.

CURSE OF SCOTLAND, a term applied to the *nine of diamonds* in a pack of playing cards. Much uncertainty prevails respecting the origin of this phrase. The most probable explanation is, that it refers to the detestation entertained in Scotland toward John Dalrymple, first earl of Stair, on account of his concern in the massacre of Glencoe, and for which he had to resign office, 1695. The heraldic bearing of this personage was "or, on a saltire azure, nine lozenges of the field." These nine lozenges resemble the nine of diamonds, and hence the popular phrase, the curse of Scotland.

CURSING. See INCANTATION, SWEARING.

CURSO'RES, an order of swift-footed, large, and strong birds, of which the ostrich, the emeu, and the cassowary are examples. The wings, in most species, are not developed sufficiently for flight, though they add speed in running. Among the fossil C. were the æpyornis, the dinornis, etc., larger than any birds now living.

CURTAIN, in fortification, is the portion of rampart or wall between two bastions or two gates. In a regular siege, to batter down the C. is one of the main operations depended on; and many of the external works constructed by the defenders are intended to frustrate, or at least embarrass, this operation.

CURTIN, ANDREW GREGG, b. Penn., 1817; governor of Pennsylvania in 1860, when he displayed great energy and ability in raising troops for the union in the war of the rebellion, which began in that year.

CURTIS, BENJAMIN ROBBINS, LL.D., b. Mass., 1809–74; graduated at Harvard. He was a member of the bar in Boston, and in 1851 was appointed one of the justices of the U. S. supreme court, resigning this office in 1857. On the impeachment of Andrew Johnson, he appeared as one of the counsel for the defendant. His reports of law cases are well known.

CURTIS, GEORGE TICKNOR, b. Mass., 1812; graduated at Harvard, and began law practice in Boston, afterwards removing to New York. He has been several times in the Massachusetts legislature, and was for a time U. S. commissioner. While acting as such he returned to his master the fugitive slave Thomas Sims, an act which brought upon him severe censure. Among many books issued by him are *Rights and Duties of*

Merchant Seamen; Treatise on the Law of Copyright; History of the Origin, Formation, and Adoption of the Constitution of the United States; and various works on legal subjects.

CURTIS, GEORGE WILLIAM, LL.D., b. Rhode Island, 1824. In early life he was clerk with a merchant of New York. In 1842, he and a brother joined the Brook Farm association, near Roxbury, Mass., and from there both went out as farmers. In 1846, he visited the old world, and on returning published *Nile Notes of a Howadji*, comprising his observations in Egypt. Two years later came *The Howadji in Syria*. About this period he undertook the editorship of a new monthly magazine (Putnam's), and was a frequent contributor to the *New York Tribune*. After the suspension of the magazine (in which Curtis was a heavy loser), he lectured and wrote for the Harpers, particularly "The Editor's Easy Chair" in the *New Monthly Magazine*, a series of papers regularly continued to the present date (1880). He has for a long period been the chief editor of *Harper's Weekly*, a very widely circulated illustrated journal. Among his separate works not already mentioned are *Lotus Eating; Prue and I; Trumps;* and the *Potiphar Papers*. He is one of the regents of the university of New York. He is popular as a lecturer and eminent as a political orator, and is master of a clear and finished literary style.

CURTIS, SAMUEL RYAN, b. N. Y., 1805–66; a graduate of West Point; served in the Mexican war as col. of volunteers; was a member of congress from 1855 to 1861. In the war of the rebellion, he served in various grades, reaching maj.gen. of volunteers. In 1865, he was commissioner to arrange treaties with certain Indian tribes. He was greatly interested in the construction of the Union Pacific railroad.

CURTIUS, ERNEST, a distinguished German philologist and antiquary, b. Sept. 2, 1814, at Lübeck. After a good preliminary education at the high school of that place, he attended several German universities (Bonn, Göttingen, and Berlin) as a student of philology. In further pursuance of the path he had chosen—viz., the investigation of Greek antiquity—he went (1837), in company with prof. Brandis, to Athens, where he stayed several years. When his teacher, O. Müller (q.v.), came to Athens, C. accompanied him in his travels through Greece. On the death of Müller at Athens, in 1840, C. returned to Germany, visiting many places in Italy by the way. He graduated in Halle, and after he had taught for some time at two Berlin gymnasiums, he received an extraordinary professorship at the university of that place. His *Anecdota Delphica Inscriptiones Atticæ Duodecim*, and *The Akropolis of Athens*, were published about this time. In 1844, he was called to the honorable position of tutor to the present crown-prince of Prussia. Six years later, he returned to his academical office; in 1856, he was called to Göttingen; and in 1863, he was made ordinary professor at Berlin, and permanent secretary of the academy of sciences. In 1874, he was sent by the German government to negotiate a treaty with the Greeks, to permit its undertaking those important excavations at Olympia begun in 1875. His principal works are *Peloponnesos* (1852), a description of the country of Greece, with reference to its traditions, history, and monuments; *Attic Studies* (1864); and a *History of Greece*, which has been translated into English by A. W. Ward (1868–76).

CURTIUS, GEORG, a distinguished classical scholar, the brother of the former, who has acquired a high reputation for the light he has thrown on the Greek and Latin languages, by applying to them the comparative method. Born April 16, 1820, at Lübeck, he studied at Berlin and Bonn. After a short activity at Berlin, and a longer stay at Prague and Kiel universities, he accepted (1862) the professorship of classical philology at Leipzig. Of his published works are to be noted, *De Nominum Græcorum Formatione* (Berl. 1842); *Die Sprachvergleichung in ihrem Verhältniss zur Classischen Philologie* (Dresd. 1845); *Sprachvergleichende Beiträge zur Gr. und Lat. Gram.* (Berl. 1846); *De Nomine Homeri* (Kiel, 1855). His *Griech. Schulgrammatik* (11th ed. 1875) is in high repute, and his *Grundzüge der Griech. Etymologie* (Leipzig, 1862) is a most valuable contribution to that department of philology (Eng. trans., 1878).

CURTIUS, METTUS or METIUS, a noble Roman youth who (according to tradition) heroically sacrificed his life for the welfare of his country, 362 B.C. A chasm, it is said, had opened in the forum, and the soothsayers predicted that some great calamity would happen if there were not thrown into it the best wealth of the state. While it was proposed to consult the oracles, and determine what this best wealth could be, C. appeared on horseback and in full armor, and exclaimed: "Rome has no greater riches than courage and arms." He then rode into the chasm, which immediately closed over him.

CURTIUS, RUFUS QUINTUS, a Roman historian, author of the work *De Rebus Gestis Alexandri Magni*, in ten books, of which the first two have been lost, and the text of the remainder has come down to us in a damaged condition. Great differences of opinion have existed with regard to the time in which C. wrote, for his name is first mentioned by writers after the 12th century. Some critics have supposed that C. lived in the reign of Augustus; others, that he wrote in the 2d c., or under Constantine or Theodosius; while some regard the work ascribed to C. as a composition of the 13th century. The most probable opinion is that he flourished in the time of Vespasian. The value of the work is as dubious as its authorship. C. had a very inaccurate knowledge of geography, chronology, military tactics, astronomy, and historic criticism; hence his work is far

from being reliable as a whole. The style, though declamatory, is on the whole pure and elegant. The first edition of C.'s history was published at Venice about 1471. Among modern editions may be mentioned Mützell's (Berlin, 1841) and Zumpt's (Brunswick, 1849).

CURUKU OIL, or BRAHMADUN'DU OIL, a pale yellow, limpid oil, obtained in large quantities in India from the seeds of the *argemone* (q.v.) *Mexicana* or prickly poppy, a plant accidentally introduced, but which now flourishes luxuriantly in all parts of India. It is used for lamps, and for other purposes, but possesses properties which render it unfit for food.

CU'RULE CHAIR, the chair of state, equivalent to a throne, among the early Romans. None except consuls, prætors, and a few others high in authority were permitted to occupy it. The chair was usually ornamented with gold and other precious work.

CURVATURE. The C. of a plane curve at a point is its tendency to depart from a tangent to the curve at that point. In the circle, this tendency is the same throughout, for the curve is perfectly symmetrical round its center; in other words, the C. of a circle is constant. In different circles, the C. is inversely as the radius—i.e., it diminishes as the radius increases. The reciprocal of the radius is accordingly assumed as the measure of C. of a circle. A straight line, which has no C., may be considered part of a circle whose radius equals infinity as the reciprocal of infinity, measures the C., and is = 0.

The constancy of C. in the circle suggests an absolute measure of C. at any point in any other curve; for whatever be the C. at that point, we can always find a circle of the same curvature. The radius of the circle which has the same C. at any point in a curve as the curve itself at that point, is called the radius of C. of the curve for that point; and the circle itself is called the *osculating* circle. If we know the radius of C. of a curve at different points, we can compare its C. at those points. We have thus the means also of comparing degrees of C. in different curves.

The problem of measuring the C. of a curve at any point is the same, then, with that of finding its radius of curvature. In some simple cases, as in the conic sections, this may be done geometrically; it is usually necessary, however, to employ the calculus. If the curve be referred to rectangular co-ordinates, and x, y be a point in it, then it can be shown that radius of C. $= \dfrac{\left(1+\frac{dy^2}{dx^2}\right)^{\frac{3}{2}}}{\frac{d^2y}{dx^2}}$. If the curved line, instead of being plane, twists in space, it is called a curve of double curvature. See CONTACT and OSCULATION.

CURVE means, in common language, a crooked line that departs gradually from the straight direction; in mathematics, however, it is usually restricted to lines that follow some law in their change of direction. Thus, the law of the circle is, that all points of it are equally distant from a fixed point, called the center. The law of a plane curve is generally expressed by an equation between the co-ordinates of any point in it referred to a fixed point. See CO-ORDINATES. When the equation of a curve contains only powers of x and y, the curve is algebraic; when the equation contains other functions, logarithms, for instance, of x and y, the curve is called transcendental. The cycloid, e.g., is a transcendental curve.

There are also curves, like the spiral, that do not continue in one plane; these are called curves of double curvature. To express the law of such a curve requires three co-ordinates and two equations.—Curves are said to be of the first, second, third, etc., order, according as their equations involve the first, second, third powers of x or y. The circle ellipse, parabola, and hyperbola are of the second order of curves. There is only one line of the first order, namely, the straight line, which is also reckoned among the curves.—The higher geometry investigates the amount of C. of curves, their length, the surface they inclose, etc.

The number of curves that might be drawn is, of course, infinite. A large number have received names, and are objects of great interest to the mathematician—in some cases, for their beauty; in others, for their remarkable properties. Among the most interesting are the following: 1, circle; 2, ellipse; 3, hyperbola; 4, parabola; 5, cissoid of Diocles; 6, conchoid of Nicomedes; 7, lemniscata; 8, cycloid; 9, harmonic curve; 10, trochoid; 11, the witch; 12, cardiode; 13, curves of circular functions—e.g., curve of sines; 14, the logarithmic curve; 15, the spiral of Archimedes; 16, the catenary; 17, the tractory; 18, the tractrix; 19, the ovals of Cassini; 20, the reciprocal spiral.

CURVES, ANTICLINAL AND SYNCLINAL, are terms applied to the elevations or depressions in undulating strata. The ridge-wave is called the anticlinal curve, and the top of the ridge is known as the anticlinal axis; whilst the trough is the synclinal curve, and the bottom of the trough the synclinal axis.

CURZOLA (ancient, *Corcyra Nigra*, so called from the somber color of its pine forests), an island of the Adriatic, forming a part of the Austrian crown-land of Dalmatia, in lat. 42° 57′ n., long. 17° east. It has a length of about 25 m., with an average breadth of 4

miles. It is well covered with wood, which on the s. coast grows down to the water-edge. The woods furnish ship-timber, a considerable quantity of wine is raised, and the fisheries of the coast are productive. The population numbers altogether 11,000, about 2,000 of whom are located in the town of C., at the n.e. extremity of the island.

CURZON, PAUL ALFRED DE, b. 1820; a French painter especially devoted to landscape works. Among his best works are the "Acropolis of Athens" and the "Shores of the Cephissus."

CUSA, NICOLAS DE, 1401–64; cardinal of the Roman Catholic church, the son of a poor fisherman. The interest of this man for our times lies in his philosophical much more than his political or ecclesiastical activity. He prophesied the end of the world in 1734.

CUSCUS. See LEMON GRASS.

CUSCUTACEÆ. See DODDER.

CUSH, a cognomen, to theorize on which would be a waste of time. In Scripture, it seems to mean sometimes a man, sometimes a country. It is undoubtedly applied in general to the region s. of the Israelites; including portions of Africa s. of Egypt (Ethiopia, etc.), and probably also portions of Arabia. Other applications of it have been advocated, but remain unproved.

CUSHAT. See PIGEON.

CUSHING, CALEB, LL.D., 1800–79; b. Mass.; a lawyer of eminence. Politically, he began life as a whig, but, with president Tyler, he drifted over to the other side. He was often chosen a member of the Massachusetts legislature, and in 1835 was sent to congress. As commissioner to China, he negotiated our first treaty with that empire. He served as col. in the Mexican war; was made justice of the supreme court of Massachusetts, 1852; and was attorney-general of the United States, 1853–57. He was one of the counsel for the United States in the Geneva conference. He was a man of remarkable erudition, and great logical faculty; but his extraordinary abilities, though they did not fail of public recognition, seem to have failed of their due permanence of application.

CUSHING, LUTHER STEARNS, 1803–56; b. Mass.; an American lawyer, well known as a reporter of judicial decisions, and as the author of a *Manual of Parliamentary Practice*, 1845.

CUSHING, THOMAS, LL.D., 1725–88; b. Boston; a graduate of Harvard, and president of the general court, or legislative body of Massachusetts. He was a member of the provincial and Philadelphia congresses. In England, he had the repute of being the great leader of American rebellion.

CUSHING, WILLIAM, LL.D., 1732–1810; b. Mass.; a graduate of Harvard, lawyer, and attorney-general of Massachusetts. He succeeded his father as chief-justice of the supreme court.

CUSHING, WILLIAM B., 1843–74; b. Wis.; for a time a member of the naval academy, who showed conspicuous bravery in the naval service of the union during the war of the rebellion.

CUSHMAN, CHARLOTTE SAUNDERS, b. Boston, 1816; d. there 1876. She was of Puritan descent, from Robert, one of the organizers of the pilgrim emigration, himself arriving but a few weeks after the landing of the *Mayflower*. Charlotte was the eldest of five children, left poor with the mother by the early death of her father. She had a good voice, and took lessons in singing in hope of being able to assist in the support of the family. In the spring of 1830, she first sang at a public concert, and her fine contralto voice and good manner were at once approved. It was her intention to follow the lyric profession, and she appeared with success in *Marriage of Figaro* and other operas. In 1835, she went to New Orleans, where she suddenly lost the control of her voice, so far as singing was concerned. She was greatly disheartened, but at the request of a tragedian (Mr. Barton) she undertook her first dramatic part, and that was no less than "Lady Macbeth." She made a grand success, and the promising *prima donna* became on the instant the favorite *tragedienne*. Every manager wanted her, and she rapidly added such characters as "Romeo" (to bring forward her sister Susan as "Juliet"), "Elvira," "Bianca," "Helen McGregor," "Queen Gertrude," "Goneril," "Emilia," "Tullia," "Nancy Sykes," and the wonderful "Meg Merrilies." Later on she played both "Queen Catherine" and "Cardinal Wolsey" in *Henry VIII.*; also "Ophelia," "Pauline," "Viola," "Katherine" (in *The Shrew*), "Lady Teazle," and many other parts. While great in Shakespeare, she will be longest remembered as "Meg Merrilies." She visited England and the continent twice or thrice, and had exceptional triumphs in London and the principal cities of England and Ireland. She resided several years in Rome, where she was the intimate friend of Miss Emma Stebbins, the American sculptor. It was not alone success in her art that made Charlotte Cushman celebrated. She was not only a great and good artist, but a good woman, honored in the most cultivated society in America and Europe. Her final appearance in New York, when she took leave of the stage of that city, was memorable. On the last night she played "Lady Macbeth." When the curtain fell, a body of the most eminent citizens, with

William Cullen Bryant at their head, came upon the stage and presented the actress with a laurel crown, inscribed "C. C. Palmam qui meruit ferat." Miss Cushman never married. In 1880, her tomb in Mt. Auburn (near Boston) was marked by an obelisk, which is in form an exact copy of Cleopatra's needle as it stood at Heliopolis.

CUSHMAN, ROBERT, abt. 1580–1625, one of the early New England pilgrims. He chartered the *Mayflower* and sailed in her from Southampton, in company with the *Speedwell*. When that vessel was found unseaworthy, and left at Plymouth, England, he remained as leader of the delayed pilgrims, and followed with them in the next vessel. On the 12th of Dec. (old style), 1621, he preached the first sermon that was printed in America, the subject being, "The Sin and Danger of Self-love." The next day he sailed for England on business for the infant colony. C. was a man of ardor and fidelity, eloquent in speech, and with great capacity in affairs.

CUSK. See TORSK, *ante*.

CUSP (Lat. *cuspis*, the point) is a point in a curve at which its two branches have a common tangent. If we conceive a curve to be generated by a moving point, then a C. is where the point suddenly stops and *returns* for a time in the same general direction as that in which it was moving when it reached the C. point. Cusps are of two kinds: 1, when the two branches have their convexities turned in the same direction with respect to the common tangent at the C. point; 2, when they have their convexities turned in opposite directions to the common tangent at the C. point.

CUSP, in architecture, is the point formed by the meeting of two small arches, or foils, in foil arches (q.v.), or tracery. Cusps often terminate in rich bosses of flowers and leaves.

CUSSO, KOSSO, or CABOTZ, *Brayera anthelmintica*, or *Hagenia Abyssinica*, a small Abyssinian tree of the natural order *rosaceæ*, sub-order *spiraceæ*, the dried flowers of which have been long used in Abyssinia as an anthelmintic, and have been found so efficacious in the removal of tape-worm, that they are now a much valued medicine in Europe. The flowers are simply dried, in order to be ready for the market; they have an aromatic, but not very agreeable smell, and are administered in the form of an infusion.

CUSTARD, a composition of milk or cream, eggs, etc., sweetened with sugar, and flavored according to taste. Custards are of various kinds, such as plain, baked, lemon, orange, almond, coffee custards, etc. For a plain C., the following is a recipe as given by M. Soyer: Mix a pint of boiling milk with two ounces of sugar and the thin yellow peel of half a lemon; then take four eggs, beat well in a basin, and add gradually the milk, etc. (not too hot); pass the mixture through a colander, and, having filled the custard cups with it, place them over the fire in a stew-pan, containing about one inch of hot water, and leave them here until sufficiently set (about twelve minutes is the time required). With this as a basis, a variety of custards are produced by the simple addition of flavoring ingredients, as almonds, orange-peel, etc.

CUSTARD APPLE, the name commonly given in the West Indies and other tropical countries to the fruits of certain species of *anona*, a genus of trees of the natural order *anonaceæ* (q.v.). Some of the fruits of this genus are among the most delicious produced in tropical countries, as the cherimoyer (q.v.), and even the common C. A. (*A. reticulata*), which is regarded as a native of America, but is now very common throughout the East Indies, the variety cultivated in the Eastern archipelago being very superior even to the West Indian. The C. A. is a large, dark-brown, roundish fruit, sometimes from its size and appearance called bullock's heart in the West Indies; the tree is of considerable size. Some other American species of *anona* are sometimes called custard apples, and two or three which are natives of western Africa. To this genus also belong the sweet-sop, the sour-sop, the pinana or pinha, all of them tropical American fruits, and the ALLIGATOR APPLE of the West Indies (*A. palustris*), a fruit of pleasant taste, but regarded as dangerously narcotic.

CUSTER, GEORGE A., 1840–77; b. Ohio; graduate of West Point, and a most gallant officer in the U. S. army. He served with honor and distinction during the war of the rebellion. He was killed in a contest with the Indians in Montana in 1877.

CUSTINE, ADAM PHILLIPE, Count de, 1740–93; a French statesman during the revolution of 1789. He was suspected of disloyalty to the revolutionists because of his aristocratic birth, and was duly guillotined. His son met the same fate.

CUSTINE, ASTOLPHE, Marquis de, grandson of count Adam; 1793–1857; b. France; author of several novels and an unsuccessful tragedy. He also published some books of travels.

CUSTIS, GEORGE WASHINGTON PARKE, an adopted son of George Washington, 1781–1857; b. Md. He was a grandson of Mrs. Washington—his father being her son by her first husband. Just after the surrender of Cornwallis, this son, John Parke Custis, died; and of his four children, two were adopted by Washington. C. was the only member of Washington's family who survived after 1852. C. studied at Princeton; and in 1802, went to reside on an estate of 1000 acres at Arlington, near Washington. His daughter married Robert E. Lee, afterwards general in the confederate

army, and the grand estate was confiscated by the government, and is now the site of a union soldiers' cemetery.

CUSTODY. See IMPRISONMENT.

CUSTOM, in English law. This is either general or particular. The principal doctrines relating to general customs have been stated under COMMON LAW. Of particular customs, it may be remarked that, in order to establish them as law, they must be proved by verdict of a jury, except the C. of the city of London, which is proved by certificate by the lord mayor, aldermen, and recorder. A particular C. must, like a general C., be established as in force for a time whereof the memory of man runneth not to the contrary. See COMMON LAW. A C. must have been uninterrupted as regards right, though the exercise of it may have been disused; it must have been held without objection, and be unopposed to other customs; it must be not unreasonable nor uncertain in operation.

CUSTOMARY FREEHOLD, in English law, a species of estate which, in all practical respects, is identical with copyhold (q.v.), but in which the tenure is expressed to be according to the custom of the manor, without adding the words "at the will of the lord."

CUSTOM-HOUSE, the office at a seaport where the customs duties (see next article) are paid, vessels entered and cleared, etc. The several custom-houses in the United Kingdom have each a separate establishment of officers, according to the extent of the trade in the port to which it belongs, and the consequent exigencies of the service. The whole are, however, under the control of the commissioners of customs. The salaries of the various officers, and other details of the service, will be found in Parkinson's *Under Government;* Bell and Daldy, 1859.

CUSTOMS DUTIES, the portion of the revenue of the United Kingdom derived from a tax on imports. The origin of the term is connected with the long conflict between the crown and parliament as to the right of taxation. To meet the claims made by the house of commons of the exclusive right to vote all supplies, it used to be maintained that there were certain duties on exportation and on importation to which the crown had acquired a right by *custom,* and after the power of parliament over this branch of taxation had been fully established, it retained its old name. This tax, after the excise came in force, was always applicable distinctively to goods changing place. There were customs not only upon things leaving and things coming to the British dominions, but also upon commodities transferred from one part to another. In Scotland, the duty on commodities imported into any town from a foreign country was called the great custom; and the duty charged by a burghal corporation on commodities coming from the country districts within its walls was called the small or petty customs. At present, the term C. D. applies solely to the tax levied on commodities imported from abroad.

The tax on imports was of old a simple percentage, familiarly known to the readers of English history as "tonnage and poundage," from the method in which it was adjusted to heavy and light goods. Subsequently, however, the notion prevailed that the C. D. might not only be a source of revenue, but an instrument for furthering the various theories about protecting this trade and discouraging that, which prevailed from time to time. When it was held as an established principle, with regard to any trade, that the customs should be adjusted in such a manner as either to aid or to impede it, the regulations regarding that trade alone would have complexity enough for a whole code of customs laws, the object of which was mere revenue. The more complex the arrangements, the more open were they to the machinations of the smuggler or defrauder, and consequently regulation had to be added to regulation, till the whole became a chaos. In some instances, the duties were such as to act as a prohibition to importation; in others, merely as a heavy increase on the price. In either case, there would be relaxations in favor of the produce of our own colonies, and perhaps of some favored country with which we had a treaty of reciprocity. Then, to encourage our own trade and manufactures, it was considered politic to allow goods to be imported for exportation abroad, or to be imported for the purpose of being worked up into a manufacture, and there would be a difference between the extent of encouragement granted to that manufacture, if it were for home consumption or for exportation. The method in which such relaxation was accomplished was at first by charging the duty on the importation, and afterwards repaying it by what was called a "drawback;" and this was subsequently accomplished in an easier method for the importer, by allowing him to "bond" the goods in the government warehouses until the duty was paid, or the conditions which dispensed with it fulfilled. See WAREHOUSING SYSTEM.

In the year 1825, the laws of the British customs were consolidated into eleven acts of parliament—the fruit of the exertions of the late Mr. Deacon Hume. It will give a conception of the confused and cumbersome condition into which the system had merged, to note that the number of acts repealed on the occasion of the consolidation was 443, and it was afterwards discovered that several had been omitted. There was still a long list of C. D., many of them intended for purposes beyond the mere collection of revenue; but the free-trade legislation of 1846 cleared away a great mass

of this burden on the commerce of the country, and almost every year has contributed to the abbreviation of the list of duties or tariff (q.v.). One by one, articles of solid food have been exempted; and nearly the whole customs revenue is now derived from tea, coffee, dried fruits, spirits, wine, and tobacco. Thus simplified and reduced, the C. D. supply an enormous amount of revenue. The British revenue for the year ending 31st Mar., 1878, was £81,598,435, and to this amount the customs contributed £20,196,624.

The defects which, according to the doctrines now prevalent in this country, are to be avoided in a code of customs, are—1. The prohibition or discouragement of the importation of useful commodities; 2. Encouragement to the smuggler; and 3. Loss of revenue by raising the duty to a height which discourages importation. Under the first head, see ANTI-CORN-LAW LEAGUE, CORN LAWS, and FREE-TRADE. The second is connected with the view that on stimulants the duty cannot be too high, even though it should greatly impede their importation—the duty on tobacco is, in some instances, as high as 900 per cent on the value of the article. But then, if the smuggling trade be encouraged, the stimulant is not only obtained without any contribution to the revenue, but the people become demoralized, and trained to crime. Under the third head, a memorable example is furnished by the sugar-duties of France, which were so high that the native agriculturists could make sugar from beet-root a little cheaper than the duty-paid foreign sugar. Hence the article was dear, but had it not been for the height of the duty, it would not have been worth while to make it at home, and at the same time there arose little or no revenue from it.

The collection and general management of the C. D. is under one great central department of the government in London. The office of receiver-general was, in 1871, united with that of the comptroller-general, and there is a fourfold division into the paymaster's, examiner's, accountant's, and auditor's branches.

CUS'TOS ROTULO'RUM (Lat. keeper of the *rotuli* or rolls), one of the justices of the peace of a county appointed by the crown to keep the county records.

CÜSTRIN'. See KÜSTRIN.

CUTCH, a protected principality under the presidency of Bombay, stretches along the gulf of its own name and the Indian ocean between Guzerat and Sinde. It extends in n. lat. from 22° 45′ to 24° 40′, and in e. long. from 68° 26′ to 71° 45′, containing, in something of a triangular form with the maritime line as a base, an area of 15,100 sq.m., and a pop. of rather more than half a million. It is divided naturally into C. proper and the Runn of Cutch.—1. C. proper, consisting of 6,500 sq.m., and numbering nearly all the inhabitants, is the belt on the sea-shore, touching Sinde, of which it may be regarded as a physical continuation, on the n.w., and being separated by a detached portion of the Runn from Guzerat on the s.e. While the southern edge of this belt is merely a sandy desert, the northern section, traversed lengthwise by two parallel ranges of hills, presents, amid much sterility, many fertile tracts, which yield cotton, rice, etc., and feed a large stock of horses, kine, buffaloes, and camels. The grand defect of the country is the scarcity of water. Hence the crops occasionally fail from the scantiness of irrigation; and in the month of Mar., 1861, this region was said to be suffering more severely than almost any other in India from a nearly general famine. Timber is scarce, for the growth in the mountains is chiefly brushwood. Here and there, however, decayed trunks of great size, more particularly on the southern ridge, indicate the former existence of noble forests. The mineral productions are coal, iron, and alum. The traces of volcanic action are numerous. Earthquakes also have recently occurred; one of which, in July, 1819, besides shaking every fortification to its foundations, and destroying several hundreds of people, threw up an enormous mound of earth and sand many miles in extent, and simultaneously submerged an adjacent district of corresponding size. The pop. of the state was estimated, in 1871, to be 409,522, being about 63 individuals to a sq. mile. The ruler is styled the rao; and the feudatory chieftains under him are about 200.—2. Runn of C.—subdivided into two parts, the smaller, of 1600 sq.m., on the e., and the larger, of 7,000 sq.m., on the n.—is merely an amphibious desert, being, in a great measure, hard ground during the dry season, and then, in turn, a sort of shallow lake formed by the heavy rains and pent-up tides of the s.w. monsoon. It is supposed to have been originally a permanent inlet of the ocean, and to have had its level raised by some such convulsion of nature as that which marked the year 1819. The periodical disappearance of the waters leaves behind it one continuous crust of salt. This dreary waste, however, is not without its elevated spots, the islets, doubtless, of a remoter era. Herds of wild asses and clouds of flies are its only inhabitants, and to cross it by day, except in the rainy season, is almost certain death.

CUTCH GUNDA'VA, a district in Beloochistan. The Hala range of mountains extends along the western frontier. The soil is rich, producing grain and cotton. The climate is damp and unhealthy.

CUTCH, or KACHH, GULF OF, a portion of the Arabian sea, 110 m. long, running between Cutch and Guzerat.

CUTH'BERT, SAINT, OF DURHAM, one of the three great saints of England in the middle ages, the other two being St. Edmund of Edmundsbury, and St. Thomas-à-

Becket of Canterbury. St. C. was b. about 635. Neither his birthplace nor his parentage has been ascertained; but a legend, which was long generally believed, told that he was born in Ireland, and drew his lineage from one of the petty kings of that country. When the light of record first falls upon him, he is a shepherd boy in the kingdom of Northumbria, which then stretched northwards to the Forth. In 651, while watching his flock by night on the heights of Lauderdale, he believes that he sees the heavens open, and a company of angels descend upon the earth, and again ascend to heaven, carrying with them the soul of St. Aidan, the pious bishop of Lindisfarne, or Holy island. The vision determines him to become a monk, and in the same year he enters the monastery of Melrose, of which St. Boisil was then provost or prior, and St. Eata, abbot. When the latter removed to the newly founded monastery of Ripon, St. C. accompanied him, and was appointed to the office of superintendent of the guests. In 661, St. Boisil died of the plague, which then ravaged Britain, and St. C. was chosen to succeed him as provost or prior of Melrose. While in this office, he distinguished himself by his assiduity in visiting the neighboring villages, and especially the remoter mountain hamlets, sometimes on horseback, but oftener on foot, and laboring by his teaching and example to reclaim the people from the superstitious or pagan rites into which they had fallen. After a few years spent in this way, he left Melrose for the island monastery of Lindisfarne, of which he became provost or prior, his old master, St. Eata, being abbot. Longing for an austerer life even than the monastic, he quitted Lindisfarne in 676, to become an anchorpite, or solitary recluse, in a hut which he built with his own hands on Farne island. Here, in 684, he was visited by Ecgfrid, king of Northumbria, Trumuine, ex-bishop of the Picts, and other great men of the north, who came at the request of the synod of Twyford to entreat that he would accept the bishopric of Hexham. He reluctantly complies with their wishes, but his heart is still with his Northumbrian islands. He exchanges the see of Hexham for that of Lindisfarne, and still thirsting after solitude, at the end of two years he resigns his bishopric, and returns to his hut in Farne island. Here he died on the 20th of Mar., 687. The anniversary of his death was a great festival in the English church, which commemorated also the 4th of Sept., as the anniversary of the day on which his body was translated to Durham. The influence which St. C. exercised upon his age seems to have been due chiefly to his fervent piety and extraordinary asceticism. The gift of a persuasive tongue is ascribed to him, and he would seem to have had skill and prudence in the management of affairs, but nowhere is there any trace of his learning.

The fame of St. C. had been great during his life; it became far greater after his death. Churches were dedicated to him throughout all the wide country between the Trent and Mersey on the s., and the Forth and Clyde on the north. When his tomb was opened at the end of 11 years, it was believed that his body was found incorrupt, and so, for more than 800 years, it was believed still to continue. It remained at Lindisfarne till 875, when the monks, bearing it on their shoulders, fled inland from the fury of the Danes. After many wanderings through the s. of Scotland and the n. of England, it found a resting-place at Chester-le-Street in 882. It was transferred to Ripon in 995, and in the same year it was removed to Durham. Here, inclosed in a costly shrine, and believed to work daily miracles, it remained till the reformation, when it was buried under the pavement of the cathedral. The grave was opened in 1827, when a coffin, ascertained to have been made in 1541—when the body was committed to the earth—was found to inclose another, which there was reason to suppose had been made in 1104; and this again inclosed a third, which answered to the description of one made in 698, when the saint was raised from his first grave. This innermost case contained, not, indeed, the incorruptible body of St. C., but his skeleton, still entire, wrapped in five robes of embroidered silk. Fragments of these, and of the episcopal vestments, together with a comb and other relics, found beside the bones, are to be seen in the cathedral library. The asceticism which distinguished St. C. in life, long lingered round his tomb. Until the reformation, no woman was suffered to approach his shrine; the cross of blue marble still remains in the cathedral floor which marked the limits beyond which female footsteps were forbidden to pass, under pain of instant and signal punishment from the offended saint. His wrath, it was believed, was equally prompt to avenge every injury to the honor or possessions of his church. It was told that William the conqueror, anxious to see the incorrupt body of the saint, ordered the shrine to be broken up; but scarcely had a stroke been struck, when such sickness and terror fell upon the king, that he rushed from the cathedral, and, mounting his horse, never drew bridle till he had crossed the Tees. A cloth, said to have been used by St. C. in celebrating mass, was fashioned into a standard, which was believed to insure victory to the army in whose ranks it was carried. Flodden was only one of many fields in which the defeat of the Scots was ascribed to the banner of St. Cuthbert. It hung beside his shrine until the reformation, when it is said to have been burnt by Calvin's sister, the wife of the first Protestant dean of the cathedral.

The life of St. C. was twice written by the venerable Bede—briefly in vigorous hexameters in his *Liber de Miraculis Sancti Cuthberchti Episcopi;* at greater length in prose, in his *Liber de Vita et Miraculis Sancti Cudberchi Lindisfarnensis Episcopi.* In this latter work, he made use of an earlier life by a monk of Lindisfarne, which is still preserved. Besides these lives—all of which have been printed more than once—and what

is told of St. C. in Bede's *Historia Ecclesiastica Gentis Anglorum*, the chief ancient authorities are the *Historia Translationis S. Cuthberti*, published by the Bollandists in the *Acta Sanctorum, mens Martii*, vol iii.; the *Libellus de Exordio Dunhelmensis Ecclesiæ* by Symeon of Durham; the *Libellus de Natvcitate S. Cuthberti de Historiis Hybernensium excerptus*, and the *Libellus de Admirandis B. Cuthberti Virtutibus*, by Reginald of Durham, both published by the Surtees society. There are two modern memoirs of St. C.—the late Rev. James Raine's *St. Cuthbert* (Durham, 1828), and the very Rev. Monsignor C. Eyre's *History of St. Cuthbert* (Lond. 1849).

CUTHBERT, a disciple of the venerable Bede in the monastery of Jarrow, of which he himself was afterwards abbot, was present at the death of his master in 735, and has left a beautiful and touching relation of the event in a letter to his fellow-disciple, Cuthwine. It has been often printed; the best editions are those in Twysden's *Decem Scriptores* (Lond. 1652), and in Stevenson's edition of Bede's *Historia Ecclesiastica* (Lond. 1838).

CUTHBERT OF CANTERBURY, a native of the kingdom of Mercia, became bishop of Hereford in 736, and archbishop of Canterbury in 740. He died in 758. An instructive letter was addressed to him by St. Boniface (or Winfrid) on the ecclesiastical abuses of the age. It has been printed more than once, and will be found in the appendix to the late prof. Hussey's edition of Bede's *Historia Ecclesiastica* (Oxon. 1846).

CUTHBERT'S BEADS, ST. See BEADS.

CUTICLE. See SKIN.

CUTLASS is a sword about 3 ft. long, broad and straight, with a japanned hilt. Cutlasses are mostly used by sailors in the navy, when boarding and taking possession of the enemy's ships.

CUTLER, LYSANDER, b. Me., d. 1866; a maj.gen. in the union army during the rebellion.

CUTLER, MANASSEH, LL.D., 1742–1823; b. Conn.; graduate of Yale; a Congregational minister. He was interested in botanical studies. C. was the leader of the pioneers who settled northern Ohio, and was elected to congress in 1800.

CUTLER, TIMOTHY, D.D., 1685–1765; b. Mass.; an American clergyman, graduate of Oxford, who became president of Yale college, 1719, and rector of an Episcopal church in Boston, 1723.

CUTLERY, the general name for all kinds of cutting instruments, such as knives, forks, scissors, razors, etc. The workman who makes these is called a cutler; the swordmaker, a sword-cutler; but the manufacturer of workmen's tools is called a "tool-maker," or a "*steel toymaker*," not a cutler. In Birmingham, for example, such implements as hammers, chisels, pincers, hatchets, etc., are technically called toys.

Shells, flints, and other sharp-edged stones formed the rudest and most ancient cutting instruments, and the earliest traces of human existence upon our island and elsewhere, are associated with stone "celts" and other weapons and cutting implements. These were followed by bronze weapons and implements, which were in use among the Romans for some purposes up to about the time of the Christian era, bronze surgical instruments having been found at Pompeii. This bronze, like steel, could be made soft for working into shape, and then hardened, but by the opposite means used for hardening and softening of steel, bronze being softened by sudden cooling from a red heat, and hardened by slow cooling. Some cities in Spain and the n. of Italy acquired a high reputation for the manufacture of cutting instruments, more particularly swords, during the middle ages, when the chivalry of the period sought the best equipments. Latterly, all countries have been outstripped by England as regards tastefulness, excellence, and cheapness in cutlery. In this kind of manufacture, the lead is taken by Sheffield, which had gained a name for its *whittles* as early as the reign of Richard I. Why, with their ingenuity, taste, and skill in the arts, neither the French nor Belgians succeed in their C., would be difficult to explain. Certain it is that their C. is comparatively inferior as regards temper and finish, while their apparent incapability of making the delicate hinges and springs of clasp-knives has provoked repeated remark. At the same time, it is to be allowed that foreign C. is rapidly improving, particularly in table-knives, on which a few years have made a great difference in France. In the manufacture of American axes, Canada has made most marvelous advances, its produce as respects this article excelling that of England.

Good *table-knives* are made of steel and iron welded together; the tang, which goes into the handle, and the shoulder, are of iron, and the blade of steel. The tang and shoulder are forged from bar-iron, and the blade from shear or cast steel. Knife-blades, razor-blades, and other small articles, are usually forged into their required shape while still attached to the bar, which serves for the workmen to hold them by, and is called the "porter." When the bar becomes too short, it is grasped in a pair of tongs held close by a ring which clamps them by sliding up their conical handles. Two men are employed in forging such work, which is said to be "two-handed." The principal workman, or "fireman," uses a small hammer of 2 to 4 lbs. weight, while the "hammerman" wields the sledge-hammer, weighing from 10 to 15 lbs. The "fireman," who

attends the heating as well as the anvil-work, directs the hammerman, whose blows merely follow those of the small directing hammer of the fireman. In *drawing down* or *reducing* a bar both in length and width, the flat face of the hammer is used; but when the length or breadth alone is to be extended, only the "pane" or narrow edge of the hammer. The concavity of razor-blades is made by hammering the blade on a small round-faced anvil; the notch or "nail-hole" of a penknife is struck by means of a chisel of the required form. Superior work, such as razor-blades, are *smithed* after forging—that is, beaten upon an anvil, to condense the metal as much as possible—and slightly ground or *scorched* on a rough stone, to finish the shaping, and remove the "scale" or black oxidized surface, which would interfere with the color of the tempering. Common knives are made entirely of iron, and the difference of price arises not merely from the difference of cost of the material, but from the greater facility of working. It should also be understood that, in many articles composed of steel welded to iron, the saving of steel is not the only advantage, for steel being more brittle than wrought iron, it is very desirable, in all articles subject to a transverse breaking strain or to concussion, that every part except the cutting or working edge should be of iron. Thus, a hatchet made entirely of steel would be far less durable than one of iron with a welded steel cutting-edge. A table-knife with a steel tang would be weaker than one with an iron tang. Hammers should only be *faced* with steel, etc.

The great usefulness of steel for all kinds of implements used for cutting or exposed to wearing friction, depends upon its property of acquiring a high degree of hardness when heated and suddenly cooled, and of then being capable of softening again in various degrees by reheating moderately. See TEMPERING METALS.

Table-forks are forged rudely into the shape of the tang and shank, first as though but a single thick prong were required; the part for the prongs is then beaten out, and a stamping-die is brought down upon it, which forms the prongs, with a thin film of steel between them; this is cut out by a cutting-die. Then they are softened and filed up, again hardened, and tempered, and ground, to smooth and finish. The dry-grinding of forks, needles, etc., is a very deleterious trade, on account of the particles of steel which enter the nostrils of the workmen, and produce most painful irritation, followed by a peculiar disease called "grinders' asthma," which is said to shorten life so seriously that few dry-grinders, exposed to the steel dust, reach forty years of age. Many remedies have been proposed for this. A magnetic mouthpiece was invented; but the workmen would not wear it, on account of its novelty, its grotesque appearance, the trouble of cleaning it, and the belief that if their trade were made more healthy, greater numbers would enter it, and wages would be reduced. A revolving fan, which sets in motion a current of air, that is carried by a pipe to the outside of the building, has been used with greater success, and is now in general use when it can be applied, though its introduction was much opposed by the workmen. In the needle-trade especially, it has been most beneficial, entirely removing all danger from the operator. The use of wet stones would, of course, entirely obviate the evil, but they are not applicable to many kinds of work, especially that which is ground before hardening, as the stone wears away very rapidly under these circumstances.

Penknives and other pocket-knives are the work of many hands. Besides the blades, there are the separate pieces of the spring, the handle, rivets, etc., the making of each of which is a distinct trade. All these pieces are finally fitted and put together by the finisher; a good two-bladed knife passes through his hands from 70 to 100 times. The difference in the amount of labor bestowed on the best and the commonest C. is very remarkable, and the difference of price is, of course, proportionate.

CUTTACK, the district, is in the province of Orissa, on the n.w. coast of the bay of Bengal, and has an area of 3,178 sq.m., and a pop. (1871) of 1,494,784. The name, however, has been generally used to include the three districts of C., Pooree, and Balasore, with a joint area of 7,717 sq.m., and a pop. (1871) of 3,034,690. This larger district extends in n. lat. from 19° 40′ to 21° 45′, and in e. long. from 85° 8′ to 87° 31′. The Mahanuddee is the main river, its delta being wholly comprised within the district. Among the natural features of the country, the most remarkable is the Chilka lake, which is, for many miles, separated from the sea by a strip of sand not more than 300 yards wide. Next to Cuttack, the chief towns, reckoning from the s., are Pooree, with its temples of Juggernaut, at the mouth of the most southerly arm of the Mahanuddee; Kanarak, or the Black Pagoda, about 20 m. further to the n.; and Balasore. The trade of the district is inconsiderable. Iron ore is said to be found.

CUTTACK' ("royal residence"), the capital of a district of its own name in the province of Orissa, presidency of Bengal, stands immediately below the bifurcation of the Mahanuddee, thus occupying the apex of the delta of that river. The advantage, however, of this position, in a political and commercial point of view, seems to be in a measure neutralized by the cost of providing against the encroachments of the bordering streams. With a population in 1871 of 50,878, the city has no pretensions to architectural beauty. It has very little trade; and its manufactures are principally shoes and brass cooking-vessels. C. is 220 m. s.w. of Calcutta, in lat. 20° 28′ n., and long. 85° 55′ east.

CUTTEAMUN'DU, the juice of the *euphorbia cuttimundu*, a species of spurge (q.v.), a native of India, particularly of the Northern Circars. It is used for cementing iron with other substances, as for uniting the blade and handle of a knife. The fresh juice is used as a vesicant. In a dried state, it is capable of being molded into any form, and a great variety of articles may be made of it, as of gutta-percha. A medal was awarded to Mr. Elliot at the London exhibition of 1851, for the introduction of this interesting substance to notice.

CUTTER is a name given to two kinds of small vessels. The cutters used by yachtsmen, smugglers, and revenue cruisers, and which are built with especial reference to speed, have a single mast, and a straight running bowsprit that can be run in on board occasionally. They are much like sloops in rig, but have larger sails. Such small vessels occasionally venture on long voyages. In 1857, the *Charter Oak*, a C. of 23 tons, crossed the Atlantic from New York to Liverpool; and, in 1858, the *Christopher Columbus*, a C. of 45 tons, with a crew of only two boys, besides the owner, performed the same voyage in 45 days. The cutters belonging to ships of war are clincher-built boats, from about 24 to 28 ft. in length, employed for various purposes; they weigh from 10 cwt. to 24 cwt. each. Two such cutters are supplied to every ship of war, except those of the smallest kinds.

CUTTINGS are branches or portions of branches of trees or shrubs, employed to produce new plants, by the insertion of the lower end into the earth. By care, and in the most favorable circumstances, almost any tree or shrub may be propagated by C., but some only with great difficulty, and soft-wooded trees or shrubs most easily. Nothing is more easy than to propagate willows, fuchsias, currants, gooseberries, etc., in this way; but many other plants, commonly propagated by C., require greater attention on the part of the gardener, warmth, a uniform damp atmosphere, and shade. Some kinds of apple are occasionally propagated by C., and in warmer climates than that of Britain, this mode of propagation is found suitable for a greater number of kinds. C. are most advantageously taken from branches of which the wood is young, yet at least a year old. The top is generally cut off, and not much more left above ground than is inserted into it. Care must be taken in planting C. not to use such force as to strip off the bark Some herbaceous plants are propagated by C., which, in pinks and carnations, are called *pipings*.

CUTTLE-FISH, *Sepia* and *Sepiadæ*, a genus and family of cephalopodous mollusks of the order *dibranchiata*. See CEPHALOPODA. The body is oblong and depressed, sac-like, with two narrow lateral fins of similar substance with the mantle. There is an internal shell lodged in a sac on the back part of the mantle, somewhat oval and blade-shaped, being comparatively thick near the anterior end, where it is terminated by a sharp point affixed, as it were, to its general outline; the whole shell is light and porous; it is formed of thin plates with intervening spaces divided by innumerable partitions; and consists chiefly of carbonate of lime with a little gelatinous and other animal matter, which is most abundant in the *phragmocone*, or internal harder part of the shell, where also the laminæ and partitions are closer than in the outer part. The eyes are very large, and the head is furnished with eight arms, each of which has four rows of suckers, and two long tentacles expanded and furnished with suckers on one side at the extremity. The COMMON C. (*sepia officinalis*) is abundant on the British coasts. Its skin is smooth, whitish, and dotted with red. It attains the length of a foot or more. It is one of the pests of fishermen; often, along with calamaries, partially devouring the fish which have been caught in their nets. In Scotland, the fishermen call it the O fish. It is not itself easily caught, being very active in making its escape by swimming, and also promptly throwing out its ink to darken the water around it. It is sometimes cast upon the shore, but far more frequently its bone, which is used for making pounce, tooth-powder, etc., for forming molds for small silver castings, for polishing, and for other purposes in the arts; and was formerly often used in medicine as a corrective of acidity in the stomach, for which purpose, however, it is no better adapted than any other form of carbonate of lime. The ink of the C. furnishes the valuable pigment called *sepia* (q.v.), which is said by some chemists to contain a peculiar animal principle called *melanine* (Gr. *melas*, black), and is wonderfully indestructible. Dr. Buckland indeed found the pigment remaining in fossil mollusks akin to the C. to be fit for use, and to make excellent sepia, notwithstanding all the unreckoned ages that have elapsed from the time of its secretion by the living organisms.—The eggs of the C. are not unfrequently cast ashore, clustered together like grapes, and are known to the frequenter of the coast as *sea-grapes*.—The flesh of the C. was esteemed by the ancients. A receipt for making a C. sausage will be found in Athenæus.—Numerous species of C. inhabit different seas.

CUTTY STOOL, a seat once used in the Scottish church for the exposure of offenders against chastity. The sinner was required to sit on the stool before the whole congregation and endure a lecture from the minister.

CUT-WORM, a somewhat indefinite name for destructive grub worms of various species, many of which belong to the genus *agrotis*. The most destructive are the

winter dart-moth and the wheat dart-moth, destroying the germs of wheat and buckwheat. Sometimes they devastate whole fields of corn, cabbage, and other vegetables. One species ravage the young buds of apple and pear trees. No prevention has yet been found effective.

CUVIER, Georges Chrétien Léopold Dagobert, Baron, was b. Aug. 23, 1769, at Mömpelgard, a t. then belonging to Würtemberg, but now to France. His father was an officer in a Swiss regiment. Having made rapid progress in learning at the Mömpelgard gymnasium, C. entered, in 1784, the Karlsakademie at Stuttgart. Here, in the midst of various studies, he retained that predilection for natural history which he had displayed when only 12 years old. The restricted means of his parents, however, compelled him, in 1788, to take a situation as private tutor in the family of comte d'Héricy, who resided near Fécamp, in Normandy. Here C. lived for 6 years, quietly but ceaselessly pursuing his studies in natural history. An acquaintance accidentally formed between him and the abbé Tessier (noted as a writer on agriculture), was the cause of C.'s obtaining an introduction to Geoffroy St. Hilaire and other eminent Parisian savans. Startled by the novelty and comprehensiveness of his views on zoology, Geoffroy St. Hilaire urged him to come to Paris, which he did, and, in 1795, was appointed professor in the ecole centrale of the Panthéon. Soon after this appointment, C. was made assistant to Mertrud, the teacher in comparative anatomy at the Jardin des Plantes, and now he began to form that collection in natural history which ultimately became the largest in Europe. In 1796, he was made a member of the national institute; in 1800, he succeeded Daubenton in the collége de France, and, in 1802, he was made perpetual secretary of the institute. He gradually rose in the estimation of the emperor, and, in 1808, was commissioned to superintend the institution of academies in the new territories attached to France. Shortly before the fall of Napoleon, C. was admitted into the council of state. The restoration did not deprive him of his honors, but added to them; he was made chancellor of the university of Paris, and, henceforward, received from time to time new rewards for his services to science. After a visit to England (1818), where he was received with great honors, he was, in 1819, admitted into the cabinet by Louis XVIII., and, in 1826, was made grand officer of the legion of honor; but his decided opposition to the royal measures for restricting the freedom of the press, lost him the favor of Charles X. Under Louis Philippe, he was made a peer of France in 1831, and in the following year was nominated minister of the interior, when he was suddenly attacked with paralysis, of which he died, May 13, 1832.

It is difficult, in our narrow compass, to give a summary of the merits of C., so various were his attainments, so great was his success in so many departments. He laid the foundation of the now universally recognized method of classification in zoology (q.v.), and raised comparative anatomy (which until his time had been merely a heap of unconnected details) to the dignity of a science. After a long series of patient observations on numerous animals, especially the hitherto little-known order of mollusca, he published (1801–5) his *Leçons d'Anatomie Comparée*, which was completed by the *Mémoire pour servir à l'Histoire de l'Anatomie des Mollusques* (1816). With admirable sagacity, he applied the principles of his comparative osteology to the remains of fossil vertebrate animals, and thus opened a field of investigation in which numerous explorers have since successfully labored. His *Recherches sur les Ossements Fossiles des Quadrupèdes* (1821–24) is a mine of information in natural history, and affords the strongest arguments in favor of the theory of a progressive series of animals, advancing from the most simple to the most complex forms of organization. C.'s rare faculty of expressing scientific truths in a popular and elegant style, was displayed in his celebrated *Discours sur les Révolutions de la Surface du Globe et sur les Changements qu'elles ont produits dans le Règne Animal* (latest edition, Paris, 1851). This discourse was published as an introduction to the above-named *Recherches sur les Ossements Fossiles*. In concert with Valenciennes, C., in 1828, commenced a *Natural History of Fishes*, which was founded on the largest ichthyological collection ever made by an individual. It was continued by Valenciennes. Lastly, we may notice the éloges delivered by C. (and published in the *Recueil d'Eloges Historiques*, 1819), as valuable contributions to the history of science.

In public life, C. was as remarkable for activity as in the quiet work of the study. He never blindly surrendered himself to any party, but at all times gave proof of an honest, sagacious, and resolute character. In his plans for the extension and improvement of national education, he was zealous and indefatigable, as also in his efforts for the welfare of the Protestant church in France, of which he was a member.—Mrs. R. Lee's *Memoirs of Baron C.* (Lond. 1833); Pasquier's *Eloge de C.* (Paris, 1833).

CUXHA'VEN, a t. of Germany, situated on the left or southern bank of the Elbe, just where it is lost in the German ocean. It is about 60 m. distant from Hamburg, to which free city it belongs. C. is a small place, but of importance as the port from whence the Hamburg steamers ply when in winter the Elbe is frozen over. The harbor affords good shelter, and is much resorted to by vessels waiting for favorable winds. Pilots for the Elbe are taken in here. Pop. '75, 4,102.

CUYA'BA, capital of Matto Grosso, the second largest and most westerly province of Brazil, occupies pretty nearly the center of South America, being in lat. 15° 36′ s., and long. 56° west. It stands on the left bank of a river of the same name, and is estimated to contain about 10,000 inhabitants. Its mines, which have yielded gold and diamonds since 1719, are now nearly abandoned, the cost of working them being unremunerative. C. sends to Rio, the principal seaport of the country, large quantities of hides and ipecacuanha by caravans of 200 or 300 mules each. The chief edifices of the city are its three churches, an hospital, a school of philosophy, and the public buildings of the province.

CUYAHO'GA, a co. in Ohio, bordering on lake Erie, traversed by several railroads; 426 sq.m.; pop. '70, 132,110. Productions, grain, wine, butter, and wool. Co. seat, Cleveland.

CUYLER, THEODORE LEDYARD, D.D., b. N. Y., 1822; graduated at Princeton; first a Presbyterian minister in New Jersey; then pastor of Market street Reformed church, New York; and now pastor of Lafayette avenue Presbyterian church, Brooklyn, which has the largest membership of that denomination in the United States. He has written several religious works, and a prodigious number of letters and articles in religious newspapers.

CUYP, or KUYP, JACOB GERRITSE, commonly called the old C., was b. at Dordrecht, in 1575. Jacob C.'s representation of cows and sheep, battles and encampments, are clever, but his fame rests principally upon his excellent portraits. His coloring is warm and transparent; his manner, free and spirited. C. died in 1650.—AELBERT CUYP, Jacob's son, was also b. at Dordrecht, in 1605. He excelled in the painting of cattle grazing or reposing, moonlights, wintry landscapes, still waters with ships, horse-markets, hunts, camps, and cavalry-fights. During his life-time and long after, Aelbert's pictures, although in many respects equal to those of Claude, were held in little estimation. Opinion, however, has now changed regarding them. One of his still waters, which was sold in 1777 for 416 guilders (£34 13*s.* 4*d.*), brought 12,720 guilders (£1060) in 1844. England is particularly rich in his works. He died at Dordrecht, 1691.—BENJAMIN CUYP, a nephew of Aelbert, lived at Dordrecht, and painted biblical pieces in Rembrandt's style, and familiar scenes of country life. His best works are in the manner of Teniers. His sea-shores have less repute. The dates of his birth and death are unknown, but, from the multitude of his pictures, it is conjectured that he lived to a great age.

CUZ'CO, the name of a city, a province, and a department in Peru. 1. C., the city, was originally the capital of the Incas (in the language of the Incas, says Garcilasso, C. signifies "navel") and the center of an empire, which, besides the territory of the existing republic, comprised Bolivia, most of Ecuador, and portions also of Chili and the Argentine confederation; and is still, next to Lima, the most populous city in the state, containing fully 47,500 inhabitants. It stands on the Guatanai, one of the remotest head-waters of the Amazon, in lat. 13° 31′ s., and long. 72° 2′ w., at the eastern end of that section of the Andes known as the Knot of Cuzco, 11,000 ft. above sea-level. Notwithstanding its aboriginal name, C., with the exception of some neighboring ruins, part of which, perhaps, carry one back beyond the era of the Incas, is really of Spanish origin, being built in the form of a square, and presenting many handsome edifices. It is about 200 m. to the n.n.e. of Arequipa, having its maritime outlet in Islay, the port of that city. The manufactures of the place are cottons, woolens, embroidery, and jewelry.—2. The province, otherwise styled the Cereado, embraces nothing beyond the city itself but the suburb of San Jeronimo.—3. The department, subdivided into 11 provinces, lies wholly in the sierra or Andine region of the country, having the coast on the w., and the montana, or Transandine territory, on the east. It numbered, in 1871, 464,000 inhabitants, being considerably more populous than any other department. It stretches in s. lat. from 13° to 15°, and in w. long. from 70° to 73°, with an area of about 45,000 sq. miles. In addition to C. itself, it has the towns of Abancay and Urubamba.

CY'AMUS BALÆNA'RUM. See WHALE LOUSE.

CYANÆ'A, jelly fishes known as sea-nettles from a peculiarly poignant sting, which makes them the annoyance of sea-bathers.

CY'ANE, a nymph, wife of Eolus, the god of the winds. The legend was that Pluto changed her into a fountain.

CYAN'IC ACID is a compound of cyanogen (q.v.) and oxygen along with water, and is represented by the symbol C_2NO,HO, or CyO,HO.

CY'ANITE, KYANITE (Gr. *kyanos*, blue), DISTHENE, or SAPPARE, a mineral composed of alumina and silica. It often occurs crystallized, and generally in broad prisms. It is sometimes colorless, red, yellow, etc., but frequently of a fine sky-blue, slightly tinged with violet: it is transparent, and sometimes beautifully opalescent. It occurs chiefly in mica-slate, talc-slate, and granite; is found in different parts of Europe, Asia, and America, and in several places in Scotland. It is sometimes used as a gem.

CYAN'OGEN (C_2N or Cy) is a compound organic salt radical, which is mainly interesting as being the principal component of hydrocyanic or prussic acid. It is most

easily prepared by heating the cyanide of mercury (HgCy) or the cyanide of silver (AgCy) in a tube, when the C. is evolved as a gas at ordinary temperatures, but can be condensed by cold and pressure into a thin, colorless liquid, which freezes at -30° F. Gaseous C. has a specific gravity of 1806 (air = 1000), is inflammable, and burns in air or in oxygen with a characteristic purple or rose tint; is soluble in water to the extent of 4 to 5 volumes of the gas in 1 of water. It combines with metals, such as potassium, to form a class of important cyanides, as the cyanide of potassium. See POTASSIUM, HYDROCYANIC ACID, etc.

CYANOHY'DRIC ACID. See HYDROCYANIC ACID.

CYANOM'ETER, an instrument for determining the color of the sky: a disk divided into sections, the several sections being tinted with blue, gradually increasing in intensity. If the sky be viewed through it, some of its sections will appear deeper and some lighter in tint than the sky. The section where there is no perceptible difference gives the measure or degree of the blueness of the sky.

CYANO'SIS (Gr. *kyanos*, blue), lividity of complexion, with fullness of the capillaries and minute veins, especially of the face and lips. A name characteristically applied to the color in certain cases of congenital disease or malformation of the heart. See HEART, DISEASE AND MALFORMATION OF.

CYAN'OTYPE PROCESSES, in photography, are those in which the compound radical cyanogen is employed; they were discovered by sir John Herschel, and depend for their successful practice on the reduction of a persalt of iron to the state of protosalt, by the action of light, in the presence of organic matter.

Good paper is immersed in a solution of ammonio-citrate of iron of the strength of 40 grains to one ounce of water; it is then dried, and exposed—at any convenient time during a fortnight—under a negative, when a picture of a pale brown tint becomes faintly visible upon a yellow ground; it is then brushed over with a solution of ferrocyanide of potassium (yellow prussiate of potash), which develops the picture of a deep blue tint; and this may be further deepened by immersion in a solution of carbonate of sodate, which has the effect, at the same time, of removing the unaltered ammonio-citrate, and permanently fixing the picture. Similar results may be obtained by employing ferridcyanide of potassium (red prussiate of potash), or a mixture of the ferridcyanide and ammonio-citrate, in which latter case the paper is sensitive as soon as treated with the mixed solutions, and must therefore be dried in the dark. To fix the picture, it is only necessary to wash with water. A subsequent treatment with a weak solution of proto-nitrate of mercury, has the effect of apparently removing the whole of the picture. If the mercury salt, however, be perfectly washed away, and the picture dried, and ironed with a very hot iron, it is speedily reproduced in all its vigor.

CYANU'RIC ACID is an organic acid allied to cyanic acid, and having the formula $C_6N_3O_3,3HO$, or $Cy_3O_3,3HO$. It is obtained by heating urea to expel ammonia, or by the destructive distillation of uric acid.

CYATH'EA, a genus of ferns (q.v.), of the sub-order *polypodiaceæ*, containing many species, natives of tropical and sub-tropical regions, both of the old and of the new world. They are tree-ferns, and some of them have lofty stems and gigantic fronds; they are generally also characterized by great gracefulness and beauty. *C. arborea*, sometimes designated the common tree-fern, is a native of the West Indies, Brazil, etc. The fronds are bipinnate, the pinnules deeply pinnatifid. The roots of *C. medullaris*, a species found in New Zealand, contain much starch, and are baked and used as food.

CYATHOPHYL'LUM, a genus of fossil stony corals, with a simple or branched polyparium, internally lamellated, the lamella having a quadripartite arrangement. The older portions are cut off by transverse "tables" or septa, and the base of the stem is often supported by root-like processes. This genus was especially abundant in the Devonian measures, 36 species having been described from them. It made its first appearance in the Silurian seas, and perished at the close of the carboniferous epoch.

CYAX'ARES. I., King of the Medes, who began to reign about 663 B.C. In 610, he was at war with the king of Lydia, when there occurred an eclipse of the sun, whereupon the kings made a treaty of peace.

CYAX'ARES II., grandson of Cyaxares I., and uncle of Cyrus the great, supposed to be the "Darius the Mede" spoken of by the prophet Daniel. He reigned in Babylon two years after its conquest by Cyrus.

CYB'ELE. See VESTA.

CYB'IUM, a genus of fishes of the family *scomberidæ* (q.v.), having a long first dorsal, detached finlets, an elongated body, a keeled tail, no pectoral cuirass, and no armature on the lateral line, compressed trenchant teeth in the jaws, and very numerous villiform teeth in other parts of the mouth. A number of species are natives of the seas of the East Indies, some of which are much esteemed for the table; and one species, *C. commersoni*, is used in a dried as well as in a fresh state; and in a dried state is, to some extent, an article of commerce in India.

CYCADA'CEÆ, or CYCAD'EÆ, a natural order of exogenous plants, consisting of small trees and shrubs, somewhat resembling palms in their general appearance, but much

more nearly allied to *coniferæ* (pines, firs, etc.) in their botanical characters; C. being one of the few orders placed by Lindley along with *coniferæ* in his class of *gymnogens* (q.v.). The stems are generally simple, and either cylindrical or short and spheroidal; sometimes they are branched by successive forkings; they are much marked with scars of leaf-stalks; they consist internally of a mass of pith traversed by woody bundles, and rings of woody matter. The leaves are large and pinnated, and unfold by unrolling, like the fronds of ferns. This curious and beautiful order contains about 50 known species, natives of tropical and sub-tropical countries. None are found in Europe. They all have a mucilaginous nauseous juice, but with this there is often much starch, which, being separated, forms a wholesome article of food. A kind of sago is made in Japan from the cellular substance which occupies the interior of the stem of *cycas revoluta*, in the eastern peninsula from *C. pectinata*, and in the Moluccas from *C. circinalis*. From these species, which are trees 30 to 40 ft. high, there exudes a transparent gum, resembling tragacanth in its properties. Their nuts are also eaten, after being fermented and roasted. The large seeds of *dion edule* afford a kind of arrow-root in Mexico; and a starchy substance, sometimes called arrow-root, and sometimes sago, is obtained from *zamia pumila* and other dwarf species in the West Indies. Caffer bread (q.v.) belongs to this order.—Fossil C. are numerous, and occur in some of the oolitic and other strata in England.

CYCH'LA, a genus of fishes of the family *chromidæ* (included by Cuvier in the *labridæ*, or wrasse family), of which many species occur in the rivers of tropical America. They have small and crowded teeth, forming a large band. Some of them are reckoned among the finest fishes for the table in Brazil and Guiana. They are also remarkable for the beauty and brilliancy of their colors. Some of them are large, and some small. Allied to this genus is *chromis*, of which one species, *C. Niloticus*, the Egyptian *corycina* of the ancients, inhabits the Nile, and is reckoned the best fish in Egypt. It attains the length of two feet.

CYC'LADES. See ARCHIPELAGO and GREECE.

CYC'LAMEN, a genus of plants of the natural order *primulaceæ*, having a wheel-shaped corolla, with a long reflexed limb, and flower-stalks twisted spirally downwards after flowering. The species are herbaceous perennials, not numerous, and chiefly natives of the s. of Europe. They have turnip-like, partly subterranean stems, which are very acrid, but nevertheless are greedily eaten by swine, and the plants are accordingly often designated SOW-BREAD. They are drastic and emmenagogue. A very stimulant ointment is prepared from them, which externally applied by friction, expels intestinal worms from children. Several of the species are frequent in our flower-gardens, on account of the beauty and fragrance of their flowers, which have the additional charm of being produced early in spring. One species only, *C. hederæfolium*, has a very doubtful claim to a place in the flora of Britain.—The active properties of the species of C. have recently been found to depend upon a peculiar principle called *cyclamine*, which produces effects on the animal system similar to those of curari (q.v.).

CY'CLE (Gr.), which means simply circle, is a term used in chronology to denote an interval of time in which certain phenomena always recur in the same order. Cycles have chiefly arisen from the periods of revolution of the earth and other celestial bodies not being commensurable. One unit of time is the day of 24 hours, being the period of revolution of the earth round its axis. But neither the year—the period of the earth round the sun—nor the month—the period of the moon round the earth—can be measured by days, or even by hours, so exactly as not to leave fractions. Cycles have been invented to swallow up these fractions of time in whole numbers expressing days, in such a way that after a certain number of revolutions of the body whose period has been put against that of the earth on her axis, the body shall at last occupy the same place in the heavens and calendar as it did when the C. commenced. Of the numerous cycles or periods of this kind that have been invented, the more important are noticed under their specific names. See INDICTION, METONIC CYCLE, PERIOD, GOLDEN NUMBER, etc.

CYC'LIC POETS, the "routine" writers of Greek mythological stories. The name was used in a derogatory sense, implying that the writers were mere followers of greater men. Their names are now scarcely known.

CYCLOBRANCHIA'TA (Gr. circle-gilled), an order of gasteropodous mollusks, in which the gills usually form a series of lamellæ, surrounding the body between the foot and the mantle. To this order belong the univalve *patellidæ*, or limpets, and the multivalve *chitonidæ*, or chitons.

CY'CLOID (Gr. circle-like). If a circle roll along a straight line on its own plane, a point on the circumference describes a curve which is called a cycloid. The curve is one of the most interesting we know in respect both of its geometrical properties and connection with dynamics. One of its most interesting properties is this: The time of a body's descending from rest from any point in the arc of an inverted C. to the lowest point is the same, from whatever point of the curve the body begins to descend. This is sometimes expressed by saying that the C. is the *isochronous* (Gr. equal-time) *curve*. The body having reached the lowest point, will, through the impetus received in the

fall, ascend the opposite branch of the curve to a height equal to that from which it fell, losing velocity in its ascent by the same degrees as those by which it acquired it in its descent, and it will employ precisely the same time in ascending as it did in descending. It is clear that if a surface could be procured that would be perfectly smooth and hard, the C. would thus present a solution of the perpetual motion. The curve was discovered by Galileo in 1615.

CYCLOID FISHES, an order of fishes, according to the classification proposed by Agassiz, having *cycloid* scales (Gr. *kyclos*, a circle)—scales formed of concentric layers, not covered with enamel, and not spinous on the margins. Cycloid scales are generally imbricated, but are sometimes placed side by side without overlapping. Very many of the existing fishes are of the cycloid order, and fossil C. F. are numerous in the more recent strata from the chalk upwards, but they first appear in the chalk.

CYCLONES. See STORMS.

CYCLOPE'AN ARCHITECTURE, or MASONRY, the name which has come to be generally used for a wall of large irregular stones, unhewn and uncemented. The term originated in Greece, where structures of this kind were fabled to have been the work of the Cyclopes, or one-eyed giants. The walls of Tiryns, near Nauplia—alluded to by Homer—are an example of the ruder style of Cyclopean masonry. They are of irregular unshapen stones, from 6 to 9 ft. long, from 3 to 4 ft. wide, and from 2 to 3 ft. deep; the interstices are filled up by small stones, but no mortar is used. The walls of Mycenæ and of Epirus are examples of more advanced C. A.: here, the blocks, although irregular in size and shape, are fitted carefully to each other, showing close joints and a smooth surface. These structures are now commonly believed to have been reared by the Pelasgians (q. v.), probably more than a thousand years before the Christian era. They are found not only in Greece, but in Italy and Asia Minor.

The next stage of Cyclopean masonry shows an approach to horizontal courses, as in the walls of several towns in Greece, and of some in Etruria. Lastly, the name of Cyclopean work is applied, but perhaps not quite accurately, to a kind of masonry which obtained among the Etruscans (q.v.), where the blocks are both squared and laid in horizontal courses, but are not cemented. In some cases—as in the walls of Cosa, in Tuscany, believed to have been first a Pelasgian, and then an Etruscan city—the lower part is of irregular polygonal blocks, the upper part of squared stones in horizontal courses. In at least one instance—a wall in the Peloponnesus—a foundation of excellent ashlar is surmounted by irregular polygonal blocks of the usual Cyclopean type.

Masonry, partaking more or less fully of the Cyclopean character, is to be found in Persepolis, and elsewhere in Asia, in several parts of western Europe, and in some parts of America. The walls of Cuzco, and the ruins of what is called the house of Manco Capac, on an island in the lake of Titicaca, in Peru, are interesting examples of the C. A. of the new world. Instances of Cyclopean work on a smaller scale are to be found in the British islands, in the walls of the primitive "duns" or hill-forts, or in the "cashels" or precincts of early religious houses. Among Irish examples, may be mentioned the Grianan of Ailech, in the county of Donegal; Staigue Fort, in the county of Kerry; Dun Ængus, on one of the isles of Arran, on the w. coast of Galway; the Giant's Sconce, near Coleraine; and the Rock of Cashel. Among Scotch instances, may be named the Laws, in the parish of Monifieth, not far from Dundee, and the ruins on St. Columkille's island, near Migsted, in Skye. In the Bibliothèque Mazarine, at Paris, there is an interesting set of models of the Cyclopean buildings of Greece and Italy, by M. Petit-Radel, the author of *Recherches sur les Monumens Cyclopéens.*

CYCLOPE'DIA. See ENCYCLOPÆDIA.

CY'CLOPS (Gr. *kuklopes*, "the round-eyed"), in Greek mythology, are of three kinds. 1. The Homeric C., a wild, lawless, gigantic race, inhabiting the sea-coasts of Sicily, the most prominent of whom is Polyphemus (q.v.). Although Homer does not directly call them one-eyed, yet he expressly terms Polyphemus such, and the later poets attribute his peculiarity to the rest. 2. The three C. mentioned by Hesiod, Brontes, Stereopes, and Arges, each having one eye in the middle of his forehead; these were sons of Uranus and Gæa, belonged to the race of Titans, and forged thunderbolts for Zeus. Hurled into Tartarus by their father, but delivered by their mother, they helped Kronos to usurp the government of heaven. Kronos, however, in his turn, threw them back to Tartarus, from which they were again released by Zeus, whose servants they now became. Finally, they were slain by Apollo, because they forged the thunderbolt with which Zeus killed Asclepius. Later tradition placed their workshop in Mt. Ætna, or in the volcanoes of Lemnos and Lipari, and made them the slaves of Hephæstus. 3. The C. mentioned by Strabo, as a people who had come from Thrace or Lycia to Argolis, and were distinguished for their skill as builders. Their constructions are known as the Cyclopean walls, and many of them still exist in parts of Greece and Italy. The statement of Strabo is quite untrustworthy. More probably the so-called Cyclopean walls were built by some ancient race, perhaps the Pelasgians (q.v.), at a period long anterior to the historical civilizations of Greece and Rome.

CYCLOPS, a genus of minute entomostracous crustaceans of the order *branchiopoda* (q.v.), having a soft and rather gelatinous body divided into two portions, one consistin

of the head and thorax, the other forming the tail. There is only one eye, situated in the middle of the forehead, and generally of a bright crimson color, sparkling like a gem when the animal is viewed through a microscope. The species of C. are numerous; they inhabit both the sea and fresh waters, generally residing among or upon aquatic plants. They are extremely active, and dart about with great rapidity.

CYCLOP'TERUS. See LUMP-SUCKER and SUCKING FISH.

CYCLORA'MA, a series of views, which, being wound round cylinders, are made to pass in consecutive order before the spectator, so as to produce the effect of motion on his part, as the banks of a river are seen from a steamboat, or the country from a railway.

CYCLO'SIS (Gr. circulation), the name employed to designate certain still very imperfectly understood movements of the contents of cells in plants. As they have been observed in plants of the most different natural orders, it is not unreasonably presumed that they prevail throughout the whole vegetable kingdom, and characterize the active life of all vegetable cells.

CYDNUS, a river of Cilicia, passing the city of Tarsus and emptying into the Mediterranean. It was on this river that Cleopatra made her voyage to meet Antony.

CYDO'NIA. See QUINCE.

CYG'NET, a young swan.—CYGNET-ROYAL, in heraldry, a swan gorged with a ducal coronet, having a chain thereunto affixed, and reflexed over its back.

CYG'NUS. See SWAN.

CYGNUS (Lat. the swan), a constellation in the northern hemisphere, between Lyra and Cassiopeia. Several stars in this constellation have received the particular attention of astronomers. See STARS.

CYL'INDER (Gr. *kylindo*, to roll) is the name of a genus of geometrical solid figures, of which there may be endless species. The most common kind of C. is that which is generated by the revolution of a rectangular parallelogram about one of its sides, which line is called the axis of the cylinder. But in order to embrace all varieties of cylinders, we must generalize the mode of generation. A C., then, is a solid generated by a line which moves parallel to itself while one end traces upon a plane any curve whatever. When the position of the generating line is at right angles to the plane, the C. is *right;* when not, it is *oblique.* If the curve traced is a circle, and the line perpendicular to the plane, the C. is a *right circular C.*, etc. In all cases, the content of the C. is found by multiplying the number of square units in the base by the number of linear units in the altitude, which is the perpendicular distance between the two ends. The area of the convex surface is equal to a rectangular parallelogram whose base is the circumference of the end, and its height the length of the generating line. To this must be added the areas of the two ends, to get the whole surface of the cylinder.

CYLLE'NE, a mountain in n.w. Arcadia, the fabled birthplace of Mercury. Its modern name is Zyria.

CY'MA (Lat.), in architecture, a molding consisting of a hollow and round conjoined. When hollow in the upper part, it is termed C. recta; when hollow in the lower part, it was called C. reversa.

CYMA'TIUM. See ENTABLATURE.

CYMBALS are military instruments of percussion, which, when struck one against the other, produce a loud harsh sound of no fixed pitch. The best C. are those made in Turkey and China. Attempts to discover and imitate the composition of the metal have all failed. The notes in music for this instrument are all placed on the same line or space, in rhythmical succession. C., although military instruments, are now much used in the orchestra by modern composers.

CYMBEL, an organ stop of the mixture species, consisting of three ranks of pipes. Also a stop found in very old continental organs, consisting of a machine like a star placed high up on the front of the organ, on which were hung small bells, which sounded when the star was moved round on its center by a current of air from the organ.

CYME, in botany, a common form of centrifugal (q.v.) inflorescence, in which the rachis or floral axis disappears by separating into irregular branches, and these are short and corymbose. It is of very general occurrence in the *caryophyllaceæ.* Examples may be seen also in the common elder, different species of *viburnum*, etc. The *verticillasters* of the *labiatæ* are small cymes in the axils of opposite leaves, assuming nearly the appearance of whorls.

CYM'RY. See CELTIC NATIONS,

CYNAN'CHĒ (Gr. *kuōn*, a dog, and *anchō*, I suffocate), a term applied to the severer forms of sore throat. See THROAT, AFFECTIONS OF THE.

CYNAN'CHUM, a genus of plants of the natural order *asclepiadaceæ*, having a wheel-shaped corolla, and a lobed or cleft corona. *C. monspeliacum*—a herbaceous twining plant, with roundish, heart-shaped, stalked leaves, a native of the shores of the Mediter-

ranean—yields the drug called *Montpellier scammony*, a violent purgative, and not much used. *C. ovalifolium* is a native of Penang, and its sap yields caoutchouc of excellent quality.

CYNAROCEPH'ALÆ. See COMPOSITÆ.

CYN'ICS, the name applied to a sect of Greek philosophers, who were distinguished mainly for their morose and snarling ethics. For a knowledge of their peculiar opinions, see articles ANTISTHENES, DIOGENES, MENIPPUS, etc.

CY'NIPS. See GALL-FLY.

CYNOCEPH'ALUS. See BABOON, *ante.*

CYN'ODON, a genus of grasses, having digitate or racemose spikes, with spikelets on one side, glumes nearly equal, boat-shaped, and containing one floret, which has two awnless paleæ, the fruit coated with the hardened paleæ. The most important species is *C. dactylon*, a grass very widely diffused, being the principal fodder-grass and best pasture-grass of India, where it is the principal covering of many thousands of square miles, and is known by the names of *dhob, doorba*, etc., and also common in the s. of Europe. In Britain, it is rare, being found only on the sandy shores of Cornwall. Its creeping roots, and those of its congener, *C. lineare*, have medicinal virtues, and are sometimes used as a substitute for sarsaparilla.

CYNOMO'RIUM, a genus of plants of the curious parasitic natural order *rhizantheæ* (q.v.). *C. coccineum*, a plant of a strange fungus-like appearance, is found in the islands of Malta and Gozo, most abundantly on a particular rock in Gozo. It was long known as *fungus melitensis*, and enjoyed the highest reputation as a styptic, besides being used as an astringent in dysentery and other maladies. So high a value was set upon this plant, that the knights of Malta took it under their particular care as one of their choicest possessions; it was carefully gathered and deposited in a government office, from which the grand-master sent it to friendly sovereigns, and to the hospitals of the island. A keeper of the rock which produces the plant is still appointed, and his salary appears in the public accounts of Malta.

CYNOSCEPH'ALÆ, a mountain range in Thessaly, ancient Greece, noted for two important conflicts. In the first the Thebans defeated the tyrant of Pheræ, 364 B.C.; in the second the Romans defeated and captured Philip of Macedon, 196 B.C.

CYN'OSURE (Gr. *kynosoura*, the tail of the dog, *Ursa Minor*, the Little Bear) is the constellation of which the pole star is the principal star. Milton's lines—

> Where perhaps some beauty lies,
> The Cynosure of neighboring eyes.—*Allegro.*—

have made the word popular; the metaphor is grounded on *Ursa Minor* being the constellation towards which the others look, as it were, and round which they wheel.

CYNOSU'RUS. See DOG'S-TAIL GRASS.

CYNTHIAN'A, a city, capital of Harrison co., Ky., on the Licking river and the Kentucky Central railroad, 66 m. s. of Cincinnati; the scene of some fighting during the rebellion; pop. '70, 1771. It is in a fertile agricultural district, and is widely known for its famous race course.

CYNURIA, a district in the Peloponnesus, inhabited by a rude class of Ionians. The city of Thyrea (now called Astros) was one of their strongholds.

CYPERA'CEÆ, or CARICI'NEÆ, sometimes popularly called SEDGES, a natural order of plants, akin to grasses, but having generally a triangular stem, which is without joints, or almost so, and often leafless. The leaves are sometimes sheathing, but their sheaths are always entire, not split, as in the grasses. The flowers, which are hermaphrodite in some, and unisexual in others, consist of a scale-like *glume*, under which lie the organs of fructification, the pistils alone being frequently inclosed in a separate urn-shaped covering; the place of the perianth is sometimes supplied by a few bristles. The stamens are 1 to 12 in number, the anthers erect: the ovary is one-seeded, the style single, trifid or bifid; the fruit a small crustaceous or bony nut, the embryo lenticular, and inclosed within the base of the albumen. Plants of this order, which contains fully 2,000 known species, occur in all zones; some of the genera, as *carex* (q.v.), abounding in the colder, some, as *cyperus* (q.v.), in the warmer parts of the world. Many of them are plants of very humble growth, some, as bulrushes, papyrus, etc., comparatively large, but none rival in size the bamboos and other gigantic grasses. Most of them grow in marshy and moist places, but a few in sunny dry places. Their stems and leaves are in general very deficient in succulence, and in most of them, also very rough, so that they are eaten by domesticated cattle only when in a very young state, and rather from necessity than from choice, and are regarded by farmers as mere weeds. See CAREX, CYPERUS, and SCIRPUS. Some of the uses of plants of this order are noticed in the articles BULRUSH, COTTON-GRASS, and PAPYRUS.

CYPE'RUS, a genus of plants of the natural order *cyperaceæ*, distinguished by hermaphrodite flowers and compound spikelets of numerous two-rowed glumes, including no bristles or scales. It contains a great number of species, chiefly tropical, and gradually decreasing in number towards the colder parts of the globe. Only two are

found in England, and these are very rare. Many of the species have tubers or corms, which in some are mucilaginous and nutritious; in others, contain also a bitter principle, and possess medicinal qualities. Of the latter class is *C. longus*, or sweet C., one of the species which have been found in England, common in ditches and wet meadows in some parts of Europe, the rhizome of which has an odor of violets, and is astringent, tonic, and stomachic. It has been employed in medicine from very ancient times; but is now more used in perfumery. Some of the Indian species are also used medicinally and in perfumery in their native country, as well as species of kindred genera. Of those with esculent tubers, the most important is *C. esculentus*, sometimes called rush-nut, a native of the s. of Europe and n. of Africa, which is cultivated to a considerable extent in Egypt, Italy, Spain, Portugal, and the s. of France. The root of this plant throws out creeping branches, at the end of which form farinaceous tubers of the size of a hazel-nut, which are called earth almonds (*amande de terre*) by the French. They have a sweetish taste, and are used like almonds for the dessert, and also for making *orgeat* (q.v.). They are said to possess not only nutritive, but restorative and stimulant properties. Of late, they have become a considerable article of commerce, upon account of the bland fixed oil which they yield, and are chiefly exported from Spain and Portugal to Holland. They contain about 16 per cent of oil. The roots of this plant and its allies are the only roots known to contain much oil. The tubers of *C. bulbosus* or *jemenicus* are eaten in India, either roasted or boiled, or are dried in the sun and made into bread; but their small size makes them troublesome of collection and preparation. Those of *C. germinatus* are also eaten. The tubers of some species of scirpus (q.v.) resemble in quality those of the esculent species of cyperus. The fiber of *C. textilis* is so strong that it is employed in India for making mats.

CYPRÆ'A. See COWRY.

CY PRÈS, doctrine of, in English law. As the law forbids the giving of an estate tail to the son of an unborn son of a living person, after a life-estate given to such unborn son, and would regard such estate tail as void, the courts, when such a gift is made in a will, apply the doctrine of C. P., and endeavor, *as near as possible*, to carry out the testator's wish, by giving to the unborn son of the living person an estate tail, instead of for life, and so enabling his son to succeed if the entail be not barred. See ENTAIL. So also, when a charity cannot reasonably be administered precisely as directed by the testator, the court will, by the doctrine of C. P., administer it as near as possible to his directions.

CY'PRESS, *Cupressus*, a genus of plants of the order *coniferæ*, the species of which are evergreen trees or shrubs, with small generally appressed and imbricated leaves, and with almost globular cones, the scales of which bear numerous hard seeds. The best known species is the COMMON C. (*C. sempervirens*), a native of the Levant, the n. of Africa, and the s. of Europe, and sometimes met with in England. It is a tree of no great height, with quadrangular twigs. The leaves are dark green, and the tree has, therefore, a somber aspect, and from very early times has been an emblem of mourning; the Greeks and Romans put its twigs in the coffins of the dead, they used it to indicate the house of mourning, and planted it about burial-grounds, as is still the custom in the east. The wood of the C. is yellow or reddish, and has a pleasant smell. It is very hard, compact, and durable; the ancients reckoned it indestructible; and the resin which it contains gives it the property of resisting for a long time the action of water. It is not liable to the attacks of insects, and was formerly much esteemed for the purposes of the cabinet-maker. Some believe that the C. is the true cedar-wood of Scripture, and it has also been supposed that it is *gopher wood*. Specimens of this wood are in existence in museums, which are known to be several thousands of years old. The doors of St. Peter's at Rome, made of C., lasted from the time of Constantine the great to that of pope Eugene IV., above 1100 years, and were perfectly sound when at last removed, that brazen ones might be substituted. Medicinal virtues were formerly ascribed both to the wood and seeds of the C., and the balsamic exhalations of the tree were reckoned very salutary in diseases of the chest.—Several other species of C. are natives of temperate and warm climates in different parts of the world. There are many species, the principal of which are the Portugal C. or cedar of Goa (*C. Lusitanica*), a native of Goa naturalized in Portugal; *C. thurifera*, a native of Mexico, which exudes a resin used in that country for incense; *C. torulosa*, a native of the Himalayas, and which has been grown successfully in Britain; *C. funebris*, lately introduced into Britain from China; the white C., or white cedar of North America (*C. thyoides*). The deciduous C. or Virginian C. (*taxodium distichum*, or *schubertia disticha*) is now regarded as belonging to a different genus, and attaining a height of 120 ft., and found in the cypress swamps of Delaware and elsewhere.

CYP'RIAN, THASCIUS CÆCILIUS, an illustrious father of the African church, was b. in Carthage about the beginning of the 3d century. He belonged to a respectable family, and was a distinguished teacher of rhetoric before his conversion to Christianity, which took place about 246 A.D. His benevolence secured for him a high degree of popularity, and his piety no less veneration, in consequence of which he was made bishop of his native city in less than three years. In 250, he fled into the desert, to avoid the persecution of Decius. Here he remained a whole year, but not in idleness. The same pru-

dence, energy, and activity that he had always displayed, were now shown in that extensive correspondence which he carried on with his clergy on ecclesiastical matters. On his return to Carthage in 251, he suppressed, but with moderation, the rising controversy regarding the *lapsed* (q.v.), or Christians who, during the time of trial, had apostatized. C.'s views regarding the proper dignity of the bishop of Rome have frequently been mistaken: he, indeed, recognized the Roman bishop as the successor of Peter, and as the representative of the unity of the church; but he asserted that the pre-eminence of the Roman see was confined to the earliest times, and that, in later times, other bishops, or successors of the apostles, had dignities equal to that of the successors of Peter. He therefore firmly opposed the supremacy asserted by the Roman bishop, Stephanus, in the question of baptism by heretics. In the persecution under Valerian, 257, C. was banished to Curubis; but having returned to Carthage in the following year, he was there beheaded. C. was both a learned and eloquent divine, but he was even more conspicuous for his dignified, moderate, and wise conduct. His knowledge of human nature enabled him to exercise a wide influence over the African church; and his correspondence, from which the best idea of his character is obtained, gives us an interesting picture of the times in which he lived. His writings—less crabbed and rhetorical than those of his teacher, Tertullian—contain, besides 81 *Epistolæ*, or official letters, several important treatises, among which may be mentioned the *De Unitate Ecclesiæ Catholicæ*, the *De Lapsis*, the *De Disciplina et Habitu Virginum*, the *De Gratia Dei*, and the *De Idolorum Vanitate*. The best editions of C.'s complete works are that of Fell, bishop of Oxford (1682), and that of Baluze (Paris, 1726). There are many lives of Cyprian. One of the most recent is by Reinkens (1873).

CYPRIN'IDÆ, a family of malacopterous fishes, having a small mouth, the jaws almost toothless, but the pharynx or hinder part of the mouth furnished with teeth; the body generally covered with scales, the gill-rays few, and no adipose fin (like the second dorsal fin of the trout or salmon). The genera and species are numerous. All the C. are fresh-water fishes. They are found in the lakes and rivers of almost all parts of the world. To this family belong the carp, dace, tench, bleak, bream, barbel, minnow, gold fish, roach, loach, etc. Many of the species are much esteemed for the table. The fecundity of the C. is great.

CYPRINODON'TIDÆ, a family of malacopterous fishes, allied to *cyprinidæ*, with which they were formerly ranked, but differing from them in having the jaws more protractile and toothed. Some of them are American, some Asiatic; some inhabit fresh, and some salt water. To this order belong some interesting and curious fishes, particularly the anableps (q.v.), remarkable for the conformation of its eyes. The species of the genus *orestias* are found in the lakes of the Andes, at a great elevation above the sea, and are higly esteemed for the table.

CYPRIPE'DIUM, the plant known as lady's slipper and moccasin flower. It is used to some extent as a sedative in nervous diseases.

CY'PRIS, a genus of minute entomostracous crustaceans of the order *branchiopoda* (q.v.), having the body inclosed in a shell of two horny pieces, somewhat resembling that of a bivalve mollusk. The antennæ and feet are beautifully feathered with long fringed bristles, by means of which these animals swim with much vivacity. They abound in every pool of stagnant water. Their horny shells are very abundant in a fossil state in the wealden rocks of England, in the limestone of the carboniferous series, etc.

CY'PRUS (anc. Gr. *Kupros*, mod. Gr. *Kibris*, Fr. *Chipre*, Ital. *Cipro*), an island situated s. of Asia Minor, in that portion of the Mediterranean called the Levant. C. was anciently divided into many small kingdoms. It was originally possessed by the Phœnicians, from whom it passed to the Greeks, and subsequently to the Egyptians and Persians. After the victories of Alexander, it declared for Macedon. It next became a portion of the Græco-Egyptian kingdom of the Ptolemies, then of the Roman and Byzantine empires. The Arabs conquered it 648 A.D.; in 1191, it was taken by Richard Cœur-de-Lion, who ceded it to the Templars. After several vicissitudes, it came into the possession of the Venetians, from whom it was finally conquered by the Turks in 1571. The "conditional convention" concluded between the English and Turkish governments in 1878 leaves C. a Turkish possession, but provides for its being occupied and administered by England.

C. is nearly 150 m. long by 55 broad, has an area of 3,700 sq.m., and a pop. now little over 150,000. A range of mountains—the Stavro Vuno and Santa Croce (ancient *Olympus*)—the sides of which are very bold and rugged, runs through the whole length of the island, attaining an elevation of more than 7,000 ft. above the sea. Three fifths of the island is mountainous. Of these one fifth has splendid forests of oak interspersed with walnut trees, and would furnish large supplies of sulphur, pit-coal, and metals of various kinds, under intelligent management; while two fifths is adapted for vine and olive culture, and the growth of fruit-trees generally. "The remaining two fifths is composed of magnificent plains, and extensive open country, which, though wanting in rivers and streams, are still very productive in cereals." The soil is exceedingly fertile, yielding all kinds of grain. The chief products are wheat, barley, cotton, silk, madder

roots, oil, wine, carobs, and salt. The wine of C. is still excellent. The chief drawbacks to production, besides mismanagement, are the want of water—most of the streams becoming dry in summer—and the ravages of the locusts. The climate varies in various parts of the island; in the central plain, and about Larnaca, the summer heat is intense, especially from the middle of Sept. till the end of October. Fevers, seldom fatal, are prevalent in the hot months; but on the whole the climate seems to be healthy. Drainage and the planting of trees, hitherto recklessly extirpated, might greatly benefit the least healthy regions. Agriculture and manufactures are alike in a backward state; the Greek Christians, who compose three fourths of the population, having grown indolent and spiritless under Turkish domination. There are, however, many proofs of progress in Cyprus. Especially noteworthy is the fact, that in 1871, Nicosia was, by means of a submarine cable to Latakia, on the Syrian coast, brought into telegraphic communication with the rest of the world. This line was extended to Larnaca. In 1874, 1323 vessels entered, and 1313 cleared, the ports of C. The imports in 1874 amounted to £147,092, and the exports to £378,225. The chief towns are Nicosia, the capital; Famagosta; Larnaca, the residence of the consuls; and Limassol. See gen. Cesnola's *Cyprus* (1877).

CYPRUS (*ante*), one of the largest islands in the Mediterranean, in the extreme n.e. of that sea, nearly equidistant from Asia Minor on the n. and Syria on the e.; 46 m. from the former, and 60 m. from the latter; 145 m. long and 60 wide at the extreme points; 3,678 sq.m.: pop. 135,000—said to have been 1,000,000 when under the rule of Venice. By treaty between the British government and the Ottoman empire, June 4, 1878, Asiatic Turkey was placed under British protection, with the stipulation that if Russia shall restore to Turkey the conquests made in Armenia during the late war, Cyprus shall be evacuated by England and the convention be at an end. Sir Garnet Wolseley was appointed governor, and was installed as administrator, July 23. The island was formally taken possession of in the name of the queen by vice-admiral lord John Hay, July 12, 1878. The present high commissioner and commander-in-chief is maj.gen. Robert Biddulph. A great part of the island is occupied by mountain ranges in a general direction of w. to east. One of the most lofty, and which fills the whole s. portion of the island, is generally called by modern geographers Mt. Olympus, but the ancients applied that name to only one particular peak. The highest summit so far as known is that of Mt. Troödos, 6,590 feet. The s. range terminates in the isolated peak of Oros Stavro, or hill of the Holy Cross, a conspicuous object from Larnaka, and evidently the one called Olympus by Strabo, although it is but 2,300 ft. high. The n. range is an unbroken ridge for 100 m., inferior in elevation to the other, its highest summits not exceeding 3,200 feet. Between these ranges is a broad plain extending across the island from the bay of Famagosta to that of Morphu on the w., about 60 m. long and from 10 to 20 m. wide. This plain is called the Messaria, and is watered by two streams. It is for the most part open and uncultivated, presenting nothing but barren downs, but corn is grown in some places, and the whole valley is doubtless susceptible of cultivation. The plain is bare of timber, and only the loftiest and central summits of Mt. Olympus retain their covering of pine woods. The climate varies in different localities; in the central plain and about Larnaka the heat is excessive, but is tempered by cool sea-breezes until about the middle of Sept., between which time and the end of Oct. is the hottest period. The winter is short and cold, but snow is seldom seen except upon high mountain peaks. Fevers are prevalent during the warm months.

In ancient times this island supplied the Greek monarchs of Egypt with timber for their fleets. It was also celebrated for its mineral wealth, especially for copper, a metal which takes its name (cuprium) from the name of the island. No copper mines are now worked. There was also considerable silver produced, and Pliny says the precious stones were found there. Salt, for which the island was noted in old times, is still produced in large quantities in the neighborhood of Larnaka and Limasol. It is said that gold and coal have been recently found. The principal vegetable productions are cotton, wines, and fruits; some tobacco is grown. Cultivation is easy, and the soil in many places is exceedingly productive, particularly at the foot of Mt. Olympus, and along the level land of the n. shore. The want of good harbors is greatly felt. The chief places of trade, Larnaka and Limasol, have only roadsteads; and Salamis, which was the chief port of antiquity, as well as Famagosta, which held that position under the Venetians, were only artificial harbors on an open sandy coast. The English have selected Famagosta as the most favorable place to construct a good harbor. The towns in Cyprus worthy of notice are, 1. Lefkosia, commonly called Nicrosia, which since the time of the Lusignan kings has been the capital of the island; 2. Famagosta, on the e. coast near the ruins of Salamis, which was the chief port under the Venetians, and famous for the defense against the Turks in 1571, now having only a few hundred inhabitants; 3. Larnaka, on the s.e. coast on the site of the ancient Citium, now the chief place of trade, with 5,000 or 6,000 inhabitants; 4. Limasol, on the s. coast, some distance w. of the site of Amathus, the chief point for the export of wines; 5. Baffo, or Papho, on the site of the ancient Paphos, on the s.w. angle of the island, the seat of the Greek bishop; and, 6. Tzerini, or Tzerinia, the ancient Kerynea, which retains its old Venetian fortifications, but is an inconsiderable place.

The early history of this famous island is imperfectly known. It was certainly colonized at a remote period by the neighboring Phenicians, who established the worship of Ashtaroth (called by the Greeks Astarte, and by them identified with their own Aphrodite), for which worship—better known as that of Venus, to whom a temple was built—the island was long celebrated. The Greeks settled there soon after the Phenician colonization; and it is probable that the former soon obtained political supremacy, while the latter held influence over the manners and customs, arts, and religious rites, which were wholly different from those in Crete, Rhodes, or other Ægean islands. The first known fact in the history of Cyprus, is its conquest by the Egyptian king Amasis in the 6th c. B.C. In 525 B.C., however, there was a revolt against Egyptian and an acceptance of Persian rule, the island thenceforth becoming a tributary province of the Persian empire. As a proof of the island's great prosperity about this time, it is noted that Cyprus contributed not less than 150 ships to the Persian fleet under Xerxes. Evagoras, king of Salamis, succeeded in extending his authority over a great part of the island, 387 B.C., and became independent of Persia, but under his son the Persian rule was again enforced. After the battle of Issus, when Alexander advanced in Phenicia, all the cities of Cyprus declared in his favor, and sent ships to assist him in the siege of Tyre. During this period, though the island was subject to Persia, the several cities enjoyed the privilege of local self-government. Their institutions, however, presented one marked difference from those of other Greek cities. They were governed by kings, of whom there were not less than nine in the island. The cities which were the seats of those petty monarchies were: Salamis, Citium, Amathus, Curium, Paphos, Marium, Soli, Kerynea, and Lapathus. Idalium and Golgos, names celebrated in the history of the worship of Venus, appear to have been merely *sanctiones* or holy places. After the death of Alexander, the possession of this island, so important for its seemingly inexhaustible forests (it is now quite bare of trees), became an object of contention among his successors. After varying fortunes, it passed into the hands of Ptolemy of Egypt. But in 306 B.C. a great effort to recover it was made by Demetrius, son of Antigonus, who reduced the whole island and laid siege to the city of Salamis. The effort of Ptolemy, who came with a great fleet to raise the siege, gave rise to one of the most memorable naval battles of antiquity, in which the Egyptians were utterly defeated, and Salamis, with all the island, passed into the power of Demetrius. But Ptolemy recovered the island in 295 B.C., and thenceforth it continued to be one of the most valuable possessions of Egypt. More than once this island decided the sovereignty of the Nilo kingdom. Finally, the aggressive Romans fixed their eyes on Cyprus; the tribune Clodius proposed its seizure in violation of all right or decency; and Cato was the reluctant instrument for consummating the outrage. About half a century before the beginning of the Christian era, there ensued a period of stagnation in which little is heard of the island. Cyprus is noticed in Acts iv., 36, where it is mentioned as the native place of Barnabas; and in Acts xi., 19–20, it appears prominently in connection with the earliest spreading of Christianity. When Paul was sent with Barnabas from Antioch on his first missionary journey, this island was the scene of their first labors. The most remarkable event in the history of Cyprus while it was under the Roman empire was a great revolt of Jews, who had established themselves there in large numbers, in which revolt the Jews, 117 A.D., are said to have destroyed not less than 240,000 of the other inhabitants. After the division of the Roman empire, Cyprus passed under the Byzantine emperors. In 646 the Arabs became masters and destroyed the city of Salamis. Two years later, the Greeks recovered sway; but in 802, it was again conquered by Haoun-el-Raschid, who was soon compelled to relinquish it to the Byzantine rulers. In 1184, Isaac Comnenus made Cyprus an independent sovereignty. In 1195, Richard of England ejected Comnenus and put Guy de Lusignan in possession as compensation for the loss of Jerusalem, of which Guy had been appointed king. For three centuries, Cyprus had a succession of petty kings, who introduced the feudal system and other European institutions. After many attempts to secure control, the Venetian republic came into full possession of the island in 1487, and held the rule for about 80 years. In 1570, Selim II., sultan of Turkey, invaded Cyprus with 60,000 men, quickly subdued the country districts, took the capital (Nicosia) after a siege, and murdered 20,000 of its inhabitants. Famagosta held out for a year and then made a capitulation, which was of course immediately violated by the Moslem butchers, who slowly tortured to death the governor of the city. From that period, Cyprus has been a part of the Turkish empire. Two events only have disturbed the stagnation of that blighting rule; an insurrection in 1764, which was quickly suppressed, and a massacre of the Greek population in 1823. Under the Koran and the Crescent an island that should be the most enterprising, prosperous, and productive in all the east, is one of the most impoverished and worthless. See ARCHÆOLOGY.

CYP'SELUS. See SWIFT.

CYR, ST., the name of several places in France, the most important of which is St. C., in the department of Seine-et-Oise, about 3 m. w. of Versailles. Pop. '72, 1695. The village owes its origin to an educational institution for the daughters of nobles of fourth descent on the father's side, founded here in 1686 by Louis XIV., on the suggestion of Madame de Maintenon. There were about 250 pupils, for whom Racine

wrote his tragedies of *Esther* and *Athalie*. Madame de Maintenon died here, and was buried in the choir of the church. The institution was suppressed at the revolution. The buildings were at first converted into a military hospital, and in 1803 into a military school by Napoleon for the education of some 300 officers, about 140 of whom leave annually.

CYRENA'ICA, the name of the district whose capital was Cyrene (q.v.). At one period, it nominally stretched from Carthage to Egypt, and extended inland as far s. as the oasis of Fezzan; but a great portion of this territory was occupied by the subject Libyan tribes, and not by the Greek colonists, who were confined chiefly to the plateau of Baca, with the subjacent coast. This portion of C. was, and still is, one of the loveliest and most agreeable regions of the world. The climate is delicious, mountains on the s. sheltering the land from the scorching blasts of the Sahara, and cool sea-winds fanning it on the north. From the central plateau, whose breadth is about 80 m., the land slopes down in verdent terraces to the Mediterranean. These terraces are cut and watered by mountain streams, forming luxuriant ravines. The productions of C. mentioned by ancient writers are corn, oil, wine, honey, fruits of all kinds, cucumbers, truffles, cabbage; flowers yielding the richest perfumes; and a rare plant called *silphium* (still abundant), from which was obtained the gum-resin, greatly esteemed for medicinal purposes. The country was also celebrated for its breed of horses, but was much exposed to the ravages of locusts.

The chief cities of C. were Cyrene, Teucheira (afterwards called Arsinoë), Hesperides (afterwards called Berenice), Barca, and Apollonia. To each of these five cities (whence in the time of the Ptolemies C. was named Pentapolis and Pentapolitan Regia) a certain amount of territory was attached. This favored their individual independence; and the consequence was that the dynasty of Battus, who led the first Greek colony to Cryene (q.v.), exercised very little influence over C. in general. After passing into the hands of the Egyptians and Romans, C. became a portion of the Byzantine empire. In 616 A.D., it was conquered by the Persian Chosroes, and in 647 was overrun by the Arabs. Ancient C. nearly corresponds with modern Barca (q.v.)

CYRENA'ICS, a sect of philosophers founded by Aristippus of Cyrenaica, a pupil of Socrates, about 380 B.C. Their theory was that moderate and reasonable enjoyment was the great object as well as the best method of life. A century later Epicurus elaborated the same idea.

CYRENA'IC SCHOOL. See ARISTIPPUS.

CYRENÉ, the capital of Cyrenaica (q.v.), was founded 631 B.C., by a colony of Spartans under Battus, who dynasty lasted for nearly two centuries. During this period, it made rapid advances. On the death of Arcesilaus IV., the last of the Battidæ, about 450 B.C., a republic was established, but the political condition of the city under the new government was far from prosperous. Party contests raged, until at last it fell into the hands of the Romans. During its prosperity, C. carried on a great commerce with Greece and Egypt, and to a less extent with Carthage. Its extensive ruins still attest its former magnificence. C. was the birthplace of the philosophers Aristippus, Anniceris, and Carneades, the poet Callimachus, the astronomer Eratosthenes, and the rhetorician Synesius, who afterwards became bishop of Apollonia.

CYRE'NIUS, PUBLIUS SULPICIUS, a Roman proconsul (governor) of Syria at the time of the birth of Christ. He seems to have had two official terms—from 4 to 1 B.C., and from 6 to 11 A.D.

CYRIL, a professor in the ancient law college of Berytus, and one of the founders of the œcumenical school of jurists, opening the way for Justinian's legislation. He is called the great Cyril in distinction from C., a jurist who lived after Justinian. C. wrote a treatise on definitions, in which, according to a statement of his contemporary Patricius, the subject of contracts was treated with superior precision and great method.

CYRIL, SAINT, bishop of Alexandria, was one of the most energetic but least amiable of the church fathers. The date of his birth is not known. He was educated by the fanatical monks of Nitria, with whom he lived for five years, and who probably inspired him with that fiery, intolerant, and ignorant zeal which characterized him through life. Subsequently, he went to Alexandria, where he became a presbyter, and on the death of his uncle, Theophilus, 412 A.D., obtained the episcopal see. The Alexandrian Jews, who were numerous and wealthy, were the first to feel the fierceness of his religious hate. Some Christian blood having been shed by them in a city tumult, C. put himself at the head of a rabble of zealots, attacked the Jewish quarter of Alexandria, destroyed the houses, and banished the inhabitants. Orestes, the prefect of Egypt, having drawn up an accusation against C., was attacked in the streets by 500 monks, who had come up from the deserts of Nitria, at the call of their old companion, eager for the work of destruction. One of these monks having fallen in the skirmish, his corpse was carried in procession to the high church of Alexandria, where C. delivered a sanguinary discourse, gave the dead monk the name of *Thaumasius*, and pronounced him a martyr and a saint. But perhaps the most barbarous deed with which this persecutor of heretics and heathens had to do, was the murder of the heathen maiden Hypatia (q.v.), the daughter of the mathematician Theon. Theodoret gravely accuses him of

instigating the Alexandrian populace to this horrid act. But the most important historic event in his career was his controversy with Nestorius (q. v.). All the worst features of his disposition appeared in this broil. Even the gentle Neander overflows with pious wrath, and pursues C. through 60 pages of his *Church History* with the fiercest epithets. In the midst of unquietudes, which he himself had largely occasioned, he died 444 A.D. C.'s numerous writings consist of commentaries, treatises, homilies, epistles, etc. The best edition was published by Aubert (7 vols., Paris, 1638). See Neander's *Kirchengeschichte*, transl. by Bohn, vol. iv. pp. 133–196.

CY'RIL, SAINT, bishop of Jerusalem, an eminent church father, was b. at Jerusalem about 315 A.D., and ordained a deacon in 334, a presbyter in 345, and on the death of Maximus in 351, was elected bishop of his native city. His metropolitan was the Arian bishop, Acacius of Cæsarea, with whom he was soon engaged in hot conflict concerning originally the rights of his office, but ultimately their differences of doctrine. Acacius accused C., before a council hastily "got up" at Cæsarea in 358, of selling the treasures of his church in a time of famine to feed the poor! Strange to say, C. was deposed for doing this praiseworthy action. He now appealed to a larger synod, which was held at Seleuceia. This synod restored him to his office; but once more, through the persevering hostility of Acacius, he was deposed by a council assembled at Constantinople in 360. On the death of the emperor Constantius, he was again restored to his episcopate in 362. Soon after, his old enemy Acacius died, but C. was immediately involved in new difficulties. After considerable strife, C. was banished, by order of the emperor Valens, in 367; nor did he return till the emperor's death in 378. He died in 386.

C.'s writings are extremely valuable, not on account of their vigor, profundity, or beauty, but on account of their theology. They consist of 23 treatises, 18 of which are addressed to catechumens, and 5 to the newly baptized. The former are for the most part *doctrinal*, and present to us in a more complete and systematic manner than the writings of any other father the creed of the church; the latter are *ritual*, and give us a minute account of baptism, chrism, and the Lord's supper. Their style is simple and unattractive. The best edition of C.'s works is that published by Touttée, the Benedictine monk (Par. 1720).

CYRIL, the apostle of the Slaves (in the 9th c.), sprang from a respectable family living in the half-Slavic, half-Greek town of Thessalonica. On account of his knowledge, he obtained the surname of the philosopher. Having been consecrated a priest, he went forth, during the reign of the Byzantine emperor, Michael III., to evangelize the Chasars, who dwelt by the Caspian sea. His labors were very successful, the khan himself being among his converts. Boris, the heathen prince of Bulgaria, having about this time besought the patriarch of Constantinople to send him a preacher of the gospel, C., along with his brother Method, were selected. Their labors were not in vain. Boris was baptized in 860. Rastic, prince of Moravia, next invited them to his country. They accepted the invitation, and while there, assisted by a number of their own pupils, completed their translation of the Holy Scriptures, which is in use to the present day, as a sacred or church language, among all Greek-Catholic Christians (Russians, Bulgarians, and Serbs). From Moravia, Christianity, according to the Slavic ritual, spread into Bohemia, whose prince, Boriwoj, and his spouse, Ludmilla, were baptized by Cyril. C. died in 869. The *Apologi Morales*, ascribed to C., were published by Corter (Vienna, 1630). See Richter's *Cyril and Method* (Olmütz, 1825).

CYRILLA, evergreen trees and shrubs, of which some varieties are found in the southern United States. Under cultivation, some of these varieties are exceedingly ornamental.

CYRILLIC ALPHABET, a method of writing invented about 863 A.D. by St. Cyril. This, with certain modifications, is the alphabet now used in Russia.

CYRUS, a river in Asia. See KURA, *ante*.

CY'RUS, the founder of the Persian monarchy, commonly called C. THE ELDER, was, according to Herodotus, the son of Cambyses, a Persian noble, and of Mandane, daughter of Astyages, the Medo-Persian king. His birth was a source of alarm to his grandfather Astyages, who had previously had a dream, the interpretation of which portended that the offspring of Mandane would one day be the ruin of the Median supremacy and the ruler of all Asia. He therefore contrived to get the infant into his own hands, and gave it to Harpagus, his chief servant, with orders to put it to death. Harpagus promised to do so, but intrusted it privily to the care of a herdsman, who brought it up along with his own children. The young C. quickly distinguished himself among the country lads by his superior daring and dignity. On one occasion he was elected king in some boyish game by his companions, and in the exercise of his regal authority, caused a nobleman's son to be severely scourged. The father complained to Astyages, who caused the culprit to be brought before him, and recognizing in his person and mien his own grandson, sent C. back to Persia—the magi having in some way satisfied him that his dream had already received its fulfillment. C. himself, however, did not think so, and as he grew up to manhood, began to meditate ambitious schemes. All writers testify to his courage, amiability, and address. He was exactly the kind of man to gather round him brave, venturesome, loyal followers. The tyranny of Astyages had made him hate

ful to his subjects, and by the help of the crafty Harpagus, C. soon formed a party among the Medes favorable to his designs. Putting himself at the head of his Persian troops, C. advanced into Media, and overthrew the forces of Astyages (559 B.C.). After consolidating his new dominions, which seems to have cost him many years' labor, he proceeded in his career of conquest. The kingdom of Lydia first yielded (546 B.C.), and its king, the famous Crœsus, fell into his hands. Ultimately, the whole of Asia Minor was subdued. But the crowning triumph of C. was his capture of the city of Babylon, the metropolis of Assyria (538 B.C.), whose king was Labynetus, the Belshazzar of Daniel. Through the instrumentality of C., the Jews were delivered from their captivity, and allowed to return to Palestine. His vast ambition, however, proved his ruin. He wished his power to overshadow all Asia, in harmony with the dream of his grandfather; and although his dominions already extended from the Hellespont almost to the Indus, he resolved to subjugate the Scythian peoples, and began an unjust war with the Massagetæ, a nation or tribe who dwelt to the n.e. of the Caspian, beyond the Araxes, whose queen was called Tomyris. At first C. was successful, but in a second engagement he was defeated and slain (529 B.C.).

Such is the account given by Herodotus, and although we are unable to affirm that it rests on absolutely historical ground, it is unquestionably to be preferred to any other. The work of Xenophon, entitled the *Cyropædeia*, is not a history; it is a historical romance, and was manifestly intended by the author for such. Xenophon wished to picture a great and wise king, and finding the elements both of greatness and wisdom in C., he took advantage of his historic personality, and engrafted upon it whatever, according to his own notion, would ennoble and dignify it.

CYRUS, THE YOUNGER, the second of the sons of Darius Nothus, or Ochus, lived about 130 years after the great Cyrus. He conspired against his brother Artaxerxes Mnemon, who had succeeded to the throne (404 B.C.). The plot, however, being discovered, he was at first sentenced to death, but afterwards pardoned, and even restored to his dignity as satrap of Asia Minor. Here he employed himself in making arrangements for war against his brother, although he concealed his purposes to the very last. In the spring of 401 B.C., he left Sardis at the head of 100,000 Asiatics, and 13,000 Greek mercenaries, under pretence of chastising the robbers of Pisidia. Artaxerxes being warned of C.'s perfidy, made preparations to oppose him, and the two armies encountered each other in the plains of Cunaxa, 500 stadia from Babylon. C. was defeated and slain, although the Greeks fought with the greatest courage, and even routed that portion of Artaxerxes' troops immediately opposed to them. The fortunes of the Greeks, on their retreat through the highlands of Armenia, in severe winter-weather, are recorded by Xenophon in his *Anabasis* (q.v.).

CYST (*kystis*, a bladder), a word sometimes used in the original sense as applied to hollow organs with thin walls, as the urinary bladder and gall bladder; but commonly reserved for the designation of pathological structures or new formations within the body, having the bladder form. Cysts are commonly transparent, and often almost structureless in their tenuity; they are commonly, however, lined by an epithelium (q.v.), and have membranous walls, with faint indications of fibrous structure. They are either simple or compound, unilocular or multilocular; they are sometimes small, numerous, and separate; in other cases, they grow to an enormous size, and are very complex. Some cysts are distinctly parasitic, and of independent animal nature; such are hydatids (q.v.) and the cystic entozoa (q.v.) generally. Others are probably formed out of the structures in which they arise, their true pathology being, however, obscure. Such are the cysts of the kidney, and still more distinctly, the immense complex cystic structures which form in the ovary. See OVARIES.

CYSTICER'CUS (Gr. bladder-tail), according to many naturalists, a genus of cystic worms (q.v.), characterized by a dilated cyst with a single head, which has four suckers and a circlet of hooks. This genus has, however, latterly been displaced from the system of nature by the discovery that the forms referred to it are only the young of tape-worms. This discovery has been confirmed by a multitude of observations and experiments with regard particularly to *C. cellulosæ*, found in human beings, and in many rodent and pachydermatous animals—as rabbits, pigs, etc.—the young of the common tape-worm; and *C. tenuicollis*, found more rarely in human beings, but often in the abdominal cavity of ruminant quadrupeds, and of pigs, horses, and many other animals—the young of a tape-worm of the dog. *C. cellulosæ* often exists in great numbers in the flesh of pigs, causing the diseased appearance known as *measly*. See CESTOID WORMS. It sometimes occurs in like manner infesting the human body, in muscles of most various parts; it has been found even in the heart, in the brain, and in the eye. That in such cases it sometimes causes death, is too certain, and its removal is not easy, except when it is so situated that it can be reached by the knife, nor is there any sure indication by which its presence in many situations can be known; but it appears also that it may die and be absorbed without causing any very serious consequences to the person in whom it has dwelt. The cysts of this species are always of small size; those of *C. tenuicollis*, however, which generally occurs in the liver, or in other abdominal organs, sometimes become, in some of the lower animals,

as large as a child's head. Injurious consequences are produced by them when either numerous or very large.—See Cobbold's *Entozoa.*

CYSTIC WORMS, an order of *entozoa,* or intestinal worms, according to the system of Zeder and Rudolphi, for some time generally received by naturalists, characterized by the body ending in a transparent cyst or bladder filled with pellucid fluid, this body having sometimes only one head, as in *cysticercus,* sometimes many, as in *cœnurus.* It has, however, been found that certain species, as *cysticercus cellulosæ* and *cœnurus cerebralis,* are the young of cestoid worms, and it is therefore concluded as highly probable, that all the C. W. are of the same nature, more particularly as all present the appearance of immaturity, in the want of visible organs of reproduction. Until a comparatively recent date, the animal nature of C. W. was not recognized, nor is it long since their relation to tape-worms and other cestoid worms has been fully ascertained. See CESTOID WORMS, CYSTICERCUS, ECHINOCOCCUS, STAGGERS, and TAPE-WORM.

CYS'TIN, or CYS'TIC OXIDE, forms a rare variety of calculus (q.v.). It contains $C_6H_8NO_4S_2$, has a crystalline texture, a brownish-yellow color, and is semi-transparent. It is not soluble in water, alcohol, or ether, but dissolves in the strong acids.

CYSTI'TIS. Inflammation of the urinary bladder (q.v.).

CYTHE'RA. See CERIGO, *ante.*

CYTI'SUS, a genus of plants of the natural order *leguminosæ,* suborder *papilionaceæ,* of which some of the species, having long twiggy branches, are popularly called broom (q.v.), others are called laburnum (q.v.), whilst others still are generally known by the name cytisus. The characters of the genus are stated in the article BROOM. The species are numerous—small trees or shrubs, with leaves of three leaflets, and yellow, white, or purple flowers, natives chiefly of the warmer temperate parts of the old world. Many of them are very beautiful, and some are among the esteemed ornaments of our shrubberies, others of our green-houses.

CY'TOBLAST. See CELLS.

CYZ'ICUS, a peninsula of Anatolia, Asia Minor, projecting into the sea of Marmora. It lies to the s.e. of the island of Marmora, and about 70 m. s.w. of Constantinople. It was at one time an island, but the gradual formation of an isthmus connected it with the mainland. Its length from s. to n. is about nine miles, and its breadth from e. to w. 18 miles. In early times, C. was a Milesian colony, and the city of C., upon whose site vineyards and orchards now flourish, is described by Strabo as one of the first cities in Asia, alike for extent and splendor.

CZACKI, TADEUSZ, an eminent Polish author, was born in 1765, at Poryck, in Volhynia. At the age of 20, he obtained an office in the supreme justiciary court at Warsaw, and was also made director of the crown archives—a situation which enabled him to gratify his taste for Polish history. Some essays on Polish finance induced the diet to select him, in 1788, as a member of the commission of inquiry into the state of the revenue. His efforts to animate the industry and extend the commerce of his native country were most praiseworthy. A valuable result of his travels through Poland for this purpose is a map of its river-system. He also interested himself greatly in the navigation of the Dniester. At the second partition of Poland, he lost his property, but it was afterwards restored. The chief labor of his life, however, was in connection with the education of his countrymen. His endeavors to instruct the people in the old Polish provinces of Russia, where education had been almost wholly neglected, met the approval of the emperor Alexander. The most important of C.'s educational institutions was the gymnasium at Krzemieniec. In 1807, he was appointed the deputy of prince Czartoryski, who had the care of public instruction in the Polish government of w. Russia. C. died at Dubno, 8th Feb., 1813. His writings prove the comprehensive character of his attainments. His most valuable work is upon Lithuanian law (*O Litewskich i Polskich Prawach,* 2 vols., War. 1800).

CZAR, more properly *Zar,* is a title of the Russian emperor. The word is derived from the old Slavonic language, and signifies much the same as Ger. *Kaiser,* Lat. *Cæsar,* to which it probably owes its origin; although some etymologists identify it with the termination of the names of the old Assyrian kings—such as Phalassar, Nabonassar, and Nabopolassar. After the 12th c., we find the Russian annalists giving the title of C. to the grand duke Wladimir, Monomach (died 1125), and to several of his successors In general, however, the rulers of the various Russian provinces were called grand dukes till the 16th century. Thus, we have the grand dukes of Wladimir, Kiew, Moscow, etc. The grand duke Wassilij Iwanowitch first assumed, in the year 1505, the title of *Samodershez,* which signifies autocrat. The son of Wassilij, Iwan II., Wassilijewitch the cruel, caused himself to be solemnly crowned C., 16th Jan., 1547. From this time, the Russian monarchs called themselves czars of Moscow; and after the conquest of Little Russia and Smolensk, czars of all the Russias. The word now became practically the equivalent of emperor; yet Peter I., in 1724, thought fit to assume this latter title in addition; and as the Russian language had no term corresponding to it besides C., the Latin word *Imperator* was introduced, while the empress was termed *Impera-*

triza. At first, several European powers refused to sanction the assumption of imperial dignity by the Russian C., but ultimately consented to do so, The wife of the C. was named czariza (czarina); the sons, czarewitch; the daughters, czarewna; but after the death of Alexei—Peter I.'s son—these titles were abolished, and the imperial princes called grand dukes, and the imperial princesses grand duchesses. In 1799, the emperor Paul I. introduced the title of cesarewitch (not czarewitch) for his second son, the grand duke Constantine. The heir-apparent and his wife are still called cesarevitch and cesarevna. Among the Russian people themselves, the emperor is more frequently called gossudar (hospodar, i.e., lord) than czar.

CZARTORYS'KI, the name of a Polish family of ancient lineage. MICHEL FRYDORYK, 1695–1775, was chancellor of Lithuania in 1752. His brother, AUGUST ALEXANDER, was the palatine of Red Russia, and accumulated great wealth. His son, ADAM KAZIMIERZ, was president of the diet which elected Poniatowski king. His wife was distinguished for beauty and poetic genius. Another member of the family, ADAM JERZY, 1770–1861, was prominent in the futile attempts at revolution in Poland.

CZARTORYS'KI, ADAM GEORGE, son of prince Adam Casimir C., of an ancient Polish house, sometimes (but wrongly) said to be sprung from the Jagellons (q.v.), was b. at Warsaw, 14th Jan., 1770. Having completed an excellent education at Edinburgh and London, he returned to his native country, and took part against Russia in the war occurring on the second partition of Poland. On the defeat of the Poles, C. was taken to St. Petersburg as a hostage, and here he exhibited so much ability and prudence as to gain the friendship of the grand duke Alexander, to whom he was attached, and the confidence of the emperor Paul, who made him ambassador to Sardinia. When Alexander ascended the throne, he appointed C. assistant to the minister of foreign affairs; and he took an active part in official life until after the peace of Tilsit. As curator of the university of Wilna, to which he was nominated in 1803 by Russia, he exerted all his influence to keep alive a spirit of nationality; and when some of the students were arrested on a charge of sedition, and sent to Siberia, C. resigned his office. His successor reported to the emperor, that the amalgamation of Russia and Lithuania had been delayed a century by C.'s occupancy of the curatorship. Russian favors could not deaden or even dull C.'s pure patriotism. Into the revolution of 1830 he threw himself with all his heart. He was elected president of a provisional government, and in this capacity summoned a national diet, which met, and in Jan., 1831, declared the Polish throne vacant, and elected C. head of the national government. He immediately devoted half of his large estates to the public service, and adopted energetic measures to meet the power of Russia, but in vain; the Poles were crushed, and C.—specially excluded from the general amnesty, and his estates in Poland confiscated—escaped to Paris, where he afterwards resided, the liberal friend of his poor expatriated countrymen, and the center of their hope of a revived nationality. In 1848, he liberated all his serfs in Galicia, and during the Crimean war he ineffectually endeavored to induce the allies to identify the cause of Poland with that of Turkey. He died July, 1861.

CZAS'LAU, a t. of Bohemia, 45 m. e.s.e. of Prague. Its deanery-church, in which the celebrated blind Hussite leader, gen. Ziska, was buried, is surmounted by the highest steeple in Bohemia. C. is also noted as the scene of an important victory gained over the Austrians by Frederick the great, 17th May, 1742. Pop. '69, 5,998. Here there are copper works, manufactures of chicory and beet-root sugar, and a distillery.

CZECHS, the most westerly branch of the great Slavic family of nations. About 451–95 A.D., the C. migrated from their lands in Carpathia, on the Upper Vistula, and came into the country now known as Bohemia. According to tradition, their chieftain was named Czech. Georgsberg, near Raudnitz, on the Elbe, is said to have been the first place chosen by the C. for their encampment. Other Slavic tribes migrated into Bohemia; but in the course of time the C. gained such an ascendency that, in the 9th c., the name C. was commonly applied to the whole Slavic population of Bohemia (q.v.). Here, in Moravia, and in other parts of Austria, the C. now number in all above 6,000,000.

CZE'GLED, a market t. of Hungary, 40 m. s.e. of Pesth. It has some handsome buildings and large breweries. The inhabitants (1869), 22,216 in number, are employed principally in agricultural pursuits, the district around yielding much grain and red wine.

CZENSTOCHAU, or CZENSTOCHOWA, a monastery of the order of St. Paul the Hermit, in the Polish government of Kalisch. It is the most frequented place of pilgrimage in the whole country, and is celebrated throughout all the Slavic nations. It occupies a commanding position on the Warthe, not far from the Silesian frontier, and possesses the famous dark-colored picture of the mother of Christ, which has given occasion to the worship of the Black Virgin by all the Polish Catholics, This picture is probably of Byzantine origin. According to the legion in connection with it, it was painted by Luke himself; passed into the hands of the princess Helena; subsequently found its way through a Russian prince, Laon, to Belz in Galicia: and finally, through Wadyslaw, duke of Oppeln, who built the monastery of C., was brought thither to assist him against the Tartars. In more recent times, C. is noted as being the only place in

Poland which offered resistance to the army of Charles Gustavus, king of Sweden, on which occasion (1655 A.D.) the inmates, comprising 70 monks and 150 soldiers, withstood a siege of 38 days carried on by a Swedish force of 10,000 men. At a later period, however, C. lost its importance as a military position. At the foot of the eminence on which the monastery stands, lie two little towns, Old and New C., which carry on a considerable trade in holy pictures and amulets.

CZERKA'SY, a t. of Russia, in the government of Kiev, on the Dneiper; pop. 13,311.

CZER'MAK, JOHANN NEPOMUK, b. 1828; a Bohemian physiologist, the introducer of laryngoscopy and rhinoscopy into medical practice.

CZER'NOWITZ, capital of Bukowina, in Austria, situated on a hill near the right bank of the Pruth, about 140 m. s.e. of Lemberg. It is the seat of a Greek archbishop; and in 1875 a university was founded here. The manufactures are fast developing. Pop. '69, 33,884.

CZER'NY, GEORG; properly, *Karadjordje*, i.e., Black George; the leader of the Servians in their struggles for independence; was b. in 1770, in the neighborhood of Belgrade. He showed, when young, his hatred of the oppressors of his country by murdering a Moslem. After spending some time in Austria, he returned to his paternal estate. In Aug., 1801, a band of janizaries broke into his dwelling, and plundered it. C. fled, vowing vengeance. He soon collected a band of malcontents, and commenced a sort of guerrilla war. Gradually his numbers increased, and in 1804 he captured the fortress of Schabaz. Subsequently, he invested Belgrade, and in the beginning of 1806 routed the Turks at the rivers Drina and Morawa. Assisted secretly by Russia, he captured Belgrade in Dec., 1806. After the treaty of Slobosje (8th July, 1808), he was elected governor by the people, and recognized as prince of Servia by the sultan. The French invasion of Russia in 1812 compelled the latter country to let Servia shift for itself. Hostilities recommenced; the Turks were successful, and C. had to flee to Russia. He afterwards went to Austria, where he lived for some time. Meanwhile, the freedom of Servia had been secured through the leadership of Milosch Obrenowicz; and in July, 1817, C. returned, intending, as some suppose, to rally his partisans round him for the furtherance of his ambitious schemes, when he was murdered at the instigation of prince Milosch.

CZERNY, KARL, 1791–1857; a German composer who wrote a vast number of pieces. Liszt was one of his pupils. His *Practical School of Composition* is well known.

D

D, THE fourth letter in the Græco-Roman alphabets, was called in the Semitic languages *daleth* (hence Gr. *delta*, i.e., "door;" and in all probability its original hieroglyphic or picture form was a door). The Greek Δ, in fact, yet preserves a recognizable resemblance to the door or opening of a tent, the kind of door most familiar to a nomadic people. D. belongs to the order of letters called *dentals* (see LETTERS, ALPHABET), *t*, *d*, *th* (in *th*in), *th* (in *th*ine), and in the corresponding words of sister-languages is often exchanged with those of the same order or organ; thus: Ger. *du*, Eng. *thou;* Ger. *tod*, Eng. *death;* Lat. *duc-*, Eng. *tug;* Lat. *duo*, Eng. *two*. A more remarkable interchange is that between *d* and *l*, and *d* and *r*. See L and R. D seems to have been drawn into some words (to which it does not radically belong) by a kind of affinity for *n*, as Lat. *canis*, Gr. *kyon*, Eng. *hound;* Lat. *gener-*, Eng. *gender*. *Di* followed by a vowel is sometimes transformed into J; as in *Janus* for *Dianus; Journal* from *diurnal*. *Di* followed by a vowel in Latin, has, in Italian, become *z;* and from MSS. and other evidence, we know that this sibilant sound of *di* prevailed, in the popular pronunciation at least, while Latin was yet a living tongue. Thus, *diabolus* is found written *zabolus*, and *Amazones, Amadiones*.—D, the Roman numeral for 500, arose out of the character Iↀ See NUMERALS.

D, in music, is the second note in the natural scale, and is a whole tone above C, to which it stands in mathematical proportion as 9:8, that is, when C vibrates eight times, D vibrates nine times. The whole tone from C to D is called the greater whole tone, being a comma larger than the next whole tone from D to E.

DAB, *Platessa limanda*, a fish of the same genus with the plaice and flounder, and very much resembling them, but easily distinguished from either of them by its more uniform and lighter-brown color, the roughness of its scaly surface, and its more curved lateral line, which rises into a high arch over the pectoral fin. It is common on all sandy parts of the British coasts, inhabits deeper water than the flounder, and does not, like it, enter the mouths of streams. It is known on the coasts of the firth of Forth as the salt-water fluke. It is preferred to the flounder for the table. It seldom exceeds 12 in. in length. A rather larger species of the same genus, less plentiful on the British coasts, is the LEMON D. or SMOOTH D. (*P. microcephala*). Its body is smooth, its color a pretty

mixture of various shades of reddish-brown and yellow: its head and mouth are very small.

DABCHICK. See GREBE.

DABOLL, NATHAN, 1750–1818; a teacher in Connecticut, author of a famous school arithmetic. His son C. L. invented the fog-horn or fog-trumpet.

DA CA'PO (Ital. from the beginning), a term in music, frequently placed at the end of a part or movement, indicating that the performer must return to the beginning of the movement, or to some other part of it usually marked with the sign 𝄋, and finish where the word *fine* is placed. Scarlatti was the first who introduced the use of the *da capo* in his opera of *Theodora*. The words are generally abbreviated, thus, D. C., sometimes *D. C. al fine*.

DAC'CA, the district of which the below-mentioned city is the capital, extends in n. lat. from 23° 12′ to 24° 17′, and in e. long. from 90° 11′ to 90° 58′, containing 2,897 sq.m., and numbering (1872) 1,852,993 inhabitants. Forming part of the great delta of the Ganges and Brahmaputra, it is traversed by streams in every direction, being so low and level as to be generally flooded during the rainy season. It is, on this account, admirably adapted to the cultivation of rice. From the character of the country, roads—happily rendered less necessary by the net-work of rivers—are very difficult of construction. In addition to the city of its own name, the district has two principal towns, Narainganj and Islampoor. Though the climate, as a whole, is moist, yet it by no means presents uniformity in this respect, the annual rain-fall varying in different years from 46 to 93 inches. Among commercial crops, cotton—the raw material of the far-famed muslins—once occupied a prominent place. It is now comparatively neglected, being too short in the staple for the coarse fabrics which alone continue to be made in the district. Recent attempts to introduce a better variety from the United States have failed. It was in 1765—the epoch of the cession of Bengal, Bahar, and Orissa on the part of the Great Mogul—that D. became subject to England; but down to 1845, the heirs of the native ruler succeeded each other as stipendaries of the East India Company.

DAC'CA, a city of Bengal proper, stands about 190 m. to the n.e. of Calcutta, in lat. 23° 43′ n., and long. 90° 25′ east. It is situated on the Burha Gunga, a considerable auxiliary of the Dulasseree, which is itself at once a mingled offset of the Brahmaputra and the Ganges, and an affluent of the lower course of the former stream. The city thus enjoys singular facilities in the way of inland navigation. Down to the close of the 18th c., D. was widely celebrated for the delicate texture of its muslins, which, in the phraseology of the east, were characterized as "flowing water" and "evening dew;" and, in connection with this manufacture, the French and the Dutch as well as the English, had extensive establishments in the place. Since 1801, however, these European agencies have disappeared; while the annual value of the elegant fabric, under the influence of British competition, has gradually fallen from £250,000 to nothing at all. The present aspect of the city is in keeping with this utter decay of its staple trade. In many quarters are ruins overgrown with jungle, the haunts of tigers and serpents; and this remark is applicable to numerous splendid edifices, such as the residences of its native princes and the factories of its foreign sojourners. Still D., within a space of 4 m. in length by 1¼ in breadth, contains, by the census of 1872, 69,212 inhabitants. It seems, of late years, to have partially recovered from the effects of its commercial decline, and produces lac, dye, soap, cheese, and gold and silver ornaments. Sometimes as many as 300 elephants are for sale in the depots here. There are 180 mosques and 119 pagodas and places of worship belonging to Romanists, Armenians, Greeks, and English, as also a college and several schools. D. is connected with Calcutta by the Eastern Bengal railway. The maximum temperature in 1871 was 89° and the minimum was 54.6°. The rainfall in 1871 was 82 inches.

DACE, DARE, or DART, (*leuciscus vulgaris*), a fresh-water fish of the family *cyprinidæ* (q.v.), and of the same genus with the roach, ide, chub, bleak, minnow, etc. It chiefly inhabits the deep and clear water of quiet streams. It is found in Italy, France, Germany, etc., and in some of the rivers of England, but is very local. It is in form not unlike the roach, but rather more elongated; the mouth is rather large, the scales smaller. The upper parts are dusky blue, becoming paler on the sides, and passing into white on the belly, the cheek and gill-covers silvery white. The D. is gregarious, and swims in shoals. Its flesh is preferred to that of the roach, but is not highly esteemed. The D. is perhaps the liveliest and most active of the *cyprinidæ*, and affords the angler fair sport both with fly and bait. It is fished for with a light float and a fine gut-line. The float is set so that the bait may almost touch the bottom. At the least symptom of a bite, the angler must strike quickly. The best baits are the red-worm, the tail of a lob-worm, gentles, greaves, and flies or grubs of any kind. The best places to fish with bait are moderately sharp streams, of from 2 to 4 or 5 ft. deep. Dace at times take the fly very freely, and show capital sport. Small red and black palmers will be found the most useful flies for the purpose, and their killing properties will be greatly increased if the hook is tipped with a tough gentle, as D. are very apt to follow the fly without taking it, when the gentle overcomes their scruples; a

small piece of the white, tough, inner rind of bacon answers equally well; and even a small piece of wash-leather may be used. Shallows, scours, and by the edge of weed-beds, are the best spots for the fly. D. may be taken also by "dapping" with the natural fly, and those so taken are usually the finest fish. D. seldom exceed a pound in weight, though in some rivers they have been taken up to 1½ lb. In the Thames, a fish of half a pound is considered unusual. They spawn in the end of April, or early in May, and soon recover their condition again.

DACE'LO, a genus of the kingfishers, natives of Australia. One specimen is known as the laughing jackass, so called because of its harsh discordant note.

DA'CIA, the land of the Daci or Getæ. Its geographical limits were very indefinite until its conquest by the Romans. After that period, it comprised the various countries now known as eastern Hungary, Transylvania, Bukowina, Moldavia west of the Pruth, Wallachia, and the Banat of Temesvár. The Getæ came originally from Thrace, and were divided into various tribes. Their course northward can only be imperfectly traced, but we know that, shortly before the time of Alexander the great (335 B.C.), they had migrated across the Danube. It is not known when or for what reason the Getæ changed their name to Daci. They seem to have been the most valiant of the Thracian barbarians. Curio, the first Roman general who ever penetrated as far n. as the Danube, did not venture to assail them. Julius Cæsar, however, is said to have intended their subjugation. In 10 B.C., Augustus sent an army up the valley of the Maros. From this time, there was almost continual fighting between the Romans and the Daci, on the whole, to the advantage of the latter, who actually compelled their civilized enemies, in the reign of Domitian, to pay tribute. In 101 A.D., the emperor Trajan crossed the Theiss, and marched into Transylvania, where he fought a great battle near Thorda. The peasant calls the battle-field to the present day *Prat de Trajan* (*Pratum Trajani*, field of Trajan). The Daci, who were commanded by their famous chief Decebalus, were defeated. A second expedition of the emperor's (104 A.D.) resulted in the destruction of their capital, the death of Decebalus, and the loss of their freedom. Roman colonists were sent into the country, a bridge was built over the Danube—the ruins of which are still extant—and three great roads were constructed. In 270–75 A.D., the Romans abandoned the country to the Goths, and the colonists were transferred to Mœsia. After a series of vicissitudes, D. fell into the possession of the Magyars in the 9th century.

DACIER, ANDRÉ, a French author, b. of Protestant parents at Castres, in upper Languedoc, 6th April, 1651, studied at Saumur; and in 1672, came to Paris, where he was employed to bring out an edition of the Latin writer *Festus*, for the use of the dauphin, which he did in 1681. In 1683, he married Anna Lefèvre, also a Protestant, and two years later, both entered the Roman Catholic church. D. subsequently became royal librarian, member of the academie des inscriptions, and perpetual secretary of the "academie." He died 18th Sept., 1722. D.'s principal works, besides his *Festus*, are *Œuvres d'Horace en Latin et en Français* (Par. 1681–89), an edition of Valerius Flaccus, and numerous translations into French of Greek authors, such as Plutarch and Epictetus, all of which are of very middling quality, while the expositions and criticisms are extremely shallow.

ANNE DACIER, wife of the preceding, was b. at Saumur in 1651, and after the death of her learned father, who had developed her talent, came to Paris, where she acquired such a reputation by her edition of Callimachus (1674), that the duke of Montausier commissioned her to edit several of the ancient authors for the use of the dauphin. Similarity of tastes and employment led to a marriage between her and André Dacier. Her domestic duties did not, however, weaken her literary ardor. Besides editing various of the classics, she translated the comedies of Terence; the *Amphitryon*, *Epidicus*, and *Rudens* of Plautus, accompanied by an able dissertation on the origin, progress, and mutations of dramatic poetry; Anacreon, Sappho, and the *Plutus* and *Clouds* of Aristophanes. Her admiration of Homer was unbounded, and, in spite of her sex, involved her in two learned controversies. Madame D. is generally acknowledged to have possessed a more acute and vigorous mind than her husband. She died 17th Aug., 1720.

DACOITS, the name given to a class of men in northern India, who live by robbery and plunder. They were formerly employed in war by the native sovereigns. It is stated that one tribe alone, between 1818 and 1854, killed 172 persons and obtained plunder valued at $575,000. Much has been done to break up the roaming bands, but they are not yet extinct in Bengal and Burmah.

DACOITS, or DACO'TAH INDIANS, in the United States. See SIOUX and INDIANS.

DA COSTA, ISAAK, 1798–1860; a Dutch poet and theologian of Portuguese-Jewish descent, who claimed kindred with the celebrated Uriel d'Acosta. His principal poetical works are well known in Holland, and besides these he was the author of many theological works chiefly in connection with criticism of the gospels.

DACRYD'IUM, a genus of trees of the natural order *taxaceæ*, having male and female flowers on separate trees. The species are lofty trees, chiefly natives of Australia and New Zealand. *D. Franklinii* is called HUON PINE, although rather a yew than a pine. Its timber is harder than any Baltic pine, and is excellent for spars for naval purposes.

D. taxifolium, the kakaterra tree of New Zealand, attains a height of 200 ft., and is also very valuable for its timber. A beverage resembling spruce-beer is made from its branches.

DAC'TYL (Gr. *dactylos*, the finger), the name of a measure or "foot" in Greek and Latin versification, consisting of a long and two short syllables, as in the word *ōmnĭbŭs*. It was so called from its resemblance to the finger, which consists of three joints—one long and two short. The same name is sometimes applied to a trisyllabic measure in English verse, consisting of one accented syllable and two unaccented syllables, as in *dĕstiny*. See VERSE. Dactylic verses consist of dactyle and equivalent feet. See HEXAMETER.

DAC'TYLIS. See COCK'S-FOOT GRASS.

DACTYLOL'OGY, the art of communicating thoughts by the fingers. See DEAF AND DUMB.

DACTYLOP'TERUS. See FLYING GURNARD.

DADE, a co. in s.e. Florida bordering on the Atlantic ocean and Mexican gulf; 4,400 sq.m.; pop. '80, 194—4 colored. It is the wild swampy region of the Everglades. There is one good harbor near, cape Florida. Co. seat, Biscayne.

DADE, a co. in n.w. Georgia on the Tennessee and Alabama border, intersected by the Alabama and Chattanooga railroad; 160 sq.m.; pop. '80, 4,703—1085 colored. It is a rough region, having iron, coal, and other minerals. Co. seat, Trenton.

DADE, a co. in s.w. Missouri, on the Sac river; 498 sq.m.; pop. '80, 12,557—247 colored. Agriculture is the main business. Co. seat, Greenfield.

DA'DO (Ital. a die), in classical architecture, the term applied to the cubic block which forms the body of a pedestal. It is also applied to the plane face and the series of moldings which, in the interiors of buildings, form, as it were, a continuous pedestal. The interior D. is formed of wood, and, running round the bottom of the walls of a room, serves to protect the plaster or paper from injury. It is generally about three ft. in height, and surmounted by a narrow cornice.

DA'DUR, a t. of Beloochistan, is 5 m. to the e. of the Bolan pass. Though it is in the 30th degree of n. lat., it is said to be one of the hottest places in the world. It contains about 3,000 inhabitants. It is worthy of notice chiefly as the spot where in Nov., 1840, the British troops routed a Kelat force. The neighborhood yields grains of various kinds, pulse, cotton, sugar, madder, and fruits.

DÆDA'LUS, according to the Greek myths, was sprung from the old Athenian race of kings, the Erechtheidæ, and was a contemporary of Theseus and Minos. He was famous for his ability as an artist and mechanician. Among the numberless works which he is said to have executed, may be mentioned the Cretan labyrinth, the Colymbethra, or reservoir, near Megaris in Sicily, the temples of Apollo at Capua and Cumæ, that of Artemis Britomartis in Crete, and an altar sculptured with lions on the Libyan coast. His mechanical genius is clearly celebrated in the poetic fiction of his flying safely over the Ægean by means of wings which he had himself made. D. got the credit among the Greeks of having invented carpentry, and most of its tools, such as the saw, the axe, the plumb-line, the gimlet, as also glue. The history of D. is obviously a myth, wherein, as recent criticism has conclusively shown, is embodied that epoch in which the first rude forms of art were thrown aside, and a higher skill and intelligence displayed.

DAENDELS, HERMANN WILHELM, a Dutch gen., was b. in 1762 at Hattem, in Gueldres, took part in the revolutionary disturbances that broke out in Holland in 1787, and was in consequence compelled to seek refuge in France. In the campaign of 1793, he rendered important service to Dumourier, and was elevated to the rank of a gen. of brigade. In 1799, he commanded one of the two divisions of the republican army, which, with a third corps under the orders of gen. Brune, compelled the Anglo-Russian forces to surrender. Circumstances induced him to leave the service in 1803, but in 1806 he was reinstated in his former rank by the king of Holland. He now conquered East Friesland, and was made governor-general of Münster, commander-in-chief of the Dutch cavalry, marshal of Holland, and governor-general of the Dutch East Indian possessions. This last office he held from 1808 to 1811, and discharged its duties with great prudence. He also published a work upon his administration in Java, which was an important contribution to our knowledge of that island. On the overthrow of Napoleon, his services were secured by the new king of Holland, Wilhelm I., who intrusted him with the organization of government in those colonies on the coast of Africa which had been restored to the Dutch. In this capacity he labored with energy and success until his death in June, 1818.

DAËT', a t. of the island of Luzon, Philippines, situated on a river of the same name, which falls into the bay of San Miguel on the eastern side of the island. Some of the houses are built of stone and some of nipa palm. Pop. 7,702.

DAF'FODIL (corrupted from Lat. *asphodelus*), the English name of those species of *narcissus* (q.v.) which have a large bell-shaped corona. The common D. (*N. pseudo-narcissus*) is a native of England and of most parts of Europe, growing in woods and hedges. It is naturalized in many places in Scotland, but seems scarcely indigenous.

All the other species are more southerly, chiefly abounding in the countries near the Mediterranean. Some of them, as *N. minor*, have become naturalized in some places in England, having been long known as ornaments of gardens, in which double-flowered varieties are also cultivated. They are favorites, not so much for their beauty, which is not of the most delicate kind, as on account of their large yellow flowers, which are produced early in spring. The bulbs are purgative and emetic. The mode of cultivation is the same as for other species of narcissus.

DAG, a thick clumsy pistol, used in the 15th and 16th centuries. In the *Spanish Tragedy*, published in 1603, one of the characters shoots the dag.

DAGGER, a weapon resembling a sword, but considerably smaller, being used for stabbing at close quarters. Daggers are generally two-edged, and very sharp towards the point. Originally, it had no guard for the hand, and was worn at the girdle in a sheath. It is now regarded as a general military weapon in European countries.

DAGGETT, DAVID, LL.D., 1764–1851; b. Mass.; graduate of Yale, 1783. He was a jurist of eminence, held a number of local offices, and was chosen United States senator. In 1832, he was chief-justice of the supreme court of Connecticut.

DAGGETT, NAPHTALI, 1727–80; b. Mass.; graduate of Yale, and professor of divinity in the college. He was president *pro tem.* for a year. When the British attacked New Haven in 1779, he was so badly treated by them that he never recovered. He published an account of the famous "Dark Day in New England."

DAGGETT, OLIVER ELLSWORTH, D.D., son of David; b. Conn., 1810; a graduate of Yale; Congregational pastor for 23 years in Canandaigua, N. Y.; then for three years professor of divinity in Yale college; afterwards pastor of the Second church, New London, Conn. He was one of the compilers of the *Connecticut Hymn Book*, and has written many articles in the *New Englander*.

DAGHESTAN' (Tartar, *Tagh stan*, signifying mountainous country), a province of Asiatic Russia (called also Derbend), between the Caucasus and the w. coast of the Caspian sea. Area about 10,000 sq. miles. Pop. '72, 448,299. The surface is generally mountainous, being traversed by offsets from the Caucasus, but there are, however, valleys and level tracts of great fertility. The inhabitants are chiefly Lesghians (fanatical Mohammedans). Until 1812, the country belonged to Persia. Since its annexation by Russia, the Lesghians have fought desperately for independence (see SHAMYL and CAUCASUS). The chief town is Derbend (q.v.).—See *Daghestan*, by A. Cunynghame, 1872.

DA'GO, an island in the Baltic sea, forming a part of the Russian government of Esthonia, situated near the entrance of the gulf of Finland. The narrow channel called Sele-sund separates it from the island of Oesel on the south. Its length is estimated at about 34 m., and its breadth at 15 miles. The soil, a mixture of sand and chalk for the most part, is not fertile, the coasts are rocky, and shoals make navigation dangerous. The population, Esthonians mostly, number about 10,000, and are chiefly employed in fishing and cattle-rearing.

DAGOBA, or DAHGOPA (according to Wilson, from *deha*, the body, and *gopa*, what possesses, because it contains the hair, teeth, etc., of Buddha; according to others, from *dhatu*, a relic, and *gabba*, a shrine), are monumental structures containing relics of Buddha. Dagoba seems to be the common Singhalese term for such monuments; but the more general name is stupa (q.v.) or tope.

DAG'OBERT I., one of the early Frankish kings, d. 638 A.D. He was a son of Clotaire II., and after the death of his father he reigned over the whole of the Frankish dominions. His court was remarkable for magnificence, rivaling that of Constantinople. But he was noted for debauchery.

DA'GON (Heb. *dag*, a fish), the national idol of the Philistines, is frequently mentioned in Scripture; in profane history, the name by which it is known is Derceto. It is always represented on ancient medals as half-fish, half-woman, but the Hebrew writer or writers speak of it as a masculine being. Some scholars have attempted to show that the word D. comes from the Phœnician *dagan*, wheat; and that it is not the name of a fish-god, but of a god of agriculture. It is possible, however, to combine both notions, by supposing that D. was a deified mortal who had come in a ship to the coast, and taught the people agriculture and other useful arts. Ancient history abounds with such mythological personages, one of whom was called by the Babylonians *Odakon*, and is regarded by the learned Selden as identical with the fishy idol of the Philistines.

DAGUERRE, LOUIS JACQUES MANDÉ, 1789–1851; a French painter, in early life a revenue officer. He was especially successful as a scene painter for the opera, and afterwards in panoramic views on a large scale. He also opened a diorama in Regent's park, London. He lost heavily by a conflagration, but speedily re-established his fame on a secure basis by the invention of the daguerreotype, in which he was aided by Nicephore Niepce. Daguerre became an officer of the legion of honor. The progress of his invention—forming permanent pictures on prepared surfaces by the chemical

action of light—was for a long time slow and tedious; but improvements came, until now the photograph may be taken in an instant, and even a horse under full run is portrayed as if not in motion.

DAGUERREOTYPE PROCESS, the name given to the original photographic process, as introduced by its inventor, M. Daguerre, in 1839. Notwithstanding that it has now become so unpopular, on account of the very circumstance which gives such perfection to the result—viz., the polish of the plate—it is a process which yields to none in point of microscopic perfection of detail and perfect gradation of shade. The pictures it yields are positive or direct, as given in the camera, though they also appear as negative when viewed at certain angles, and are the result of the successive action of the vapors of iodine, bromine, and mercury upon a highly polished surface of chemically pure silver. The manipulations involved in conducting the process are—1. Cleaning and polishing the plate; 2. Rendering the plate sensitive; 3. Exposing it in the camera; 4. Developing the latent image; 5. Fixing the picture.

A copper plate of moderate thickness is coated with silver by the electrotype or other suitable method, and then polished to the utmost possible extent, so as to obtain, though by mechanical means, a chemically pure surface; it is then exposed first to the vapor of iodine, and then to the vapor of bromine for a length of time, ascertained in practice by watching the beautiful succession of prismatic colors which begin to appear with the first contact of the vapor. The length of exposure in the camera which follows is determined by the amount of light at the time of operating, and the relation between the diameter and focal length of the lens employed. The development of the latent image, which is the next operation, is effected by exposing the plate in a suitable box to the vapor of mercury, which attaches itself to the various parts of the picture in proportion to the more or less intense action of the light. Those portions of iodide and bromide of silver unacted on by light, are next removed by immersing the plate in a solution of hyposulphite of soda; and the picture is subsequently fixed and intensified by pouring over its surface a solution of hyposulphite of gold, and applying heat; by which means it is coated with a thin film of metallic gold, and thereby rendered so permanent that it cannot be rubbed out by ordinary means, but requires a chemical solvent for its removal. It may be mentioned, in conclusion, that though M. Daguerre published, in 1839, the first *practicable* process for taking pictures by the agency of light, his experiments would seem to have been suggested by the researches of M. Niepce, who, in 1820, obtained impressions on silver plates rendered sensitive by exposure to the vapors of sulphur and phosphorus.

D'AGUESSEAU, HENRI FRANÇOIS, 1668–1751; chancellor of France. When little more than 21 years of age he was appointed one of the three advocates-general, and the eloquence and learning which he displayed in his first speech gained for him great reputation. In 1700, he was made procurator-general, and in 1717, advanced to chancellor. A year afterwards he was deprived of his office because of his firm opposition to the wild schemes of John Law. When more than 80 years of age, he retired from the duties of chancellor, still holding its rank.

DAHL, JOHANN CHRISTIAN CLAUSEN, a Norwegian landscape painter, b. at Bergen, 24th Feb., 1788, was at first intended for the church, but afterwards devoted himself to art. He studied painting for six years under the direction of prof. J. G. Moller. His first attempts were in *genre* and miniature. They did not exhibit much genius; but public attention was at length excited by a work which he exhibited in Dresden, in 1819, entitled "Cascade among Rocks in Norway." Next year, he went to Italy, where Thorwaldsen and the Prussian consul-general, Bartholdy, commissioned him to execute several works. In 1821, he was appointed professor of painting at Dresden, where he subsequently resided. D. was fond of reproducing on his canvas the picturesque scenes of his native country, which he often revisited. Among his more famous works are a "View of Naples," "Winter in Zeeland," "View of Bergen," "Scene from the Environs of Christiania," and a "Winter Scene on the banks of the Elbe," the last two of which attracted great attention at the Paris exhibition of 1855. D., who was a member of several academies, died at Dresden, 14th Oct., 1857.

DAHLGREN, JOHN ADOLF, 1809–70; b. Philadelphia; a distinguished officer in the U. S. navy, a midshipman in 1826. He served in Brazil and in the Mediterranean squadron, and on the coast survey, being commissioned as a lieut. in 1837. Somewhat later he was engaged in the ordnance department, where he procured the adoption of the Dahlgren gun. He was the inventor of a rifled cannon, and introduced bronze howitzers. In 1855, he was made commander, and when the war of the rebellion began, he was in command of the Washington navy yard. In July, 1862, he was appointed capt., and chief of the bureau of ordnance. The next year, he rose to rear-admiral, and had command of the s. Atlantic and subsequently of the s. Pacific squadron. In 1869, he again took command of the Washington navy yard.

DAHLGREN, ULRIC, 1842–64; son of John Adolf; an early volunteer in the union cause when the war of secession broke out. He performed brave and distinguished services, and was killed in an effort to rescue the union soldiers confined in Libby prison.

DAHLGREN GUN, named after a naval officer in the service of the United States government, is the result of a careful series of experiments on the construction of large ordnance. One peculiarity consists in having relatively less metal in front of the trunnions, and more behind, than had hitherto been customary. Dahlgren guns, made to fire shells or hollow shot, have been introduced to a considerable extent in the U. S. navy.

DAH'LIA, a genus of large perennial herbaceous plants of the natural order *compositæ*, sub-order *corymbiferæ*, natives of Mexico. All the varieties in cultivation in our flower-gardens, of which not fewer than 2,000 have been carefully enumerated, are derived from two species, *D. variabilis* and *D. coccinea*, and chiefly from the former. Few plants manifest so strong an inclination to sport and produce new varieties as the D., and florists have also obtained many by the artificial fecundation of one with the pollen of another. Dahlias were first brought to Madrid by Spanish botanists in 1789, and were soon introduced into England, but did not become well-known in English flower-gardens till about 30 years after. The name was given in honor of Dahl, a Swedish botanist; but because another genus of plants had received the same name, an attempt was made to change it to *Georgina*, which is sometimes used on the continent, but D. universally prevails both popularly and among botanists in Britain. Among the most essential characteristics of a fine D., according to the estimation of florists, are a fullness of the flower, a perfect regularity in the shape of the florets, and the absence of an eye or disk; and florets of the disk, as in other "double" *corymbiferæ*, having assumed the appearance of florets of the ray. Dahlias have tuberous roots, which contain a considerable quantity of *inulin* (q.v.), and are in use as an article of food in Mexico. It was at one time attempted to introduce them into cultivation in Europe for the food either of man or of cattle; but the taste is nauseous to European palates, and even cattle do not readily eat them. Dahlias are often cut down in the northern parts of Britain by early frosts, in the very midst of their flowering; and their tubers require to be taken up for the winter, and stored in a dry place out of the reach of frost till spring. They are propagated by seed, by cuttings, and by tubers. The finer varieties are sometimes grafted on more ordinary stocks.

DAHLMANN, FRIEDRICH CHRISTOPH, professor of history and political science in the university of Bonn, was born, May 17, 1785, at Wismar. His earlier studies in Copenhagen and Halle were devoted to archæology and philology; but his attention was subsequently directed to the study of politics and the history of the middle ages. The results of his diligence appeared in his *Vita Ansgarii*, his *Researches in German History* (2 vols., Altona, 1822–23), his edition of the *Dithmarsh Chronicle* (Kiel, 1827), and other works. In 1829, D. was appointed professor of political science in Göttingen, where he published (1830) his valuable work on the *Sources of German History*. Banished in 1837, by king Ernest of Hanover, on account of his protest against the abolition of the Hanoverian constitution, he went to Leipsic and Jena, where he wrote his historical masterpiece, the *History of Denmark* (3 vols., Hamburg, 1840–43). In 1842, he became professor of history at Bonn, and took a prominent part in the political affairs of Germany after the movement in 1848, heading the constitutional liberals, who were unfortunately too reasonable to be successful. At the close of the struggle, he returned to his academic duties, to which he devoted himself till his death, 5th Dec., 1860.

DAHLONE'GA, a t. and co. seat of Lumpkin co., Ga., 60 m. n.n.e. of Atlanta, in the midst of a gold-mining region, remarkable chiefly for the mint established there, 1835, and abandoned in 1871. Pop. '70, 471—104 colored. Dahlonega, Indian *Taulau-neca*, is an anglicized Cherokee name meaning dollar-yellow, in reference to the gold coinage.

DAHOMEY, an independent state of Guinea, Western Africa, extending along the coast from fort Badagry on the e., to the river Volta, which separates it from Ashantee on the west. Its limits have not been precisely defined, but it is usually regarded as extending back to the Kong mountains. It will thus lie between lat. 6° to 8° 50′ n., and long. 0° 30′ to 3° e.; its breadth being about 200, and its length 180 miles. D. is for the most part a vast plain, rising with gentle ascent from the sea towards the Kong mountains, with offsets of which it is traversed in its most northerly parts. Although it has no river of any importance save the Volta on its western boundary, it is well watered by springs and streams; and the soil, a rich, red-colored clay, almost quite free of stones, is extremely fertile. Magnificent trees clothe the hills in the n., and maize, beans, and peas grow in splendid luxuriance on the plains, as well as yams, potatoes, melons, limes, oranges, pine-apples, and other tropical fruits; cotton, sugar, tobacco, and indigo are also raised. The scenery is described as exceedingly varied and beautiful. Lions, tigers, elephants, hyenas, and enormous snakes of the boa kind abound. The Dahomans, who came into possession of this tract of country about the beginning of the 18th c., are for the most part tall, well formed, and intelligent, and, for an African race, singularly honest, and far advanced in agriculture. With the exception of a few Mohammedans, whose religious belief is in no way interfered with, they are all pagans, and practice fetish-worship. The king is the most absolute of despots. Wholesale murder is one of the chief features in religious and state ceremonies; but, according to capt. Burton, who visited D. in 1864, the number of the victims has been greatly exaggerated. Still, as many as 500 human victims are sometimes sacrificed at one

"grand custom;" the present king immolated that number at the death of his father. Of the regular army of 15,000, about 2,500 are Amazons (devoted to celibacy), who are the most effective soldiers, but exceedingly ferocious. The revenue, until recent years, depended greatly upon the sale of slaves; but the vigilance of the cruisers employed to prevent the traffic has reduced this source of income materially. Hence the monster slave-hunts which periodically took place are now comparatively rare. In 1876, the coast of D. was placed under a strict blockade by Great Britain, on account of an outrage on a British subject, for which the king of D. refused satisfaction. Pop. 180,000.—ABOMEY, or AGBOME, the capital, is situated about lat. 7° 30′ n., long. 1° 40′ east. It is stated to be 4 m. in circumference, is surrounded by a ditch and clay walls, pierced by six gates, in each of which are two openings—one for the exclusive passage of the king, the other for his subjects. The houses are mostly of one story, built of clay, and thatched. There are no regular streets, each house standing within its own inclosure of clay wall. There are three palaces belonging to the king here, which differ little from the other houses, save in their greater size. Farms are cultivated within the city. Pop. about 20,000. The port of D. is Whydah.—See Forbes's *Dahomey and the Dahomans;* Burton's *Mission to Gelele, King of Dahomey;* Skertchly's *Dahomey as It is* (1874).

DAH'RA, a district of Algeria, once inhabited by the Ouled-Riahs, a Kabyle tribe. It has acquired a melancholy celebrity as the scene of a frightful massacre perpetrated by the French in the month of June, 1845. The district contains immense caverns. In these the Ouled-Riahs, hotly pursued by the French under col. (afterwards marshal) Pelissier, took refuge. They were ordered to surrender their arms and horses, and were promised, in return, life and liberty. On their refusal, fascines were made up, kindled, and placed at the entrance of the caves. Thrice col. Pelissier sent a flag of truce, exhorting the imprisoned Kabyles to accept his terms, but in vain—the last messenger being received with a discharge of musketry. The fire was therefore again kindled in all its intensity, and gradually the cries of agony from the interior of the caverns ceased, until nothing broke the dead silence but the occasional crackling of the green wood of which the fascines consisted. When the caverns were examined, about 600 dead bodies were found scattered here and there; but it was calculated that in all (including those who afterwards died and those who could not be got at), about 800 had been suffocated by smoke, or gored to death by the maddened cattle whom they had brought with them into their fatal asylum. The news created a great sensation in Paris. Marshal Soult, then minister of war, formally condemned the deed; but marshal Bugeaud, the governor of Algeria, affirmed that Pelissier had only acted under positive orders.

DAILLE, or DALLÆUS, JEAN, 1594–1670; a learned Protestant divine, tutor to the grandsons of Plessis Mornay, and the author of a number of controversial works. He was president of the last national synod held in France in 1659.

DAIMÏE'L, a t. in Spain, in the province of Ciudad Real, twenty m. e.n.e. of the city of that name. It is in general tolerably well built; it has several squares, and its principal streets, though unpaved, are wide and comparatively clean. Its chief buildings are the churches of San Pedro and Santa Maria—the former a Doric, and the latter a Gothic structure—a town-hall, and a hospital. D. is environed by fine public walks and gardens, and has manufactures of woolens, linen, blonde lace, etc. Pop. 13,000.

DAI'MIO, the official title of the feudal lords of Japan, having almost independent rule in their special provinces or districts; but modern changes have largely restricted their privileges and authority in the direction of the consolidation of the empire.

DAIR-EL-KA'MAR, or DEIR EL-KAMR, a t. in Syria, and the capital of the Druses, about 13 m. s.s.e. of Beyrout. It is situated on the edge of a deep and picturesque glen of Mt. Lebanon, the banks of which and the slopes above are richly clad with mulberries, olives, and vines, which are cultivated in terraces by an exceedingly industrious population. On the opposite side of the glen stand the ruins of the palace Bteddîn, formerly the residence of emir Beshîr, who, for more than half a century, from 1788 to 1840, ruled over the Lebanon with a strong but impartial hand. Pop. of Dair-el-Kamar about 8,000.

DAIRY, all that concerns milk and its management on a farm; or the place or house where the milk is kept, cheese made, etc. (The old word *dey*, the milkmaid who presided over the *deyry* or dairy, is probably allied to *dug*, a teat, and to Lat. *duc-*, to draw, or milk; in Polish, *doic* is to milk; and in Sw. *deja* is a dairymaid.) Throughout the best cultivated districts, both of England and Scotland, the growing of corn and green crops, and the rearing and feeding of stock, were at one time to a considerable extent carried on in conjunction with the dairy. This mixed system of husbandry, though it may have reduced the farmer's risks, has gradually decreased. In many districts of the country, however, such as some parts of Ayrshire and Lanarkshire, the midland counties of England, and in Cork and neighboring Irish counties, great attention is still given to milk-cows, and dairy produce pays the bulk of the rent.

The selection of cattle of a sort profitable for the dairy, is a point of the first importance. Certain breeds have long been famed for their milking properties; at the

head of these is generally placed the Ayrshires. In proportion to their small size, and the limited amount of food which they consume, they yield a large quantity of rich, good milk, and have been long and justly prized by the dairymen of Glasgow and other Scottish towns, as well as latterly by those in several districts of England, and Highland portions of Scotland. With all their superb milking properties, however, they are comparatively worthless as feeders or beef-producers unless crossed with the Short-horn. Some Ayrshire cows have been known to give from 18 to 20 quarts of milk daily, and yield 14 lbs. of butter per week. The cows of the Channel islands also stand in high repute. The elegant, deer-like Alderneys are kept, more especially in England, by those who prize rich milk, and many landed proprietors and farmers have one or two amongst their herds to impart a higher color and richer flavor to the milk and butter. Alderneys frequently give 16 quarts of milk daily, and 8 or 9 lbs. of butter per week, while instances occur of their yielding as much as 12 or 14 lbs. The small Brittany breed, scarcely larger than goats, have also been brought to this country, and are profitable for gentlemen's families, and where only one or two cows are kept. These breeds are, however, in little favor with those who, besides dairying, look also to the breeding of profitable grazing-stock. Some families of the Short-horns unite, with size, substance, and aptitude for fattening, excellent milking properties. Short-horns, or animals with a large infusion of Short-horn blood, constitute the bulk of the handsome and high-priced cows seen in metropolitan markets, and long preferred to all others by the London dairymen. Throughout the n. of England, such cows were in favor, and were used by the late Mr. Horsfall, whose excellent papers on dairy management, published in the *Journal of the Royal Agricultural Society of England*, should be read by all interested in this subject. With his liberal dietary, fifteen to twenty cows daily average, for seven or eight months, ten or eleven quarts of milk each, producing a pound of butter. The original Short-horns, in the hands of the Brothers Colling, Mr. Bates, the Earl Ducie, and other earlier breeders, were excellent milkers; and even at the present day certain families are to be found still retaining their ancient character. Of late, however, many breeders of our more fashionable and prize-taking Short-horns have devoted their undivided attention to early maturity, flesh, and quality, neglecting altogether the milking properties. This, in some respects, is to be regretted. Prize stock of this and some other breeds give no more milk nowadays than fosters their calves, and some of them, indeed, make a poor job of that. Many of the animals are thus never milked by the hand. Herefords are not particularly famed for dairy purposes. The blood-red, plump Devons are more remarkable for the richness and butter-producing character of their milk than the quantity of it. The ancient Long-horns, once common in the midland counties of England, and prized for their milk, have mostly given place to more handy, symmetrical breeds. The old black Fife, or Scotch horned cows, included some famous milkers in their day, but scarcely any of them are to be met with now. The polled Angus, the Galloway, and the West Highland cows have a fair quantity of milk of remarkably fine quality, that of the West Highland breed in particular. The small Shetland breed produces an astounding quantity of splendid milk, and so do the Kerry and some other Irish cows.

Good milking animals of every breed possess certain qualities in common, which guide the farmer in profitably recruiting his dairy-stock. They have neat, tapering, well-placed heads; large, prominent, bright eyes; small and rather narrow necks; light fore-quarters; oblique rather than upright shoulders; large and shapely udder, well under the belly; largely developed milk-veins; a pliant mellow skin, well covered with soft silky hair; thin tail, with a good brush at the end of it; small and fine below the knee. Of great importance, also, is the fact of the animals being descended of parents possessing good milking qualities, for certainly no property is more distinctly hereditary. The milk of small and young cows is usually richer than that of larger or older animals. From four to eight is the most profitable age for the dairy-cow; after that, the milk is poorer; the animals eat more food, especially during winter; and, moreover, become less profitable when dried for feeding. The stock is usually recruited by heifers bred on the farm, which are generally preferred to those bought in. Of course in the larger dairies about Glasgow, the w. of Scotland, in the midland and southern counties of England, and in America, the cows cannot be all, or nearly all, bred and reared. Many must therefore be bought in, though they seldom turn out quite so well as the others. Heifers should not be put to the bull before they are two years old, and the milking properties of the animals will not be fully developed until they have had a second or third calf. Red and roan are the favorite colors.

In no department of the farm are carelessness and irregularity more injurious and ruinous than in the dairy portion. To produce large quantities of good milk, it is absolutely necessary that the cow be supplied with the materials which conduce to a great flow. These briefly consist of albuminous materials and phosphates for forming the caseine, and oily matters for producing the butter. In the ordinary or ancient dietary of cows, these materials, especially during winter, are seldom present in sufficient amount to produce, without waste, a copious flow of good milk. Cows fed on meadow hay, when producing from 12 to 16 quarts of milk daily, require something more than even 20 lbs. of turnips or mangold to sustain them. A still greater falling-off in flesh and fat—a constant robbing, in fact, of the materials of the body to supply the secretion of milk—is

observed in the case of some milk cows kept on the Scotch system on straw and a full allowance of turnips. Under better management, the expensive hay and roots may be materially reduced in quantity, and the adequate amount of nutriment supplied by such articles as bean-flower, rape, or cotton cakes, bran, malt coombes, and the like; whilst sufficient bulk—an important matter in the feeding especially of ruminants—is attained by the use of chopped straw. The cutting of straw into chaff insures the eating of a larger amount, and thus becomes nearly twice as valuable as when employed merely as litter. Bean-straw, when steamed or fermented with pulped or grated roots, loses entirely its bitter flavor, and being rich in albuminous matters, is specially adapted for milking cows. A portion of the roots, or all of them where the supply is small, should be pulped, mixed with the cut chaff, and the mixture allowed to lie in a heap for a day or two before being used. With the roots should be added 3 or 4 lbs. or rape-cake and 2 lbs. of bran for each cow. The moisture and flavor of the succulent roots permeate the dry food, inducing fermentation, with the development of sugar, and the mass thus becomes more palatable and digestible. Sometimes the mixture is steamed and given warm; and for milk-cows in cold weather, one or two such messes given daily, usually pay for the cost and trouble of steaming. Of the mixture thus fermented or steamed, the cows should have as much as they can eat thrice a day. Cows in full milk, or intended to be speedily fattened, should have sprinkled over it a small quantity of bean or wheat meal, to the extent of 1 lb. or even 2 lbs. daily. After each meal, give 3 lbs. of good meadow-hay, and be careful never to allow of hay or anything else more than can be cleared up at once and with relish. In most parts, especially of England and w. of Scotland, cabbage and green rape form the best succulent food for the first two winter-months; turnips and Swedes for the next two; whilst mangold should serve until the grass is abundant in spring; but it should ever be borne in mind, that animals thrive best on varied and frequently changed food. A few feeds of mangolds, when the Swedes are the staple root, and *vice versâ*, besides being a pleasing variety, will be found to augment the quantity of the milk. Rape-cake answers for milk cows quite as well as the more expensive linseed-cake, especially when its bitter taste is got rid of, as already advised, by fermenting or steaming. The increased produce, improved condition of the cows, and enhanced value of the manure, amply repay the trouble and the cost of this higher system of feeding, which amounts to from 1*s.* 6*d.* to 1*s.* 9*d.* per head daily.

The summer-feeding of cows is more natural and less expensive than the winter. In the English dairy counties, they are grazed upon the old pastures which are for this purpose preferred to those more recently laid down; whilst in Scotland they are often pastured upon the clovers. They should never have to work hard for their meals, and should further receive in the house, when brought in for milking, cut clover and rye-grass. Unless in the case of very fine and rich pastures, an allowance of rape-cake is also advisable. Such management not only improves the yield and quality of the milk, but supports the cows in high condition, and maintains the pastures in high and increasing fertility. This last matter is worthy of consideration, for under the older system, many of the once-famed dairy-farms of Cheshire and other counties rapidly declined in value. The tons of butter and cheese carried away from the soil left it poor and unprofitable. In such circumstances, the use of bones and other such manures, by improving the condition of the soil, greatly improved the nutritive quality of the grass and hay. The produce of good land in high condition is always more valuable alike for dairy and for feeding purposes. A given acreage will support more animals, if the produce be cut and brought to them, than if they are permitted to depasture it. The advantages of both systems are, however, secured by running the cows at grass during part of the day and giving them cut clover in the house during the remainder. Throughout the early and later part of the season, it is better that the animals be out during the day, and in at night; but in the intense heat of a warm summer, their being housed in the day secludes them from the attacks of troublesome flies, and permits their grazing undisturbed during the cool of the night. When cows run and jade themselves in the pastures during oppressive heat, their value as milkers is depreciated.

A good supply of water is necessary for milk-cows, which require much more than feeding-stock. In winter, they should have access to it at least twice a day, and require it still oftener in summer. Adequate shelter, and comfortable and convenient buildings are very essential to successful management. Unless the housing is good and comfortable, the materials which ought to go to the formation of butter are wastefully spent in supporting animal heat. Cows in full milk are most profitably kept in well-ventilated byres or hovels, of which the winter temperature should fall little below 60°.

The heifer may be put to the male when about two years old. The period of gestation is nine calendar months, or 284 days, but is usually shorter in young animals, and when the calf is a female. During pregnancy, cows fortunately are little liable to disease. Abortion occasionally occurs, and is most common about the third or fourth month. The heifer should receive the ordinary food of store-stock until within six or eight weeks of calving, when it is profitable to diet her as recommended for cows. It is a great mistake to starve cows in calf. They should be fairly and carefully fed, and milking suspended entirely for about 2 months, or at least 6 weeks before calving. In older cows, especially if good milkers, for a fortnight before calving, the bowels must

be kept relaxed, the teats drawn, and any milk removed several times a day, and an occasional dose of salts given. Such simple precautions will prevent that apoplectic form of milk-fever which destroys so many excellent milk-cows. The enlargement of the udder, and appearance of milk, the loosening of the ligaments of the pelvis, the relaxation of the vulva, and the animal's evident desire to be alone, betoken the approach of parturition. The act is generally accomplished speedily and easily, and without requiring much assistance. The calf usually comes with its forelegs first, and its head rather on one side, with the nose between the knees. The cow often stands, and as the calf drops, the navel-string is ruptured. With a wisp of straw, the little animal is rubbed dry, and receives either from its mother, or from a bottle, a small quantity of the rich new milk popularly known as the "beastings" or cherry-curds technically termed the colostrum (q.v.). In this the caseine is mostly displaced by more easily digested albumen; whilst the large amount of sugar and oily matter promotes the clearing out of the bowels. In few cases of dairying are the calves allowed to suckle their dams. Many of the calves are sold young, to graziers and feeders; others are intended for veal, and are fed highly for a short time on good milk, meal, and cake; while some —a few of the female animals—are fostered and reared with a view to fill blanks in the cow ranks. These latter get warm milk for five or six weeks, and skimmed for about as long, after which grass, early roots, and cake sustain them. For the first nine days, calves should be carefully muzzled to prevent them eating straw. They do not ruminate until the ninth day is passed, and if before then they eat any straw, death generally ensues. The cow after calving should have a drink of meal and tepid water, to which a little salt may be added. For the first week, steamed food, bran-mashes, with good hay, constitute the best food: roots at all times, and cold water during winter, are best withheld. Cleansing drinks are quite uncalled for; and if the placenta do not come away within 12 hours after calving, it may be very properly and safely removed by any one accustomed to such offices. After the lapse of a fortnight from the date of calving, roots may be given in considerable quantities, provided always the change has been accomplished gradually. Turnips touched by frost should be studiously avoided to cows either before or after calving, especially before.

In England, milking is usually done by men, 8 or 10 cows being allotted to each, and the operation, except in the case of newly calved cows, is repeated only night and morning. In Scotland, the milking is generally done by women, three times a day; and more milk is thus got than by milking only twice. The removing of the whole of the milk at each operation is most essential; indeed, experienced dairymen aver that half their profit lies in carefully getting the last of the milk, which, as is well known, is much the richest. With liberal feeding, such as that above described, well-selected cows yield daily, in a fortnight or three weeks after calving, 12 to 16 quarts, and should continue to do so for six or eight months. Even with the same management, the milk of some cows is especially rich, and yields an unusually large proportion of butter; whilst others are equally remarkable for the way they fill the cheese-tub. A quart of ordinary milk yields about an ounce of butter; and more in summer than in winter; but under good feeding, the amount reaches and even exceeds an oz. and a half, and is tolerably equal at all seasons. A quart of new milk yields 4 ozs. of curd; and each cow is estimated to produce 500 lbs. of cheese in the season. It is essential that the cows be kindly treated by those to whom their milking is intrusted; otherwise, the animals will retain the best of the milk. Some people approve of giving food to the cow during the milking process. This may secure a freer discharge of the milk, but it establishes a troublesome custom, which, once begun, must generally be carried out ere the cows allow their milk to flow; and in dairies not very systematically conducted, or small, the application of food at the milking hour is often inconvenient. On many farms, where dairying is not a special feature, much of the value of the cows is lost by imperfect and careless milking—the work of unscrupulous servants.

In the successful management of milk, butter, and cheese, much depends upon the dairy itself. It should have, if practicable, a northern exposure. Proximity to sewers, pig-sties, or any offensive smells, must be sedulously avoided. Stone and lime are the best materials. The walls may be advantageously lined with a skirting of brick, or, where the cost is not objected to, with white glazed tiles. A lofty roof and free ventilation must be provided, with windows looking north. A double door is advisable—a light sparred one placed inside, useful in summer for freely admitting plenty of air; and a solid, well-fitting, boarded one, removable in summer, and necessary for keeping out the winter cold. The temperature of the dairy may be further moderated, in hot weather, by allowing a stream of cold water to trickle slowly over the floor, or, better still, round the milk-vessels, placed in large vats, and by hanging throughout the room coarse calico saturated with water several times a day. In winter, hot-water pipes, closed doors, windows protected by straw, and such other appliances, must be resorted to for the maintenance of the desirable temperature of from 50° to 56°. Further to insure an equable temperature, it is advisable to shelter the building with trees and shrubs, and, if possible, have it 4 or 5 ft. below the level of the ground. No animal food, drying clothes, or indeed anything else, except milk, butter, and newly made cheese, should ever enter its walls. To remove any acidity or noxious emanations, charcoal-powder is sometimes kept strewed on the shelves. An annual whitewashing of roof and walls

helps to cleanse and purify. Daily must the floor and shelves be thoroughly scrubbed and washed, and not a drop of spilled milk allowed to remain for many minutes unremoved. By far the neatest and best shelves are of stone or slate, 2½ ft. wide, raised on stout iron rods about 2 ft. from the bricked or paved floor. The dishes are best made of earthenware, or oak lined with lead. Where many cows are kept, these last may be conveniently made 3 ft. wide, and 4 or 5 ft. long. They will thus project 6 in. over the shelf, and should be provided with a brass plug, by which the milk, when skimmed, can be drawn off without moving the vessels. These, and the milk-buckets, and, indeed, every article that comes in contact with milk or butter, must be kept scrupulously clean. Immediately after use, they should be rinsed out with cold water, and then with hot; wooden and metal articles well scoured with a scrubber, again washed, or, where practicable, dipped into a boiler amongst scalding water, and then set aside for several hours to dry, air, and sweeten. For scrubbing purposes, a small, tightly girded bunch of mountain heath, where such can be had, is best adapted, and failing it, a wisp of strong straw. These should be changed frequently. Indeed, the comparatively short period of their duration is a guarantee for that. Inattention to the proper cleaning and scouring of the dishes, especially in sultry weather, is sure to be marked by sour milk. Upon many farm homesteads in Scotland, loss is occasioned by the unsatisfactory condition in which the dairies are kept.

The milk, when brought into the dairy, is run through a wire-gauze or horse-hair strainer, into the vessels above described. To encourage the rapid rise of the cream, the layer of milk should be shallow, especially in summer. At the end of 12 or 24 hours, the cream is carefully removed; and in cool weather the milk may stand for another 12 or 24 hours, when it is again skimmed, the residue going to the pigs or calves. The cream removed at the first skimming is always richest and best; and where it is desired that the butter should be first rate, any subsequent skimmings may be kept separate, and churned by themselves. Churning at short intervals of twice or thrice a week is preferable to allowing the cream to stand for a longer period. Every time cream is added, the contents of the tank or cistern are well stirred, and a little salt added, unless, as in Scotland, where the butter is liked perfectly fresh. The cream should be kept as cool as possible, especially during the several hours preceding churning. For this end, in very hot weather, the cream-tank is sometimes lowered into a conveniently deep well, or placed for several hours in a water-cistern or under a running tap. In such weather, the churning, which generally occupies from 30 to 40 minutes, should be done at night, the butter laid in brine, and made up early next morning. When the whole milk is kept for churning, care must be taken never to add new milk to that which has already been sour. Cheese-making (see CHEESE) was a laborious process. Now, however, by the establishment of dairy factories in America, and latterly in England, much of the manual labor is saved. The factories have been very successful in America, where they are carried on to a great extent, and with advantageous results to all concerned. On the same principle, two have existed in Derbyshire for several years.

Railway communication has greatly extended, improved, and even cheapened the dairy supplies of London and other large towns. The night and early morning trains now carry thither from distances of 60, 80, or 100 m., quantities of butter and milk, the latter in large tins, which in hot weather are usually covered with wetted calico to promote evaporation, and thus keep the milk cool and sweet. The sale of the sweet-milk is found to pay better than the making either of butter or cheese. Quantity rather than quality of milk is usually the main requirement, and a liberal amount of soft succulent food is accordingly used. In London, Edinburgh, Glasgow, and other large towns, the cow proprietors do not rear their own cows, and dependent as they are on the ordinary cow market, they often buy animals which they do not find it advisable to keep long. They put a great many through their hands. For the most part of the year they are necessarily stall-fed, the dietary consisting of cut grass, various sorts of early roots, and distillers' or brewers' draft and wash. This sloppy sort of food produces a great quantity of milk, which is the main desideratum. The grass raised from town-sewerage irrigation has latterly been given extensively to city dairymen's cows. The milk from cows fed on this grass has been blamed for engendering typhoid fever. Whether it is blameworthy or not is a point that has not as yet been set at rest.

Statistics show that the united kingdom is gradually becoming more dependent on foreign supplies of dairy produce. In 1856, 513,392 cwt. of butter were imported; and in 1875, the quantity had increased to 1,467,183 cwts. Cheese shows an even greater increase in the same period, the quantity imported in 1856 being 407,076 cwts., and in 1875, 1,626,413 cwts. To add to the significance of the statistics, the exports from Great Britain indicate a decrease. The butter exported in 1856 reached 139,548 cwts.; and in 1875, 39,281 cwts. Cheese exported in 1856, 39,545 cwts.; and in 1875, 21,428 cwts.

For further information, the reader is referred to the following works: *Dairy Farming*, by John C. Morton; *Dairy Management*, by J. Horsfall, being a republication of the papers above alluded to (Ridgway); *Dairy Management*, by Mrs. Scott (Blackwood); articles on Dairy Management in Morton's *Cyclopædia of Agriculture;* and Stephens' *Book of the Farm.*

DA'IS (Fr.). This term was used with considerable latitude by mediæval writers. Its most usual significations are the following: 1. A canopy over an altar, shrine, font, throne, stall, chair, statue, or the like. The term was applied to the canopy without regard to the materials of which it was composed, which might be cloth, wood, stone, metal, or other substance. 2. The chief seat at the high table in a hall, with the canopy which covered it, from which probably the word in all its significations was introduced, its French meaning being a canopy. 3. The high table itself. 4. The raised portion of the floor, or *estrade*, on which the high table stood, and by which the upper was divided from the lower portion of the hall; and 5. A cloth of state for covering a throne or table. In old writings, the word occasionally takes the form of *dois*, and more rarely that of *dez* or *detz*.

DAI'SY, *Bellis*, a genus of plants of the natural order *compositæ*, sub-order *corymbiferæ*. The common D. (*B. perennis*), plentiful throughout Europe, flowers almost all the year in pastures, meadows, and grassy places. What are called double varieties, with flowers of various and often brilliant colors, are very commonly cultivated in gardens, the flowers consisting entirely of florets of the ray. A variety called the *hen-and-chickens, D.*, frequent in cottage-gardens, has the flower (head of flowers) surrounded by smaller ones, the short stems of which grow from the summit of the *scape* or leafless stem. The D. (*gowan* of the Scotch) has long been a favorite with poets and lovers of nature, characteristic as it is of many of the fairest summer scenes, its blossoms gemming the pastures, and recommended also by its frequent appearance during the severer seasons of the year. Its flowers close at night. It is not found in America. A species of *bellis* is, however, found in the United States (*B. integrifolia*), but it is confined to Tennessee, Arkansas, and the neighboring regions. Europe produces some species unknown in Britain, but of little interest; and species of the nearly allied genus *bellium* are also found in the s. of Europe. In the days of chivalry, the D. was the emblem of fidelity in love, and was frequently borne at tournaments both by knights and ladies.

DAISY, MICHAELMAS. See ASTER.

DAKO'TA, or DACO'TAH (so called from the Dacotah Indians or Dacoits—see SIOUX), a territory of the United States, bounded by Minnesota on the e., Nebraska on the s., Montana and Wyoming on the w., and the British possessions on the north. It was formerly part of the territory of Minnesota, but was detached when that became a state. D. is in length 414 m., its average breadth is about 360 miles, and it has an area of 150,932 sq. miles. The territory is watered by the Missouri and its branches. D. includes open grassy plains, high rolling prairies, and abounds in game furnishing valuable furs. The land is fertile and well timbered, and is rich in coal and other minerals. The N. Pacific Railway runs across D. from e. to west. The territory was only organized in 1860, and the population (in 1870, 14,181) is rapidly increasing.

DAKOTA (*ante*) (meaning "leagued" or "allied," with reference to confederate Sioux tribes), a territority of the United States, organized 1861, bounded e. by Minnesota and Iowa, s. by Nebraska, w. by Wyoming and Montana, and n. by British America. Dakota lies between 43° and 49°n. and about 97° to 104°w., and has an area of 150,932 sq.m. In length Dakota is 414 m., and in breadth 360. The surface n. and e. of the Missouri river is in the main rolling prairie, in which are many streams and lakes, but no swamps or marshes. A single plateau (Coteau des Prairies), having an elevation of 1450 ft. above tide, runs along the e. margin of the territory more than 200 m., with a width varying from 15 to 20 m.; and in the middle and in the n. portion there is a similar though smaller elevated region. There are no mountains in Dakota the Black hills in the s.w. corner being the most important elevations. These hills, extending into Wyoming, cover about 6,000 sq.m., and their bases are nearly 3,000 ft. above tide; the highest peaks are under 7,000 feet. In the basin of the Red river of the North there are vast plains covered with grass affording pasturage and winter feed in abundance. In the Black hills region there are extensive forests of pine and other useful timber, and in nearly all sections there is timber enough for the ordinary demands of settlers. In the s. and s.w. between the Big Cheyenne and White rivers is a large tract called the "Bad Lands" (*Mauvais Terres*), entirely barren, and furrowed into countless forms by the action of water upon the blue-clay formation. Over the plateaus and prairies are scattered isolated buttes (summits) from 500 to 1500 ft. high.

The Missouri river divides Dakota into nearly equal parts, coming in from the n.w. at about 48° n. and 104° w., and passing out at the extreme s.e. corner, forming the southern boundary for about 100 m. In its course through Dakota the Missouri receives from the w. the Yellowstone, Little Missouri, Big Knife, Heart, Grand, Moreau, Big Cheyenne, White, and Niobrara rivers; from the n. and e. it gets Little Muddy, White Earth, Beaver, Little Cheyenne, Dakota, Vermilion, and Big Sioux. On the e. border of Dakota rise the head-waters of the Minnesota, an affluent of the Mississippi; and the n.e. part of the territory is drained by the Red river of the North and its tributaries, the main river forming more than half the eastern boundary. This river is navigable for about 200 m. in Dakota, and the Missouri is navigable throughout. Dakota is remarkable for the great number of lakes in the eastern half of its territory. The

Mini Wakan, or Devil's lake, is the largest, covering more than 250,000 acres; others of considerable size are Thompson, Long, Traverse, Big Stone, Turtle, Wood, Tchanikanah, and Pembina. In temperature, Dakota, though very cold in winter, is on the whole favorable for agriculture. In the n. the winters are long, but all crops except Indian corn ripen easily. In the s. the climate is delightful, and the usual crops and small fruits are easily raised. Agriculture is the chief industry, but some manufactures are already established.

A century ago all these northern and western regions were the resort of fur traders, trappers, and hunters, and the business of fur hunting is still important. In the n. portion of Dakota, buffalo, elk, moose, and deer are found; also black and cinnamon bears, wolves, lynxes, badgers, wolverines, foxes, prairie dogs, rabbits, gophers, and squirrels. Birds are abundant in a great variety of species, and the waters are well supplied with fish.

Yankton, on the Missouri river at the extreme s. border of Dakota, is the capital, and the largest town; Pembina, 425 m. directly n. of Yankton, and on the boundary between Dakota and Manitoba, is the oldest town and one of the most important. Until the settlement of the boundary between the United States and British America, it was, under English rule, the center of the famous Selkirk settlement. There are several important military posts on the w. frontiers of Dakota. Indian reservations take up about 60,000 sq.m. of the territory. The Yankton Sioux has 625 sq.m.; the Sisseton, 2,000 sq.m.; the Sioux, in all, 40,000 sq.m.; the Poncas, 900 s.m.; and the Arickarees, Mandans, and Gros Ventres, 13,500 sq.m.

At the beginning of 1879 there were five railroads in operation or in progress—the Northern Pacific, from Bismark to Duluth, Minn., 195½ m.; Dakota Southern, from Sioux City to Yankton, 55¾ m.; Winona and St. Peter, from lake Kampeska to Winona, Minn., 38½ m.; Sioux City and Pembina, from Pembina to Beloit, Iowa, 15¾ m.; Worthington and Sioux Falls, from Sioux Falls to Sioux Falls Junction, Minn., 15 miles.

In 1878, the territory had 10,459 children of school age (5 to 20 years), of whom 5,410 were enrolled, with 257 teachers, and $32,804 yearly cost of schools. (For latest statistics, see Appendix.)

DAKOTA, a co. in s.e. Minnesota, on the Mississippi, intersected by four or five railroads; 550 sq.m.; pop. '80, 17,391. The productions are chiefly agricultural, and the soil fertile. Co. seat, Hastings.

DAKOTA, a co. in n.e. Nebraska, bordering on Dakota and Iowa, and bounded e. by the Missouri; 400 sq.m.; pop. '80, 3,213. The surface is rolling prairie, and the soil fertile. Co. seat, Dakota.

DAKOTA RIVER (also called JAMES river), a stream of Dakota territory, of about 600 m. length, emptying into the Missouri below Yankton.

DAKOTAS, North American Indians residing or wandering between the Mississippi and the Rocky mountains. They believe that their ancestors came eastward from the Pacific, and their language is said to resemble Mongolian. They have had many wars with the Algonquins and the Illinois. At present they form a dozen tribes, known as Osages, the Poncas, the Iowas, etc.

DALAI'-LA'MA. See LAMAISM.

DALAMOW, a city of Oude, on the left bank of the Ganges, in lat. 26° 4′ n., and long. 81° 7′ east. It is 68 m. above Allahabad. Pop. '71, 5,654, of whom only 250 are said to be Mohammedans. D. has long been regarded as a holy place in connection with its sacred river, having two antique temples of Siva on the margin of the stream, and an ancient ghat or stair for aiding the ritual ablutions of the pilgrims.

DALARADIA, the ancient name of a territory in Ireland which comprehended what is now the southern half of the county of Antrim, and the greater part of the county of Down. It was sometimes also called *Cric na Cruithne*, "the region of the Picts," from the Irish name of its inhabitants, otherwise called the Dal Araidhe, "the race of Fiacha Araidhe," a chief or prince of Ulster, who is said to have lived about 236 A.D. The name continued in use till the end of the 12th century. It must not be confounded with Dalriada (q.v.).

DAL'BERG (formerly, DALBURG), the name of an ancient and noble German family, of which several members held, by hereditary right derived from the oldest times of the middle ages, the office of chamberlain to the archbishopric of Worms. So great was the renown of the D. family, that at every coronation of a German emperor the royal herald exclaimed: "Is there no Dalberg here?" whereupon the representative of the family kneeled, and received from the new emperor the dignity of "first knight of the empire." Several members of this family have been celebrated as patrons of literature and art, of whom the most distinguished is

DALBERG, KARL THEODOR, BARON VON, Chamberlain of Worms, and archbishop of Regensburg, b. at Hernsheim, Feb. 8, 1744. He studied at Göttingen and Heidelberg, and, after some time passed in travel, devoted himself to the church. At Erfurt, of which he was appointed governor, 1772, he was active and generous as a patron of literature and art, and also contributed greatly to the social and commercial welfare of the

little state placed under his control. After holding several high offices in the church, D. was sent to Paris (1804), in order to assist in adjusting several ecclesiastical affairs with Napoleon and pope Pius VII. He died at Regensburg, Feb. 10, 1817. D. was as highly respected as a ruler and a scholar as for his private character. During his whole life, he cultivated the friendship of those eminent in literature and art, such as Goethe, Schiller, Wieland, etc. His writings—marked by sound learning and eloquence of style—include a treatise *On the Influence of the Arts and Sciences on Social Order* (1793), and *Pericles, or the Influence of the Fine Arts on the Public Welfare* (1806). These were his favorite objects of study; but natural history, chemistry, botany, mineralogy, and agriculture, also engaged his attention.

DALBER'GIA, a genus of trees and climbing shrubs of the natural order *leguminosæ*, sub-order *papilionaceæ*, having a stalked membranous pod, which is flat, tapers to both ends, and contains 1 to 3 flat seeds. The leaves are pinnate, with a terminal leaflet. All the species are natives of warm climates. Some of them are valuable timber-trees, particularly the Sissoo of Bengal (*D. sissoo*), much prized, and more extensively used in the n. of India than any other timber-tree except the sal (q v.). *D. monetaria*, a native of Surinam, yields a resin very similar to dragon's blood.

DALE, a co. in s.e. Alabama, on the Choctawhatchee river; formerly (until divided) 900 sq.m.; pop. '80, 12,677—2,121 colored. It is a sandy and unproductive region. Co. seat, Newton.

DALE, David, 1739–1806; a Scottish manufacturer who secured the use of Arkwright's spinning patent, and founded the New Lanark mills, and subsequently other important establishments, becoming very rich, and noted for benevolence. Robert Owen married his daughter and succeeded him in the Lanark mills. Dale was the pastor of a church in which grew up a peculiar sect of Scotch independents who called themselves "Dalites."

DALE, Richard, 1756–1826; an American naval officer, who, after joining the English service in the beginning of the revolution, went over to his own country and served under Paul Jones. He was several times taken prisoner. After independence he was appointed captain, and had command of the squadron sent against Tripoli. He resigned in 1802.

DALECAR'LIA, or Dalarné (signifying "valley-country"), an old province of Sweden, now forming the län or county of Fahlun or Falun (q.v.). The Dalecarlians are celebrated for the part they took under Gustavus Vasa in freeing their country from the yoke of Christian II. of Denmark.

DALGAR'NO, George, an almost forgotten but very able author, was b. at Aberdeen about 1626, studied at Marischal college, and afterwards kept a school in Oxford for 30 years, where he d. Aug. 28, 1687. He deserves to be remembered for two remarkable works—the *Ars Signorum, Vulgo Character Universalis et Lingua Philosophica* (Lond. 1661); and *Didascalocophus, or the Deaf and Dumb Man's Tutor* (Oxf. 1680). The former is a very ingenious attempt to represent and classify ideas by specific arbitrary characters irrespective of words. It contains the germs of bishop Wilkins' subsequent speculations on a "real character and a philosophical language." Leibnitz has repeatedly alluded to it in complimentary terms. The latter work has for its design, "to bring the way of teaching a deaf man to read and write, as near as possible to that of teaching young ones to speak and understand their mother-tongue." D. has the great merit of having anticipated, by more than 130 years, some of the most profound conclusions of the present age respecting the education of the deaf and dumb.

DALHOU'SIE, Marquis of, James Andrew Broun-Ramsay, Gov.gen. of India, third son of the ninth earl of D., was b. April 22, 1812, at Dalhousie castle, Midlothian. He was educated at Harrow, and graduated at Christ church, Oxford. In 1832, by the death of his only remaining brother, he succeeded to the honorary title of lord Ramsay. In 1835, he contested the representation of Edinburgh, in the conservative interest, against the Whig candidates, sir John Campbell, afterwards lord Campbell, and Mr. Abercromby. He bore his defeat with great good-humor. In 1836, he married the eldest daughter of the eighth marquis of Tweeddale; in 1837, was elected for Haddingtonshire. On the death of his father, in 1838, he succeeded to the earldom of D., and became a member of the upper house. In 1843, he was appointed, by sir Robert Peel, vice-president of the board of trade, and in 1845, succeeded Mr. Gladstone as president of the board. The "railway mania" threw an immense amount of labor and responsibility upon his department; but the energy, industry, and administrative ability he displayed in his office, no less than his readiness and fluency in parliament, marked him out for the highest offices in the state. When sir Robert Peel resigned office in 1846, lord John Russell, who succeeded him, paid the earl of D. the rare compliment of asking him to remain at the board of trade, in order to carry out the regulations he had framed for railway legislation and intercommunication. In 1847, he was appointed gov.gen. of India, as successor to lord Hardinge, and arrived in Calcutta, Jan. 12, 1848—the youngest gov.gen. ever sent to that country. His Indian administration was not less splendid and successful, in regard to the acquisition of territory, than in the means he adopted for developing the resources of the country and improving the administra-

sion of the East Indian government. Pegu and the Punjab were conquered; Nagpore, Oude, Sattara, Jhansi, and Berar were annexed—altogether, four great kingdoms, besides a number of minor principalities, were added to the dominions of the queen under his governor-generalship. Railways on a colossal scale were planned, and partly commenced; 4,000 m. of electric telegraph were spread over India; 2,000 m. of road between Calcutta and Peshawur were bridged and metaled; the Ganges canal, the largest of the kind in the world, was opened; the Punjab canal was undertaken; important works of irrigation all over India were planned and executed; and the official department of public works were reorganized. Among other incidents of his beneficent administration may be cited the permission to Hindu widows to marry again; relief to persons of all sects from the risk of forfeiting property by a change of religion; the improvement of education and of prison-discipline; the organization of the legislative council; the improved training of the civil service, covenanted and uncovenanted; and the reform in the postal service of India, whereby a letter from Peshawur to cape Comorin, or from Assam to Kurrachee, is now conveyed for three farthings, or $\frac{1}{16}$th of the old charge. These, and many other achievements of his Indian administration, will be found in a minute which he drew up on resigning office, in which he reviewed, with pardonable pride, the events of his eight years' governor-generalship. His constitution had never been strong, and it gave way under the incessant labor and responsibility imposed upon him by his noble ambition. Meanwhile, honors had been showered upon him by his queen and country with no sparing hand: in 1848, he was made a knight of the Scottish order of the Thistle; in 1849, he received the marquisate, the thanks of both houses of parliament and of the East India Company, for the "zeal and ability" displayed in administering the resources of British India in the contest with the Sikhs, immediately previous to the annexation of the Punjab; in 1852, on the death of the duke of Wellington, he was nominated by the then prime minister, the earl of Derby, to the office of constable of her majesty's castle of Dover, and lord warden of the cinque ports. D. sailed from Calcutta in Mar., 1856. On his arrival in England, he was unable to take his seat in the house of lords; and the remainder of his days was spent in much physical suffering and prostration of strength. On the 19th Dec., 1860, he died at Dalhousie castle, in his 48th year, leaving behind him a name that ranks among the highest in the roll of Indian viceroys for statesmanship, administrative vigor, and the faculty of inspiring confidence among the millions subjected to his sway. As he died without male issue, his title of marquis became extinct on his death, the earldom of D. and other Scottish honors reverting to his cousin, baron Panmure, who died in 1875.

DA'LIAS, a t. of Spain, situated in the province of Almeria, 20 m. w.s.w. of the city of that name, and about 4 m. from the Mediterranean. It is badly and irregularly built, and is subject to earthquakes. Pop. 9,000, who are employed chiefly in mining, smelting, and fishing.

DA'LIAS, a t. of Andalusia, Spain, in the province of Almeria, and 18 m. w.s.w. from Almeria, about 9 m. from the Mediterranean, on a small river, which is navigable for boats up to the town. The immediate neighborhood is a dreary sandy plain; but not far off are mountains containing lead and antimony mines, which afford employment to many of the inhabitants of the town. Husbandry and fishing are the other principal occupations. The streets are mostly irregular, and the town is ill built. It suffered considerably from an earthquake in 1804. Near D., on the sea-side, are mineral baths, much frequented. Pop. 9,000.

DALIN, Olof von, 1708–63; a Swedish poet, who, at the age of 24, began his literary career by starting the *Argus*, a journal in imitation of Addison's *Spectator*. He published a vast number of sketches, poems, etc. In 1756, he was tutor to the crown prince, and was arrested and tried on suspicion of having taken part in the attempted revolution of that year. He was acquitted, but was exiled for five years. He was afterwards ennobled and made a privy-councilor. His great work was a *History of the Swedish Kingdom.*

DALKEITH', a burgh of barony, 6 m. s.e. of Edinburgh, stands near the junction of the North and South Esk, and is a station of the North British railway. It chiefly consists of one main street. Pop. '71, 6,386. It has one of the largest corn-markets in Scotland; has a large and commodious market-hall, erected in 1854; manufactures of brushes, woolens, and hats, besides iron-foundries, tanneries, and coal-works. D. arose round an ancient castle, which was long a great stronghold. The regality of D. was successively held by the Grahams, the Douglases, the earls of Morton, and the earls of Buccleuch—the latter having bought it from the Mortons in 1642. During the minority of James VI., D. castle was the chief residence of the regent Morton; hence it was called the Lion's Den. Gen. Monk lived in it during his government of Scotland under Cromwell. Dalkeith palace, the chief seat of the duke of Buccleuch and Queensberry, built about 1700 on the site of the old castle, is a large square structure overhanging the North Esk, amid fine grounds, in which the two Esks flow and unite. There are about a dozen places of public worship. Besides the old parish church, there is another, a fine cruciform structure in the early English style, built (1840) and endowed by the duke of Buccleuch. An Episcopal chapel stands within the palace grounds. D.

possesses several good public and private schools. The Dalkeith union workhouse, opened in 1849, was the first of such houses in Scotland. The town has much improved during the last 30 years, and is becoming gradually more extensive.

DALKISSORE, a river of Bengal proper, joins the Hoogly from the right at Diamond harbor, about 30 m. below Calcutta. It has a s.e. course of about 170 m., rising in lat. 23° 30′ n., and long. 86° 34′ east. In its lower section, the D. assumes the name of the Roopnerain. That channel of the Hoogly which receives the Roopnerain, has of late years become silted up through the same cause to which the adjacent delta owes its existence, so as to be now frequented only by native craft. Nor does it, on other grounds, afford a desirable passage upwards, for as the tide sets strongly into the Roopnerain, as offering less resistance to its progress, many vessels bound to Calcutta have been swept up the shallow estuary, and lost.

DALLAS, a co. in s.w. Alabama intersected by the Alabama river and two railroads; 890 sq.m.; pop '80, 48,437—40,012 colored. The chief productions are corn and cotton. Co. seat, Cahawba.

DALLAS, a co. in central Arkansas, on Saline river; 700 sq.m.; pop. '80, 6,507—2,207 colored. The chief productions are agricultural. Co. seat, Princeton.

DALLAS, a co. in central Iowa intersected by two railroads; 576 sq.m.; pop. '80, 18,746. Agriculture is the chief business. Co. seat, Adell.

DALLAS, a co. in central Missouri; mostly wild land; 576 sq.m.; pop. '80, 9,272—88 colored. Productions, agricultural. Co. seat, Buffalo.

DALLAS, a co. in n.e. Texas, drained by Trinity river; 900 sq.m.; pop. '80, 33,490—4,965 colored. It is fertile, well watered, and with good timber. Agriculture is the main business. Co. seat, Dallas.

DALLAS, ALEXANDER JAMES, 1759–1817; born in the island of Jamaica, died in Trenton, New Jersey; a lawyer of Pennsylvania and author of reports on law cases and decisions. He was the projector of the United States bank at the time when the nation was in great trouble about currency to carry on the war with England. He was also secretary of the treasury, and acting secretary of war, superintending the reduction of the army after peace.

DAL'LAS, GEORGE MIFFLIN, an American statesman and diplomatist, was b. at Philadelphia, July 10, 1792. He was educated at Princeton college, where he graduated with high honors in 1810. Soon after he was called to the American bar, he accompanied Mr. Gallatin in his special embassy to St. Petersburg as private secretary. On his return, he resumed the practice of the law, and successively filled the offices of deputy of the attorney-general of Philadelphia, mayor of Philadelphia, and district-attorney of Philadelphia, an office which his father had held. In 1831, he represented Pennsylvania in the senate of the United States, but after two years retired, and resumed his profession. In 1837, he was appointed American minister at St. Petersburg, but was recalled in 1839. In 1844, he was elected vice-president of the United States, and held this office until 1849. In 1856, he succeeded Mr. Buchanan as American minister at the court of St. James. He was empowered to settle the Central American question; but shortly after his arrival, a dispute between the two governments, arising out of the dismissal of Mr. Crampton, the British minister at Washington, by the president of the United States, threatened to bring the diplomatic mission of D. to a premature termination. Through the forbearance of lord Palmerston, he was, however, permitted to remain, and discharged the duties of American minister until 1861, when he was succeeded by Mr. C. F. Adams. In person, he was tall, and of venerable aspect. He diligently studied the politics and institutions of the mother-country, and during his embassy assiduously attended the debates in both houses of parliament. He died in 1864

DALLES, romantic and perilous rapids on the Columbia or Oregon, form, along with the chutes above them and the cascades below them, an almost continuous interruption between the tide-water of the river and its long reach—about 400 m.—of comparatively practicable navigation towards the interior. They are subdivided, reckoning downwards, into the Little D. and the D. proper. On the latter, the basaltic rocks, which, from a considerable distance above, bound the channel, suddenly confine the stream to one third of its width, with a perpendicular wall on either side; while the damming up of the plunging surges fearfully aggravates the difficulties and dangers of the descent.

DALLES CITY, or THE DALLES, the co. seat of Wasco co., Oregon, on the Columbia river, 120 m. e. of Portland. Pop. '70, 942.

DALLING AND BULWER, Baron. See BULWER, SIR HENRY LYTTON, *ante*.

DALL' ONGARO, FRANCESCO, 1808–73; an Italian poet and dramatic author. He aided in organizing the Garibaldi legion in Rome, and on the capture of the city by the French he went to Ancona, and afterwards to Switzerland. From the latter refuge he was expelled, and spent four years in Belgium. Some years afterwards he returned to Italy and became professor of literature in Milan and Naples. He became noted as a writer of works of fiction.

DALMA'TIA, a narrow strip of territory, extending along the Adriatic sea, and bounded on the n. by Croatia, on the e. by Bosnia, Herzegovina, and Montenegro. Lat. 42° 15′ to 44° 54′ n., long. 14° 30′ to 19° e. It forms, with its adjacent islands, the most southern crownland of the Austrian empire. Area, 4,881 sq.m.; pop. '69, 456,961. The coast of D. is everywhere steep and rocky; and the adjacent series of islands, divided by picturesque straits and channels, are of a like character. Numerous bays intersecting the coast form excellent havens and landing-places. Offsets from the Dinaric Alps traverse the interior, and attain in Mt. Orien, the highest culminating point, an elevation of 6,332 ft.; the Velebich mountains, separating D. from Croatia, and which belong to the Julian Alps, have a height of more than 5,000 ft. The mountains of D., for the most part composed of limestone, present a bleak and barren aspect, with many romantic chasms and fissures, through which dash impetuous mountain-streams. The chief rivers —none of which, however, are of any importance—are the Zermagna, Kerka, Cettina, and Narenta, the second and third of which are broken in several places by beautiful cascades and falls. The lakes are numerous, but, with the exception of Lake Vrana —which is separated from the Adriatic by only a narrow tongue of land, and the waters of which are brackish—they are periodical, drying up in summer, and filling their beds in late autumn. A large part of the whole area of D. consists of moor and morass, yet in summer there is often a great scarcity of water. The climate is in general warmer than that of any other part of Austria, the African sirocco being occasionally felt on its shores. The minerals are limestone, coal, gypsum, etc. Agriculture is in a backward state. About one ninth of the land is arable, and produces wheat, barley, oats, maize, rye, and potatoes. Wine and olives are also produced. More than half of the land is in pasture, and wood occupies about a fifth. The islands are not very fertile, but supply good timber for ship-building. Cattle-rearing, sea-faring, and the fisheries on the coast, are the chief kinds of industry. The live-stock in 1872 consisted of 673,600 sheep, 280,650 goats, 6,000 mules, 16,000 asses, 17,000 horses, and 26,300 pigs. The annual value of the exports and imports is £1,500,000. The exports consist principally of wine, oil, brandy, hides, wool, wax, honey, and fruits. Of the whole population it is computed that about 55,000 are Italians, 1000 Albanians, 1000 Germans, 500 Jews, and the remainder consists of southern Slavonians—chiefly Dalmatians and Morlaks. The Dalmatians are a fine race of men—bold and brave as seamen and soldiers—and formerly were the main support of the military power of Venice. But it must be added that they are deceitful and rapacious, while the love of independence is extreme. They speak the Illyrian-Servian or Herzegovinian dialect; but the language used in the govenment offices, especially in Spalatro, is the Italian. The Morlaks—who inhabit the interior, the mountainous district, and the Turkish sanjak of Hersek—are also good soldiers, hospitable and faithful to their engagements, lovers of independence, but it is said they are addicted to robbery and drunkenness. D. is divided into four circles—Zara, Spalatro (or Spalato), Ragusa, and Cattaro. These are also the names of the chief towns.

In ancient times, D. was a considerable kingdom, and, after many unsuccessful attempts, was first subjugated by the Romans in the time of Augustus. After the fall of the western empire, D., which had formed the most southern part of the province Illyricum, was captured by the Goths, from whom it was taken by the Avari (490), who in their turn yielded it to the Slavonians about 620. The state founded by the Slavonians continued until the beginning of the 11th c., when king Ladislaus of Hungary incorporated a part of D. with Croatia, while the other part, with title of duchy, placed itself under the protection of the Venetian republic. The Turks afterwards made themselves masters of a small portion; and by the peace of Campo-Formio (1797), the Venetian part of D., with Venice itself, became subject to Austrian rule; and when Austria, in 1805, had ceded this part of D. to Napoleon, it was annexed to the kingdom of Italy; afterwards (1810) to Illyria. Since 1814, D. forms part of Austria; the commune of Spizza being added by the congress of Berlin in 1878.

DALMAT'IC (*dalmatica*), the deacon's robe, in the Roman Catholic church. It was originally of linen, but it is now generally made of the same heavy silk as the planeta (q.v.), worn by the priest.

DAL'RIADA, the ancient name of a territory in Ireland, comprehending what is now called "the Route," or the northern half of the county of Antrim. It signifies primarily, "the race of Riada;" and secondarily, "the country of the race of Riada," i.e., Cairbre Righfada, or "Cairbre of the Long Arm," the son of a chief or prince of the Scots in Ireland, and himself a warrior of note. He lived in the 3d c., and not only obtained an ascendency in the district of Ireland which came to be called after him, but, according to some writers, planted a colony of his Scottish countrymen on the shores of Argyleshire in Alba, or Albany, as Scotland was then called. It is certain that about 506 A.D. some of his descendants, led by Loarn, Fergus, and other sons of Eirc, son of Muinreamhar, passed over to Argyleshire, where they settled themselves permanently, and founded the kingdom of "Dalriada in Albany," or "the Scots in Britain." More than twenty kings of this state are enumerated before Kenneth MacAlpin, who, about 843, united under one scepter the Dairiads, or Scots, and the Picts, and thus became the first king of Albany, which about two centuries afterwards began to be known as Scotia or Scotland.

DAL'RIADS, or DALREUDI'NI, the inhabitants of Dalriada (q.v.).

DALRY', a t. of Ayrshire, Scotland, on the Garnock, near the mouth of the Rye, 20 m. S.W. of Glasgow; it is a station on the Glasgow and South-western railway. The vale of the Garnock is naturally beautiful and fertile; but its mineral wealth in coal, lime, and iron has recently caused a great change in its aspect, and it is much disfigured by blast-furnaces, etc., and by vast heaps of refuse from mines. D. was recently a small village, but has of late rapidly increased in population and importance in consequence of the establishment of iron-works at and near it. D. possesses also a large woolen mill, which gives employment to upwards of 400 hands. Pop. '51, 2,706; '61, 4,232; '71, 5,214. It is feared that the increase in population and prosperity will not long continue, as the ironstone is being rapidly exhausted.

DALRYM'PLE FAMILY, a very old and illustrious Scottish family, deriving its name from the lands of Dalrymple in Ayrshire. The principal members are:

DALRYMPLE, JAMES, VISCOUNT STAIR, a lawyer and statesman, son of a small proprietor in Ayrshire, was b. at Drummurchie, in the same county, May, 1619, educated at Glasgow university, and at an early age, entered the army raised in Scotland to repel the religious innovations of Charles I. But the bent of his mind lay towards civil and literary pursuits; and in 1641, he was appointed professor of philosophy at Glasgow. The use which he made of philosophy, however, was rather to aid him in basing law—his favorite study—on profound and comprehensive principles, than to add another metaphysical system to those already in existence. In short, his wish was to be a philosophic lawyer, rather than a philosopher. In 1648, he entered as an advocate at the Scotch bar, where he rapidly acquired great distinction; in 1649, and again in 1650, he was appointed secretary to the commissioners sent to Holland by the Scottish parliament to treat with Charles II.; and in 1657, was induced—but with difficulty—to become one of the "commissioners for the administration of justice" in Scotland under Cromwell's government. Dalrymple was a conscientious, but at the same time an exceedingly moderate and enlightened royalist; and although appointed one of the new Scotch judges after the restoration, he resigned his seat in 1663, because he could not take the "declaration" oath, which denied the right of the nation to take up arms against the king. His great talents, however, induced the monarch to accept his services on his own terms. Dalrymple was now created a baronet. In 1671, he became lord president of the court of session. As a member of the privy council he was invariably the advocate, though not always successfully, of moderate measures. In 1681, when the infamous "test" oath was under consideration, Dalrymple, with the dexterity of a lawyer, caused John Knox's confession of faith to be introduced as a part of the test; but as this confession inculcated resistance to tyranny as a duty, the one half of the test contradicted the other. Dalrymple's private conscience, however, was more fastidious than his public one, for he himself refused to take the very oath which, by his ingenuity, he had virtually deprived of its despotic character, and in consequence had to resign all his appointments. Before this, he had published the *Institutions of the Law of Scotland*, which is still the grand text-book of the Scotch lawyer. The disquisitions are both profound and luminous, characterized alike by their philosophic insight and their sound common sense. After some time spent on his estate in Wigtonshire, Dalrymple went to Holland in 1682, to escape the persecution to which he was subjected at home. During 1684–87, he published at Edinburgh—though he himself was then residing at Leyden—his *Decisions;* and in 1686, at Leyden, a philosophic work in Latin, entitled *Physiologia Nova Experimentalis.* He accompanied the prince of Orange on his expedition to England. When matters were prosperously settled, William re-appointed him lord president of the court of session, and elevated him to the peerage under the title of viscount Stair. He died 25th Nov., 1695.

DALRYMPLE, JOHN, eldest son of the preceding, held office under James II., and also under William III. While secretary of state for Scotland, he incurred great odium on account of his share in the barbarous transaction known as the "massacre of Glencoe." In 1703, he was elevated to the earldom of Stair. He died in 1707.—Sir JAMES DALRYMPLE, second son of viscount Stair, was the author of *Collections concerning Scottish History preceding the Death of David I.* (1705), and the grandfather of sir John Dalrymple of Cranstoun, author of *Memoirs of Great Britain and Ireland, from the Dissolution of the last Parliament of Charles II. until the Sea-battle off La Hogue.*—The other sons—Viscount Stair had altogether nine children, five sons and four daughters—were more or less distinguished.

DALRYMPLE, JOHN, second son of the first earl of Stair, and grandson of viscount Stair, was born at Edinburgh, July 20, 1673. He had the misfortune, while young, to kill his elder brother, by the accidental discharge of a pistol. This unhappy circumstance induced the parents, both for their own comfort and that of the boy himself, to educate him away from home. He was placed under the care of a clergyman in Ayrshire, who, by his prudence and kindness, soon developed the excellent qualities of the youth. Dalrymple afterwards went to Leyden, where he had the reputation of being one of the best scholars in the university. He completed his curriculum at Edinburgh. In 1701, he accepted a commission as lieut.-col. of the Scottish regiment of foot-guards, and gained the highest distinction in Marlborough's campaigns. When the accession of the

tory ministry, in 1711, put a stop to the brilliant career of the great duke, Dalrymple retired from the army. When George I. succeeded to the throne, Dalrymple—who had become earl of Stair by the death of his father in 1707—was made a lord of the bedchamber, a privy-councilor, and commander-in-chief of the forces of Scotland. Next year, he was sent as ambassador to France, in which capacity he exhibited the highest ability, and was of the greatest service in traversing the schemes for the reinstatement of the pretender; but as he refused to flatter his countryman, Law—notorious in connection with the fatal Mississippi scheme—who was then omnipotent in France, the government was mean enough to recall him. For 22 years he lived in retirement at Newliston, near Edinburgh, devoting himself chiefly to agriculture, which was then bgeinning to improve in Scotland. He was the first to plant turnips and cabbages in the open fields. In 1742, he was sent as ambassador to Holland, and in the following year served under George II., at the battle of Dettingen. Later, he was made commander-in-chief of the forces of Great Britain. He died in 1747. See *Annals, etc., of the Viscount and Earls of Stair*, by J. M. Graham (1875).

DALRYMPLE, SIR DAVID, a Scottish judge and historical antiquary, commonly known as lord Hailes, was b. at Edinburgh, 28th Oct., 1726. He was the grandson of sir David Dalrymple, youngest and reputedly the ablest son of viscount Stair. He was educated first at Eton, afterwards at Edinburgh, and finally at Leyden, whence he returned to Scotland in 1746. In 1748, he was called to the Scottish bar, where his success was highly respectable, but not astonishing. D. was a man of extensive culture and classical tastes, of sound judgment, and great industry, but a very indifferent orator; and, in consequence, men of far inferior powers often acquired a greater reputation and a more lucrative practice. In 1766, he was appointed one of the judges of the court of session, and assumed the title of lord Hailes, by which he is chiefly known to posterity. His accuracy, diligence, judicial impartiality, and dignified demeanor, secured him the highest respect in his new office. Ten years after, he was made a justiciary lord. He died 29th Nov., 1792.—Although D.'s official duties were very arduous, he found time to compose numerous works, surpassing in value those of many men whose lives have been wholly devoted to literature. We can afford to mention only a few: *A Discourse on the Gowrie Conspiracy* (1757); *Memorials and Letters relating to the History of Britain in the Reign of James I.* (1762), a curious and interesting volume; *The Works of the ever-memorable John Hailes of Eton, etc.* (1765); *Memorials and Letters relating to the History of Britain in the Reign of Charles I.* (1766); *Annals of Scotland from the Accession of Malcolm III., surnamed Canmore, to the Accession of Robert I.* (1776); and *Annals of Scotland from the Accession of Robert I., surnamed the Bruce, to the Accession of the House of Stuart* (1779). Besides these, D. wrote works on legal antiquities and ancient church history, edited old Scotch poems, and published sketches of the lives of various notable Scotchmen, as specimens of how a *Biographia Scotia* might be executed.

DALRYMPLE, ALEXANDER, F.R.S., F.S.A., younger brother of the preceding, was b. at New Hailes, the seat of his father, near Edinburgh, 24th July, 1737. In 1752, he obtained an appointment in the East India company's service; but his extreme youth, as well as the imperfect education he had received at home, rendered it necessary, on his reaching Madras, that he should be placed under the store-keeper for a time. Lord Pigot himself, at that time governor of the presidency, condescended to give him lessons in writing; but young D. having, unluckily for his own prospects, fallen upon some papers in the secretary's office relating to the commerce of the Eastern archipelago, became so engrossed with the importance of the subject, that, after some bickerings with his superiors, he relinquished his appointment, and made a voyage of observation among the eastern islands. At Sooloo, in the course of his expedition, he concluded a commercial treaty with the sultan, which might have led to beneficial results; but on his return in 1762, he found political affairs entirely changed, small-pox raging, and most of his influential friends dead. The scheme, in consequence, proved a failure. In 1765, he returned to Britain, to urge its importance on the home-authorities, but did not succeed. In 1775, however, he was sent out to Madras as a member of council, but was recalled in two years, apparently without good reason, for in 1779 he was appointed hydrographer to the East India company, and shortly after received a pension. In 1795, when the admiralty resolved to establish a similar office, it was conferred on D., who held it till within a short period of his death, which occurred 19th June, 1808, at Marylebone, London. D. wrote a vast number of letters, pamphlets, etc., containing plans for the promotion of British commerce in various parts of the world, political dissertations, accounts of geographical expeditions, etc. His library was rich in works of navigation and geography, all of which were purchased by the admiralty. His collection of poetry, also very valuable, was deposited in the library at New Hailes, as a family heirloom.

DALTON, a t. in Whitfield co., Ga., on the East Tennessee, Virginia and Georgia, the Western and Atlantic, and the Selma, Rome, and Dalton railroads, in a beautiful valley surrounded by mountains; pop. about 4,000—439 colored. It was a place of strategic importance during the rebellion.

DAL'TON, a t. of Furness, Lancashire, England, on a gentle acclivity, about 3½ m. from the sea, and 18 m. w.n.w. from Lancaster. It is connected by railway with the

railway-system in Lancashire on the one hand, and with that of Cumberland on the other. There are iron mines and foundries in the vicinity, and malting is carried on, but not to so great an extent as formerly. Near the town are the ruins of Furness abbey, founded in 1127 by Stephen, count of Boulogne, and afterwards king of England, for monks of the Cistercian order. Pop. of township (1871), 9,310.

DALTON, EDWARD BARRY, 1834–72; b. Mass.; a physician in California; graduated at Harvard, 1855, and at the New York college of physicians and surgeons, 1858. He served as medical director in the army of Virginia during the rebellion, and afterwards in the army of the Potomac. In 1866, he became sanitary superintendent of the New York board of health. He died in California. His medical reports are valuable.

DALTON, JOHN, was b. Sept. 5, 1766, at Eaglesfield, near Cockermouth, in Cumberland. He received his early education in the school of his native place, and, after 1781, in a boarding-school kept by a relative in Kendal. Here his love of mathematical and physical studies was first developed. He wrote several mathematical essays, and in 1788, commenced a journal of meteorological observations, which he continued throughout his whole life. In 1793, he was appointed teacher of mathematics and the physical sciences in the new college at Manchester, where he chiefly resided during the remainder of his life, though frequently employed, after 1804, in giving lectures on chemistry in several large towns. In the years 1808–10, he published his *New System of Chemical Philosophy*, 2 parts (Lond.), to which he added a third part in 1827. In 1817, he was appointed president of the literary and philosophical society at Manchester. He was also a member of the royal society, and of the Paris academy, and, in 1833, received a pension of £150, afterwards raised to £300. In the same year, D.'s friends and fellow-townsmen collected £2,000, to raise a statue to his honor, which was executed by Chantrey, and placed at the entrance of the royal institution in Manchester. D. was also honored by the university of Oxford with the degree of D.C.L., and with that of LL.D. by the university of Edinburgh. He died, universally respected, at Manchester, July 27, 1844. His chief physical researches were those on the constitution of mixed gases, on the force of steam, on the elasticity of vapors, and on the expansion of gases by heat. In chemistry, he distinguished himself by his progressive development of the atomic theory (q.v.), as also by his researches on the absorption of gases by water, on carbonic acid, carburetted hydrogen, etc. His treatises are mostly contained in the *Memoirs of the Literary and Philosophical Society of Manchester*, the *Philosophical Transactions*, Nicholson's *Philosophical Journal*, and Thomson's *Annals of Philosophy*. Besides these, we have his *Meteorological Essays and Observations* (Lond. 1793; 2d ed. 1834). D. was unquestionably one of the greatest chemists that any country has produced. Profound, patient, and intuitive, he had precisely the faculties requisite for a great scientific discoverer. His atomic theory elevated chemistry into a science. In his habits, D. was simple; in his manners, grave and reserved, but kindly, and distinguished by his truthfulness and integrity of character.

DALTON, JOHN C., b. Mass. 1825; Harvard, 1844 and 1847, M.D. First essay on *corpus luteum* prize of Am. Med. Ass., 1851; Prof. Buffalo, '51–54; Ver. Med. Coll., '54–'57; L. I. Hosp. '59–'61; Prof. Phys., Col. Phys. and Surg. 1855, and now continues. Has made many contributions to physiology. His principal book is a "Treatise on Human Physiology."

DALTONISM. See COLOR-BLINDNESS, *ante*.

DALY, CHARLES P., LL.D., b. New York city, 1816; for many years a leading jurist, being chief-justice of the court of common pleas. He has published *History of the Courts of New York*, and many legal papers of importance. He is president of the American geographical and statistical society, in which he has taken a deep interest.

DAM, TINKER'S, a guard of dough or clay placed by a tinker around a cavity to confine the melted metal until it "sets." It is worthless after use.

DAM (Fr. *barrage*), a barrier for raising the level of water in a stream, for the purpose of forming a reservoir, or for turning the water in another direction. Several dams are sometimes placed upon a water-course for the purpose of preventing too rapid an escape of water where it is needed for irrigation or for moving machinery. There is also a variety of dam called a coffer-dam, in which an inclosure is bounded by a barrier which prevents exterior water from entering, used generally for the purpose of excavation. Dams constructed for raising the level of water have an important use in the slack-water navigation of rivers. The materials which enter into the construction of dams differ according to circumstances. If the structure be required to bar a narrow gorge and a considerable stream, it must be made very strong, not only to withstand the hydrostatic pressure, but also the force of the current, which often, during freshets, becomes very great. The materials are then generally composed of a combination of wood-work and masonry. Masonry may be principally used when the gorge is so narrow as to allow of the construction of a sufficiently small horizontal arc to resist the pressure. When the dam is very long (across a wide stream), unless a vast amount of stone is used, wooden braces must be employed. Where the body of water to be restrained is not more than 4 or 5 ft. deep and the bottom is firm, a clay or stiff loam embankment 9 or 10 ft. thick, well compacted, will answer the purpose if a gate be provided to keep the water from flowing over the top of the embankment, which would

cause it to wear away. It is not always economy to build the dam in the narrowest part of a stream, or where the opposite banks nearest approach each other. This will often cause during a freshet too great a depth of running water over the dam, by which it may be endangered. A point should be selected where the dam can be made of sufficient width to allow the water to pour over it without piling up too much, and where the foundation is good. The line of a dam may be transverse or diagonal to the flow of water. The diagonal is sometimes of advantage in increasing the width of flow, but is liable to interfere with the bed of the stream below more than the transverse line. Where practicable, the form of an arc, the convexity fronting up stream, is the best; but a broken line may sometimes be employed to advantage, the angles pointing up stream acting as braces, while the angles pointing down stream may be held by natural rock formation or heavy masonry, strengthened by bracing. There are a great many large dams in the manufacturing districts of New England, and in freshets, the giving way of some of them through faulty construction, has caused great destruction of life and property.

An example of a well-constructed dam is at Holyoke, Mass., across the Connecticut river. It is 1017 ft. long and 30 ft. high. The braces are formed of large square timbers inclined 22° from the horizontal, with the lower ends bolted in the rock, and the upper ends sustaining timber frame-work. The canal for delivering the water, which is received by thirteen gates, is faced with masonry, and is 144 ft. wide at the top, and 22 ft. deep. It is said to be the best water motive-power utilized in the United States. A remarkable dam exists across the river Furens, in France, for protecting the town of St. Etienne from freshets, and also for supplying the town with water. It is 164 ft. high, and 328 ft. wide at the top. The excavations for the foundation were very great and expensive, and the dam was constructed entirely of masonry, the stone laid not in tiers, but so as to produce a unity of mass, and with hydraulic cement, which is the mortar always used. The pressure of the contained water, at the depth of 154 ft., as much as 67 lbs. to the square inch, has sometimes been sufficient on this dam to force water through the pores of the material. In India, dams are constructed for purposes of irrigation, and some of them are of enormous magnitude. One of the longest is on the Godavery river at Dowlaisweram. Its total length is 4,872 feet.

A good example of the mode of constructing a coffer-dam under great difficulties, on account of quicksand bottom, was furnished in the work preliminary to the building of the dry-dock at the Brooklyn navy-yard. There was over 60 ft. of utterly unstable micaceous sand below the mud at the bottom of the river. This of course, under so great pressure, would flow almost like water itself. The area required to be excavated through this material was over two acres at the top and one acre at the bottom, which was 37 ft. below mean high water. The first attempt was a failure, and longer and stronger piles were then used, filled between with stone and coarse gravel. There were six concentric rows of piles, the walls being over 60 ft. thick.

Where the bottom does not admit of pile-driving, crib-work, weighted with stone and sunk in proper position, is used, the crevices being stopped with hydraulic cement. At Blossom Rock, in San Francisco harbor, a combination of crib-work and iron cylinder was used in the construction of the coffer-dam by means of which the excavations were made, preparatory to blasting. An iron cylinder 6 ft. in diameter, armed with thick india-rubber flaps at the bottom, was sunk to the ground and then surrounded with crib-work. Excavation was then made within the cylinder, which was from time to time depressed until the depth was reached necessary to exclude the water.

DAMAGES, in law, are the pecuniary recompense claimed on account of suffering an injury through the act of another. The peculiar constitution of the English common-law courts, which, till lately, prevented them in most cases from giving any other remedy than by way of D., rendered the questions relating to this subject of unusual importance; but the progress of recent legislation has been in the direction of restricting actions for D. to the cases in which the restitution of property or enforcement of a right cannot be otherwise attained. The court of chancery, on the other hand, could not give D., it could only enforce performance of an obligation by personal restraint, and hence, according to the nature of the remedy desired, the suitor resorted to the one or other court. In Scotland, the supreme court has always been able to give redress in either way.

Where a sum ascertained in amount is due, the action is one not properly for D., but of debt. But where the sum is not ascertained, as where an injury has been done to a man's character or property, the action in either country can in general only be for D., the amount of which the injured party estimates, and which is determined by the judgment of the court, or verdict of a jury, subject to certain fixed rules which the courts have laid down, as the principle according to which the estimation is to be made. These, it is obviously impossible to detail here, and reference must be made to the title of the special subjects out of which a claim may arise for such information as it is practicable to give. It may be observed, however, that it is a general rule to restrict the amount of D. to that of the actual pecuniary loss, wherever it can be ascertained; and that neither in Scotland nor England will a stipulated penalty for breach of agreement be accepted as determining the sum due for D., unless it shall appear, by the use of the

term "as liquidated damages," or some equivalent expression, that both the parties had intended to fix conclusively the sum payable in case of default. Other general rules are, that the injury for which D. are claimed must have affected the claimant individually, and not merely as one of the general public, although it is not essential that the injury should have done material hurt to him, as this only affects the amount of damages. And the injury suffered must have been the direct and immediate consequence of the act done; if it has only been a secondary or remote result of the act, no D. will be given. And any act sued on must be an actual injustice; it is not enough that it produces disadvantageous results, if these arise only from doing what the party was justified in doing. D., therefore, may be sued for in respect of a crime involving liability to criminal punishment; but in England, in the case of a felony, no action for D. will lie against the offender, because it is the duty of the complainant to prosecute him criminally. It is otherwise, however, in the case of misdemeanors; an action for D. is there independent of criminal proceedings. In Scotland, this is the rule in reference to every species of crime.

DAMAGES (*ante*), a term which designates the rules which govern pecuniary awards in a court of justice. The principles are general, and substantially the same in all countries. The chief principle is to give compensation for some right violated. There is necessarily a wide margin for opinion and judgment in all such cases, depending largely upon agreements and fortuitous conditions and circumstances. In general, damages are compensatory only, but in some cases they are punitory or exemplary.

DAMAN', an outlying portion of the Punjab, runs about 300 m. along the right or w. bank of the Indus, extending back, with an average breadth of about 60 m., as far as the Suliman mountains. It stretches in n. lat. from 28° 40' to 33° 20', and in e. long. from 69° 30' to 71° 20'. In the absence of irrigation, the district in general is little better than a plain of smooth, bare, hard clay—the result of alternate inundation and evaporation. But when duly irrigated, this baked and burned surface becomes very productive, more especially in the strip of land—known as the Derajat—which is nearest to the bordering stream.

DAMAN, a seaport t., province of Guzerat, Hindustan, belonging to the Portuguese. It stands at the mouth of the Daman Gunga, or Daman river, which rises in the Syadree mountains, as the upper extremity of the western Ghauts is called by the natives, in lat. 20° 11' n., and long. 73° 42' east. Common spring-tides give at least three fathoms on the bar, while outside is a roadstead of more than double that depth. The harbor affords good shelter from the s.w. monsoon, and, as the neighborhood is well stocked with suitable timber, the people are largely employed in the building and repairing of ships. The peculiar drawback of the locality is the scarcity, or rather the want, of fresh water. The river, even when swollen by the rains into an inundation, is brackish, and the wells likewise are so in some degree. Endemic fevers are the natural consequence. The place is fortified with a rampart and bastions, and it is described as having been, before the arrival of the whites, "a town great and strong." Pop. 6,000.

DAMAN, *Hyrax*, a genus of quadrupeds, highly interesting as a connecting link between the *rodentia* and the *pachydermata*. On account of their small size, their thick fur, and their general appearance, they were always ranked among the former, till Cuvier pointed out their essential agreement, in dentition and anatomical characters, with the latter, and assigned them a place next to the elephant and the rhinoceros, remarking, that "excepting the horns, they are little else than rhinoceroses in miniature." He adds that "they have quite similar molars, but the upper jaw has 2 stout incisors curved downwards, and, during youth, 2 very small canines, the lower jaw 4 incisors without any canines." The skull, also, and other bones of the head, resemble those of the pachyderms. The muzzle is short; the ears, short and round. The ribs are more numerous than even in the pachyderms—21 pair, a number exceeded in no quadrupeds except the sloths, whereas no rodent has more than 15 pair. The toes are united by the skin to the very nail, as in the elephant and rhinoceros, and are round and soft, merely protected in front by a broad nail, which does not reach the ground. The legs are short. The tail is a mere tubercle. There are several species of this genus, natives of Africa and of the s.w. of Asia. The SYRIAN D. (*H. Syriacus*) is now generally believed to be the *shaphan* of the Old Testament, the *cony* (q.v.) of the authorized English version. The D. is common in Syria and Palestine, inhabiting rocky places, and sheltering itself in the holes of the rocks, but not burrowing, for which its feet are not adapted. It is a timid, harmless creature, quick and lively in its movements, completely herbivorous, easily domesticated, and, in confinement, readily eating bread, roots, fruits, and herbs. It is about 11 in. long, and 10 in. high; brownish-gray above, white beneath, the thick hair interspersed with long scattered bristles. The ASHKOKO (*H. Abyssinicus*) of Abyssinia, first described by Bruce, and supposed by him to be the shaphan, is now believed to be distinct from the Syrian D., although very similar. The KLIP-DASSE (*H. capensis*) of South Africa differs from the shaphan in its darker color and rather larger size, and also in having only 3 toes on each foot, whereas the Syrian D. has 4 toes on the fore-feet and 3 on the hind-feet. It is very common in rocky places in South Africa, both on the hills and near the sea-shore. Its favorite food consists of aromatic plants, and its flesh, although eatable, is highly flavored. In the places which it frequents, a peculiar sub-

stance called *hyraceum* (q.v.) is found—an animal secretion, to which medicinal virtues are ascribed, but the nature and origin of which have not yet been thoroughly ascertained.

DAMAR', a t. of Yemen, Arabia, pleasantly situated on an elevation about 120 m. n.n.w. of Aden. It has about 5,000 houses, is the residence of a governor, and has a college, attended by several hundred students.

DAMASCE'NUS, JOANNES, the author of the standard text-book of dogmatic theology in the Greek church, was b. at Damascus about 700 A.D. On account of his eloquence, he was surnamed *chrysorrhoas* ("Golden Stream"). In 730, he became a monk in the convent of St. Saba at Jerusalem, where he spent the rest of his days in the composition of theological works. He died about 756 A.D., and had the honor of being canonized by both the Latin and Greek churches. D. was a man of extensive erudition, and was considered the ablest philosopher of his time; but the word "philosopher" must have meant something very different in those days from what it does now, as D.'s writings are characterized by weakness of judgment and want of critical power. The best edition is that of Le Quien (2 vols., Paris, 1712).

DAMASCE'NUS, NICOLAUS, a Greek historian of the time of Augustus and Herod the great, with whom he was on terms of intimacy. His principal work was a universal history in 144 books, of which only a few fragments remain. He also wrote an autobiography, in which much may be learned of the lives of Augustus and of Herod.

DAMAS'CIUS, a philosopher b. at Damascus about the middle of the 5th century. He taught philosophy in Athens in the time of Justinian. There remains of his works only *Difficulties and Solutions of First Principles.*

DAMAS'CUS (Arabic, *Dimishkesh-Shâm*), a city of Syria, the largest in Asiatic Turkey, occupies a situation of unrivaled beauty on a luxuriant plain at the eastern base of the Anti-Libanus, and 53 m. e.s.e. of Beyrout, which forms its port, lat. 33° 27′ n., long. 36° 23′ east. The appearance of the city from a distance is beautiful in the highest degree. The bright buildings, sparkling beneath a Syrian sun, rise out of a sea of various tinted foliage, while all around—save on the n.w., where stretches the long bare snow-white ridge of the Anti-Lebanon—extend charming gardens, rich cornfields, and blooming orchards, with the river Barrada (the Abana of Scripture) and its branches winding through until they lose themselves far to the e. in the lake Bahr-el-Merj, into which the Phege (the Pharpar of Scripture), a smaller stream, also flows. As in the case of all eastern cities, the expectations excited by a distant view of D. are by no means realized on a close inspection. The city proper is about 6 m. in circumference, and is partly surrounded by old tumble-down walls, portions of which date from early Roman times, while other parts are of Saracenic architecture, and some mere mud-patches of the present day. The streets generally are dirty and decayed, and so very narrow that a loaded donkey almost entirely blocks up the passage. The best street is "Straight street," mentioned in the Acts of the Apostles in connection with St. Paul. The houses for the most part are very mean-looking structures, often presenting to the street nothing but a dead-wall with a doorway in it, while the best have rough mud-walls, with a projecting upper story extending so far over the narrow street that hands may be shaken from opposite windows. But as the interior of the city presents a sad contrast to its charming surroundings, so do the rich interiors of the houses contrast with their miserable externals. Fine marble-paved courts ornamented with trees, shrubs, and fountains, rooms with arabesqued roofs and walls, most luxuriously furnished, are the common features of all the dwellings of the wealthier classes. The principal buildings of D. are places of worship, chief of which is the Great Mosque—formerly a heathen temple, then a Christian church—composed of different kinds of architecture, and occupying a quadrangle 163 yards by 108 yards, the interior dimensions being 431 ft. by 125. The floor is of marble tesselated, and covered with Persian carpets, and the walls and piers of the transept are enriched with beautiful devices formed of various colored marbles, while rows of noble Corinthian pillars divide the interior into nave and aisles. Altogether, this is one of the handsomest ecclesiastical buildings of which Mohammedans can boast. The citadel is large and imposing, but not strong; and the Great Khan is a splendid building, erected of black and white marble. There are many interesting remains of antiquity in D., but they are lost amid the mean modern structures and the bazaars. The latter are numerous, and finer than those of Cairo or Constantinople, and very well supplied with goods of oriental manufacture; each class of goods having a bazaar for itself. The manufactures of D. used to be important, consisting of silks, cottons, coarse woolen cloth, jewelry, saddlery, and arms; but her productions are now little more than sufficient for local consumption. Before 1860, her looms were reckoned at 3,000, while now they are said to barely reach 1300. The manufactures of the famous Damascene blades have long ceased to exist. This decline is chiefly caused by the taxation upon raw products. The trade with Bagdad was large; but in 1857 the caravan was plundered on its way across the desert, the loss to the merchants of D. being estimated at £40,000. This paralyzed the commerce. The annual caravan to Mecca from D. at one time consisted of some 50,000 or 60,000 persons, most of whom engaged to some extent in trade; but the facilities which in recent

years have been afforded for making the pilgrimage by way of Egypt and the Red sea, has caused a considerable diminution in the pilgrims, and consequently in the trade. One of the greatest blows at the prosperity of D. was struck in 1860, when the Druses (q.v.) entered the city, and destroyed about 6,000 houses in the Christian quarter, killing from 3,000 to 5,000 persons, and selling many of the women into Turkish harems. The imports of British goods, chiefly plain and printed calicoes, cotton handkerchiefs, and cotton yarn have been valued at £150,000. In 1870, the value of the goods brought into D. by the great (Bagdad) caravan was £90,000. Pop., including the adjoining village of Salahiyeh, 150,000; 130,000 are Mohammedans, 15,000 Chistians, and 5,000 Jews.

D. is perhaps the most ancient city in the world. Josephus attributes its foundation to Uz, the great-grandson of Noah; but whether it dates so far back or not, it is certain that it was a place of consequence in the days of Abraham. During the time of the Hebrew monarchy, it was the capital of Syria. It afterwards passed successively under the rule of the Assyrians, Persians, Macedonians, Romans, and Saracens; and finally, in 1516, it was captured by the Turks under sultan Selim I.—in whose hands, with the exception of a short interval (from 1832–40), when it belonged to the pasha of Egypt, it has remained ever since. Under every change of dynasty and every form of government, D., unlike most cities, has retained its prosperity.

The vilayet of D. comprises all the territory between the Lebanon and the Euphrates —that is, all between lat. 31° to 36° n., and long. 35° to 41° east. The surface is for the most part level and very fertile, and produces grain of various kinds, hemp, flax, silk, cotton, madder, tobacco, and cochineal. The vilayet of D.—or of Syria as it is also called—is accounted the most important vilayet of Turkey. Pop. 518,750.

DAMASCUS BLADE. See DAMASKEENING, *ante*.

DAMASK, the name given to all textile fabrics in which figures of flowers, fruits, or others not of geometrical regularity, are woven. The word is supposed to be derived from the city of Damascus having been an early seat of these manufactures. From the intricacy of the early process, the art of D. weaving was long a mystery confined to a few localities; but since the introduction of the Jacquard machine, it is extensively employed wherever ornament is wanted in the stuffs used for dress or house-furnishings. The rich satins and brocades of Lyons and Spitalfields, the flowered ribbons of Coventry, and the bed and window curtains of Halifax and Bradford, are all examples of D. manufacture; but it is in the department of table-linen that the art has had its widest scope and greatest triumphs. The principal seats of the manufacture, on the continent of Europe, are at Courtrai and Liege in Belgium, and in some parts of Saxony, Silesia, and Austria; in England, to a considerable extent at Barnsley, in Yorkshire; in Ireland, at Belfast, Lisburne, and Ardoyne; and in Scotland, at Dunfermline, which may be called the metropolis of the manufacture.

There are three descriptions of D. known in the trade—viz. 1. Full harness, which is generally employed in patterns of limited size and minute detail, the peculiarity being that the Jacquard machine only lifts one thread by each needle, and in such cases, the pattern is repeated to fill up the breadth wanted. 2. "Single" or "common" D., in which any number of threads, from two to seven, can be lifted by one needle, to form the pattern; while the ground is produced by a set of five shafts and heddles, giving from twice to seven times the extent of pattern obtained from the same machine by the full-harness process. In full harness and single D. goods, a square fabric is considered the proper medium, that is, the warp and weft equal; but sometimes a thread or two less or more on warp or weft is used, according to the effect wanted to be produced. 3. In double D., the pattern is produced in the same way as in single, and the ground formed by eight shafts and heddles, forming what the weavers call an eight-leaved twill, absorbing one half more weft than warp, and giving that fine satin-like ground which distinguishes double damask. Besides these descriptions of D., a mixed cotton and woolen colored fabric in table-covers has been introduced, and is now manufactured extensively, the ground of which is woven with twelve shafts.

To give an idea of the capital required to work the finer branches of the trade, it may be mentioned, that it is quite usual for the mere designing and painting of a pattern to cost £50; and £70 has been paid for some extensive designs; while the famous "Crimean hero" pattern, containing portraits of the queen, prince consort, emperor Napoleon, etc., cost £600 of outlay, ere a yard of cloth could be brought to market, employing seven Jacquard machines, consuming 50,000 cards, and containing 4,800 threads in the square yard. In 1836, there were in Dunfermline 3,000 D. and 517 diaper looms, and the capital embarked in the trade was estimated at £826,261, and the total number of persons employed, 5,044. Steam-power was successfully inaugurated in 1849, when one factory employed about 100 power-looms. In 1877, there were 11 power-loom factories, with 4,000 looms, two-thirds of which were employed in the weaving of damask. When it is considered that the production of one power-loom is equal to that of four hand-looms, some idea may be formed of the development of the trade since 1836.—A good description of D. and the D. loom is to be found in Chalmers's *History of Dunfermline*, vols. i. and ii.

DAMASKEEN'ING, or DAMASCEN'ING, is the art of producing upon ordinary steel certain ornamental appearances resembling those observed on the famous Damascus blades. Attention was first drawn to this branch of industry by the crusaders, who brought from Damascus to Europe many articles made of superior steel, such as sword-blades and daggers. These were found to possess not only great elasticity, united with considerable hardness, but their surfaces were covered with beautiful designs, formed by a tissue of dark lines on a light ground, or light lines upon a dark ground, and occasionally by the inlaying of gold on the steel-blue ground. These Damascus blades appear to have been constructed of steel and iron welded together; and the elegant designs were brought out by immersing the blades in dilute acids, which, eating away unequally the surface, gave rise to the mottled appearance. In genuine Damascus blades, the designs run through the substance of the blade, and the watering, or regular, almost symmetrical figuring is not worn off by friction, or even grinding. Imitations of the watering of Damascus steel are produced on common steel by etching with acids; and in this way landscapes, inscriptions, and ornaments, and decorations in general, are imprinted on the steel-blue ground. Gold and silver are also inlaid in the higher-class of sword-blades and other articles. Gun-barrels are occasionally subjected to the process of damaskeening. Attempts have been made in France to accomplish damaskeening by means of photography, but as yet with very imperfect results.

DAM'ASUS, SAINT, Bishop of Rome, was by extraction a Spaniard, and born probably early in the 4th century. In 366 A.D., he was elected bishop of Rome, but had to struggle fiercely for the possession of his office with one Ursinus, who was supported by a considerable party. His career was throughout far from peaceful. It was mainly spent in subduing the still numerous Arians in the west; in combating the heresy of Apollinaris, which he caused to be condemned by the council assembled at Constantinople in 382; and in defending the cause of Paulinus against Meletius. He died 384. It is difficult to form a just estimate of D.'s character. His enemies used to call him *Auriscalpius Matronarum* ("The ear-tickler of the married ladies"), and hinted that he was in the habit of inducing rich female penitents to make testamentary bequests in his favor—a conspicuous vice of the clergy at that time; so much so, indeed, that Valentinian was obliged to issue an edict forbidding ecclesiastics to receive such bequests for the future. The edict was addressed to D., who was required to announce it to the church. On the other hand, he was a great friend of St. Jerome, and was primarily instrumental in inducing that learned divine to undertake a new translation of the Bible. His extant works consist of seven epistles, addressed to various bishops, and rather more than forty short poems, religious, descriptive, etc., but of little or no merit. The first edition was published at Rome by Sarrazanius in 1638. D.'s festival falls on the 11th December.

DAM'ASUS II., a native of Bavaria, a bishop in the Tyrol, chosen the 155th pope on the death of Clement II., in 1047. His reign lasted but 23 days.

DAMBOOL', a vast rock-temple of the Buddhists in Ceylon, containing, among a profusion of carvings, figures of Buddha, of extraordinary magnitude. See *Ceylon*, by sir J. Emerson Tennent (Lond. 1859), vol. ii. p. 577.

DAME (Lat. *domina*, a mistress), a title of honor which long distinguished high-born ladies from the wives of citizens, and of the commonalty in general. In the age of chivalry, it was customary even for a queen to be so called by her chosen knight ("the dame of his heart, of his thoughts," etc.). In consequence of the greater courtesy shown towards women of higher rank, arose the custom of prefixing the word *ma* to *dame*, as a special proof of veneration and homage. Hence, too, the Virgin-mother was called in France *Notre-Dame* ("*Our* mistress," or lady, as if no one Christian could exclusively claim the privilege of serving her with the homage of his heart). The daughters of the king of France, as soon as they came into the world, were called *madame;* and this was also the sole title of the wife of the king's eldest brother. In England, the word D., though not much used, is now applied to married women of all classes. *Madame* is shortened into madam, which is still a word of honor, applicable, in particular cases, to majesty itself. Thus, Alfred Tennyson, in dedicating his poems to queen Victoria, speaks as a chivalrous troubadour might have done—

"Take, *madam*, this poor book of song."

DAME'S VIOLET, *Hesperis*, a genus of plants of the natural order *cruciferæ*, having four-sided or two-edged pods, and containing several species, annual and biennial herbaceous plants, natives, chiefly, of the middle and s. of Europe. One only, the COMMON D. V., or WHITE ROCKET (*H. matronalis*), is found in Britain, in hilly pastures, but perhaps rather escaped from cultivation than a true native. It has an erect branched stem, with ovato-lanceolate leaves, and terminated by numerous large lilac-flowers, which are scentless by day, but very fragrant at night, on which account this plant is cultivated in flower-pots by German ladies. The custom appears to have been an old English one also, and from it the plant derives its common name. The NIGHT-SCENTED ROCKET (*H. tristis*) is also a favorite flower in Germany.

DAMIA'NI, PIETRO, 1000–72; a Roman Catholic prelate, eminent, intellectually, and morally, who supported various reforms which Hildebrand (the great pope, Gregory

VII.) also favored, for which he was persecuted by the corrupt priests of Milan. He was appointed cardinal bishop of Ostia, 1057. In 1069, he was sent as legate to Germany to dissuade Henry IV. from applying for a divorce, in which he was successful. He was engaged on other occasions to make peace and suppress disorder. Among his writings is a fine religious hymn in Latin.

DA'MIANISTS, or ANGELISTS, a sect of the 6th c., followers of Damianus, a patriarch of Alexandria, who agreed substantially with the Sabellians.

DAMIENS, ROBERT FRANÇOIS, known for his attempt to assassinate Louis XV., was born in 1714, at Tieulloy, a village near Arras, in France. He was evilly-disposed from his youth, being known even then as *Robert le Diable.* On account of a robbery which he had committed, he was obliged to flee into Belgium in 1756, whence he returned to Paris about the end of the year. It was during his absence in that country that he formed the intention of assassinating his sovereign. The motives which led him to this are not well understood. He himself alleged that it was the conduct of the king towards the parliament; while a more popular, but apparently groundless opinion was, that he was instigated by the Jesuits. On the 5th of Jan., 1757, having gone to Versailles on the previous day, he assiduously followed the king and his courtiers about everywhere; and about six o'clock at night, when the king was entering his carriage to leave Trianon, managed to stab him. The king, however, recognized his assassin, and D. was seized. The punishment inflicted on him was horrible. The hand by which he attempted the murder was burned at a slow fire; the fleshy parts of his body were then torn off by pincers; and, finally, he was dragged about for an hour by four strong horses, while into his numerous wounds were poured molten lead, resin, oil, and boiling wax! Towards night, the poor wretch expired, having by an effort of will almost superhuman, kept his resolution of not confessing who were his accomplices—if, indeed, he had any. His remains were immediately burned, his house was destroyed, his father, wife, and daughter were banished from France forever, and his brothers and sisters compelled to change their names.

DAMIET'TA, a t. of Lower Egypt, situated on the right bank of the chief of the Nile's eastern branches, about 8 m. from its mouth in the Mediterranean, in lat. 31° 25′ n., long. 31° 49′ east. It is in general ill and irregularly built, but it has some handsome mosques and marble baths, and several bazaars. Its commerce has been much injured by the prosperity of Alexandria. It still, however, carries on a considerable trade in exporting rice, which grows abundantly in the neighborhood, fish, etc.; and in importing charcoal, soap, silk, etc. The exports in 1871, were £85,200, the imports £150,600. It is connected by railway and telegraph with Cairo, etc. The cloth known as *dimity* received its name from D., where it was first manufactured. A bar at the mouth of the river prevents vessels of more than 50 or 60 tons burden from ascending to Damietta. Pop. 37,100. The existing town was erected about 1251, but, prior to that, a city of the same name (more anciently Tamiáthis) stood about 4 m. to the south. It was strongly fortified by the Saracens, and formed on that side the bulwark of Egypt against the early crusaders, who, however, succeeded in capturing it more than once. It was razed, and rebuilt further inland on the site it now occupies, by the sultan Baybers.

DAÎMÎR (Kemâl ud-den Abu'l Bagâ Muhammed Ben Musa Ben Isa ad-Damîrî Ash-Skafei), 1341–1405; b. Cairo, Egypt; an Arabian writer on canon law, but better known to Europe by his work on natural history, *The Life of Animals,* in which he catalogues 931 beasts, birds, fishes, and insects, with the habits of which he appears to have been acquainted. The work is full of episodes treating of history and religion, in consequence of which its literary value is much increased.

DAMIRON, JEAN PHILIBERT, 1794–1862; a French philosophical writer who studied under Burnouf, Villemain, and Cousin. He lectured on philosophy in various Parisian institutions, became professor in the normal school, and titular professor at the Sorbonne. He was one of the founders of the *Globe* newspaper, a member of the legion of honor, and of the academy of sciences. He published a number of philosophical works, particularly on the history of philosophy in France.

DAM'MAR, or DAMMAR PINE, *Dammara,* a genus of trees of the natural order *coniferæ,* distinguished from all the rest of that order by their broad lanceolate leathery leaves, which have numerous nearly parallel veins, and by their seeds being winged, not at the end, but on one side. The tree from which the name, originally applied to its resinous product, has been extended to the whole genus, is the MOLUCCAN D. (*D. orientalis*), which grows on the high mountain-ridges of the Molucca islands. It grows to a great height, attains a diameter of 9 ft., and generally has the lower part of the trunk beset with knots as large as a man's head. The timber is light and of inferior quality; and the tree is chiefly valuable for its resin, which is soft, transparent, hardens in a few days, and is then white, with a crystalline appearance. The resin often flows spontaneously from the tree in such quantity, that it hangs in masses like icicles of a handbreadth and a foot long. At another period of the year, it is yellow, and less valued. By incision, especially in the protuberances of the stem, it is obtained in large pieces. So long as *dammar resin* is soft, it has a strong smell; but loses it when it dries. It contains only a trace of volatile oil, but consists

of two distinct resins, one of which is soluble in alcohol, the other not. It is light, brittle, and easily friable, readily soluble in oil of turpentine; quickly becomes viscid when heated; when sprinkled on burning coal, diffuses an odor like that of rosin or mastich; readily takes fire, and burns with much smoke and a somewhat acid smell. It is used in Asia for domestic purposes, and in the arts like other resins; it is an article of commerce, and in Europe is employed in various ways to form varnishes, which dry quickly, have a very bright luster, and being colorless, allow the beauty of the colors over which they are spread to be perfectly seen; but readily becomes viscid again, and are not permanent, so that this resin cannot be made a substitute for copal and amber. It is almost completely soluble in benzole, and in this solvent, makes an excellent colorless varnish for positive photographs on glass—it is, however, scarcely hard enough for negatives.—To this genus belongs also the Kauri Pine (q.v.) of New Zealand (*D. Australis*), which produces the resin known as *kauri resin*, or *kauri gum*.—The word *dammar, dammer*, or *damar*, signifies *resin* in some of the languages of India. The resin known as BLACK DAMMAR is obtained in the Molucca islands from the trunk of *marignia acutifolia*, a tree of the natural order *amyridaceæ*. It is a semi-fluid soft resin, with a strong smell, becoming black when it dries; it is used as pitch, also to yield a kind of turpentine, which is obtained by distillation.—*Canarium microcarpum*, a tree of the same order, also a native of the furthest east, yields, by incision of the trunk, a viscid, odorous, yellowish substance, very similar to balsam of copaiva, which is called *damar* or *dammar*, and is used in naval yards as oakum, being mixed with a little chalk and the bark of reeds, and becomes as hard as a stone.—Quite distinct from all these is the resin also called *dammar* or *piney dammar* in India, often also called copal (q.v.) in India, and *anime* (q.v.) in Britain, the produce of *vateria Indica*, a large tree of the natural order *dipteraceæ*. It is obtained by wounding the tree, and when fresh, is clear, fragrant, and acridly bitter; when dried, it becomes yellow, brittle, and glass-like. It is used in India as a varnish (*piney varnish*), which is hard, tenacious, and much esteemed. It is also made into candles in Malabar, which, in burning, diffuse an agreeable fragrance, and give a clear light with little smoke. Some of these candles were sent to Britain, and were highly prized, but the excessive duty stopped the importation. *Shorea robusta*, the sal (q.v.), so much valued in India as a timber-tree, also of the natural order *dipteraceæ*, and some other species of *shorea*, yield a resin, also known as *dammar*, and as *ral* and *dhoona*, which is much used in dock-yards in India as pitch.

DAMMU'DAH, or DUMMO'DAH, a river of India, rises in Ramgurh, a district in the presidency of Bengal, about lat. 23° 55′ n. and long. 84° 53′ e.; and after a generally s.e. course of 350 m., it enters the Hoogly from the right, in lat. 22° 13′ n., and long. 88° 7′ east. The valley of the D.—traversed by the main railway between Calcutta and the n.w. (the East Indian railway)—abounds in coal and iron; and competent judges have calculated that bar-iron may here be manufactured 20 per cent cheaper than it can be imported from Great Britain.

DAM'OCLES, one of the courtiers and sycophants of the elder Dionysius, the tyrant of Syracuse. It is recorded by Cicero that D., having lauded in the highest terms the grandeur and happiness of royalty, was reproved by Dionysius in a singular manner. The sycophant was seated at a table, richly spread and surrounded by all the furniture of royalty, but in the midst of his luxurious banquet, on looking upwards, he saw a keen-edged sword suspended over his head by a single horse-hair. A spectacle so alarming instantly altered his views of the felicity of kings.

DA'MON AND PYTH'IAS, or PHIN'TIAS, two noble Pythagoreans of Syracuse, who have been remembered as models of faithful friendship. Pythias having been condemned to death by Dionysius the tyrant of Syracuse, begged to be allowed to go home, for the purpose of arranging his affairs, Damon pledging his own life for the reappearance of his friend. Dionysius consented, and Pythias returned just in time to save Damon from death. Struck by so noble an example of mutual affection, the tyrant pardoned Pythias, and desired to be admitted into their sacred fellowship.

DAMPER, a door or valve which, by sliding, rising and falling, turning on a hinge, or otherwise, diminishes the aperture of a chimney or air-flue; this lessens the quantity of air that can pass through a furnace or other fire, and thus "damps" or checks the combustion.—The D. of a pianoforte is that part of the mechanism which, after a key is struck, and the finger is lifted up from the key, immediately checks or stops the vibration of the string. It consists of a second hammer, which, on the rising of the key, strikes the string and remains upon it, instead of bounding off as the sounding-hammer does. Perfect damping is always desirable, but seldom obtained, especially in upright pianofortes. In respect of damping, the pianofortes of the German makers are superior to the English. The more perfect the damping is, the more distinctly and clearly the passages and harmony are heard, while the instrument gains in purity of tone, when there is none of that confusion of sounds which arises from imperfect damping.

Damper is also the name given in Australia to a simple kind of unleavened bread formed of wheat flour. It is made while traveling in the bush, and baked among the ashes of a fire often kindled for the purpose.

DAM'PIER, WILLIAM, a celebrated English navigator, was b. of a Somersetshire family in 1652. He early went to sea, where he was soon distinguished alike by his intelligence and enterprise. Along with a party of buccaneers, D. crossed the isthmus of Darien in 1679, and embarking on the Pacific in canoes and similar small craft, captured several Spanish vessels, in which they cruised along the coast of Spanish America, waging war with the Spanish subjects. In 1684, D. engaged in another buccaneering expedition, in which he coasted along the shores of Chili, Peru, and Mexico, sailing thence to the East Indies, touching at Australia, and after some time returning to England, where in 1691 he published an interesting account of the expedition, entitled *A Voyage Round the World.* He was afterwards deputed by government to conduct a voyage of discovery to the South seas, in which he explored the w. and n.w. coasts of Australia, also the coasts of New Guinea, New Britain, and New Ireland, giving his name to the Dampier archipelago and strait (q.v.). The events of the latter part of D.'s life are not well known. Besides the one already mentioned, the following are his principal works: *Voyages to the Bay of Campeachy* (Lond. 1729); *A Treatise on Winds and Tides;* and a *Vindication of his Voyage to the South Sea in the Ship St. George* (1707).

DAMPIER ARCHIPELAGO AND STRAIT take their names from the famous navigator and buccaneer. The *strait,* which is 35 m. wide, separates the island of Waygiou from the n.w. extremity of Papua or New Guinea, lying almost immediately under the equator, and about long. 131° e., so as to be, as nearly as possible, the antipodes of the mouth of the Amazon. The *archipelago,* again, is off the n.w. coast of Australia, about lat. 21° s., and long. 117° east. The principal islands of the cluster are Enderby, Lewis, Rosemary, Legendre, and Depuch.

DAMPING OFF, in horticulture, the death of plants from excess of moisture in the soil and atmosphere. Young seedlings in stoves and hot-beds are particularly liable to it. Although the cause is sufficiently obvious, prevention is not always easy; not only because some plants are very sensitive as to moisture, but also because the necessity of keeping sashes closed on account of temperature often stands in the way of the ventilation which would otherwise be desirable, and it is when a moist atmosphere stagnates around them, and the temperature is not very low, that plants are most liable to damp off.

DAM'SON, a rather small oval-fruited variety of the common plum, much esteemed for preserving, and not wholly unfit for dessert. The tree grows to a considerable height, but has a bushy, sloe-like appearance. It is extremely fruitful. There are many sub-varieties, with fruit of different colors, dark purple, bluish, black, yellow, etc. Damsons are produced in great quantities in some parts of England. D. pies, and *D. cheese*—made somewhat in the manner of fig-cake—are well-known English luxuries. The name is a corruption of *Damascene,* from Damascus.—The MOUNTAIN D. or BITTER D. of the West Indies is the simaruba (q.v.).

DAMUGGO', a large and populous t. of Upper Guinea, Africa, situated on the left bank of the Niger, in lat. 7° n., long. 7° 50′ east. The houses, built of mud, and supported by wooden props, are circular in shape. The town is dirty, and has a miserable appearance. The population, the number of which has not been ascertained with any degree of accuracy, support themselves by trade and the cultivation of the soil.

DAN, a city, the position of which, at the northern extremity of Palestine, is determined: 1. By its being the northern point on the road to Damascus, at which Abraham overtook the allied forces that had plundered Sodom. 2. By its frequent designation as the northern limit of the land, as in the familiar expression—"from Dan to Beersheba." 3. By the statement of Josephus, that it stood at the lesser fountain of the Jordan; and that of Jerome, that at it the Jordan took its rise, and, as he thought from his view of the etymology, obtained its name Jor-Dan, as "the river of Dan." 4. By Dr. Robinson's discovery, in the same locality, of "a mound from the foot of which gushes out one of the largest fountains of the world—the main source of the Jordan," the signification of whose Arabic name, *Tell el Kadi,* "the judge's mound," agrees with that of the Hebrew *Dan,* "a judge." The manner in which the tribe of Dan acquired possession of this region is narrated in the book of Judges. Their inheritance by lot was well situated near the powerful tribes of Judah, Benjamin, and Ephraim; but the most fertile part of it was too small for them, and was often overrun by the Amorites and Philistines. In order to enlarge their territory they sent out spies to search for a fertile region which they might obtain by force or craft. These having gone to the north, reported that they had found there a large and good land abounding in supplies for every want, and inhabited by a people careless and secure. So the tribe, having arrayed itself for war, fell suddenly on the coveted region, putting the inhabitants to death and burning the city. When they rebuilt it they changed its name from Laish to Dan after their father. The subsequent history of the city is peculiar. The Danites stole not only the good land and the city, but also the religion which they established there. On their way north they found in Mt. Ephraim a house in which was a priest of the tribe of Levi, with an ephod and teraphim, a molten and a graven image. All these they carried away with them and set up the idolatrous worship under a permanent priesthood in their conquered home. Four hundred years afterwards Jereboam remod-

eled the worship, making Dan the religious center for the northern part of the kingdom which he had usurped. This it continued to be until, about 250 years later, the people were carried captive into Assyria. At the present day the top of the mound is strewed with ruins, including traces of old foundations and heaps of large stones. There are ruins also on the plain below. The fertility of the plain or valley, remarkable in the times of the Sidonians, continues to the present day.

DAN, the fifth son of Jacob and the first by his wife's maid Bilhah. He was own brother to Naphtali, and there is a close affinity between his name and that of Dinah, Jacob's only daughter. The tribe of Dan was, next to Judah, the most numerous of the twelve tribes at the numbering in the wilderness; yet he was the last of all to receive his portion of the land, and that portion was the smallest of all. The Bible gives but little of the history of the tribe, which seems to have been easily and often led to copy the idolatry of the surrounding heathen.

DANA, CHARLES ANDERSON, b. N. H., 1819. He studied at Harvard for two years, but an affection of the eyes compelled his retirement. He was one of the members of the Brook Farm socialistic community, near Boston, and was one of the editors of *The Harbinger*, a journal advocating the ideas of Fourier. In 1847, he became a writer on the *New York Tribune*, and was correspondent of that journal in France during the revolution of 1848. Returning to New York, he became first assistant (or managing) editor of the *Tribune*, which position he filled until about the close of 1861, when the "On to Richmond" editorial, immediately followed by the disastrous defeat of the union forces at Bull Run, led to such disagreement with Horace Greeley, the editor of the paper, that Dana was compelled to resign. He was not long afterwards appointed assistant secretary of war. After the war he became the editor of a new republican paper in Chicago, but the enterprise was not successful. Returning to New York, he became one of a company to purchase *The Sun*, the oldest of the cheap papers of the country. He was chosen chief editor, which position he retains. Besides his work as a journalist, he has edited a *Household Book of Poetry*, and in connection with George Ripley has been the editor of Appleton's *New American Cyclopædia*.

DANA, FRANCIS, LL.D., 1743-1811; b. Mass.; graduate of Harvard; admitted to the bar in 1767. He was one of the "Sons of Liberty" in and about Boston at the commencement of the revolution. He was a delegate to the first provincial congress of Massachusetts, and in 1776 was chosen one of the council who at that time acted not only as a senate, but as the executive of the state. In 1781, he was appointed minister to Russia. He returned in 1783, and was at once sent to congress. In 1785, he was appointed justice of the supreme court of Massachusetts. He was a delegate to the Annapolis convention, to the convention which framed the federal constitution, and to the convention in his own state for its ratification. In 1791, he was made chief justice of Massachusetts. In 1797, he was appointed special envoy to the French republic, but declined on account of ill health. He was one of the founders of the American academy of arts and sciences.

DANA, JAMES DWIGHT, LL.D., b. N. Y., 1813; graduate of Yale, eminent as a naturalist and geologist. He was with the Wilkes exploring expedition to the southern oceans sent out by the federal government in 1838. In 1846, he became one of the editors of the *American Journal of Science;* in 1855, he was chosen professor of natural history and geology in Yale college. His works on geology and natural history are well known.

DANA, NAPOLEON JACKSON TECUMSEH, b. Me., 1822; graduated at West Point in 1842. He served in the war with Mexico, and through the war of the rebellion, and was seriously wounded at Antietam. Soon after the war he resigned with the rank of col.

DANA, RICHARD, 1699-1772; b. Mass., grandson of Richard, who was the first of the family in America. He was a graduate of Harvard, bred to the law, and prominent in resistance to the acts of the British government which preceded the revolution. He was also a member of "The Sons of Liberty."

DANA, RICHARD HENRY, an American poet and novelist, was born in 1787, at Cambridge, Mass. After leaving Harvard college, at which he had remained three years, he adopted law as a profession, but eventually renounced it, and applied himself to literature. In 1817, he became a contributor to the *North American Review*, his connection with this periodical continuing for three years, during a portion of which time he assisted in its editorship. The *Idle Man*, which contains many of his best prose efforts, was commenced in 1821, but proving a failure in a commercial point of view, was soon discontinued. Having at an earlier date published the *Dying Raven*, a poem of great merit, he came forward, in 1827, with the *Buccaneer*, and other poems. In 1839, D. delivered in Boston and New York a series of lectures on Shakespeare.—RICHARD H. DANA, the son of D., is well known as the author of *Two Years Before the Mast* (enlarged ed. 1869). *To Cuba and Back* appeared in 1859. D. is also a distinguished authority on maritime law. He was nominated in 1876 to be ambassador in England, but the appointment was not sanctioned by the senate.

DANA, RICHARD HENRY, Jr., b. Mass., 1815, a son of Richard Henry, the poet, graduated at Harvard, and bred to the law. In consequence of ill health he made a voyage at sea, of which he published a description in *Two Years Before the Mast*. He

was admitted to the bar in 1840, and made a specialty of admiralty cases. In 1841, he published *The Seaman's Friend, containing a Treatise on Practical Seamanship*, and also an edition of Wheaton's *International Law*. He was one of the leaders of the free-soil party.

DANA, SAMUEL LUTHER, LL.D., 1795–1868; b. Mass.; a writer on chemistry and agriculture. While chemist of the Merrimack print-works he invented a method of bleaching cotton goods which was widely adopted.

DAN'AË, the daughter of Acrisius, king of Argos, and Ocaleia. According to the mythological narrative, an oracle had announced that she would one day give birth to a son, who should kill his grandfather. Acrisius, of course, felt extremely uncomfortable after this declaration, and took every precaution to keep D. a virgin. He shut her up in a dungeon, where, nevertheless, she was visited by Zeus in a shower of gold, and became, in consequence, the mother of Perseus. Acrisius put both the mother and child into a chest, and exposed them on the sea. The chest, however, drifted ashore on the island of Seriphos, and D. and her child were saved. D. remained in the island until Perseus had grown up and become a hero famous for his exploits. She afterwards accompanied him to Argos. On his arrival, Acrisius fled, but was subsequently slain accidentally by Perseus at Larissa.

DA'NAIDE, a hydraulic machine made of two cylinders one within the other, turning easily on a vertical axis, and having a small space between them. The smallest one is closed at the bottom, and the other has a hole in the middle of its base. The bottoms of the two are separated by partitions reaching from the circumference to the center, but the ring-like space between the cylinders is open. If water be turned into this space horizontally to the surface of the cylinders, they begin to revolve by friction, which motion is increased by the water in revolution acting on the radial partitions in the base. It is found that nearly three quarters of the hydraulic power can thus be utilized.

DAN'AÜS, a mythical personage, the son of Belus and Anchinoë, brother of Ægyptus, and originally ruler of Libya. Thinking his life in danger from the machinations of his brother, he fled to Argos, accompanied by his fifty daughters, known as the DANAIDES, where he was chosen king, after the banishment of Gelanor, the last of the Inachidæ. The fifty sons of Ægyptus followed him, and under the pretense of friendship, sought the hand of his daughters in marriage. D. consented, but on the bridal-night he gave his daughters each a dagger, and urged them to murder their bridegrooms in revenge for the treatment he had received from Ægyptus. All did so, except one, Hypermnestra, who allowed her betrothed, Lynceus, to escape. D., as may naturally be supposed, found great difficulty in obtaining new husbands for his daughters; and in order to get them off his hands, instituted games, where they were given as rewards to the victors, although they could scarcely have been considered very tempting prizes. As a punishment for their crime, they were compelled, in the under-world, to pour water for ever into a vessel full of holes. So runs the myth; but Strabo mentions an old tradition, which declares D. and his fifty daughters to have provided Argos with water, which is probably the origin of the scene in Hades. Greek art, of course, represents the Danaides in conformity with the popular myth. The tomb of D., in the Agora of Argos, was shown as late as the time of Pausanias.

DANBURY, a t. in Connecticut, the seat of justice of Fairfield co., on the Norwalk and Danbury railroad, 68 m. n.e. of New York; pop. '80, 11,669. There is ample water-power, with a large number of manufacturing establishments, one of which makes nearly a quarter of a million of shirts annually. Danbury was settled, 1684, and burned by the British, 1777, when the American gen. Wooster was fatally wounded. A monument was erected in his memory 77 years later.

DAN'BY, FRANCIS, A.R.A., a painter, b. about 6 m. from Wexford, in Ireland, 16th Nov., 1793. He was educated in the school of the society of arts, Dublin, and soon gave indications of superior artistic talent. His first attempts were sent to the Dublin exhibition. After 1820, he took up his residence at Bristol, whence he sent to the royal academy, London, his "Disappointed Love" (1821), "Warriors of the Olden Time Listening to the Song of their Minstrel" (1823), and "Sunset at Sea after a Storm" (1824). In 1825, D. produced "The Delivery of Israel out of Egypt;" in 1826, "Christ Walking on the Sea;" in 1827, "The Embarkation of Cleopatra on the Cydnus;" and in 1828–29, "An Attempt to Illustrate the Opening of the Seventh Seal," "The Passage of the Red Sea," and "The Deluge." Circumstances now induced him to visit the continent, where he resided till 1841, during which interval he executed very few paintings. On his return, he took up his abode at Exmouth, where he died in 1861. Among his later works, may be mentioned "A Morning at Rhodes" (1841), "The Enchanted Island" (1841), "The Contest of the Lyre and Pipe in the Valley of Tempe" (1842), "The Tomb of Christ after the Resurrection," "Fiensford Lake (Norway)—a Sudden Storm passing off," "Caius Marius among the Ruins of Carthage" (1848), and "The Departure of Ulysses from Ithaca" (1854).

DANCE, GEORGE, Jr., 1740–1825; an English architect. Among his designs was that for Blackfriars bridge in London. He was associated with his brother Nathaniel

in the foundation of the royal academy, of whose original members he was for several years the last survivor. Newgate prison and the front of Guildhall were built from his designs. His father, also named George, was noted as an architect.

DANCE OF DEATH (Lat. *Chorea Machabæorum*, Fr. *La Danse Macabre*), a name given to a certain class of allegorical representations, illustrative of the universal power of death, and dating from the 14th century. When the introduction of Christianity first banished the ancient Germanic conception of a future state, a new description of death-mythology arose, partly out of biblical sources, partly out of the popular character itself, wherein the last enemy was represented under simple and majestic images, such as that of a husbandman watering the ground with blood, plowing it with swords, rooting out weeds, plucking up flowers, or felling trees, sowing it with corpses; or of a monarch assembling his armies, making war, taking prisoners, inviting his subjects to a festival, or citing them to judgment. But with a gradual change in national manners came a change in the mode of treating the subject, and it was associated with every-day images, such as the confessional, chess-playing, and above all, with the adjuncts of a festival—viz., music and dancing. This tendency to familiarize the theme increased during the confusion and turmoil of the 14th c., when the national mind alternated between fits of devotion and license, or blent both elements in satire and humor. Such a mood as this naturally occupied itself with personifying death, and adopted by preference the most startling and grotesque images it could find—that of a musician playing to dancing-men, or a dancer leading them on; and as the dance and the drama were then intimately connected, and employed on religious occasions, this particular idea soon assumed a dramatic form.

This drama was most simply constructed, consisting of short dialogues between Death and four-and-twenty or more followers, and was undoubtedly enacted in or near churches by religious orders in Germany during the 14th c., and at a rather later period in France. It would appear that the seven brothers, whose martyrdom is recorded in the 7th chapter of the 2d book of Maccabees, either played an important part in the drama, or the first representation, which took place at Paris, in the Cloister *aux Innocents*, fell upon their festival, and hence the origin of the ancient name, Chorea Machabæorum, or La Danse Macabre. As early as 1400, the dramatic poem was imitated in Spain, and appears there in 79 strophes of 8 lines each (*La Dança General de los Muertos*), but it did not spread; while the French, having a love for pictorial representation, very early affixed an illustration to each strophe, and in 1425 painted the whole series on the church-yard wall of the Cloister of the Innocents, where the Dance of Death was habitually enacted. We find the subject treated in painting, sculpture, and tapestry, in the churches of Anjou, Amiens, Angers, Rouen, to say nothing of the numerous wood-cuts and accompanying letter-press which succeeded the invention of printing. From Paris, both poem and pictures were transplanted to London (1430), Salisbury (about 1460), Wortley hall in Gloucestershire, Hexham, etc.

But nowhere was the subject so variously and strikingly treated as in Germany. A picture in one of the chapels of the Marienkirche, at Lubeck, still, in spite of repeated repaintings, bearing the unmistakable impress of the 14th c., exhibits the very simplest form of the drama, and has some genuine Low German verses attached to it. Here we see 24 figures, partly clerical, partly lay, arranged in a descending scale, from the pope himself down to a little child, and between each of them a dancing-figure of Death, not in the form of a skeleton, but a shriveled corpse, the whole being linked in one chain, and dancing to the music of another Death. This representation is almost the same as a very ancient one at La Chaise-Dieu, in Auvergne, and points to the identity of the original dramatic spectacle in both countries.

The celebrated "Dance of Death" on the cloister walls of the Klingenthal, a convent in Basel, though painted probably not later than 1312, exhibited a departure from the simplest form—the number of persons exceeding the original 24, and the chain being broken up into separate couples. But both alike are only to be regarded as scenes from a drama, and cannot, therefore, be justly compared with a contemporary Italian painting, the "Triumph of Death," by Andrea Orcagna. And the acted drama enduring till the 15th c., we find that while there were varieties in the paintings, the poem, which was the most important feature, remained unchanged.

About the middle of the 15th c., however, the drama being altogether laid aside, the pictures became the main point of interest, the verses merely subsidiary. Accordingly, we find from this time the same pictures repeated in different places, with different verses, or no verses at all, till at length both verses and pictures entirely change their original character. The "Dance of Death" being transferred from the quiet convent walls into public places, gave a new impulse to popular art. Duke George of Saxony had, in 1534, the front of his Dresden castle ornamented with a life-size bass-relief of the subject, and other representations are to be found at Strasburg and Bern. There was a "Dance of Death" painted round the cloister of old St. Paul's in London, in the reign of Henry VI.; and there is a sculptured one at Rouen, in the cemetery of St. Maclou. But Holbein has the credit of availing himself most effectively of the original design, and giving it a new and more artistic character. Departing from the idea of a dance, he illustrated the subject by 53 distinct sketches for engravings, which he called "Imagines

Mortis." The originals of these are at St. Petersburg, and impressions of them have been frequently repeated under different names.

We may cite as authorities on this subject, Peignot's *Recherches sur les Danses des Morts* (Dijon and Paris, 1826); Massman's *Baseler Todtentänze* (Stuttgart, 1847); and Douce's *The Dance of Death* (Lond. 1833).

DANCETTE, one of the lines of partition in heraldry, which differs from indented (q.v.) only in the greater size of the notches. The indentations where the division is *per fess* dancette, never exceed three in number.

DANCING may be defined in a general way as the expression of inward feelings by means of rhythmical movements of the body, especially of the lower limbs, usually accompanied by music. Dancing may almost be said to be as old as the world, and prevails in rude as well as in civilized nations. Children, and also the lower animals, dance and gambol as by instinct. Our early records, sacred and profane, make mention of dancing, and in most of the ancient nations it was a constituent part of their religious rites and ceremonies. They danced before their altars and round the statues of their gods. The Greek chorus, "in the oldest times, consisted of the whole population of the city, who met in the public place (*choros*, the market-place), to offer up thanksgivings to their country's god, by singing hymns and performing corresponding dances." The Jewish records make abundant mention of dancing. Moses and Miriam danced to their song of triumph, when the Israelites passed through the Red sea as on dry land; David danced before the ark. It is certain that the primitive Christians danced at their religious meetings, though we have no mention of this in the New Testament. The Greeks made the art of dancing into a system expressive of all the different passions, the dance of the Eumenides, or Furies, especially, creating such terror, that the spectators seemed to see these dreaded deities about to execute heaven's vengeance on earth. The most eminent Greek sculptors did not disdain to study the attitudes of the public dancers for their art of imitating the passions. In Homer, we read of dancing and music at entertainments. Aristotle ranks dancing with poetry, and says, in his *Poetics*, that there are dancers who, by rhythm applied to gesture, express manners, passions, and actions. In Pindar, Apollo is called the dancer; and Jupiter himself, in a Greek line, is represented as in the act of dancing. The Spartans had a law obliging parents to exercise their children in dancing from the age of five. This was done in the public place, to train them for the armed-dance. They were led by grown men, and all sang hymns and songs as they danced. The young men danced the Pyrrhic dance, in four parts, expressive of overtaking an enemy and of a mock-fight.

Dancing, as an entertainment in private society, was performed in ancient times mostly by professional dancers, and not by the company themselves. Among the sedate Romans, in fact, it was considered disgraceful for a free citizen to dance, except in connection with religion. Having professional dancers at entertainments is still the practice among eastern nations. In Egypt there are dancing and singing girls, called almé, who improvise verses as in Italy. They are highly educated, and no festival takes place without them. They are placed in a rostrum, and sing during the repast; then descend, and form dances that have no resemblance to ours. All over India there are nautch girls or bayaderes (q.v.), who dance at festivals and solemnities.

It is among savage nations that the passion for dancing is most strongly manifested. Their dances are mostly associated with religion and war; and the performers work themselves into a state of frantic excitement—a kind of mechanical intoxication. As civilization advances, dancing—amateur dancing, at least—assumes a more and more subdued character. As a social amusement and a healthful exercise, dancing has much to recommend it; the chief drawbacks are the ill-ventilated and overheated rooms in which it is generally performed. By many, it is unfavorably regarded in a moral point of view; but this seems a relic of that outburst of puritanism that characterized the 17th c., and which saw sin in every joyous excitement. Dancing is doubtless liable to abuse, but not more so than most other forms of social intercourse. Connected with the subject of dancing, see ACROBATS, BALLET, PANTOMIME, COUNTRY-DANCE, QUADRILLE, POLKA, etc.

DANCING MANIA, a form of epidemic disorder allied to hysteria (q.v.), and evidently the result of imitative emotions acting upon susceptible subjects, under the influence of a craving for sympathy or notoriety. There is little doubt that imposture entered to a considerable extent into all the epidemic forms of the dancing mania, which indeed were usually attended and followed by consequences that showed but too clearly the presence of impure motives; but there is also evidence that in many cases the convulsive movements were really beyond the control of the will, whatever may have been the original character of the motives that prompted them. Epidemics of this sort were common in Germany during the middle ages, and are formally described as early as the 14th c.; in Italy, a somewhat similar disease was ascribed to the bite of a spider called the tarantula (see TARANTISM); and similar convulsive affections have been witnessed in Abyssinia, India, and even in comparatively modern times and in the most civilized countries in Europe, under the influence of strong popular excitement, especially connected with religious demonstrations. But the true dancing mania of the middle ages had its theater chiefly in the crowded cities of Germany.

In July, 1374, there appeared at Aix-la-Chapelle assemblies of men and women, who, excited by the wild and frantic, partly heathenish, celebration of the festival of St. John, began to dance on the streets, screaming and foaming like persons possessed. The attacks of this mania were various in form, according to mental, local, or religious conditions. The dancers, losing all control over their movements, continued dancing in wild delirium till they fell in extreme exhaustion, and groaned as in the agonies of death; some dashed out their brains against walls. When dancing, they were insensible to external impressions, but haunted by visions, such as of being immersed in a sea of blood, which obliged them to leap so high, or of seeing the heavens open, and the Saviour enthroned with the Virgin Mary. The frenzy spread overy many of the towns of the Low Countries. Troops of dancers, inflamed by intoxicating music, and followed by crowds, who caught the mental infection, went from place to place, taking possession of the religious houses, and pouring forth imprecations against the priests. The mania spread to Cologne, Metz, and Strasburg, giving rise to many disorders, impostures, and profligacy. These countries were generally in a miserable condition; and arbitrary rule, corruption of morals, insecurity of property, and low priestcraft, prepared the wretched people, debilitated by disease and bad food, to seek relief in the intoxication of an artificial delirium. Exorcism had been found an efficacious remedy at the commencement of the outbreak; and in the beginning of the 16th c., Paracelsus, that great reformer of medicine, applied immersion in cold water with great success. At the beginning of the 17th c., the St. Vitus's dance, as the affection was called (see CHOREA), was already on the decline; and we now hear of it only in single cases as a sort of nervous affection. A detailed account of the phenomenon is given in Hecker's *Epidemics of the Middle Ages*. See CONVULSIONARIES.

DANDELION (*leontodon taraxacum*, or *taraxacum officinale*), a plant of the natural order *compositæ*, sub-order *cichoraceæ*, common throughout Britain and the whole of Europe, in pastures and by waysides, and now also so perfectly naturalized in many parts of North America, as to be there one of the most familiar spring-flowers. The names D. and leontodon (Fr. and Gr. lion's tooth) both have reference to the form of the leaves. The whole plant abounds in a milky juice, containing a peculiar crystalline principle, called *taraxacin;* has a bitter taste; and is tonic, deobstruent, and diuretic. D. root is employed in medicine, in the form of infusion, decoction, and extract, chiefly in diseases of the liver and chronic affections of the digestive organs. It contains resin, inulin, sugar, etc. When roasted and ground, it is also sometimes used as a substitute for coffee. *D. coffee*, however, is usually a mixture of ordinary coffee and the powder or extract of D. root; and *D. chocolate* is composed of one part of common chocolate and four parts of the powder of D. root. The young leaves, when blanched, are a good salad, resembling lettuce or endive.

DANE'BROG, ORDER OF, the second of the Danish orders, was instituted by king Waldemar in 1219. The word *brog* in old Danish signifies "cloth," and thus D. is equivalent to the cloth or banner of the Danes. The order is a sort of glorification of the old national flag of Denmark, which long floated, like the oriflamme of France, at the head of the army. It is meant to recompense services rendered to the state, whether civil or military, and irrespective of age or rank. The decoration of the order consists in a cross of gold *pattée*, enameled with white, and suspended by a white ribbon, embroidered with red.

DANE'GELT, or DANEGOLD, a tribute, first of 1*s*., and afterwards of 2*s*., levied on every hide of land by the Anglo-Saxons, for the purpose of meeting the outlay requisite for defending the country against the Danes. The tax was continued after the conquest, as one of the rights of the crown, till the time of Stephen.

DANE-LAGE, or DANE-LAW. After the overthrow of the Danes under Guthrun at Ethandune by king Alfred (878 A.D.), a treaty was concluded between the two, in virtue of which the entire kingdom of Wessex, from Somerset to Kent, was evacuated by the Danes, who were, however, allowed to retain the greater part of the east coast of England, including the whole of Northumbria. This district was called Danelagh or Dane-law (which name it retained down to the Norman conquest), because the inhabitants were ruled by Danish and not by English law.

DANIEL, a Hebrew prophet, who flourished about 600 B.C. He was a contemporary of Ezekiel, and was carried captive to Babylon in the fourth year of Jehoiakim. He was one of the youths selected to be brought up for future service at the court of the conqueror, and received instruction in all the learning of the Chaldeans. His skill in the interpretation of dreams procured for him the royal favor. He rose to be governor of the province of Babylon under Nebuchadnezzar; and under Darius, the Mede, to be first president of the whole Medo-Persian empire, a dignity only inferior to that of Darius himself. The time and the place of his death are alike unknown. He was alive, however, in the first year of the reign of Cyrus, but did not return to Judea with his countrymen on their release from captivity. Epiphanius and others affirm that he died at Babylon; but the common tradition is that he expired at Susa or Shusan in Persia, when upwards of ninety years of age; and at the present day, a tomb bearing his name is the only standing building among the ruins of that ancient city. D. was the only one of

the Hebrew prophets who enjoyed a high degree of worldly prosperity. Ezekiel mentions him as a model of wisdom and piety.—The book of D. consists partly of historical notices of D., and partly of visions and prophecies, some of which are written in Chaldee. The genuineness of the book, in its present form, has been much disputed in recent times.

DAN'DOLO, a famous Venetian family, which has given four doges to the republic. The most illustrious of its members was Enrico D., b. about 1110 or 1115 A.D. Eminent in learning, eloquence, and knowledge of affairs, he ascended from one step to another, until, in 1173, he was sent as ambassador to Constantinople, and in 1192 was elected doge. In this latter capacity, he extended the bounds of the republic in Istria and Dalmatia, defeated the Pisans, and (in 1201) marched at the head of the crusaders. He subdued Trieste and Zara, the coasts of Albania, the Ionian islands, and Constantinople (17th July, 1203). When the emperor Alexius, who had been raised to the throne by the exertions of D., was murdered by his own subjects, D. laid siege to Constantinople, and took it by storm, 13th April, 1204. He then established there the empire of the Latins, and caused count Baldwin of Flanders to be chosen emperor. By the treaty of partition which he concluded with the other leaders of the crusade, Venice obtained possession of some of the islands of the Ionian sea, and of the archipelago, several harbors and tracts of land on the Hellespont, in Phrygia, the Morea, and Epirus, an entire quarter of Constantinople, and also, by purchase, the island of Candia. Soon after this, D. died (June 1, 1205), in Constantinople, and was buried in the church of St. Sophia. His monument was destroyed by the Turks at the taking of Constantinople in 1453.

DAN'DOLO, ANDREA, Doge of Venice, 1342, a member of one of the most illustrious families of that famous city. He was a student and a man of letters, and an intimate friend of Petrarch. He wrote two chronicles of Venice.

DAN'DOLO, VINCENZO, Count, 1758–1819; an Italian scientist, native of Venice, where he began life as a physician. When Venice came under Austria, he went to Milan, where he became a member of the grand council. He went to Paris in 1799, but soon afterwards returned to the vicinity of Milan and engaged in scientific agriculture. In 1805, Napoleon made him governor of Dalmatia, where he proved himself an excellent officer. He published several works on agriculture. In 1809, he retired to private life in Venice.

DANE, a co. in s. Wisconsin, intersected by five or six railroads, the co. seat (Madison) being the capital and the great railroad center of the state; 1235 sq.m.; pop. '80, 53,234. It is mostly prairie, and the soil is fertile, producing wheat, corn, oats, barley, hay, butter, wool, tobacco, hops, etc.

DANE, NATHAN, LL.D., 1752–1835; b. Mass.; graduated at Harvard, 1778; studied law in Salem, and began to practice in 1782 at Beverly. He was successively a member of the Massachusetts house of representatives, the continental congress, and the Massachusetts senate; then held various commissions to codify or revise laws; and was judge of commom pleas. He was also a member of the much abused Hartford convention. He is credited with placing in the ordinance for the government of the northwestern territory the clause forever prohibiting slavery.

DANIEL, HERMANN ADALBERT, 1812–72; a German geographer and theologian, educated at Halle, and subsequently became a professor at that university. He was one of the most eminent followers of the geographer Ritter.

DANIEL, SAMUEL, an English poet, was the son of a music-master, and was b. in 1562, near Taunton, in Somersetshire; entered Magdalen hall, Oxford, in 1579, but quitted the university without taking a degree. For some time he acted as tutor to Anne Clifford, daughter of the earl of Cumberland. In 1603, he was appointed master of the queen's revels, and inspector of the plays to be represented by the juvenile performers. Subsequently, he held other offices about the royal household. Towards the close of his life, he retired to a farm which he possessed at Beckington, in his native county, where he died, Oct. 14, 1619. D. is an elegant, if not a great poet. His writings are pervaded by a moral thoughtfulness and purity of taste which are very remarkable, but lack that vital energy of movement and memorableness of expression which result from genuine inspiration. The "well-languaged Daniel" is therefore not the most interesting of the Elizabethans, although his style is quite modern. His works include sonnets, epistles, masks, and dramas; but his chief production is a poem in eight books, entitled a *History of the Civil Wars between York and Lancaster*.

DANIEL, BOOK OF, derives its name from the chief person whose history it narrates, and who is generally regarded as its author. The close correspondence of its predictions with historical events has, indeed, led some writers to assert that it was written by some unknown person about 175 years B.C. Porphyry, in the 3d c., held this opinion, and, in modern times, Collins, De Wette, and others. Among the answers to them are: 1. That however plausible, in Porphyry's day, the assertion may have seemed that the so-called predictions of the book were written after the events in the life of Antiochus, to which some of them refer, there is no force in it now, after the progressive accomplishment, which has since been witnessed, of many predictions then unfulfilled. 2. The first book of Maccabees refers to the book of D. in the same manner

as to other books of the Old Testament: saying that the enemies of the Jews "set up the abomination of desolation upon the altar;" that "Ananias, Azarias, and Misael, by believing, were saved out of the flame," and that "Daniel, for his innocency, was delivered out of the mouth of lions." 3. It was translated into Greek, B.C. 280–250, before the date which Porphyry assigned to it. 4. At a still earlier date it was received into the Hebrew canon. 5. Its diction, partly Hebrew and partly Chaldaic, proves that its author was master of both languages; its acquaintance with Chaldean manners, customs, and religion, indicates his long residence in the midst of them; and its descriptions of public affairs after the conquest by the Medes and Persians could have been given only by one who had full knowledge of the conquerors and was in favor with them. Daniel, a Jew of noble birth, familiar with the Hebrew as his native tongue, educated from his youth in all that the Chaldeans could teach, and high in office and favor with the successive kings through the whole captivity of 70 years, fulfills all these conditions, and he alone. 6. The great favors which Alexander, in the midst of his career of conquest, conferred on the Jews at Jerusalem, are rationally accounted for by the statement in Josephus that when, at the temple, the book of Daniel was shown to him, wherein Daniel declared that one of the Greeks would destroy the empire of the Persians, he supposed himself to be the person intended, and in his joy called on the people to ask of him any favors which they chose. 7. The testimony of Christ is emphatically given to the book of Daniel, to its prophetic character, and to the approaching fulfillment of things written therein. Its place in the Hebrew canon is not among "the prophets" strictly so called, but in the same division with "the Psalms." The prophets were God's ministers among the people at large to instruct, comfort, and reprove, as well as to foretell the future Daniel's office, as has been seen, was rather that of a statesman, clothed with vice-royal authority by the kings who held him captive and made conspicuous by the manifest wisdom and power of God. He ranks with Moses and David rather than with Isaiah. His personal prosperity, the miracles wrought around him, and the revelations given him, were designed to show, among other things, that although God had allowed the Jews to be carried captive for their sins, his power, as great as it ever had been, was concentrated on Daniel as their representative, and as a pledge that he would restore them to their own land. Their release by Cyrus at the end of their 70 years is without rational explanation if Daniel's life and influence as described in the book are stricken out. The book is partly historical and partly prophetical; and portions of the history are prophecies fulfilled.

I. The historical part narrates: 1. The captivity of Daniel and his three friends, their education at the court of the king, and their superiority over the rest of the Hebrew youth. 2. The king's dream, Daniel's interpretation of it, and the consequent exaltation of him and his friends. 3. The golden image, the fiery furnace, and the deliverance. 4. The king's second dream and its interpretation, his pride, loss of reason, expulsion, and restoration. 5. Belshazzar's feast, the writing on the wall, the doom declared, the city captured, and the king slain. 6. Daniel's exaltation in the kingdom of Darius, the conspiracy against him, the den of lions and his safety there. 7. His prosperity continued during the reign of Cyrus. II. The prophecies in the book are: 1. Concerning the four kingdoms under the emblem of the image in Nebuchadnezzar's dream: its *golden head* representing the Babylonian; its *silver arms and breast*, the Medes and Persians, becoming one; its *brazen loins and thighs*, the Greeks under Alexander, divided after him into two eastern kingdoms, Egypt and Syria; its *iron legs*, the Romans, consisting of two parts—the senate and people, and led by two consuls; its *toes of iron and clay*, the kingdoms of Europe, having both the strength of Rome and the weakness of barbarous tribes; the *stone cut out without hands and smiting the image*, the kingdom of Christ commenced and advanced without human power and destined to subdue the world and continue forever. 2. These kingdoms were represented again in Daniel's vision by four wild beasts coming out of the sea, and explained by the angel as denoting four kingdoms rising out of tumults and wars: (1) The lion with eagle's wings was an emblem of Babylon; (2) The bear with three ribs between its teeth denoted the Medes and Persians conquering Babylon, Lydia, and Egypt; (3) The leopard with four wings and four heads represented the kingdom of Alexander, famous for the swiftness with which it was conquered, and divided after his death into four parts; (4) The fourth beast was great, terrible, and strong, and represented the fourth kingdom, diverse from all others, devouring the whole earth, treading it down, and breaking it to pieces; but finally to be judged and destroyed, and to be followed by the kingdom of the Most High that shall endure forever. 3. The vision of a ram, attacked by a goat rushing from the w. without touching the ground, represented the kingdom of the Medes and Persians overthrown by Alexander advancing from Macedonia with unequaled swiftness. When the goat was strong its horn was broken, and in its place came up four, pointing towards the four winds. And when Alexander was at the height of his power he suddenly died, and four kingdoms were formed out of his dominions. 4. The prophecy concerning the 70 weeks—interpreted as 490 years, each day signifying a year—revealed to Daniel by the angel Gabriel, measured off the time between the going forth of the commandment to rebuild Jerusalem and the coming and death of the Messiah. This period is subdivided into three—7 weeks, 62 weeks, and 1 week. During the *first* the city and wall would be rebuilt; at the end of the *sec-*

ond the Messiah would come, and in the middle of the *third* he would be cut off. During the third period, both before his death and after it, he would establish the covenant with many; and afterwards desolation would come on the temple and city. 5. The final revelation given to Daniel was from the lips of the Son of God appearing in the similitude of a man. Beginning at the point of time where Daniel then stood, he numbered the kings of Persia who were afterwards to arise, announced the expedition of Xerxes against Greece, and gave a condensed summary of human history onward to the resurrection of the dead to everlasting life or everlasting shame.

DANIELL, JOHN FREDERICK, D.C.L., a distinguished English savant, was b. in London, Mar. 12, 1790. He was a pupil of prof. Brande, along with whom he made several scientific tours; was elected a fellow of the royal society in 1814, and in 1816 started, in connection with prof. Brande, the *Quarterly Journal of Science and Art.* From this period, D. devoted almost the whole of his time to the subjects of chemistry and meteorology. In 1823, he published his *Meteorological Essays,* which is still the standard work on meteorology; and in 1824 the horticultural society awarded him their silver medal for his *Essay on Artificial Climate.* In 1831, he was appointed professor of chemistry in King's college, London; and in 1839 published his *Introduction to Chemical Philosophy.* In 18[illegible], he received the degree of D.C.L. from the university of Oxford. He also enjoyed the great honor of being the only person who ever obtained all the three medals in the gift of the royal society. Besides his professorship in King's college, D. also held the post of lecturer at Addiscombe, and of examiner in chemistry to the university of London. He died Mar. 13, 1845. D.'s *Meteorological Essays* was the first attempt to account, in a truly philosophical manner, for the known phenomena of the atmosphere. Besides the works mentioned, D. wrote a large number of interesting and valuable papers for the royal society. For an account of his new hygrometer, see HYGROMETER.

DANIELL, THOMAS, 1749–1840; an English landscape painter. He made a journey through India, taking a great number of important sketches. He published *Views of Calcutta; Oriental Scenery* (144 plates); *Views in Egypt; Picturesque Voyage to China,* etc. He was a royal academician and fellow of several other societies. His nephews, William and Daniel, were also artists of repute, the former assisting in the India sketches, and the latter spending many years in Ceylon.

DANISH LANGUAGE AND LITERATURE. The Danish language, which, with slight modifications, is common to the three Scandinavian kingdoms, is a branch of the ancient Gothic, and has been retained almost in its original form in Iceland. The oldest memorials of the Danish are codes of laws, as the *Skaanske Lov,* and the old and new *Sjællandske Lov,* promulgated by Valdemar the great in 1162 and 1171; but these, no less than the writings of Harpestreng, canon of Roeskilde (1244) already show marked deviations from the Icelandic, in consequence of the intermixture of the Anglo-Saxon, English, and Norman elements, due to the Danish occupation of England, and the immigration of monks and artisans into Denmark from Britain. The influence of the English dialect was again modified towards the close of the 12th c. by the influx of Germans into the country. Saxo Grammaticus, the father of Danish history, who died in 1204, wrote, like almost all his ecclesiastical brethren at that day, in Latin, as did also his contemporary, the knight Svend Aagesen. The Danish *Kæmpeviser* are the richest poetical remains of the folk-lore of the middle ages in Europe, and consist—1. Of narratives and songs of giants, demigods, and other supernatural creatures of the Scandinavian mythology; 2. Of romantic songs and tales connected with these mythical beings; and 3. Of historical verses, referring to a later period. The names of the writers are unknown, and these compositions seem rather to be the expression of the entire people than the production of individual poets. Many have, from time immemorial, been associated with certain national melodies, which have secured them a permanent place in the hearts of the people, whose disposition leads them to dwell with fondness on the memory of by-gone times and events, and to seek in the glory of the past a compensation for the national humiliation and reverses of the present. The first printed collection of the Kæmpeviser is due to the royal historiographer, Vedel, and appeared at Ribe, 1592; another edition (Copenh. 1695) by Peter Syv found its way to almost every peasant's cottage; but the most complete of any is probably that by Nyerup and Rabek, in 5 vols. (Copenh. 1810–14). After the reformation, the national literature was comparatively neglected, for the composition of poor theological treatises and bald versions of the Psalms. Among the best of the writers in this department we may instance Christian Pedersen (born 1480), who, after having made a metrical version of the ancient national chronicles, devoted himself to the diffusion of the Lutheran faith, and made Danish translations of the New Testament, and the reformer, Hans Taussen (born 1494), who composed catechisms, and translated the Pentateuch into Danish. The Danish language acquired stability and new life by the translation of the whole Bible, which, by order of king Christian III., was effected in 1550 by Palladius and other professors of the university. The close of the 16th c. was memorable for the many admirable writers on history which it produced in Denmark. Among those who edited and annotated the ancient Danish and Icelandic historical chronicles, we may mention Peder Claussen, A. S. Vedel, and Axil Hvitfeldt, whose respective works supply invaluable materials to the historical inquirer. These men were contem-

poraries of the great astronomer, Tycho Brahé, and, like him, experienced the caprices of court-favor. The 17th c. shows a large number of able writers, among whom were Longomontanus, the pupil of Tycho Brahé; the family of Bartholin, numbering seventeen in three generations, who were all known for the ability of their writings on medical, philosophical, and mathematical subjects in Latin, German, and Danish; the family of the Pontoppidans, eleven in number, all of whom have left memorials of their proficiency in philology and history, and of their acquaintance with the theology and natural history of the times; Arreboe, the father of Danish poetry, who wrote on sacred subjects, and in his principal work, *Hexameron*, described in epic verse the events of the first six days of creation; Steno, the anatomist, and the lyrical poet, T. Kingo. A new era began with the genial and versatile Ludvig Holberg (born 1684), who wrote in Latin, French, German, and Danish, and has left very numerous works on history, biography, and topography, but whose fame among his countrymen will ever rest on his inimitable comedies, farces, and satirical compositions. His genius and his writings gave an impetus to the cultivation of the Danish language, which not all the studied neglect of the court-party, and their persistence in the use of German, could check. The 18th c. produced many good historical critics—as, for instance, Torfæus, Langebek, Schöning, and Suhm, Magnæus, the Icelandic scholar, Thorlacius, and Thorkelin, learned in ancient northern lore, and Rosenvinge, the jurist. Among the epic and dramatic poets of that age, Ewald stands foremost, whose national lyrics evince true poetic genius. The close of the century was, however, unfavorable to mental development and freedom of thought; and the best writers, as in the case of Malte Brunn and the poet Heiberg, were either compelled to leave the country, or to abstain from giving expression to their opinions. Among the more recent writers, we may instance the poet Oehlenschläger—whose national tragedies and lyrical legends of Scandinavian mythology have rekindled all the long slumbering fire of Danish patriotism—Baggesen, Winther, Hauch, F. P. Müller, Heiberg, Hertz, H. C. Andersen, Rosenhoff, Hoist, and Overskou. Ingemann, who stands first as a writer of historical novels, also wrote good lyrics, and his subjects were generally taken from the national history. Short tales or novelettes would seem, however, to be more congenial to the taste of the Danes, and most of their best writers of fiction have adopted this form—as, for instance, Blicher, Heiberg, Trane, Andersen, Winther, Carit Etlar, etc. The names of Oersted, Schouw, Forchhammer, Rask, Finn Magnussen, Worsaa, Grundtvig, Petersen, and Eschricht, sufficiently attest the stand that the physical sciences, philology and archæology, have attained in Denmark in the present day. Thorwaldsen, by the gift of his works to the nation, has created a taste and appreciation for sculpture and the arts generally among his countrymen, to which they were previously strangers, and has thus given a new direction to the mental culture of the Danes.

The Danish language is peculiarly soft, from the great number (ten) of distinct vowel-sounds which it contains, the absence of gutturals, and the softening of all the consonants. It may be said to bear the same relation to the ancient tongue, the *Norœna* or *Dönsk Tunga*, that Italian does to Latin, force and precise inflections having been sacrificed for melody and simplicity.

DANISH LANGUAGE AND LITERATURE. The original language of Denmark was the pure Scandinavian or Icelandic, but it has been transformed by foreign admixture, chiefly German, until the original features are nearly lost. The changes, beginning in the 12th c., culminated at the period of the reformation, and the language is now regarded as one of the richest of the European tongues. The literature of the country has had a remarkable development, and is of great interest not only to readers in general, but to scholars in all parts of the world. Excepting a medical treatise published in the 13th c., the oldest literary production of the country is a collection of 500 ballads, by unknown authors, celebrating the achievements and adventures of the chivalric age, and written in the 13th and 14th centuries. They are of great merit, historical as well as poetical, and, being handed down at first by tradition, have lately been edited and published in an exhaustive edition by Svend Gruntvig. The first printing press was set up in Copenhagen in 1490 by Gottfried of Gheman, and in 1495 was printed the first book, a history of Denmark in verse. Next, in 1506, appeared a collection of proverbs by Peder Lolle, and eight years later, three sacred poems by Mikkel, priest of St. Alban's in Odense. These and many other works were published in Latin. It was not until the period of the reformation that the literary spirit of Denmark began to utter itself in the native tongue. Christian Pedersen translated the Psalms of David and the New Testament, printed 1529; and, in co-operation with bishop Paladus, the Bible, which appeared in 1550. The first authorized Psalter was published in 1559. Among the other authors of this early period may be mentioned Arild Hvitfield, historian; Hyeronymous Rauch, dramatist; Anders Arrebo, bishop of Trondhjem, father of Danish poetry; bishop Erik Pontoppidan, author of the first systematic analysis of the Danish language; Brigitta Thott, a lady who introduced to the Danes the writings of Seneca and Epictetus; Thomas Kingo, of Scotch descent, and Hans Adol Brorson, eminent hymn-writers. Ludvig Holberg, born 1684, was a historical and dramatic writer of great eminence, whose productions retain their interest and charm at the present day. He is sometimes called the founder of Danish literature.

His comedies, for the age in which they were written, are remarkably pure in tone and sentiment. Joannes Ewald was the most eminent Danish poet of the 18th century. One of his productions, *The Fishers*, contains the Danish national song. Werner Abrahamson, critic; Johan Clemens Tode, scientist; Ove Malling, Peter Frederik Suhm, and Ove Guldberg, historians; Bastholm and Balle, theologians; and Niels Treschow, in the department of philosophy, were also among the writers of the 18th century. After the time of Wessell and Ewald, poetry languished, but prose received a new impulse. The most eminent prose writers of the period were Peter Andreas Heiberg, political and æsthetic critic; O. C. Olufsen, scientist; Rasmus Nyrup, statistician and critic; Englestoft, historian; bishop Mynster, theologian; and Hans Christian Oersted, scientist. With the beginning of the present c., a new school of poets and novelists arose who won a high reputation in all parts of Europe. The herald of this school was Adolph Schack Staffeldt, a man who united with great seriousness and depth an exquisite taste in language. He was followed by Adam Gottlob Oehlenschläger, the greatest poet of Denmark, in whose verse the old Scandinavian mythology was imbued with fresh life; Steen Steensen Blitcher; Nikolai Frederik Severin Grundtvig; Bernhard Severin Ingemann, the first to introduce the historical novel in Denmark; Johan Ludvig Heiberg, poet and dramatist; the countess Gyllembourg, novelist—a woman of remarkable power; Christian Winther, pastoral lyrist; Hans Christian Andersen, whose works are popular in England and America; Frederik Paludan Müller, a poet of great reputation. In philology, the names of Rasmus Christian Rask and Christian Molbeck are eminent, as is that of Niels Matthias Petersen in history. Joachim Frederik Schouw was an eminent botanist; Sören Naby Kierkegaard was a philosophical writer of much originality. Peter Thun Foersom made an excellent translation of Shakespeare. The greatest living geologist in Denmark is Johannes Japetus Smith Steenstrup. Jens Jacob Asmussen Worsaae is an eminent antiquarian; and Nikolai Madvig is celebrated as a philologist. Vilhelm Thomsen has acquired distinction by his researches into the Slavonic tongue. In the fine arts there are some eminent Danish names. In painting, there may be mentioned Abilgaard, Juel, Eckersberg, Marstrand, Vermehren, Exner, Dalsgaard, and Skovgaard. In sculpture, it is necessary only to mention the name of Thorwaldsen, whose works adorn the museum at Copenhagen. The Danes are a musical people, and their first great composer was Christoph Weyse, whose comic operas are greatly admired. Hartmann and Gade are living composers of great merit.

DAN'ITES, a secret order among the Mormons suspected of having committed many murders, of which unfortunately there can be little doubt.

DANKALI', an independent state of Abyssinia, extending along the s.w. border of the Red sea, between lat. 13° and 15° 30′ n., a range of mountains running almost parallel to the coast, and about 50 m. distant from it, forming its boundary inland. D. is a sterile territory, being almost quite destitute of water. The heat is excessive, often reaching 110° F. The inhabitants are composed of various Arab tribes, and are indolent, treacherous, and cruel. They number about 70,000.

DAN'NEBROG, an ancient battle standard of the Danes, alleged to have fallen from heaven at the battle of Volmar, 1219 A.D. Like the palladium, it was supposed to insure victory, but it was twice captured and twice retak The order of the Dannebrog ranks second in the Danish orders of knighthood.

DAN'NECKER, JOH. HEINR. VON, a German sculptor, was b. at Waldenbuch, in the district of Stuttgart, 15th Oct., 1758. His parents were in the humblest circumstances; but through the favor of the duke of Würtemberg, he received a good education at the military academy at Ludwigsburg. His artistic talents were rapidly developed. In 1780, he obtained the prize for the best model of "Milo of Croton destroyed by the Lion;" and in 1783, went to Paris, where he studied for two years under Pajou; after which, he proceeded to Rome, where he met with Goethe, Herder, and Canova, to the last of whom he was indebted for much valuable instruction in his profession. At Rome, D. remained till 1790. Here he executed in marble his statues of "Ceres" and "Bacchus." On his return to Germany, the duke of Würtemberg appointed him professor of sculpture in the academy of Stuttgart, in which city he resided till his death, 8th Dec., 1841. D. was undoubtedly one of the best of modern sculptors. His forte lay in expressing individual characteristics, in which respect he has not been surpassed. This gives a great value to his busts of distinguished persons, such as Schiller, Lavater, Gluck, and the kings Frederick and William of Würtemberg. His perceptions of the beautiful and the delicate, especially in the female form, are also considered by his countrymen to be more exquisite and true than those of Canova himself. His earlier works are chiefly pagan in their subjects, while his later ones are Christian, and are pervaded by a pensive idealism. Of the former, besides those already mentioned, the principal are "Sappho," "Love," "Psyche," and "Ariadne as the Bride of Bacchus riding on a Leopard (at Frankfurt);" of the latter, "Christ," "John the Baptist," and "Faith."

DANNEMO'RA, a parish and iron-mining region of Sweden, 23 m. n. of Upsal; pop. 1000. The iron is of excellent quality, and is largely used in making steel.

DANNEVIR'KE, a wall of defense against the Franks, built by the Danes in 808 A.D., reaching from the North sea to the Baltic. During the troubles of 1848, the line of the old wall was strongly fortified, but the works were destroyed in 1864.

DAN RIVER, rising in the Blue Ridge in Virginia, passing through a considerable portion of that state into North Carolina, several times crossing the state boundaries, and finally uniting with the Staunton river in Virginia to form the Roanoke. It has a length of about 200 m., and is in some parts navigable.

DANSVILLE, a village in Livingston co., N. Y., on the Erie railroad, at the terminus of the Genesee valley canal, 38 m. s. of Rochester; pop. '75, 4,061 (township). Among the institutions are the Dansville Methodist seminary, founded 1858, and a hygienic home, established about 1860. The village is in a fertile district, and has considerable trade.

DAN'TÉ (properly, DURANTE) **ALIGHIE'RI**, one of the greatest poets of all time, and incomparably the greatest among the Italians, was b. in Florence in 1265. The outward circumstances and fortunes of his life are involved for the most part in great uncertainty. His family was, by his own account, one of the most illustrious in the city. His father dying while D. was young, his education devolved upon his mother, Bella. In this duty, in which she displayed great fidelity and judgment, she seems to have been counseled and aided by the great statesman, scholar, and poet, Brunetto Latini. The elements of knowledge D. probably acquired in Florence; in riper years, he studied philosophy at Bologna and Padua. After his banishment, he pursued theology for a time at Paris, and, if Boccaccio were to be believed, even visited England. His studies, however, did not prevent him from discharging the public duties of a citizen. He fought in the successful battle with the Aretines at Campaldino in 1289, and was present at the taking of the fortress of Caprona, 1290. What civil offices he first held, we do not know, but it is certain that he was sent on several embassies, and at last, in 1300, rose to the highest dignity of the city, being chosen one of the Priori for two months, an office which was the source of his subsequent unhappy fortunes. Florence, on the whole, belonged to the party of the Guelphs (q.v.), but was divided into the two factions of the Neri and Bianchi (the *blacks* and *whites*). The Neri were the unconditional adherents of the pope, and this of course gave to the other faction a more Ghibelline leaning. See GUELPHS and GHIBELLINES. A tumult in the city, occasioned by the heads of the ultra-Guelphic or *black* party, caused their temporary expulsion from Florence. They hurried to Rome, to lay their complaints before his holiness. D., who belonged to the Bianchi, was sent by his party to Rome, to counteract their machinations; but Boniface VIII., in concert with the Neri, got Charles of Valois, brother of Philip IV. of France, to come to Florence and restore peace under the title of peacemaker. This explains the deadly enmity of D. to Boniface. The peace established by Charles of Valois consisted in recalling the banished leaders of the Neri, in giving up the houses and property of the Bianchi to be plundered, and banishing many of them, and among others Danté. D. never entered his native city again, and his whole subsequent life was unsettled, spent in various places, and under various protectors, at Arezzo, Verona, Padua, etc. In 1304, the Bianchi made a final attempt to return to Florence by force of arms, which failed; and it was probably on this occasion that D. went to Paris. The march of Henry VII. to Rome in 1310 recalled him to Italy, and he endeavored, by addressing ardent letters to the Italian princes, to promote the cause of the empire, which had now become his own. It was probably with this view and at this time, that his work *De Monarchia* was written. The unsuccessful siege of Florence, and the death of the emperor, which followed in 1313, annihilated the last hopes of D., and he spent the closing years of his life at Ravenna, under the protection of Guido Novello da Polenta. He went on a mission for this prince to Venice, returned sick, and died on the 14th Sept., 1321.

As not unfrequently happens with distinguished men, an accidental circumstance in D.'s early youth had made an indelible impression on the soul of the poet, and, as he himself expresses it, awaked in him a "new life." At a family festivity, he had seen Beatrice Portinaci, then eight years old, the daughter of a rich citizen, and the love that sprang up in the heart of the nine years' old boy became the fountain of the poetical inspiration of his life. How pure, chaste, and tender this love was, is testified by the *Vita Nuova*, his first work, which appeared about 1300. It is a collection of poems or canzoni, bearing upon this youthful love, and along with each piece is given a history of its origin and a minute analysis. The best edition of this collection is that prepared by the marquis Trivulzio (Mil. 1827). Beatrice married a nobleman, Simone de Bardi, and died young about 1290. D. himself afterwards married a lady named Gemma, of the powerful house of Donati.

His immortal work, the *Divina Commedia*, depicts a vision, in which the poet is conducted first by Virgil, the representative of human reason, through hell and purgatory; and then by Beatrice, the representative of revelation; and finally by St. Bernard, through the several heavens, where he beholds the triune God. The name *Commedia* was given to the work by the poet himself—because, beginning with the horrible, it ends cheerfully; and because, in respect of style, it is lowly, being written in the vulgar tongue. The epithet *Divina* was added by the admiration of after-times. Hell is

represented in the poem as a funnel-shaped hollow, formed of gradually contracting circles, the lowest and narrowest of which is at the earth's center. Purgatory is a mountain rising solitary from the ocean on that side of the earth that is opposite to us; it is divided into terraces, and its top is the terrestrial paradise, the first abode of man. From this, the poet ascends through the seven planetary heavens, the heaven of the fixed stars, and the "primum mobile," to the empyrean, or fixed seat of God. In all parts of the regions thus traversed, there arise conversations with noted personages, for the most part recently deceased. At one time, the reader is filled with the deepest sorrow, at another, with horror and aversion; or the deepest questions of the then philosophy and theology are discussed and solved; and the social and moral condition of Italy, with the corruptions of church and state, are depicted with a noble indignation.

Fifty-two years after the poet's death, the republic of Florence, at the instigation of Boccaccio, set apart an annual sum for public lectures to explain the *Divine Comedy* to the people in one of the churches, and Boccaccio himself was appointed first lecturer. The example was imitated in several other places of Italy. The works of these men are among the earliest commentaries on D. that we possess. The number of editions of the work amounts by this time to about 300. Only a few, in addition to the commentaries above mentioned, deserve notice. They are: that printed at Fuligno in 1472—the earliest of all; the Nidobeatine edition at Milan (1478); the first Aldine edition (1502); the first Cruscan edition (1695); that of Volpi (1727); of Venturi (1732); of Lombardi (1791), and with additions and illustrations in 1815, 1821, and 1822; of Dionisi (1795); of Ugo Foscolo (Lond. 1842–43). A reprint of the Fuligno edition above mentioned, together with those printed at Jesi (1472), at Mantua (1472), and at Naples by Francisco del Tuppo (about 1478), appeared at London, in 1858, under the superintendence of sir Antonio Panizzi, and at the expense of lord Vernon.

The *Divina Commedia* has been translated into almost all European languages. Two translations of the whole into Latin have been printed, one by Carlo d'Aquino (1728), and lately by Piazza (1848). In French, there are a number of translations both in prose and verse. The earliest, by Grangier, in 1596, is still the nearest to the original in form, but none is good. The German translations are numerous, and such as no other modern language can equal in faithfulness. Kannegiesser has translated the whole in the measure and rhyme of the original (4th edition, Leip. 1843); king John of Saxony's translation is said by some to be the best. The chief English translations are Boyd's (1785) and Cary's (1814), in blank verse. (see "Chandos Classics," London, Warne & Co.); Wright's (1833), in triple rhymes; Cayley's, in the original ternary rhyme (the *Inferno*, 1801, the *Purgatory*, 1853, the *Paradiso* in 1854, with notes in 1855); Dr. John Carlyle's, the *Inferno*, in prose, with commentary (1849); Fred. Pollock's, in blank verse (1854); H. W. Longfellow's (1867), in blank verse, with D.'s ternary arrangement of lines. D. wrote other works.

DANTON, GEORGES-JACQUES, was b. at Arcis-sur-Aube, 28th Oct., 1759. At the outbreak of the French revolution, he was practicing as an advocate in Paris, but did not enjoy much reputation, on account of his dissolute habits. The fierce half-savage nature of the man, however, immediately found a fitting sphere for its action in the chaos into which France then fell. Mirabeau quickly detected his genius, and hastened to attach D. to himself. President of the district of the Cordeliers, D. ruled it at his will. Along with Marat and Camille Desmoulins, he instituted the Cordeliers' club, an exaggerated copy of that of the Jacobins. It soon became the rallying-point of all the hotter revolutionists. There the tall brawny man, with harsh and daring countenance, terrible black brows, and a voice of enormous power, thundered against the aristocrats, till the passions of the populace rose into ungovernable fury. It was not, however, till after the flight of Louis that the political *rôle* of D. commenced. On the 17th July, 1791, he and others assembled the people of Paris in the Champ-de-Mars, and goaded them on by furious declamation to sign a petition for the deposition of the king. Some time after, he became *procureur-substitut* for the city of Paris. The court, which found that it could not frighten D., now attempted to bribe him. It is not certain that he proved venal, but the evidence undoubtedly leaves a strong suspicion of his venality on the mind. Be that as it may, he soon broke off his secret intercourse with the royalist agents, and became more the implacable enemy of the monarchy than before. It was D. who excited to action the wild sanguinary rabble that, on the 10th of Aug., 1792, stormed the Tuileries, and butchered the faithful Swiss. The reward of his fatal eloquence was the office of minister of justice, and here the gigantic personality of the man seemed to overshadow all the surrounding figures. He stood forth as the incarnate spirit of the revolution, manifesting alike its heroic audacity in the presence of danger from without, and its maniacal terror in the presence of danger from within. The advance of the Prussians seemed for a moment to inspire France with a panic. On the 2d of Sept., D. mounted the tribune, and addressed the legislative assembly in a speech of tremendous power, probably the most effective delivered during the whole of the revolution. It closed with these words regarding the enemies of France: "Pour les vaincre, pour les atterrer, vue faut-il? De l'audace, encore de l'audace et toujours de l'audace." France quivered to its core with enthusiasm. "In a few weeks, 14 republican armies stood upon the field of battle, and repelled with unexampled bravery the

aggressions of the allied forces." But unhappily that "audacity" by which alone D. thought it possible for France to save herself, required for its perfection the immolation of the imprisoned royalists. On the very evening when D. spoke, the frightful Sept. massacres began. D. publicly thanked the assassins, "not as the minister of justice, but as the minister of the revolution." Elected by the city of Paris one of its deputies to the national convention, he resigned his judicial function, and zealously hurried on the trial of the king. As a proof of his ferocious decision of character when pressed by difficulties, it is recorded that one of his friends having pointed out that the convention could not *legally* try the king, "You are right," instantly replied Danton. "So, we will not try him; *we will kill him!*" In the mean time, D. was sent on a mission to the army of the north, commanded by Dumourier, with whom he was soon on very close terms of intimacy—too much so, indeed, for the suspicious soul of his old friend Marat. The defection of Dumourier was the signal for Marat to give vent to his suspicions. It therefore became necessary for D. to throw himself again into the van of the revolutionary movement. On the 10th Mar., 1793, he established the "extraordinary criminal tribunal," which was at liberty to make what arrests it pleased, and from whose deadly decisions there was no appeal. He also became president of the "committee of public safety." D. now set himself to crush the Girondists, or moderate party, alleging, with singular candor, that "in a revolution the authority ought to belong to the greatest scoundrels." In this he was supported by Robespierre, now gliding into power swiftly and silently like a serpent. After he had effected his purpose, however, a species of remorse seems to have seized him. He objected to the institution of the guillotine. This trait of moderation lost him the favor of the Jacobins or mountain party, whose murderous instincts led them to select Robespierre as a chief, on the permanence of whose cruelty more reliance might be placed. Several other indications of returning humanity lessened his influence still more, and at the close of 1793, D. felt that a crisis was approaching. A fruitless attempt was made to reconcile Robespierre and him. They had an interview, but parted on worse terms than ever. It was now a struggle for life between them; but D., sick of the revolution, and conscious that it was rapidly becoming a *sham* (a thing which D., with all his faults, could not abide), gave himself up to a sort of reckless apathy, which enabled the sleepless Robespierre to ruin him. His friends endeavored to rouse him. "I would rather be guillotined than guillotine," he answered. Blinded by the consciousness of his own inherent power, he also declared that his enemies "would not dare" to lift their finger against him. But men of the stamp of Robespierre—though essentially cowards, and incapable of facing danger with honest straightforwardness—have a certain furtive audacity that emboldens them to attack a greater than themselves, if circumstances are favorable. So Robespierre sprang at D., and so the great anarch perished. On the night of the 30th Mar., 1794, he was arrested, and brought before that revolutionary tribunal which he himself had established, summarily condemned, and, along with Camille Desmoulins and others, was guillotined on the 5th of April. He predicted the fate of Robespierre, calling him "an infamous poltroon," and immediately added, "I was the only man who could have saved him." D. was an atheist—not a calm, thoughtful dispassionate disbeliever in the existence of God, but one who, by his own vices, and the general godlessness of the times in which he lived, had been robbed of the spirit and power of faith in the Unseen. When formally interrogated regarding his name and dwelling, he replied: "My dwelling-place will soon be annihilated, and my name will live in the pantheon of history."

DAN'UBE (Ger. *Donau*), the second of European rivers, inferior only to the Volga, has its origin in the Brege and Brigach, two mountain-streams rising in the eastern part of the Black Forest, in Baden, at an elevation of 2,850 ft. above sea-level in lat. 48° 6′ n., and in long. 8° 9′ east. The total length of the D. 's about 1750 m.; the area which it drains is estimated at 250,000 sq.m., comprising countries widely varying in climate and productions. The average fall of the D. is 18 in. per mile. At Ulm, it attains a breadth of 108 ft., and before its junction with the Sereth the mean breadth is 6,000 ft., and the depth, which at Ulm is 6 ft., and at Passau 16, is here on an average 20 feet. The D. is joined in its course by sixty navigable rivers, and falls into the Black sea, pouring into it a volume of water nearly equal to that of all the other rivers that empty themselves there. From its source it flows in a north-easterly direction through Würtemberg and Bavaria. Passing Ulm, at which point the river becomes navigable for vessels of 100 tons, it receives from the s. the Lech and the Iser, with some unimportant streams from the n.; flows rapidly past Ingolstadt, and onwards to Regensburg (Ratisbon); then suddenly altering its course, it proceeds in a south-easterly direction, passing Straubing and Passau, where it enters the Austrian dominions. With little variation of course, the D. flows eastward from Passau to Presburg, receiving from the s. the Inn and the Ens, and from the n. the March or Morava, through a tract of country rich in minerals, well peopled, and highly cultivated. Near Linz, and also in the picturesque neighborhood of Vienna, the waters of the D. frequently divide, and inclose large tracts of soil, forming islands, among which are the Great and Little Schütt, called also the "Golden Gardens." Hurrying past Presburg, the D. alters its course to s.e., and such is its velocity here, that barges can only navigate it downwards. Passing Pesth, and

flowing directly s., it enters upon the Hungarian plain, a vast sandy and alluvial flat, in which it is continually forcing new channels and silting up old ones, sometimes sweeping away towns, or capriciously removing its waters to a distance of several miles from such as were formerly built upon its banks. Here it receives from the n. the Waag and the Gran, while the Drave from the w. adds considerably to its volume. After this accession the river turns towards the e., and joined by the waters of the Theiss and Temes from the n., sweeps past Belgrade, forming the boundary between Servia and Hungary. Still flowing eastward, the D., leaving Orsova, passes the famous "Iron Gate," a broad plateau of rock 1400 yards wide, over which the water formerly rushed with an overpowering noise. This rapid, which was followed by a series of whirlpools, eddies, and shallow falls, formed an effectual bar to the upward progress of vessels, no craft drawing more than 2½ ft. of water being able to pass it. In 1847–49, however, the obstruction formed by the "Iron Gate" was to some extent removed by blasting, so that now vessels of 8, and even 9 ft. draught, can pass at certain seasons of the year, although the majority of vessels engaged on this part of the river draw no more than 4 ft. of water. A few miles further on, it enters a plain, and proceeding uninterruptedly, forms the boundary between Wallachia and Bulgaria. From the Carpathians it receives the Schyl and the Aluta, and from Mt. Balkan the Morava. Increased by these rivers and by numberless streams, it progresses through a district fertile indeed, but badly cultivated and thinly peopled, occasionally broadening like a sea, as at Hirsova, and encircling many islands. After being joined by the Serith and the Pruth from the n., and after dividing into several branches forming deltoid islands, it flows eastward into the Black sea. The principal mouth is the Sulina, by which the greater number of ships enter. The D., which is the chief natural highway for European commerce, is throughout the greater part of its course surrounded by picturesque and impressive scenery—at one time flanked with lofty mountains, again having on each side dense and far-extending forests. At the peace of Paris, in 1856, the navigation of the Danube was declared free to all nations, and its management was intrusted to two commissions, one representing the European powers, another named by the states on the banks of the river. At the Berlin congress of 1878, it was stipulated that no ships of war should navigate the D. below the Iron Gate. The Danube steam navigation company, which has done much to increase the commerce, possesses upwards of 150 steamers and 600 tow-boats.

DANU'BIAN PRINCIPALITIES. See MOLDAVIA AND WALLACHIA.

DANVERS, a t. in Essex co., Mass., 15 m. n.n.e. of Boston, with which it is connected by rail; pop. '80, 6,638. In 1852, George Peabody, who was a native of this town, gave a sum finally amounting to $200,000 for the promotion of knowledge and morality among the inhabitants. This was the foundation of the Peabody institute and its fine library.

DANVILLE, a city and the seat of justice of Vermilion co., Ill., on Vermilion river, 16 m. above its junction with the Wabash; connected by railroads with all parts of the country; 125 m. s. of Chicago; pop. '70, 7,735. Coal-mining is the chief source of the city's importance.

DANVILLE, the co. seat of Boyle co., Ky., on a branch of Dick's river; connected by rail with Louisville and Nashville; 42 m. s. of Frankfort; pop. '70, 2,542—1210 colored. It is the seat of Centre (Presbyterian) college, founded 1819, and Danville theological seminary (Presbyterian), founded 1853.

DANVILLE, the seat of justice of Montour co., Penn., on a branch of the Susquehanna, 50 m. n.e. of Harrisburg; pop. '70, 8,436. There are rich deposits of anthracite, great quantities of which find the way to market through the Pennsylvania canal and various railroads. Iron manufacturing, however, is the principal business; of railway bars alone, 75,000 are made annually.

DANVILLE, a t. in Pittsylvania co., Va., on the river Dan, 120 m. w.s.w. of Richmond, reached by the Richmond, Danville, and Piedmont railroad; pop. about 7,000. After the abandonment of Richmond, April, 1865, Danville became for a few days the capital of what remained of the Southern confederacy.

DANZIG (Polish *Gdansk*), an important seaport of Prussia, and fortress of the first rank, in the province of Prussia, is situated on the left bank of the western branch of the Vistula, about 3½ m. from its mouth in the Baltic. D. is an ancient place, having been in existence at least as early as the 10th c., and its possession was long an object of ambition to the Danes, Swedes, Pomeranians, and Teutonic knights, the last of whom obtained and held it for a considerable period. In 1454, it became a free city under Poland, and remained so until 1793, when it fell under the dominion of Prussia, in whose hands, except during the years 1807–14, when it existed as a separate dukedom under Napoleonic rule, it has since continued. D. is surrounded by ramparts and wet ditches, and is otherwise strongly fortified, and the garrison possesses the means of laying the surrounding country under water on three sides. The city is traversed by the Motlau and Radaune, tributaries of the Vistula, the former of which is deep enough to admit vessels of 8 or 9 ft. draught up to the town. The principal port, however, is at Neufanrwasser, at the mouth of the Vistula, which river cannot be entered by large vessels on account of the sand-bars across it. Many of the streets of D. are

narrow and crooked, but the principal street, intersecting it from e. to w., abounds in fine specimens of antique architecture, and has altogether a most picturesque appearance. Among the most noteworthy buildings are the cathedral, a fine structure, commenced in 1343, but not finished until 1503, and possessed of a noble and widely celebrated picture of the "Last Judgment" (the painter of which is unknown), the church of St. Catharine, Trinity church, the fine old town-hall (which has lately been restored at a cost of 60,000 thalers), the exchange, etc. D. was at one time a prominent member of the Hanseatic league, and is still one of the chief commercial cities of northern Europe. To provide for its immense trade in grain, it has enormous granaries, capable of containing 500,000 quarters of corn, and built on an island forming one of the parts of the town where, in order to prevent fire, no person is permitted to live, nor lights allowed. In 1874, 123,223 tons (of 1000 kilos.) of wheat and other grain were exported, of which 86,470 tons went to Great Britain. The value of timber exported in 1873 was £972,360; and in 1874, £932,265; the largest quantity going to Great Britain. Besides grain and timber, there are some minor articles of export, as black beer, amber, spirits, etc. The annual value of the exports is about 20,000,000 marks (£1,000,000); of the imports, about 150,000,000 marks. In 1874, 1845 vessels entered, and 1826 cleared the harbor. The inhabitants of D., of whom the majority are Protestants, numbered in 1875, 97,935.

DAOUDNUG'UR, a t. in the province of Behar in India, stands on the right bank of the Sone. D. is about 90 m. to the e. of Benares, being in lat. 25° 3′ n., and long. 84° 27′ east. It is a wretched-looking place, most of its thoroughfares being mere passages. It possesses, however, a considerable trade, manufacturing coarse fabrics both of wool and of cotton. Pop. '71, 10,058.

DAOU'RIA, a country of Asia, partly in the Russian government of Irkutsk, and partly belonging to the Chinese territory of Mantchooria. Its limits are not exactly defined. The Daourian mountains, offsets of the Yablonoi mountains, traverse it from n.e. to s.w., and separate it from the region of lake Baikal. The mountains are fertile in minerals.

DAPH'NÉ, a magnificent grove and sanctuary in ancient times, near Antioch (q.v.). The grove was finely laid out in walks of cypress and bay trees, and as the chief resort of all the dissolute persons in the city, became the scene of the greatest debauchery. In the center, surrounded by the luxuries of nature and art, glorious gardens, fountains, baths, colonnades, stood the temple of Apollo and Diana, which was invested with the privileges of an asylum, and became for centuries a place of heathen pilgrimage. The progress of Christianity gradually revived in the Antiochenes the purer instincts of virtue and decorum, and the grove was finally abandoned. Julian the apostate, in his vain endeavor to resuscitate the lifeless corpse of paganism, visited D., and made the altars of the temple smoke once more with incense; but on his departure, they were again neglected, until one night the altars and the statues were discovered to be in flames. They were consumed to ashes; and so perished forever the gods of Daphne.

D. owed its origin to Seleucus Nicator. He planted the grove, built the temple, and gave the place a mythological history in connection with the river Peneus and the nymph Daphne, who was here turned into a laurel or bay tree, whence the grove of D. received its name. Modern travelers are not agreed as to its site. Pococke and Richter decide in favor of *Beit-el-Maa*, about 5 m. from Antioch; while Forbiger and Kinneir consider Babylas the true position.

DAPH'NE, a nymph in Grecian mythology, of the woods some say, and some say of the water. She was pursued by Apollo, and prayed for help from her mother (the earth), whereupon the ground opened and she disappeared. From the place there grew a laurel, a tree sacred to Apollo, and to all poets and heroes.

DAPHNE, a genus of plants of the natural order *thymeleaceæ*, having a 4-cleft, funnel-shaped perianth, the throat of which is destitute of scales, eight stamens, and a one-seeded succulent fruit. All the species are shrubs or small trees, some having deciduous, and some having evergreen leaves, all of them possessing in all their parts a more or less considerable acridity, which in some is so great, that they are even caustic; and the berries are poisonous, whilst, however, the flowers of some are deliciously fragrant. To this genus belongs the DAPHNE MEZEREON, well known both for the fragrance of its flowers and for its medicinal uses, naturalized in some places of England. The GAROU bush (*D. gnidium*), a native of the s. of Europe, less hardy than the mezereon, has the same medicinal properties and uses, which is also in some measure the case with many other species. The only species certainly a native of Britain is the SPURGE LAUREL (*D. laureola*), an evergreen shrub, 3 to 4 ft. high, with obovate-lanceolate leaves, which grow in tufts at the end of the branches, and give it a remarkable appearance. It grows well under the shade of trees. It is naturalized, rather than a native of Scotland.—*D. Japonica*, a species recently introduced from Japan, has exquisitely lemon-scented leaves. From the bark of some species of D., and of the most nearly allied genera, paper is made in different parts of the east, particularly *Nepaul paper* from that of *D. cannabina*. Slips of the inner bark are boiled in a lye of wood-ashes for half an hour till quite soft, are then reduced to a homogeneous pulp by beat-

ing with a wooden mallet in a mortar, churned with water into a thin paste, and poured through a coarse sieve upon a cloth stretched on a frame. The paper is subsequently polished by friction, with a shell or a piece of hard wood, and is remarkable for its toughness, smoothness, and durability. Most of the paper used in Thibet is made from the bark of different species of D. and allied genera, particularly of *Edgeworthia gardneri*, a beautiful shrub, with globes of waxy, cowslip-colored, deliciously fragrant flowers, growing on the Himalaya, at an elevation of 6,000 to 7,000 feet. The bark of *dais Madagascariensis* is also made into paper in Madagascar, and that of *gnidia daphnoides* into ropes.

DAPHNEPHO'RIA, a festival held once in nine years at Thebes in honor of Apollo. There was a procession in which the chief figure was a boy chosen for his beauty and strength, and having both parents living. Behind him moved a troop of maidens carrying green boughs and singing hymns to the god. The boy dedicated a bronze tripod in the temple of Apollo.

DAPH'NIA. See WATER-FLEA.

DAPH'NINE is a bitter, astringent, crystalline substance present in different species of *daphne*. It is analogous to asparagine. See ASPARAGUS.

DAPH'NIS, in mythology, a Sicilian youth of rare beauty, the son of Mercury and a nymph. He became a herdsman on Mt. Etna, where he won the love of a maid, who, for his supposed unfaithfulness, punished him with blindness. Thereupon his father carried him away to heaven. To Daphnis is ascribed the invention of bucolic poetry.

DA PON'TE, LORENZO, 1749–1838; an Italian poet, for many years a resident of New York, where he died. Exiled from Venice for writing a satirical poem, he went to Vienna, where he became one of the secretaries of Joseph II. There he wrote for the stage, among other works the librettos of *Don Giovanni* and *Le Nozze di Figaro*. After the emperor's death, he went to London, where he was secretary and poet of the Italian opera. In 1805, he emigrated to New York, where he taught Italian, and in 1828, was chosen professor of that language in Columbia college. He wrote memoirs of his life, a number of dramas, and translated various English works into Italian.

DARABGHERD', or DARAB', a t. of Persia, in the province of Farsistan, lat. 29° n., long. 54° 30' east. It is situated on a small river, in the midst of an extensive plain, and is surrounded by lemon and orange groves. At one time, it was a place of great extent and importance, but most of it is now in ruins, and its pop. is not more than 15,000 or 20,000.

DARAGUNJ', a t. of India, in the British district of Allahabad (q.v.), on the left bank of the Ganges, opposite to Allahabad, with which it is connected by a ferry. The bed of the Ganges is here about a mile wide, two thirds of the width being occupied in the dry season with wet sand and mud, over which the passage is difficult. Pop. 9,000.

D'ARBLAY, MADAME. See BURNEY, DR. CHARLES.

D'ARBLAY, MADAME FRANCES, (*ante*), 1752–1840; daughter of Charles Burney, an English professor of music. Frances taught herself to read and write. From her 15th year she lived in an exceptionally brilliant circle of literary men, musicians and actors. As her step-mother disapproved of her "scribbling," she burned all her manuscripts, among them a *History of Caroline Evelyn*, a story of which her first published novel *Evelina* was the sequel. About the same time (not much beyond her 15th year), she began her famous diary, which extended over a varied and interesting life of 72 years further. Her novel *Evelina, or a Young Lady's Entrance into the World*, was planned when she was about 16, written some years later, but not published until she was 26; and then by stealth. She disposed of it through her brother to Dr. Lowndes for $100, and did not herself know of its appearance until she saw an advertisement of it in the newspapers, after it had been everywhere commented upon with unqualified praise. The proud father, who had been in the secret, told it to Mrs. Thrale, and the authoress was at once admitted to the literary coterie of which Dr. Johnson was the center. The great lexicographer entertained a friendship for her which caused Boswell a jealousy as keen as it was absurd. Her *Cecilia, or the Memoirs of an Heiress*, was even more successful. In 1786, she obtained the position of second keeper of robes to queen Charlotte, wife of George III., and for five years her chief business was to assist the queen to dress, and look after her lap-dog and snuff-box, perhaps now and then to read to her. After five years she resigned, and in 1793, married M. D'Arblay, a French artillery officer. The next year her only child (who became the Rev. A. D'Arblay) was born. From 1802 to 1812, she was with her husband in France, and in 1814, published *The Wanderer, or Female Difficulties*. Her husband died in 1818. She was not remarkable for personal beauty; was small, retiring, rather prudish, delighting to be lionized, while she dreaded nothing so much as to be thought unfeminine or eccentric. Her novels are now not much read, but her *Journal and Letters*, full of egotism, are known everywhere. Her mania was to succeed as a dramatic writer, and Mrs. Siddons and Kemble appeared in one of her tragedies at Drury Lane in 1795, but the piece was a complete failure.

DARBOY, GEORGES, 1813–71; a French Roman Catholic ecclesiastic, ordained a priest in 1836. In 1855, he became titular vicar-general of Paris. In 1859, he was appointed bishop of Nancy, and in 1863, advanced to archbishop of Paris, where he was in high favor with the court, being appointed grand officer to the legion of honor. He was a strenuous upholder of episcopal independence. At the Vatican council he maintained the rights of the bishops, and strongly opposed the doctrine of papal infallibility; but when it had been declared, he was one of the first to submit. During the war with Germany he was indefatigable in works for sick and wounded soldiers. He refused to leave his post during the siege, or to seek safety in flight during the brief triumph of the commune. On April 14, 1871, he was arrested by the communists as a hostage, and May 27, he was murdered in prison, dying in the attitude of blessing, and uttering words of forgiveness. He was the author of a number of works, among which are a life of Thomas à Becket, and a translation of the *Imitation of Christ*.

DARBUNG', a mountain torrent of Bussahir, Hindustan, with a course of only 27 m., rises about 15,000 ft. above the sea, in lat. 31° 57′ n., and long. 78° 25′ e., and loses itself in the Sutlej, the most easterly of the five rivers of the Punjab, in lat. 31° 43′ n., and long. 78° 35′ east. About 7 m. above the point of confluence—having already descended 6,000 ft. in 20 m.—the D. is crossed by a wooden bridge of 33 ft. in length; and even somewhat further up, it is bordered by several villages. Its source has been described as a scene of terrific desolation, consisting of fields of snow and ice half hid under stones and rubbish.

DARBYITES. See PLYMOUTH BRETHREN, *ante*.

DARCET, JEAN PIERRE JOSEPH, 1727–1801; a French chemist who wasted a fortune in the pursuit of his favorite science, sometimes suffering extreme privations. He was tutor to Montesquieu's sons, and assisted the father in his mental labors, particularly in preparing *The Spirit of the Laws*, and in his last moments defended him against the attacks of the Jesuits. In chemistry, Darcet made many valuable discoveries. In 1774, he was appointed professor of chemistry in the college of France, and in 1784, he became a member of the academy of sciences, and director of the porcelain manufactory at Sevres. When the revolution began, he went with Robespierre and Danton.

DARDANELLES' (ancient *Hellespont*), a narrow channel separating Europe from Asia, and uniting the sea of Marmora with the Grecian archipelago. It extends from n. e. to s.w., between lat. 40° to 40° 30′ n., and long. 26° 10′ to 26° 40′ e., having a length of about 40 m., and a breadth varying from less than 1 to 4 miles. From the sea of Marmora, a strong current runs through the strait to the archipelago. To prevent an attack on Constantinople from the archipelago, the D. is strongly fortified on both sides, with many guns of immense caliber. A treaty concluded between the five great powers and Turkey in 1841, arranged that no ship of war belonging to any nation save Turkey should pass the D. without the express consent of Turkey; all merchant ships being also required to show their papers to the Ottoman authorities. These provisions were confirmed at London in 1871 and at Berlin in 1878. The D. is celebrated in ancient history on account of Xerxes and Alexander having crossed it, the former in 480 B.C., to enter Europe; and the latter in 334 B.C., to enter Asia. The point at which Xerxes crossed, by two separate bridges, was in the neighborhood of Abydos, on the Asiatic shore, opposite to Sestos. Alexander crossed at nearly the same place; and here also young Leander nightly swam across to visit Hero—a feat performed in modern times by lord Byron for "glory."

DAR'DANUS, in Greek mythology, the ancestor of the Trojans. It is said that he crossed over from Samothrace to the Troad by swimming on an inflated skin, and founded the kingdom of Dardania before the existence of Troy. He is called a son of Zeus and the pleaid Electra; and the *Iliad* represents that Zeus loved him more than his other sons.

DARDEN, MILES, 1798–1857; b. N. C., and supposed to be one of the largest of men. He was 7½ ft. high, and at the time of his death weighed over 1000 lbs. His coffin was 8 ft. long, within an in. of 3 ft. deep, and 2 ft. 8 in. wide.

DARE, a co. in n.e, North Carolina, on Albemarle sound, including a number of islands along the coast; 350 sq.m.; pop. '80, 3,245—367 colored. It is covered to a large extent with red cedar and cypress swamps. Co. seat, Manteo.

DARE, VIRGINIA, the first child b. in America of English parents, at Roanoke, Va. (now N.C.), Aug., 1587. She was the grand-daughter of John White, who was sent out by sir Walter Raleigh as governor of the colony, which had an unknown fate.

DA'RES, a Trojan priest of Hephæstus (Vulcan) in the time of the Trojan war, to whom an account of the war has been attributed, though there is no doubt that the work was written at a much later period.

DARFUR', a country of Africa, e. of Sudan, is generally said to be situated in lat. 10° to 16° n., and in long. 22° to 28° e.; but its limits are not very clearly defined. D. towards the s. is hilly, the principal elevation being a mountainous ridge called Marrah, which traverses the country longitudinally, and is the source of numerous streams. Towards the n. D. is level, sandy, and almost destitute of water. During the rainy

season, which commences in June, and continues till Sept., it exhibits a rich vegetation. The principal products are wheat, millet, rice, maize, and sesame. Tobacco, which is used by the natives in every form, abounds. Water-melons, also, are abundant during the rainy season. Among the fruits are tamarinds and dates. The minerals are chiefly copper and iron. The wealth of the inhabitants of D. consists chiefly in cattle. Horses, sheep, camels, and game abound. D. carries on a considerable trade with Egypt, Mecca, and the inland countries of Africa; it was once a notorious center of the slave-trade. The Furani are an intelligent, well-built race, and have long been Mohammedans. Their numbers are variously estimated at from 3 to 4 millions, the former estimate being that of the Egyptian governor-general. D. was annexed to Egypt in 1874–75, and the organization of the country into 4 provinces (Umshanga, Fasher, Dara, and Kakkabia) is now complete. The residence of the governor is Fasher, whence a regular postal service conveys letters to Khartum in 10 days. Kobe is the chief trading town.

DAR'GAN, WILLIAM, was b. about the beginning of the present century in county Carlow, Ireland, where his father was a large farmer. D. received, when young, a good education, and after spending some time in the office of a surveyor, where he acquired a high reputation for integrity and assiduous industry, he went to England, and was employed under Telford, who was then constructing the Holyhead road. Inspired perhaps by the example of that great engineer, D. now resolved to carve out a similar path for himself in his own country, and having returned to Ireland, obtained some small "jobs," the beginnings of a career crowned with the most splendid success—for he became one of the first capitalists in Ireland. It was D. who contracted for the first railway ever executed in Ireland (the Dublin and Kingstown), and he was afterwards connected with most of the great undertakings in that country, such as the making of railways, canals, tunnels, and embankments. He was also an extensive holder of railway stock, a steamboat proprietor, flax-grower, and farmer. He planned the industrial exhibition of Dublin (1853), with the view of developing more vigorously the material resources of his native country; and as a help towards its realization, placed £20,000 in the hands of a working-committee. This sum was gradually increased to about £100,000. The exhibition was opened on the 12th of May, 1853, by the lord-lieutenant; and was visited by the queen and prince Albert, when the honor of knighthood was offered to D., but was declined. In so far as the industrial exhibition was a *personal* speculation on the part of D., it was a failure, for he lost, it is said, £20,000 by it; but in every other respect it was highly gratifying to him, and to every genuine lover of his country. William D. was not one of those sham patriots with whom Ireland has been too often afflicted. He died Feb. 7, 1867.

DAR'IC, a cold coin of ancient Persia, used in Greece as well as Asia. It was much like the Greek stater. On the obverse is the figure of an archer kneeling, and on the reverse a royal palla. It was named from Darius Hytaspis. Its value for its times cannot now be definitely fixed; but in American gold it is not far from 7 dollars.

DARIEN, the name of a gulf on the northern coast of South America, and of the isthmus connecting the grand northern and southern divisions of the new world.—1. Gulf of D., the most southerly portion of the Caribbean sea, about 70 m. in length from n. to s., and 25 from e. to west. The shores are in most places steep, and are in many places fringed with shoals. The southernmost part of the gulf is called the bay of Choco, into which the considerable river Atrato debouches.—2. The isthmus of D. is a term commonly used as interchangeable with that of isthmus of Panama (q.v.), now the more usual name. D. was also the name given to a province in the republic of New Granada, corresponding to what is now the state of Panama in Colombia. One of the earliest Spanish settlements on the mainland was in D., the region being then called also by the Spaniards *Castilla de Oro* ("the Golden Castile") and forming the best known part of their *Tierra Firma*. In 1513, the conquistador Balboa, governor of the Darien settlement, crossed the isthmus with 290 men, and on 26th Sept. first caught sight of the Pacific ocean. As early as 1528, the idea of a ship canal across the isthmus was entertained; in 1826, a line for such a canal was traced between Panama and Portobello; and between 1843 and 1874, repeated surveys have been made by French, English, and American engineers with the same view. One of the most recent schemes proposes to take advantage of the lower course of the river Atrato, and so lies outside the isthmus, properly so called. But in all the surveys the height to be surmounted between ocean and ocean, and other great though not insuperable difficulties, have prevented the realization of any of the projects. For the railway from Aspinwall to Panama, see PANAMA. The principal ports on the northern shore of the isthmus are Chiriqui, Colon or Aspinwall on Limon bay, Portobello, San Blas, and Puerto Escoces on Caledonia bay.

DARIEN SCHEME, THE, one of the most disastrous speculations on record, and one which caused an unprecedented excitement in Scotland from 1695—in which year the Darien company was established by act of the Scottish parliament, sanctioned by royal authority—till 1701, when the last of the disappointed adventurers returned home. The D. S. was projected by William Paterson, the founder of the bank of England. Its object was to plant a colony on the Atlantic side of the isthmus of Panama, and so form a commercial entrepôt between the eastern and western hem-

ispheres. An entire monopoly of the trade of Asia, Africa, and America, for a term of thirty-one years, was granted to the company. At that time, the foreign trade of Scotland had been ruined by the English navigation act of 1660, which provided that all trade with the English colonies should be conducted in English ships alone, so that when Paterson opened his subscription-list, the nobility, the gentry, the merchants, and people, royal burghs, and public bodies in Scotland all hastened to subscribe. £400,000 were immediately put down on paper, of which £220,000 were actually paid up. Deputies in England received subscriptions to the amount of £300,000; and the Dutch and Hamburgers subscribed £200,000. The English parliament, however, actuated by a feeling of national antipathy, and the jealous clamors of trading corporations, gave its unequivocal condemnation to the scheme. The British resident at Hamburg, probably with the concurrence of the king (William III.), also made various insinuations against it. The result of this interference was the almost total withdrawal of the Dutch and English subscriptions. It must now be admitted, even by a Scotsman, that there *was* one fatal objection to the scheme—viz., the danger of settling on ground claimed by Spain, without coming to a proper understanding with that country beforehand. Unable, however, to see any sort of obstacles, incited by the vehement eloquence of Paterson, and dazzled by the magnificent proportions of the scheme, the Scotch hurried forward their arrangements. Five ships, with 1200 men on board, set sail from Leith for Panama on the 25th July, 1698. They reached their destination in four months, and having bargained with the natives for a country which they called New Caledonia, the colonists fixed the site of what was to be their capital city, New Edinburgh, and built a fort in its vicinity, which they named New St. Andrews. Having thus constituted their colony, they issued a proclamation of perfect freedom of trade, and universal toleration in religious matters to all who should join them. According to the act which established their company, all goods imported by them, with the exception of foreign sugar and tobacco, were free from all duties and impositions for 21 years; and thus, on the whole, they seemed for the first few months to be on the highway to success. But the climate, which was tolerable in winter, became unbearable in summer, and many sickened under it; their supplies also failed before they could derive a return from the soil; and on sending to the British colonies in America for provisions, they learned with the deepest indignation and despair that the British American colonies, having been informed that king William had not given his sanction to the expedition, had resolved to hold no intercourse with the new colony at Panama.

Sickly and desponding, they waited long for supplies from the mother country; but the company at home were not aware of their wretched condition, and none came. At length, having waited eight months for assistance, the colony broke up. In the mean time, 1300 colonists, including 300 Highlanders from the estate of capt. Campbell of Finab, who had charge of the expedition, had set sail from Scotland, but ere they arrived, the pioneers had fled. A Spanish force of 1500 men, and a squadron of 11 ships, immediately threatened the new-comers. Capt. Campbell marched by night with a body of 200 men upon the Spanish camp, which he broke, and completely dispersed. On returning to the fort, however, he found it invested by the Spanish squadron. The ammunition of the colonists had now become exhausted, and they were obliged to capitulate, the Spaniards granting honorable terms to all except capt. Campbell, who, however, escaped, and reaching New York, obtained a passage to Scotland. The remainder of the colonists, too weak to weigh the anchor of the vessel which was to carry them home, had to be assisted in their departure by the Spaniards. Not more than 30, among whom was Paterson, who was rendered for a time lunatic by his dreadful misfortunes, ever reached Scotland. Of Paterson, who has been regarded by some writers as a swindler, lord Macaulay, in his fifth volume of the *History of England*, says: "There is not the least reason to believe that he was dishonest. Indeed, he would have found more difficulty in deceiving others, had he not begun by deceiving himself. His faith in his own schemes was strong even to martyrdom; and the eloquence with which he illustrated and defended them had all the charm of sincerity and enthusiasm."

In Edinburgh, as the headquarters of the D. S., a building was erected to accommodate the officials, and carry on the business of the company. Known as the Scottish India house, this building, now removed, recently existed in connection with the establishment for the poor of the city—a melancholy memorial of a disconcerted national enterprise. The books and other documents which had belonged to the company are contained in the advocates' library, where they are shown as a curiosity. The most complete account of the D. S. is that by Mr. J. H. Burton, printed by the Bannatyne club.

DARIUS, or DAREIUS, is the name of several Persian kings, and, like the Egyptian word Pharaoh, is *titular* and not *personal*.—DARIUS I., the son of Hystaspes, a Persian noble, leagued himself with six other nobles to murder Smerdis, the Magian, who had usurped the throne on the death of Cambyses. The conspirators were successful in their plot, and having, after some discussion, fixed on the monarchical as the proper form of government, D. contrived to be elected king, 521 B.C. His position at first was very insecure, but his caution, skill, and energy enabled him to govern his vast dominions for 36 years. To strengthen himself, he married the daughter of Otanes, who had

been the head of the conspiracy, and likewise took three wives from the royal house—viz., two daughters of Cyrus, and one of Cyrus's son, Smerdis. He then divided his empire into 20 satrapies, and determined the exact amount of taxation to be borne by each. In some of the remoter provinces, great confusion seems to have prevailed after the death of Smerdis, the Magian; and a proof of how little D. could effect at first is afforded by the conduct of Orœtas, the governor of Sardis, who for some time was quite defiant of his authority. Babylon next revolted, and D. besieged the city unsuccessfully for two years. At last, however, it was taken by an extraordinary stratagem of his gen. Zopyrus, 516. In 513, D., with an army of 700,000, crossed the Bosporus by a bridge of boats, marched through what is now known as European Turkey to the mouths of the Danube, crossed, and advanced against the Scythians. The expedition proved a failure. D. retreated, but detached from his main force an army of 80,000 men under Megabyzus, to conquer Thrace, while he himself returned to Persia, where he extended his authority in the east as far as the Indus. The assistance given by the Athenians and Eretrians to the Ionic states, when they ventured to throw off the Persian yoke, and the part which they took in the burning of Sardis, determined D., who was also influenced thereto by the banished Hippias, to attempt the subjugation of the whole of Greece. In 495, he sent Mardonius with an army into Thrace and Macedonia, and at the same time dispatched a fleet against the islands. The former was routed by the Brygi in Thrace, the latter was shattered and dispersed by a storm when rounding the promontory of Mt. Athos. In 490, he renewed his attempt. His fleet committed great ravages in the Cyclades, but his army was entirely defeated at Marathon by the Athenians, under Miltiades, the "tyrant" of the Chersonese. In the midst of his preparations for a third expedition, D. died, 485 B.C.

DARIUS II., called, before his accession to the throne, *Ochos*, and after his succession, *Nothos* ("the Bastard"), was one of the seventeen bastard sons of Artaxerxes I. Longimanus. When Sogdianus, another of the bastards, had murdered the rightful king, Xerxes II., and assumed for himself the royal power, Ochos declared war against him, slew him, and secured the diadem for himself, 424–23 B.C. He now called himself *Darius*. His reign was ignoble. He showed himself to be completely under the control of his eunuchs and his cruel step-sister and spouse Parysatis. Rebellions were constantly breaking out among his satraps, all of which, however, were crushed except that of Amyrtæus, satrap of Egypt, who made himself independent in 414. It was during the life of D., and chiefly through the craft of Tissaphernes, satrap of Asia Minor, and of his successor Cyrus the younger, son of the king, that the Persians exercised so great an influence over the affairs of Greece in the last years of the Peloponnesian war. D. died 405–4 B.C.

DARIUS III., great grandson of D. II., called, before his accession, *Codomannus*, was a monarch noted for his mild disposition, handsome person, and courageous spirit. He was raised to the throne through the help of Bagoas, after the murder of Arses, 336 B.C. But in spite of his superior qualities, he could offer no solid opposition to the advance of the Macedonians. At the battle of the Issus, in 333, his mother, wife, and three children fell into the hands of Alexander; the victory of Gaugamela, in 331, opened to the latter the way to Susa and Persia proper. D. now fled to Ecbatana, in Media; and, on the approach of his opponent, to the northern provinces, where he was seized by Bessus, satrap of Bactria. Alexander, in a fit of generosity, hurried to deliver Darius. Bessus then prepared for flight, but D., refusing to follow, was stabbed by the barbarian, and left. The scouts of Alexander's cavalry found D. dying, and administered to his last necessities. Thanking the Grecian king for his magnanimity, and commending his family to his care, he expired (330). Alexander sent the dead body to Sisygambis, mother of D., to be interred in the tomb of the Persian kings. With him, the Persian empire, that had so long overshadowed Asia, came to a close.

DARJEEL'ING, a sanitary station of British India, in a district of the same name, in the Sikkim Himalayas. It is situated at an elevation of 7,400 ft. above the sea, on the side of a great hollow or basin, in which flows the Runjeet, a branch of the Teesta. Forest-covered mountains rise above it, where the rhododendrons of the Himalayas grow in great luxuriance. It commands a magnificent view of the snowy ranges of the Himalayas to the n. and west. Notwithstanding frequent heavy rains, and a very great annual rainfall, the climate is very salubrious. D. is only about 36 m. from the plain of Bengal, and 308 m. n. from Calcutta. It was obtained by the British government from the rajah of Sikkim in 1835, in order to be made a sanitary station. A further portion of the territory of Sikkim was annexed to the district in 1850, in consequence of outrages committed by the rajah on British subjects. Tea culture has recently been introduced, and in 1862, there were 8,762 acres under tea; in 1872, there were 55 tea plantations, extending over 52,000 acres, and employing 7,300 laborers.

DARK AGES, the period, not well defined, which elapsed between the fall of the Roman empire and the revival of letters in the 13th century. See MIDDLE AGES, *ante*.

DARK DAY, in New England, May 19, 1780. The darkness commenced between 10 and 11 A.M., and continued until the middle of the next night. The wind was from the s.w. and the darkness appeared to come with the clouds drifting from that point. It covered the country from New Jersey to Maine, and appears to have been greatest

in Massachusetts and the adjoining portion of New Hampshire; yet it was intense in Connecticut and Rhode Island. It was much less in New York, and in New Jersey it was not particularly noticed. Where it most prevailed it was impossible to read ordinary print, or read the time by a watch or clock, or do ordinary business without artificial light. An intelligent observer says: "Candles were lighted in the houses; the birds, having sung their evening songs, disappeared and became silent; the fowls retired to roost; the cocks were crowing all around as at break of day; objects could not be distinguished but at a very little distance; and everything bore the appearance and gloom of night." Two other less conspicuous dark days had been noticed in the country, Oct. 21, 1716, and Oct. 19, 1762.

DARKE, a co. in w. Ohio, bordering on Indiana, intersected by a number of railroads; 609 sq.m.; pop. '80, 40,498. The surface is generally level and the soil fertile, producing cereals, hay, butter, wool, tobacco, etc. Co. seat, Greenville.

DARKE, William, 1736-1801; b. Philadelphia; served through the revolutionary war, rising to colonel. He was killed in battle with the Miami Indians.

Darkhan', Mount, a lofty granite mountain in Mongolia, in lat. 47° 36′ n., long. 110° 10′ east. It is interesting as the place whither annually repair large numbers of Mongolians to do honor to the memory of Genghis Khan (q.v.), to whom a monument has been erected here.

DARLASTON, a t. and parish in Staffordshire, England, 4 m. s.e. of Wolverhampton; pop. of parish in '71, 12,841. It has extensive mines of iron and coal and manufactures of hardware.

DARLEY, Felix O. C., b. Philadelphia, 1822; an artist whose drawings for engravers have given him lasting fame. His illustrations appear in the works of Irving, Cooper, Longfellow, and others. Among some of the best known are illustrations of the *Legend of Sleepy Hollow*, and *Rip Van Winkle*. In 1868, he published, after a visit to Europe, *Sketches Abroad with Pen and Pencil*. He has executed four large pictures for prince Napoleon.

Dar'ling, a name derived from a governor of New South Wales, and applied to a district, a mountain-range, and a river in Australia.—1. The Darling Downs district includes an extensive tract near the dividing range in the s. of Queensland. The district has an area of about 6,000 sq.m., and is watered by the Condamine, Weir, and Moonie rivers. It is the richest pastoral district in the colony, and comprises a vast extent of fine agricultural land.—2. A mountain range, running n. and s., about 250 m. long, lying wholly in West Australia. It terminates in the direction of the sea at Point d'Entrecasteaux. Its culminating summit is not less than 3,000 ft. above the sea-level. —3. The river Darling, in New South Wales, aptly characterized as "mysterious," demands special attention, not only in itself, but also in connection with some of the most striking peculiarities of the country. From the western declivities of the almost continuous ridge that skirts the eastern coast, innumerable torrents pour down into the vast plains, which gradually slope away towards the interior. The more northerly of these torrents converge in a central "basin of clay," on the 30th parallel of s. lat., where, within a comparatively narrow space, meet the Maranoa, the Condamine, the Dumaresque, the Gwydir, the Namoi, the Castlereagh, the Macquarie, and the Bogan. In this region, the channels undergo many transformations, sometimes losing themselves in wide marshes, and sometimes presenting an inextricable labyrinth of bifurcations and junctions. After parting with a large proportion of their volume, under the combined influences of evaporation and absorption, the united streams, now distinguished as the D., pursue a journey of 600 m. to the Murray, through plains which are habitable only on the immediate verge of the water-course. Through this immense reach, the D. receives not a single affluent; nay, on the contrary, it sends out many an offset, to bury itself in some stagnant lagoon. It may be added, that none of the so-called rivers of this region of Australia, with the solitary exception of the Murray itself, is really entitled to the name. Between lofty banks of bare earth, they exhibit at times an inundating flood, at times a mere series of detached pools of every size and shape.

Dar'ling, Grace, a name famous in the annals of heroism, was the daughter of William Darling, lighthouse-keeper on Longstone, one of the Farne islands, and was born at Bamborough, 24th Nov., 1815. On the morning of the 7th Sept., 1838, the *Forfarshire*, which, with 63 persons on board, had been wrecked among the Farne islands, was seen by Darling from his lighthouse, lying broken on the rocks. At the solicitation of his daughter, then in her 22d year, he put off through the storm to the wreck; his only companion the noble girl who prompted the generous act. By wonderful strength and skill, they brought their boat to where the sufferers (nine in number) crouched, in momentary expectation of a watery grave, rescued them, and bore them safely to Longstone. Such an undertaking, so daring in itself, and so successfully carried out, filled every one with the warmest admiration. The lighthouse at Longstone, no longer solitary and peaceful, was visited by many of the wealthy and the great. Presents, testimonials, and money were heaped at the feet of the heroine; but she did not long survive her change of circumstances. She died of consumption, after a year's illness, on Oct. 20, 1842. See *Grace Darling*, by E. Hope (1876).

DAR'LINGTON, a co. in n.e. South Carolina, on the Great Pedee river, intersected by three railroads; 800 sq.m.; pop. '80, 34,485—21,558 colored. It is well watered and fertile, producing cotton, rice, corn, etc. Co. seat, Darlington Court House.

DAR'LINGTON, or DARN'TON, a burgh in the s. of Durham co., in a rich tract, on a hill-slope, on the banks of the Skerne, near its junction with the Tees, 18 m. s. of Durham city. It consists of a square market-place, from which branch several streets called gates. Pop. in '71, 27,730, many belonging to the society of Friends. The chief manufactures are woolen yarns, for imitation Indian shawls, Brussels carpets, etc.; flax, optical glasses, brass, and iron wares. Near D. was the seat of George Allan, the antiquary. St. Cuthberts, the beautiful parish church, was built in the 12th c. and has three carved stone stalls, and a tower 180 ft. high. At Oxen-le-field, 3 m. from D., are curious cavities of unknown origin, called Hell Kettles.

DARLINGTON, WILLIAM, LL.D., 1782–1863; b. Penn.; a botanist. In 1806, he went to Calcutta, and on returning published an account of his voyage. In the war with England, he served with distinction. In 1815, he was chosen to congress and re-elected in 1819. At Westchester, Pa., he founded an athenæum, an academy, and a society of natural history. Among his publications are *Mutual Influence of Habits and Disease; Agricultural Chemistry; Agricultural Botany;* and *Memorial of John Bartram.*

DARLINGTO'NIA, a perennial plant of California of the order sarraceniacæ. Its leaves are very large, sometimes 2 ft. long, and are hollow and twisted, the upper part being shaped like a hood, under which is the opening into the pitcher of the leaf. The flower stalk is frequently 4 ft. high, the flower single, and about 2 in. across.

DARM'STADT, a t. of Germany, capital of the grand-duchy of Hesse-Darmstadt, residence of the grand duke, and seat of government, is situated on the river Darm, 15 m. s. of Frankfort-on-the-Main. It consists of an old and new town, both of which are surrounded by walls and ditches. The streets of the former are narrow and squalid, but those of the latter exhibit many imposing specimens of architecture. D. has five public squares, from the center of one of which a fine Doric column rises to the height of 134 ft., and is surmounted by a statue of the grand duke Louis, who founded the new town. Besides the arsenal, the barracks, and the various religious edifices, one of which is crowned by a dome supported upon 28 large columns, D. has two palaces; one of these, the old ducal palace, contains the museums of painting—comprising 700 pictures, some of them by the most famous of the old masters—and natural history, in which are shown fossil remains of the deinotherium. The palace contains also a public library consisting of 380,000 vols. D. is more dependent upon its ducal court and the government, which holds its seat there, than upon its commerce or manufactures; but these are now becoming more important. Pop., with suburb, '75, 43,937.

DAR'NEL, *Lolium temulentum,* a grass of the same genus with the valuable ryegrass (q.v.), an annual, common in cornfields in England and many parts of Europe. It has no tufts of leaves from the root, the glumes are as long as the spikelets, or longer, the spikelets contain 5 to 7 florets which are awned. This grass has from ancient times been reputed to have a narcotic poisonous seed, to which many bad effects were ascribed, which, in years of bad harvest, were observed to ensue upon the eating of bread or the feeding of horses upon oats. Even Lindley, in his *Medical and Œconomical Botany,* published in 1849, ascribes narcotic and acrid qualities to D. seed, and speaks of fatal consequences as produced by it when mixed with flour, saying that it "is the only authentic instance of unwholesome qualities in the order of the grasses." On the other hand, it is asserted that very recent researches on the continent have completely established the perfect harmlessness of this grass and of its seed; and the effects which have been ascribed to it must therefore be regarded as proceeding from grain injuriously affected in some way by bad weather.

DARNETAL, a t. of France, in the department of Seine-Inférieure, about 2¼ m. e. of Rouen. It is well built, and has two Gothic churches. Situated at the top of a narrow valley, and intersected by two streams, D. possesses unusual facilities for carrying on cloth and other woolen manufactures. Pop. '76, 5,618.

DARN'LEY, HENRY STEWART, Lord, husband of Mary queen of Scots, the eldest son of the earl of Lennox by lady Margaret Douglas, was b. in 1546, in England, where also he was educated. He was handsome in appearance, accomplished in manners, but fatally destitute of all moral and intellectual power. D. is interesting chiefly on account of the position which he occupied with respect to his wife. See MARY STEWART.

DARTER, *Plotus,* a genus of birds very nearly allied to cormorants (q.v.), but having a bill longer than the head, perfectly straight, slender, and sharp-pointed; and also remarkable for the great length of the neck, which has obtained for them the name of *snake-birds.* They derive the name D. from darting forward their bill at their prey by means of their long flexible neck. They are very voracious, and eat great quantities of fish, which they swallow entire. They are found in warm climates.

DART'FORD (Saxon, *Darentford*), a t. in the n.w. of Kent, 17 m. e.s.e. of London by rail, on the left bank of the Darent, which is navigable for barges. It lies in a narrow

valley between two steep hills. Pop. '71, 8,298. It has large corn-mills, cotton and silk printing-works, large powder and paper mills; also manufactures of oil, iron, and machinery. Near D. stood the first rolling, slitting, and wire-drawing mill in England, as well as the first paper-mill, built by Spielman, who died in 1607. Here stand the ruins of a nunnery, founded 1355, by Edward III., with 12 acres of walled orchards and gardens. This king held a tournament here in 1331. Wat Tyler's insurrection, in the reign of Richard II., broke out at D. in 1381. Watling Street, an ancient Roman road, crossed the river here. Near D. heath are many ancient chalk hollows and pits, with deep shafts leading to numerous chambers and galleries, excavated probably for sepulture, for retreat, or to make use of the chalk.

DART'MOOR, a granitic table-land in the south-western part of the county of Devon, remarkable for its wild and rugged scenery, its towering rock-capped hills, the numerous streams that have their source in its boggy soil, and the many cyclopean relics of the aboriginal inhabitants that are scattered over its solitary wastes, where the deep silence is broken only by the sudden flight of the ring-ouzel, the screams of the curlew, or the shrill whistle of the lapwing, dotterel, or stone-plover. D. proper (or the ancient and royal forest of that name) and its adjuncts, including the outlying common lands that present the same physical features, extend about 20 m. from e. to w., and 22 m. from n. to s., occupying one fifth of the entire area of the county of Devon, or more than 130,000 acres. This moorland region, encircled by a natural rampart, moated by deep valleys, has a very considerable elevation above the surrounding country, and culminates in Yes Tor, 2,050 ft. above the sea-level. Its broken uneven surface has been compared, not inaptly, to "the long rolling waves of a tempestuous ocean, fixed into solidity by some instantaneous and powerful impulse."

The most important *rivers* that rise in northern D. are the Dart, the Teign, the Taw, the West Ockment or Okement, the Lyd, the Tavy, and the Walkham; while from the swamps of southern D. spring the Plym, the Yealm, the Erme or Aime, and the Avon, Aven, or Aune.

Geologically, D. is formed, for the most part, of granite rock, which has been protruded through the shales, slates, and sandstones of the Devonian system. Large masses of trap occur at White Tor, Cock's Tor, and other localities. Tin, copper, and manganese are found amongst the granite, of which four varieties—common, finer, red, and compact—are distinguished. These, as well as the several kinds of trap-rock, are much used for economical purposes. At Wheal, Duchy, and Birch Tor are productive tin mines. The *soil* of D. is composed chiefly of peat, which in the bottoms has accumulated in some places to the depth of 25 ft.; it rests on a subsoil of fine sand. Many of the well-watered dells and ravines are fertile, while the whole moor affords pasturage for cattle, sheep, and horses. Amongst the mosses and lichens, with which the region abounds, are the *lecanora perella* and the *L. tartarea*, or cudbear lichen. See CUDBEAR. Some years ago, both these lichens were largely exported; and it is said that, from 1762 to 1767 inclusive, nearly 100 tons of the *L. tartarea* were collected from the tors of the moor. Wistman's wood, a grove of stunted oak-trees, averaging about ten feet in height, is of venerable antiquity. It stands on a rocky declivity about 400 yards in length, and measures less than 100 yards across the widest part. The *ornithology* of D. is more limited than formerly; the progress of cultivation and the preservation of game are driving away the eagle, the bustard, the crane, and the kite, which are now rarely seen. The blackcock is likewise becoming extinct. Dr. Moore says: "The frequenters of the uncultivated parts are now chiefly the sparrow-hawk, the hobby, the goshawk, the hen-harrier, the brown or marsh harrier, and the buzzard." The *antiquities* of D., as illustrating ancient periods of British history, are worth an attentive study; of these, the Gray Wethers, below Sittaford Tor—a fine specimen of what is usually styled a Druidical circular temple—the vestiges of a large aboriginal village at Grimspound, the cromlech at Drewsteignton, the logan-stones and stone-avenues, the kistvaens, barrows, cairns, rock-pillars, and ancient trackways, whose story the old tors alone could tell, are examples. Many legends and stories of moorland adventure are related; but the most famous is that of the bold hunter, Childe of Plymstock, whose fate Carrington has celebrated in a spirited ballad. See Carrington's Poems, Mrs. Bray's *Tamar and Tavy*, and article "Lost on Dartmoor," *Chambers's Journal*, vol. i. p. 350.

During the long war with France, consequent on the great revolution and the career of Napoleon, a prison was erected in the center of the western quarter of D., at about 1400 ft. above the sea-level, for the accommodation of prisoners of war. The first stone was laid on the 20th Mar., 1806, and the building was finished at a cost of £127,000. Prince Town sprang up close by, and soon became a thriving place. The prison is now used as a depot for convicts, who are employed in cultivating the adjacent moor.

The castle, manor, and forest of D. were granted by Henry III. to his brother Richard, earl of Cornwall; and since 1337 A.D., D. has been permanently annexed to the duchy of Cornwall.

See De la Beche's *Report on the Geology of Cornwall, Devon, and West Somerset* (Lond. 1839); and for a full account of D., *A Perambulation of the Ancient and Royal Forest of Dartmoor*, etc., by Rev. S. Rowe (Plymouth and Lond. 1856); also *Papers on*

the Geology, Soil, Botany, and Ornithology of Dartmoor, by Ed. Moore, M.D., etc., in appendix of the above work.

DARTMOUTH, a parliamentary and municipal burgh and seaport, in the s. of Devonshire, built in terraces on a steep slope 300 to 400 ft. high, on the right bank of the romantic estuary of the river Dart, at a short distance from the sea. D. is 32 m. s. by w. of Exeter. The streets are narrow, and many of the houses very old, with overhanging stories, projecting gables, and wood-carvings. St. Saviour's church, of the 14th c., has a richly sculptured, painted, and gilt stone pulpit, a highly ornamented interior, and a beautifully carved rood-loft. A battery, and the remains of a castle built during the reign of Henry VII., stand at the entrance to the harbor. Pop. '71, 5,338. Many of the inhabitants are engaged in the pilchard and Labrador fisheries. The chief exports are woolens, cider, and barley. D. is a quarantine port of the English channel, and has a considerable trade with the Mediterranean. In 1876, 1457 vessels, of 106,870 tons, entered and cleared the port.—At D., in 1190, the crusaders, under Richard Cœur-de-Lion, embarked for the Holy Land. The French burned the town in the time of Richard I., but were repulsed in a third attack on it in 1404. In the reign of Edward III., D. furnished 31 ships for the siege of Calais. In 1643, prince Maurice besieged and garrisoned D. for Charles I.; but in 1646, Fairfax stormed and took it. Sir Humphrey Gilbert, who took possession of Newfoundland for queen Elizabeth, was born here. Newcomen, the inventor of the steam-engine, was an ironmonger here.

DARTMOUTH COLLEGE, at Hanover, N. H., had its origin in Moor's charity school, an institution for the education of Indian children, organized at Lebanon, Conn., in 1754, by Eleazar Wheelock, D.D. Dartmouth college received its charter in 1769 from George III., at the hands of John Wentworth, royal governor of New Hampshire. Dr. Wheelock became the first president, and the name given it was in honor of lord Dartmouth, one of its chief benefactors. Hanover, on the Connecticut river, on the western border of New Hampshire, was selected as a suitable location for the college, and grants of about 44,000 acres of land were made. An independent charter was obtained soon afterward for Moor's school, which was continued as a separate department until 1849. When Dr. Wheelock removed his school in 1770 from Lebanon to Hanover, the students consisted of 18 whites and 6 Indians, and the first class of four students graduated in 1771. Dr. Wheelock died in 1779, and was succeeded by his son John Wheelock, who after a presidency extending over 36 years, was removed from his office by the trustees in 1815. A religious controversy had caused a disagreement which led to a conflict with the legislature of the state. The legislature favored Dr. Wheelock, and passed an act to amend the charter, to change the title to "Dartmouth university," and to increase the number of trustees from twelve to twenty-one, a majority of whom should constitute a quorum. A second act, passed Dec. 18, 1816, gave the governor and council power to fill all vacancies that might happen in the board of trustees previous to the next meeting. The cause of the college was argued in the state court by Daniel Webster, Jeremiah Smith, and Jeremiah Mason, who were opposed, in behalf of the state, by Ichabod Bartlett and George Sullivan. At the Nov. term of the court, 1817, chief justice William M. Richardson rendered a decision which was adverse to the college. The case was at once carried to the supreme court of the United States, and was argued at Washington in that powerful speech which first gave Mr. Webster his national fame. Opposed to him were John Holmes, of Maine, and the attorney-general, William Wirt. In Feb., 1819, chief-justice Marshall gave a decision in favor of the college. The "university" organization was dissolved, and the old college board of trustees sustained. The question in this conflict was of vital importance not only to Dartmouth college, but to many other institutions, and the decision secured the sacredness of private trusts. Dr. Wheelock, who had been elected president by the new board of the university in Feb., 1817, died within two months, and was succeeded by William Allen, D.D, who held the office until the decision of chief-justice Marshall in 1819. Francis Brown, D.D., who had been elected president of the college by the old board in 1815, held the office until his death in 1820. His successors were: Daniel Dana, D.D., 1821; Bennet Tyler, D.D., 1821–28; Nathan Lord, D.D., 1828–63; Asa Dodge Smith, D.D., LL.D., 1863–76; and Samuel C. Bartlett, D.D., LL.D., who entered upon his duties, 1877.

The college comprises five departments, the academical, medical, scientific, agricultural, and engineering, so associated that each shares in some measure the advantages of the others. The buildings of the college are: Dartmouth hall, the oldest, of wood, 150 by 50 ft., and three stories high, contains the chapel, recitation rooms, and rooms for students; Wentworth and Thornton halls, dormitories, built in 1830, of brick, 70 by 50 ft.; Reed hall, built of brick in 1840, 100 by 50 ft., containing the libraries, the reading room, the rooms of the physical department, and the collection of pictures belonging to the college; Bissell hall, the gymnasium, built in 1867, of brick, 90 by 47 ft.; the building of the scientific department, entirely rebuilt in 1870, 56 by 36 ft.; Culver hall, built in 1870, a handsome structure, 100 by 60 ft., four stories high, containing laboratories, lecture-rooms, and rooms for the various cabinets and museums; the medical building, 72 by 32 ft., built in 1812; the observatory, 60 by 18 ft., in 1853; and Conant hall, erected in 1874. Except Conant and Bissell halls, the buildings of the college are

situated in the college park, a tract of about 40 acres, in the eastern part of the village; the chief eminence commands a view of great beauty, and the grounds are shaded with large and beautiful elms. The academic year begins about the 1st of Sept., and commencement is on the last Thursday of June; the year is divided into two terms of 20 weeks each. The regular course occupies four years; with very few exceptions all its studies are required, to entitle the student, upon the completion of the course, to the degree of bachelor of arts. The degree of master of arts is conferred, in course, on any bachelor of three or more years' standing.

The Chandler scientific department was established in 1851, by a resolution of the trustees, in acceptance of a sum bequeathed to them in trust by Abiel Chandler, esq., late of Walpole and formerly of Boston, Mass., "for the establishment and support of a permanent department or school of instruction in the college, in the practical and useful arts of life, comprised chiefly in the branches of mechanics and civil engineering, the invention and manufacture of machinery, carpentry, masonry, architecture and drawing, the investigation of the properties and uses of the materials employed in the arts, the modern languages and English literature, together with book-keeping and such other branches of knowledge as may best qualify young persons for the duties and employments of active life." Students who complete the regular course of four years receive the degree of bachelor of science. The degree of master of science is conferred in course, on bachelors of three years' standing.

At the session of the legislature of New Hampshire in 1866, an act was passed establishing the "New Hampshire college of agriculture and the mechanic arts," on the basis of the congressional land grant, and authorizing its location at Hanover and its connection with Dartmouth college. The course of study includes the English portion of a regular college course, together with such studies as meet the necessities of the intelligent farmer. Students who complete the course and prepare theses on subjects relating to agriculture or the mechanic arts receive the degree of bachelor of agricultural science. A state museum of general and applied science has been established, and receives the specimens accruing from the state geological survey. A valuable tract of land of 360 acres in the immediate vicinity of Culver hall is used for the purposes of agricultural experiment, and furnishes opportunity to the students for remunerative labor.

The medical department was founded in 1797; there or two terms of 14 weeks each, begining in Dec. and in Mar.; students, 21 years of age, who have devoted three years to the study of medicine, and during that time have attended two courses of medical lectures, including one at Dartmouth, receive the degree of doctor of medicine. A museum of pathological anatomy has been recently added to this department.

The Thayer school of civil engineering aims to provide an exclusively professional training for young men who may desire instruction of an advanced character. The course is essentially "post-graduate," limited in range, and fundamental in its scope.

The general faculty comprises, besides the president, 25 professors, 5 other instructors, and a librarian. In 1879–80, the number of students was 396, including 228 in the academical, 49 in the scientific, 31 in the agricultural, 84 in the medical, and 4 in the civil-engineering department. The number of alumni is 4,400, of whom 2,000 are living. The number of volumes in the several libraries is as follows:

United libraries (exclusive of pamphlets)	50,291
Christian fraternity's library	300
Astronomical library	1,100
Medical school library	1,600
Thayer school library	2,000
Agricultural school library	1,435
Total	56,726

DARU, Pierre Antoine Noel Bruno, Comte, author, and also one of the ablest of the first Napoleon's ministers, was b. at Montpellier, 12th Jan., 1767, and in his sixteenth year entered the army. In 179-, he was appointed intendant of the army of Brittany; but having the misfortune to speak ironically of the English as "our *friends*," the suspicious revolutionists threw him into prison as a royalist, where he remained till the fall of Robespierre. He spent his time in translating the odes and epistles of Horace (*Traduction en Vers des Po sies d'Horace*, 1800). Subsequently, he translated the Satires. In the same year in which his version of Horace appeared (1800), he published *Cleopedie ou la Th'orie des R putations en Litt rature*, a work full of spirit and felicitous turns of thought. His firmness, fidelity, and industry recommended him to Napoleon, who, in 1805, made him a councilor of state, and at a latter period, intrusted him with the portfolio of the war department. After the restoration of the Bourbons, he was made a peer. Thenceforth, he devoted himself exclusively to letters. He died 5th Sept., 1829.—D. was a member of the institute and of the academy of sciences. His writings are numerous. Besides those already mentioned, the chief are *Histoire de la R publique de Venise* (7 vols. 1819 to 1821); *Histoire de Bretagne* (3 vols. 1826); his *Eloges*, his examination of the *Genie du Christianisme:* his *Discours sur les Facultés de l'Homme* (in verse); and his *Discours sur la Liberté de la Presse*. His son, Napoleon Count Daru, named after the emperor, was born in 1802, and had the fortune (strangely enough) to

be as much disliked by Napoleon III. as his father was liked by Napoleon I. Some time after the *coup d'état*, to which he had strongly opposed himself, he was placed on the list of the proscribed.

D'ARUSMONT, FRANCES (maiden name, FANNY WRIGHT), 1795–1852; a native of Dundee, Scotland. From her friend Adam Smith and other learned men, she imbibed advanced ideas of social reform, and when still young published a defense of the doctrines of Epicurus. From 1818 to 1821, she resided in the United States, and, after a visit to France, returned in 1825 and secured land on the Mississippi (near the present Memphis, Tenn.), to make an experiment of the elevation of colored people. It was a failure, and after several years of useless expense her people were set free and sent to Liberia. In later years she lectured in various places, advancing views which led to much persecution. In 1838, in France, she married M. d'Arusmont, but the union was not happy. She afterwards returned to the United States and settled in Cincinnati, where she died. Her chief publications are *Views on Society and Manners in America; Altorf*, a tragedy; and *Lectures on Free Inquiry*.

DARWEN, a t. in Lancashire, Eng., 16 m. n.n.w. of Manchester; pop. '71, 26,553. The main industries are in the manufacture of cotton goods, carpets, paper, rope, twine, machinery, and brass. There are three fairs held every year.

DAR'WIN, CHARLES, F.R.S., a living naturalist of the highest eminence, was b. at Shrewsbury, Feb. 12, 1809. He is the son of Dr. Robert W. Darwin, F.R.S., and grandson of Erasmus Darwin (q.v.). His mother was a daughter of Josiah Wedgwood, the famous manufacturer of pottery. After attending a public school at Shrewsbury for some years, he studied at Edinburgh university for two sessions, and thence proceeded to Christ college, Cambridge, where he took his degree of B.A. in 1831. He now volunteered to go as naturalist in H.M.S. *Beagle*, commanded by capt. Fitzroy, R.N., and started for a survey of South America, and the circumnavigation of the globe, Dec. 27, 1831, returning to England Oct. 2, 1836. His entire life, so far as his health has permitted, has been devoted to scientific researches. D., who is a fellow of the principal scientific societies, has obtained the royal society's medal, and the Wollaston medal of the geological society.—His earliest well-known work, *The Voyage of a Naturalist* (2d ed. 1845), is a most interesting and beautifully written work. In 1839, was published his *Journal of Researches into the Geology and Natural History of the Various Countries visited by H.M.S. Beagle;* in 1840–43, the *Zoology of the Voyage of H.M.S. Beagle*, published by government, to which D. contributed the introduction, and many of the notes; in 1842, *The Structure and Distribution of Coral Reefs;* in 1844, *Geological Observations on Volcanic Islands;* and in 1846, his *Geological Observations on South America*. He has also written many papers in the *Transactions of the Geological Society*. In 1851–53, appeared his valuable *Monograph of the Cirripedia;* and in 1859, D.'s name became "familiar as a household word" to the mass of educated and semi-educated Englishmen, through the publication of his work, *The Origin of Species by Means of Natural Selection, or the Preservation of Favored Races in the Struggle of Life*. In the *Origin of Species*, D. contends that the various species of plants and animals, instead of being each specially created and immutable, are continually suffering change through a process of adaptation, by which those varieties of a species that are in any way better fitted for the conditions of their life survive and multiply at the expense of others. So potent and universal does this process of natural selection seem to be, that D. considers it capable, with other less important causes, of explaining how all existings pecies may have descended from one or a very few low forms of life. This theory has excited controversies which are not yet laid to rest; but it has been embraced by many of the ablest naturalists, and has already induced great changes in the methods of biology and kindred sciences. See SPECIES. D. has since written *Fertilisation of Orchids* (1862); *Variation of Plants and Animals under Domestication* (1867); *The Descent of Man and Selection in Relation to Sex* (1871); *Expression of the Emotions in Man and Animals* (1873); *Insectivorous Plants* (1875); *Climbing Plants* (1875); *The Effects of Cross and Self-fertilization in the Vegetable Kingdom* (1876); and *Different Forms of Flowers in Plants of the same Species* (1877). D.'s knowledge is not less remarkable than his caution in statement. He has of late received many high distinctions, such as the Prussian order *Pour le Mérite* (1871), degrees from Leyden (1875), and Cambridge (1877), and the membership of the French academy (1878).

DARWIN, ERASMUS, M. D., an English physician, natural philosopher, and didactic poet, was b. 12th Dec., 1731, at Elton, near Newark, in Nottinghamshire; studied first at Cambridge, and afterwards at Edinburgh, where he took his degree; and finally settled in Derby, where he died 18th April, 1802. D. had once a great reputation as a physiologist, but his system is, for the most part, inconsequential, baseless, and untenable. At the same time, many of his ideas are original, suggestive, and contain within them the germs of important truths. His strength and his weakness lay in his faculty for seeing analogies in nature. Sometimes he is exceedingly happy in his discoveries, at other times he is quite fantastical. The same remarks hold good as regards his verse, where, amid the frequent extravagance and incomprehensibility of his notions, there burst forth strains of genuine poetry. D.'s chief works are his *Botanic Garden*, in verse

(Lond. 1781); his *Zoonomia, or the Laws of Organic Life* (1793); and his *Phytologia, or Philosophy of Agriculture and Gardening* (1800).

DARWINISM, a term often too widely applied, and made to cover every subject relating to the origin and development of species. Of the writers, mainly in England, who have gathered the vast array of facts taken as a basis for the doctrine of evolution (see SPECIES), Charles Darwin (see DARWIN, CHARLES, *ante*) deserves especial notice. Though modestly confining himself to the problem of accounting for the evolution of the higher organic forms out of the lower, Darwin has done much to further the idea of a gradual evolution of the physical world. The philosophic significance of the hypothesis of natural selection, especially associated with Mr. Darwin, is due, as prof. Helmholtz points out, to the fact that it introduces a strictly mechanical conception in order to account for those intricate arrangements known as organic adaptation, which had before been conceived only in a teleological manner. By viewing adaptations as conditions of self-preservation, Darwin explains the abundant appearance of purpose in organic nature. By his resolute endeavor in this direction, he has done much to eliminate the teleological method from biology, while it is true, that, in his conception of seemingly spontaneous variations and of correlations of growth, he leaves room for the old manner of viewing the organic development as controlled by some internal organizing principle. Again, Darwin has greatly extended the scope of mechanical interpretation by making intelligible, apart from the co-operation of intelligent purpose, a genesis of the organic world as a harmonious system of distinct groups, a unity in variety, having certain well-marked typical affinities. Darwin in his doctrine of the organic world as a survival refers this appearance of systematic plan to perfectly natural causes, thus giving new meaning to the ancient theory that the harmony of the world arises out of discord. Once more, his hypothesis is of wide philosophic interest, since it supports the idea of a perfect gradation in the progress of things. The variations which he postulates are slight, if not infinitesimal, and effect a sensible functional or morphological change only after they have been frequently repeated and accumulated by heredity. Darwin's later work, in which he applies his theory of the origin of species to man, is a valuable contribution to a naturalistic conception of human development. The mind of man in its lowest stages of development is here brought into close juxtaposition to the animal mind, and the upward progress of man is viewed as effected by natural causes, chief among which is the action of natural selection. He does not inquire into the exact way in which the mental and bodily are connected. He simply assumes that, just as the bodily organism is capable of varying in an indefinite number of ways, so may the mental faculties vary indefinitely in correspondence with certain physical changes. In this way he seeks to account for all the higher mental powers, as the use of language and reason, the sentiment of beauty, and conscience. Finally, Darwin seeks to give a practical and ethical turn to his doctrine, since he defines the general good—the proper object of man's action—as "the rearing of the greatest number of individuals in full health and vigor, and with all their faculties perfect under the conditions to which they are subject." In his view of the future of the race, he leans to the idea that the natural process which has effected man's first progress must continue to be an important factor in evolution, and that, consequently, it is not well to check the scope of this process by either an undue restraint of population, or a charitable preservation of the incompetent. It is well to observe that if Darwinism confined itself to a strict following of the great investigator, it might involve less of philosophic and metaphysical theory than has become popularly associated with it, for much of which Darwin is not to be held responsible, at least in the terms of his presentation. Facts and the co-ordination of facts in their physical ranges are his inestimable contribution to science. Beyond the physical relation, he does not mark out a path. It is evident that from his treasury of facts, widely divergent systems of evolution may be drawn, according as the evolution which he has presented as a fact is accounted for by referring its cause or its working force to one or another set of principles.

DARWIN MOUNT AND **SOUND** are on the s.w. side of King Charles's South Land, Terra del Fuego. The mountain is nearly 7,000 ft. in height.

DASHKOV, Princess EKATERINA ROMANOVA, daughter of count Vorontsov, was b. 1744, and from her earliest youth received a careful training, especially in classics. She was an intimate friend of the empress Catharine II., and one of the heads of the conspiracy formed against Peter III., the success of which secured the throne to Catharine. Her conduct in this dangerous affair was, in truth, quite Amazonian; she rode forth in uniform at the head of a part of the troops whom she had instigated against Peter; but soon afterwards quarreled with Catharine, because the latter would not gratify her desire to be made col. of the imperial grenadiers. She now removed from the court, obtained permission to travel, and visited Germany, England, France, and Italy, where she made the acquaintance of many learned men (among others, Garrick, Dr. Blair, and Dr. Robertson, with the last of whom she wished to place her son for the purpose of being educated), and in 1782, returned to St. Petersburg. The empress and she were reconciled to each other, and the princess was appointed director of the St. Petersburg academy of arts and sciences; and in 1783, president of the Russian academy, established at her own suggestion in imitation of the French *Académie*. On the death of

Catharine in 1796, she was deprived of her offices, and ordered by Paul III. to retire to her estates at Novgorod. She died at Moscow, 4th Jan., 1810. Besides several comedies and occasional magazine-papers, the princess D. was mainly instrumental in inducing the Russian academy to draw up a dictionary of the Russian language. This work was completed in twelve years. The princess herself assigned the various letters of the alphabet to different scholars, took three herself, and superintended the execution of the whole. Her very interesting memoirs were published by Mrs. W. Bradford (2 vols., Lond. 1840).

DASS, PETTER, 1647–1708; son of a Scottish merchant of Dundee, who, in 1630, left his native land to escape from the troubles in the Presbyterian church, settled in Bergen, Norway, and married a Norse girl. Thus, though of Scottish descent, Dass was born on an island on the coast of Norway, and was educated in Bergen university. In 1672, he was ordained a priest, and for many years fulfilled the duties of that office in the wild northern regions of that country, during which period he wrote innumerable reams of verses. These writings passed from hand to hand, but few of the poems were printed in his life-time. The most famous, *The Trumpet of Northland*, was not published until 1739. *The Norwegian Song of the Valley* appeared in 1696, and in 1711, came a volume entitled *Spiritual Pastime*. Even now the *Trumpet* is one of the most favorite national poems, and long ago won for its author the title of "father of Norwegian poetry." It is a rhymed description of the province of Northland, given in dancing verse of the most breathless kind, and full of humor, fancy, wit, and quaint learning.

DA'SYA, a genus of red algæ, about a dozen species of which are found in the United States. The genus includes some of the most beautiful sea-weeds.

DAS'YURE, *Dasyu'rus*, a genus of carnivorous marsupial quadrupeds, nearly allied to the opossums; but differing from them in having only eight incisors in the upper, and six in the lower jaw, and only twelve molars in each jaw; also in their tail being everywhere covered with long hairs, and not prehensile; in the hinder thumb being reduced to a mere tubercle, or wanting; and in the important anatomical character of the want of a cœcum. All the species are Australian. The URSINE D., or ursine opossum (*D. ursinus*), was very abundant in the n. of Van Dieman's Land, when first colonized, and very destructive to sheep and poultry. It is about the size of a badger, of a stout form, with a tail half as long as the body; the body and tail covered with coarse black hair, marked with white bands. It burrows in the ground. It is very untamable. The spotted-tailed D. (*D. macrourus*) is about as large as a cat, has a tail fully as long as the body, is of a rich brown color with white spots, and, as well as a rather smaller species (*D. maugii*), the *wild cat* of the colonists, is very destructive to poultry in Van Dieman's Land.

DA'TARY, an assistant to the pope, sometimes called chancellor. To relieve the pope of unimportant business he has power to grant certain requests, in which he is assisted by a *pro* and a *sub* datary.

DATE (Lat. *datum*, given), the precise time at which a document was written, or an event happened. The importance of accurately ascertaining the date of an event or writing is very obvious, but the difficulty which there may be of doing so is not so apparent. It might be thought, for example, that, at least in modern times, where the day of the month and year are authoritatively set down, there can be no room for any further question; but it is not so. If, for instance, we refer to a newspaper of the reign of queen Anne, we shall see the *Amsterdam Gazette* of the 22d Feb. translated in the *London Gazette* of the 13th Feb., and abridged in the *Edinburgh Courant* of the 19th Feb., all of the same year, 1705. And this is but one of several seeming inconsistencies or contradictions of the same sort.

In the first place, the difference in the two *styles* by which dates are reckoned may cause a discrepancy of ten, of eleven, or of twelve days, according to the century to which the date belongs. Until 1582 there was but one style or calendar throughout Europe; but in that year Pope Gregory XIII. introduced the "new style" or "Gregorian calendar," which at once corrected the long-accumulated errors of the old method of computing time, by declaring the 5th to be the 15th of Oct., 1582, or, in other words, by striking ten days out of the almanac of that year. The new style was adopted generally in Roman Catholic countries. Most Protestant countries, on the other hand, continued for a longer or shorter period to use the "old style," or "Julian calendar." It is necessary, therefore, in dealing critically with dates after 1582, to ascertain what "style" was in use at the time and place in question. This, in not a few cases, may call for some inquiry; but generally, the following table will serve to show when the chief states of Europe adopted the new style:

Year.	Country.
1582.	Great part of Italy, France, Lorraine, Portugal, Spain, Holland, and the greater part of the Netherlands.
1584.	The Roman Catholic parts of Germany and of Switzerland.
1586.	Poland.
1587.	Hungary.
1682.	The city of Strasburg.

Year.	Country.
1700.	The Protestant parts of Germany and of Switzerland, Guelders, Zutphen, Utrecht, Friesland, Groningen, and Overyssel.
1749 or 1751.	Tuscany.
1752.	Great Britain and Ireland.
1753.	Sweden.

In Russia and Greece the old style is still followed, and it obtains generally in the east. Thus, what was the 12th Jan. 1879 at Paris and London, was the 31st Dec. 1878 at Athens and St. Petersburg.

But difference of *style* is not the only cause of perplexity in dates. Countries using the same style, and therefore agreeing as to the day of the *month*, may differ as to the *year* to which they refer an event. Thus the beheading of king Charles I. was reckoned, both in England and in Scotland, to have taken place on the 30th of Jan.; but while England held the year to be 1648, Scotland held it to be 1649. The cause of this discrepancy was the difference which obtained as to the beginning of the year. By the English, the year was held to begin on the 25th of Mar.; by the Scots, on the 1st of Jan. It becomes necessary, therefore, in considering dates, to keep in view not only the style which was used, but the day on which the year was accounted to commence. There was much variation in this respect, not only between one country and another, but even in the same country as between one time and another, as well as between its different provinces at the same time. The new years' days most commonly used were the Nativity or Christmas (25th Dec.), the Circumcision (1st Jan.), the Annunciation or Lady Day (25th Mar.), and the Resurrection or Easter. The 1st of Jan. was adopted as the commencement of the year by France in 1563, by Scotland in 1600, by England in 1752. In this last country, the inconvenience of dating by a different year from most of the other great European states had been so generally felt that for some time before the new mode of computation was sanctioned by act of parliament, dates falling between 1st of Jan. and 24th Mar. were commonly expressed in both ways, thus: 2d Feb. $170\frac{6}{7}$, or 1706–7, the lower or last figure indicating the year according to the present reckoning.

Hitherto, we have spoken of dates where both the year and the day of the month are set down in figures. But in ancient writings, even where the year is expressed in figures, nothing is more common than to indicate the day of the month only by reference to some festival or other peculiarity in the service of the church. Thus, an English letter of the latter part of the 15th c. is dated in this way: "Written at Paston, in haste, the Wednesday next after *Deus qui errantibus;*" that is, the first Wednesday after the third Sunday after Easter, on which day that portion of the church service which is called the *introit* begins with the words *Deus qui errantibus.* So, again, as late as the year 1310, the battle of Weissenburg, near Prague, is described by the contemporary chroniclers as having been fought "upon the Sunday on which the church sings *Reddite quæ sunt Cæsaris Cæsari;*" that is, the 22d Sunday after Pentecost, which, in the year referred to, fell upon the 8th Nov. A still more common way of dating was by reference to a saint's day. Thus, the English parliament which met at Westminster on the 6th Oct., 1399, is described in the contemporary record as meeting "on Monday, the Feast of St. Faith the Virgin;" and the Scottish parliament which met at Scone on the 3d Dec., 1318, as meeting "on the Sunday next after the feast of St. Andrew the Apostle." In order, therefore, to interpret all this class of dates—and it is a very large one—recourse must be had to the calendar and service books of the church, or to the "glossaries of dates" and "catalogues of saints' days" which antiquaries have compiled from them.

For centuries, it was more common to date by the year of the king's reign than by the year of our Lord. The risk of error in reducing this way of computation to that now in use is such, that in Rymer's *Fœdera*, a great collection of English state papers, printed at the public expense, in the beginning of the 18th c., many documents of all the reigns from Richard I. to Edward IV. are misplaced by a whole year. These mistakes arose chiefly from insufficient inquiry as to the day from which the king dated his reign. This was assumed to be from the day of his predecessor's death, but in point of fact the early English sovereigns dated their reign only from the day of their coronation. Where a D., therefore, has to be ascertained by reference to a regnal year, it becomes necessary to make sure not only of the time when the king came to the throne, but of the very day from which he reckoned his reign. In the case of the popes of Rome, this inquiry is at once more than usually necessary, and more than usually troublesome, inasmuch as, until comparatively recent times, scarcely any two of them in immediate succession dated or computed on the same principle. Not a few of them, indeed, adopted different computations at different times of their reign. Thus, Pius II., during his pontificate of six years (1458–64), commenced the year sometimes on the 25th Dec., sometimes on the 1st Jan., and sometimes on the 25th Mar. Some popes, again, dated from the day of their election; others, from the day of their consecration or coronation. Nor is it only in interpreting regnal years into modern chronology that there is a chance of error; there is proof that occasionally the regnal years were wrongly computed at the time, by the kings themselves, or rather by the officers who wrote their

charters. Thus, for example, it has been discovered that from the time that king David II. of Scotland returned from captivity in 1357, the year given as that of his reign is one year short of the truth. In dealing with regnal years, there is yet another risk of mistake to be guarded against. Until the 16th c., it was not common for kings to distinguish themselves by numbers from their predecessors of the same name. In order, therefore, to discriminate one from another, charters or other deeds of the English Henries and Edwards, or the Scottish Roberts and Jameses, recourse must be had to such tests as the character of the writing, its seal, its style and language, and above all, the names of the persons enumerated in it.

With no other help than is to be gained from such tests, the antiquary is often called on to fix the date of a charter, containing no reference to the year of our Lord, the year of the king's reign, the year of the pope's pontificate, or any other measure of time. If the persons mentioned in the deed be men of note, he may be able to ascertain its date to a year, a month, or even a day; on the other hand, if they are obscure, he may be unable to reduce the date within a narrower range than 50 or even 100 years.

The skill of the antiquary is not unfrequently put to the proof in another way. Dates were often recorded by reference only to an event of the time. Thus, one leaf of the Scottish statute-book contains two acts of parliament, with no more explicit record of their date than that the one was passed "at Aberdeen in Lent next after the coming in Scotland of Vivian the legate of the apostolic see;" and that the other was passed at Stirling "on the Monday next before the feast of St. Margaret the maiden next after the first coronation of Philip king of the French." An examination of contemporary chronicles fixes the date of the one statute to 1177; of the other to 1180.

In order to facilitate the discovery and rectification of dates, various elaborate works have been published. By far the most important—*L'Art de Vérifier les Dates des faits Historiques, des Chartes, des Chroniques et autres Monuments*—is due chiefly to the labors of the Benedictines of St. Maur. The best edition of this admirable work is that of Paris, in 8 folios, the first three containing the period from the birth of Christ till the year 1770, being published in 1783–87; the fourth containing the period before the birth of Christ, in 1820; and the last four, continuing the work from 1770 downwards, in 1821–38. A reprint of this edition, in 42 octavos appeared at Paris in 1818–44. Of the other French works, it will be enough to name two—the *Nouveau Traité de Diplomatique*, also by the Benedictines of St. Maur (Par. 1750–65, in 6 vols. 4to), and the *Eléments de Paléographie, par Nat. de Wailly* (Par. 1838, in 2 vols. 4to). The best English work is *The Chronology of History*, by the late sir Harris Nicolas, published in Lardner's *Cabinet Cyclopædia*, 1838. Haydn's *Dictionary of Dates* (Vincent's edition, 1876) is a standard popular work. See INTERNATIONAL DATE LINE.

DATE OF DEED. See DEED.

DATE PALM (*Phœnix*), a genus of palms, the most important species of which is the common DATE PALM, the *palm tree* of Scripture (*Ph. dactylifera*), a native of the northern half of Africa, the s.w. of Asia, and some parts of India, and which has also been brought into cultivation in the s. of Europe, and might certainly be introduced with advantage into the s. of the United States, and many warm parts of America and Australia. The stem, which is straight and simple, reaches a height of 30 to 60 ft., and bears a head of 40 to 80 glaucous pinnated leaves, of 8 to 10 ft. long, with lanceolate acuminated leaflets, very much closed up, and a number of branching spadices, each of which on the female tree bears in general 180 to 200 fruits (dates, *dactyli*). A bunch of dates weighs 20 or 25 pounds. This is one of the most important and useful of all the palms, and is indispensable to millions of the human race, on account of the supply of food which it affords them. In Egypt and the other countries on the n. coast of Africa, in Persia, and in Arabia, dates form the principal food, and date palms the principal wealth, of the people. The fleshy part of the fruit contains 58 per cent of sugar, accompanied by pectin, gum, etc. The main ingredient, therefore, in a dietetic point of view, is the sugar. The fruit is eaten either fresh or dried, and in the latter state becomes an article of commerce. Cakes of dates pounded and kneaded together, and so solid as to be cut with a hatchet, are the store of food provided for African caravans on their journey through the Sahara. A liquor resembling wine is made from dates by fermentation, and also a kind of vinegar. In Persia, an ardent spirit is distilled from dates. The soft pith at the summit of the palm stem, along with the young leaves not yet unfolded, are eaten under the name of *palm cabbage*, and the undeveloped panicles of flowers also form an article of food to the Persians and Arabs. The liquor called *palm wine* is prepared by fermentation from the sap of the palm, the top being cut off, and a hollow scooped out, in which the sap collects. Three or four quarts are obtained daily from a single palm for ten days or a fortnight. The quantity afterwards diminishes, till the tree becomes quite dried up. Many of the inhabitants of North Africa use the roasted date stones or seeds as a substitute for coffee, for which purpose the seeds of the *Phœnix reclinata* are also employed in the s. of Africa. The seeds or stones of dates are in many places ground for the sake of the oil which is afterwards obtained from them by expression, and the remaining paste or cake is given as food to cattle. From leaf-stalks of the common D. P., all kinds of basket and wicker work are also made, and walking-sticks, fans, etc. The leaves themselves are made into bags, mats, etc.;

the fibers of the web-like integuments at the base of their stalks into cordage. The wood is used for building, fences, etc.—The TODDY PALM of the n. of India, or wild D. P. (*Ph. sylvestris*), so nearly resembles this species, that it is doubtful if it is distinct. In some places, the trees present a curiously distorted and zigzag appearance, from the practice of yearly tapping the alternate sides for the sap or *toddy*. The incision is just below the crown, and slopes upwards and inwards; a vessel is hung below the wound, and the juice conducted into it by a little piece of bamboo. It forms a grateful and wholesome beverage; readily also fermenting into palm wine, and by distillation yielding *arrack* (q.v.); whilst, if boiled down without being allowed to ferment, it yields the saccharine syrup called *jaggery*, from four pounds of which one pound of sugar is obtained, a single tree producing about seven or eight pounds of sugar annually. The operation of tapping for toddy spoils the fruit of the tree, which is small and much inferior to the African date. It is, however, eaten.—Another species, *Ph. paludosa*, the most gregarious of Indian palms, growing only six or eight ft. high, covers the whole landscape of the Sunderbunds with the liveliest verdure. *Ph. acaulis*, *Ph. farinifera*, and *P. spinosa*, are three other closely allied species; the first grows in the driest soils in the damp valleys of the Himalaya to 5,000 ft. above the sea. All three are dwarf species.

DATE PLUM, *Diospyros*, a genus of plants of the natural order *ebenaceæ*, consisting of deciduous trees, whose fruit is a globose berry, natives of warm or temperate climates. The black heartwood of some species is ebony (q.v.), and the hard timber of others is known as IRONWOOD. Some are valued for their fruit. The COMMON DATE PLUM, or PISHAMIN, also called the EUROPEAN LOTUS and the DATE OF TREBIZOND (*D. lotus*), is a tree of 20 to 40 ft. in height, with oblong shining leaves and small reddish white flowers, a native of the coasts of the Caspian sea, Mauritania, etc., but cultivated and naturalized in the s. of Europe. Its fruit is of the size of a cherry, and in favorable climates larger, yellow, sweet, and astringent. It is eaten when over-ripe, like the medlar, or is used for conserves. The tree bears fruit abundantly in the neighborhood of London, but is somewhat tender in the climate of Britain, and its fruit more austere than in more southern regions. This fruit has been supposed by some to be the *lotus* (q.v.) of the lotophagi. The VIRGINIAN DATE PLUM, or PERSIMON (*D. Virginiana*), is a tree of 30 to 60 ft. high, with ovate oblong leaves and pale-yellow flowers, a native of the southern states of North America, where one tree often yields several bushels of fruit. The fruit is about the size of a bullace, reddish, with six to eight oval seeds. It is not palatable till mellowed by frost, and is sweet and astringent. A kind of beer or cider and an ardent spirit are made from it.—The *mabola* (*D. mabola*) is cultivated as a fruit-tree in the isle of France. Its fruit is about the size of a quince, and has a very agreeable flavor.—The *kaki* (*D. kaki*), sometimes called the KEG-FIG, is a Japanese tree, sometimes kept in green-houses in France and England. The sweetmeat called *figues-caques* is made from this fruit in France. The fruit resembles a plum. It is occasionally brought from China as a dried sweetmeat.—The fruit of some other species of *diospyros* is also edible, as that of *D. decandra*, a large yellow berry, which, notwithstanding a disagreeable smell, is sold in the markets of Cochin-China.

DATHOLITE, a mineral of a grayish or greenish white color, occurring both massive and crystallized in rhombic prisms, the edges and angles of which are cut off by planes. It is composed of boracic acid, silica, and lime, with a little water. It has been found both in gneiss and in trap rocks. The Salisbury crags and Corstorphine hill, near Edinburgh, are localities for datholite.

DATISCA'CEÆ, a small natural order of plants, allied to *begoniaceæ*, and consisting of herbs and trees, chiefly natives of the temperate parts of the northern hemisphere. *Datisca cannabina*, a plant much resembling hemp in its general appearance, a native of Crete, possesses very marked tonic properties. It contains also an amylaceous substance, called *datiscin*, resembling inulin. It affords a yellow dye.

DA'TIVE. See DECLENSION.

DATU'RA. See THORN APPLE.

DAUB, KARL, 1765–1836; a German theologian, educated at Marburg, where he was tutor for a time. In 1794, he was professor of philosophy at Hanau, and soon afterwards of theology at Heidelberg, which office he held during life. His writings are of much importance, since they reflect the influence upon theology exercised by the several schools of philosophy prevailing during his time.

DAUBENTON, LOUIS JEAN MARIE, a French naturalist, was b. at Montbar in Burgundy, 29th May, 1716. His father wished him to be an ecclesiastic, and sent him to acquire a knowledge of theology at the Sorbonne in Paris, but D. had no inclination for this study, and gave himself up to that of medicine and anatomy. In 1741, after he had taken his degree at Rheims, he returned to Montbar to practice his profession. In the following year, however, his old school-fellow, the comte de Buffon, induced him to come to Paris, and assist him in the preparation of his great work on natural history. For this office D. was admirably qualified. The sobriety of his understanding, the scrupulous care with which he pursued the smallest investigations, his perseverance and industry, were in complete contrast to the impatient spirit and rapid generalizing of his

brilliant coadjutor, and enabled him to correct and moderate some of Buffon's hasty theories, as well as to substantially enrich the work with a multitude of new and important facts relative to the anatomy of animals. Unfortunately, Buffon, who was exceedingly jealous, allowed himself to be influenced unfavorably in regard to D., on account of the high estimation in which the Parisian savans generally held the latter. The result was an estrangement between the two friends (who were, however, ultimately reconciled), and science suffered severely in consequence. D., who had contributed richly to the first 15 volumes of the *Histoire Naturelle*, ceased to have further connection with the work, and the subsequent labors of Guéneau de Montbéliard, Bexon, and Sonnini, but ill supplied the want which his absence created. D. now devoted himself almost entirely to his duties in the *Jardin du Roi*, in which he held an appointment. In 1778, he was made professor of natural history in the college of medicine. During the revolution, the convention also appointed him professor of mineralogy in the museum of natural history. He died 1st Jan., 1800.

Besides his labors in connection with the *Histoire Naturelle*, D. contributed largely to the first *Encyclopédie*. In the memoirs of the académie des sciences, and in those of the société de médecine, are to be found a multitude of his most interesting and valuable papers on natural history and mineralogy. Cuvier composed a notice of D.'s life and works for the memoirs of the institute.

DAUB'ENY, CHARLES GILES BRIDLE, M.D., F.R.S., late professor of botany and chemistry in the university of Oxford, devoted himself chiefly to the elucidation of natural phenomena by the aid of chemical science. His attention was at an early period directed to the chemistry of volcanic action, and one of his first productions was *An Essay on the Geological and Chemical Phenomena of Volcanoes* (Oxford, 1824), which was followed by his great work, *A Description of Active and Extinct Volcanoes* (Lond., 1826). It applies in a remarkable manner the principles of chemistry to the phenomena produced by volcanic changes. To the examination of mineral and thermal springs, a subject closely allied to that of volcanic investigation, D. also applied himself. In 1837, he visited America for scientific purposes, and published the results of his observations in two volumes, *Notice of the Thermal Springs of North America* (1838), and *Sketch of the Geology of North America*. Italy and Auvergne, on account of their volcanic phenomena, attracted the notice of D., and largely employed his pen. His *Introduction to the Atomic Theory* (1831), *Lectures on Agriculture* (1841), and *Lectures on Climate* (1862), are very valuable. D. died Dec. 12, 1867.

DAUBER, the name of mud-wasps (family *sphigidæ*, genus *Pelopœus*), common in the United States. The female builds her nest of mud, in the form of a cone the size of a cigar. Here, in separate cells, she lays her eggs, and with each egg imprisons a spider alive, but paralyzed by her sting. When the eggs hatch, the grub feeds on the spider, passes the pupa state, gnaws through the mud of the nest and comes out a perfect wasp.

D'AUBIGNÉ. See MERLE D'AUBIGNE.

DAU'CUS. See CARROT.

DAULATABAD'. See DOWLATABAD.

DAULIS, an ancient city in Phocis, destroyed by the Persians under Xerxes; after being rebuilt, was again destroyed by Philip of Macedon; it was rebuilt for the third time, and considered from its position on a high hill almost impregnable. Its ruins are now visible near the village of Davlia.

DAUMIER, HENRI, a celebrated French caricaturist, was born at Marseilles in 1810. Fashion, tittle-tattle, scandal, politics, blemishes of figure, and oddities of character have in turn inspired his inexhaustible genius for mockery. Few among his illustrious contemporaries have escaped his pencil, and the worst of it is, that his caricatures have always some strikingly truthful feature about them. D. made his *début* in the *Charivari*, in a series of sketches from *Robert Macaire*, after which followed *Les Actualités*, *Les Divorceuses*, *Les Femmes Socialistes*, *Les Philanthropes du Jour*, *Les Grecs*, *Les Gens de Justice*, *Les Bons Bourgeois*, *Les Pastorales*, and *Les Papas*. The revolution of 1848 suggested two of his most remarkable series—*Idylles Parlementaires*, and *Les Représentants représentés*. D. is one of the contributors to the *Charivari*. He has been called by French critics the *Aristophanes* and the *Paul Louis Courier* of caricature.

DAUN, LEOP. JOS. MARIA, GRAF VON, commander-in-chief of the imperial troops during the seven years' war, was the son of Wirich Philipp Lorenz von Daun, a distinguished officer in the Austrian service, and was born at Vienna, 25th Sept., 1705. Entering his father's regiment, he acquired no inconsiderable reputation during the Turkish campaigns, 1737–1739. The Austrian wars of succession also afforded him many opportunities of displaying that combination of valor and prudence for which he was famous. After the peace with Prussia in 1745, D. became master-gen. of the ordnance, fought against the French in the Netherlands, 1746–48, and in 1754, received the dignity of field-marshal. Before this, he had, in spite of many obstacles, introduced into the imperial army a new military system, and reorganized the military academy at Vienna. At the commencement of the seven years' war, he commanded the army of Moravia in 1757, and neutralized the defeat of the Austrians under gen. Broune near

Prague, by driving Friedrich II., who had beleaguered that city, as far as Collin, and forcing the king, after a hard-fought battle, to evacuate Bohemia. On the 14th of Oct., 1758, he gained another victory over Friedrich at Hochkirch, and but for the too late arrival of the prince of Baden-Durlach with reinforcements, would probably have annihilated the Prussian army. On the 25th of Nov., 1759, at Maxen, he compelled Fink, the Prussian gen., with 11,000 men, to surrender. After this, however, he gained no important successes. Friedrich began to understand his tactics, and to conduct his campaigns accordingly. D. died 5th Feb., 1766.

DAUNG, a tract within the limits of the presidency of Bombay, contains 950 sq.m. and 70,300 inhabitants, extending in n. lat. from 20° 22′ to 21° 5′, and in e. long. from 73° 28′ to 73° 52′. It is subdivided into several petty states, the whole being under one feudal chief, who is styled the rajah of Daung. The country is valuable principally on account of its teak-forests, which are rented by the British government.

DAUNOU, Pierre Claude François, 1761-1840; a French politician. In the convention of 1792, he denied the right of that body to try the king, and voted only for his detention. He was the first president of the council of five hundred. In 1798, he was conspicuous in organizing the Roman republic. His later years were devoted to literature, and in 1807, he became keeper of the archives of France. In 1819, he was professor of history and morals in the college of France, and in 1839, he became a peer.

DAUPH'IN (Lat. *delphinus*), formerly the title of the eldest son of the French king, was originally that of the sovereign lords of the province of Dauphiné. The last of these, Humbert II., dying childless (1349), bequeathed his possessions to Charles of Valois, grandson of Philippe VI. of France, on condition that the heir apparent to the throne of France should bear the title of D. of Vienne, and govern the province. Louis IX. conferred on the D. almost sovereign rights; but after his time these were gradually abridged, until Dauphiné was placed under the same laws as the rest of the kingdom, and the title became merely honorary. After the revolution of 1830, it was abolished altogether.

DAUPHIN, a co. in s.e. Pennsylvania, bounded w. and s.w. by the Susquehanna, intersected by a number of railroads and two canals; 530 sq.m., pop. '80, 76,148. The Blue mountain crosses it near the center. The valleys are fertile. Coal and iron are abundant. The chief productions are agricultural, though there are many manufactories. Co. seat, Harrisburg, the capital of the state.

DAUPHINÉ, formerly a frontier province in the s.w. of France, now comprises the departments of Drôme, Isère, and Hautes Alpes. After the fall of the Roman empire, D. formed the southernmost part of the kingdom of Burgundy. It then passed under the dominion of the Franks, and after the dismemberment of the Carlovingian monarchy, it became a portion of the new Burgundian kingdom of Arles. It then passed by legacy into the possession of the German emperor in 1032, and remained united with Germany till the middle of the 14th c., when it was presented to France by the last of the lords of Dauphiné. See Dauphin. The old rulers of the land bore the title of dauphin (a title which probably originated in their having the figure of a *dolphin* for their crest), and the name was afterwards transferred to the district.

DAUPHIN'S CROWN is a circle of gold set round with eight fleurs-de-lis, closed at the top with four dolphins, their tails conjoined in a fleur-de-lis.

DAUW, *Equus burchellii*, a s. African quadruped, which may be regarded as intermediate between the zebra and the quagga, and is sometimes called the *zebra of the plains*, and by the cape colonists *bonte quagga* or *striped quagga*. In the language of the Bechuanas, it is called *peetsi*. It is found in numerous herds in the wide plains n. of the Orange river, is rather larger than the zebra, and of more robust figure; of a light bay color, the belly, legs, and tail white; the face, head, and body striped with black; the tail is tufted to near the root. The hoofs are much less concave beneath than those of the zebra, and are thus adapted to the plains, as those of the zebra are to the rough surface of the mountains. The D. is less easily domesticated than the quagga, but more so than the zebra.—This, or a very similar species, is found as far northwards as Congo and the Galla country.

D'AVENANT, Sir William, an English poet and playwright, was b. in the year 1605 or 1606 at Oxford, where his father kept the Crown inn, a house at which Shakespeare was in the habit of stopping when on his journeys between London and Stratford. D., while still a child, had a great admiration for Shakespeare, and when only 10 years of age, on the occasion of Shakespeare's death, the precocious boy penned an ode *In Remembrance of Master William Shakespeare*. He began to write for the stage in the year 1628, and 10 years after, on the death of Ben Jonson, he was appointed poet-laureate. He afterwards became manager of Drury Lane theater, but entering into the intrigues of the civil war, he was apprehended, and cast into the Tower. He escaped, however, to France, and returning, distinguished himself so much in the cause of the royalists, that he was knighted by Charles after the battle of Gloucester. D. a second time got into difficulties, and was confined in the Tower for 2 years, when he was released, as is said, on the intercession of Milton. Once more free, he set about establishing a theater,

and succeeded. After the restoration, he was favored by royal patronage, and continued to write and superintend the performance of plays until his death, April 7, 1668. D.'s epic, entitled *Gondibert*, a poem of about 6,000 lines, is now almost wholly forgotten.—CHARLES D'AVENANT, a son of the preceding (b. 1656, d. 1714), distinguished himself as a writer on political economy and finance. His chief works are: *An Essay upon Ways and Means of Supplying the War* (1695); *Discourses on the Public Revenues and the Trade of England* (1698); *A Discourse upon Grants and Resumptions* (1700); *An Essay upon the Balance of Power; The Right of Making War, Peace, and Alliances* (1701); *Essays upon Peace at Home and War Abroad* (1704), etc. A selection of his works was published in 1771, by sir Charles Whitworth, afterwards earl Whitworth.

DAVENPORT, a city of Iowa, U. S., on the right bank of the Mississippi, at the foot of the upper rapids, and opposite Rock Island, Ill., on the Great Western route from Chicago. It is connected with Rock Island by a large iron bridge across the Mississippi with railway, carriage, and foot tracks; contains 25 churches, 3 banks, Griswold college; cotton, woolen, and other manufactories. Coal is abundant, and a large trade is carried on by rail and river. The scenery is of the finest on the north Mississippi. Pop. '70, 20,038.

DAVENPORT (*ante*), a city in Iowa, on the Mississippi, below the upper rapids, opposite Rock Island, Ill., 335 m. n. of St. Louis, and 183 m. w. of Chicago; pop. '80, 21,834. It is reached by the Davenport and St. Paul, and the Chicago, Rock Island, and Pacific railroads, while railroads coming to the e. bank of the Mississippi give easy communication with the Atlantic cities. The city is on the top and slope of a steep bluff, and commands an extensive view of Rock Island and the river. On the island are the U. S. arsenal and military headquarters, and many fine buildings put up by the general government. From D. to the island there is a wrought-iron bridge for railway and carriages, which cost $1,000,000. The city has a city hall, court-house, opera-house, nearly 30 churches, 4 banks, the academy of the Immaculate Conception and the seminary of St. Charles Borromeo (both Roman Catholic), Griswold college (Prot. Ep.), a Roman Catholic hospital, and a number of excellent schools. The water and gas works of the city are very superior. The manufactures are chiefly of carriages, farming tools, furniture, lumber, flour, and woolen goods. There is a large local trade from the fine agricultural region in which the city is situated.

DAVENPORT, EDWARD L., b. Mass., 1816; d. Penn., 1877; an American actor. He made his first appearance in Providence, R. I., playing a minor part in *Sir Giles Overreach*, with the elder Booth as "Sir Giles." Davenport made rapid progress, and was soon recognized as a leading artist in tragedy, comedy, and melodrama. He supported Anna Cora Mowatt Ritchie in a wide range of characters both in this country and in England, and played with Macready and other stars. While in England he married Mrs. Vining, herself an actress, of a family of actors. Returning about 1860, he traveled over the United States, playing in the principal cities, chiefly in Shakespearean characters and those drawn from Dickens's novels. Among his latest conspicuous representations were such widely divergent characters as "Brutus" in *Julius Cæsar* and "Bill Sykes" in *Oliver Twist*. His daughter Fanny is an actress of established fame, and her sister Blanche is a vocalist of excellent standing. Davenport was highly esteemed for his genial and open-hearted manners.

DAVENPORT, JOHN, 1597–1670; one of the most zealous and eminent of the Puritan divines who came to New England. Graduated at Oxford, and was a minister in the church of England; but his Puritanic opinions led him to quit that church in 1635. Two years afterwards he came to Boston, and in 1638 was one of the founders of the New Haven colony. Goffe and Whalley, the regicides, were protected by him. In 1668, he became minister of the First church in Boston, and died in that charge. He was a minister in New Haven for 30 years, and was active in the civil government.

DAVENTRY, an ancient municipal borough in the w. of Northamptonshire, at the sources of the Avon and Nene, 13 m. w. of Northampton, and near the Birmingham railway, Grand Junction canal, and Watling Street. It is well built on an eminence, and has two principal streets. Pop. '71, 4,051. The chief manufactures are shoes and whips for export. D. was occupied by Charles I. in 1645, before the battle of Naseby. A mile to the e. of D., on Dane's or Borough hill, is a foot-shaped Roman camp, supposed to be Ben-avenna, one of the largest in the kingdom. Near it is one of an acre in extent.

DAVID, a t. on the left bank of a river of the same name in Panama, one of the federal provinces of the United States of Colombia (formerly New Granada), and lying on the frontier of Costa Rica, in Central America. D. is in lat. 8° 23′ n., and long. 82° 27′ w., and is separated by a comparatively narrow part of the isthmus of Darien from the lagoon of Chiriqui, an inlet of the Caribbean sea, which, with sufficient depth for large ships, penetrates nearly 50 m. into the land towards the Pacific ocean. To this position the place appears to owe its prosperity. Though of recent origin, it numbers more than 4,000 inhabitants, with a constant and regular immigration. It exports rice, coffee, hides, turtle, shells, and gold-dust. Its climate is understood to be comparatively salubrious.

DAVID (Heb. "beloved"), king of Israel, the 9th and youngest son of Jesse, belonged to the tribe of Judah, and was probably educated in one of the schools of the prophets. He first publicly signalized himself by slaying Goliath of Gath, a gigantic Philistine, who had "defied the armies of Israel." Previously, he had acquired a considerable reputation as a skillful harper, and had subdued by his music the paroxysms of insanity which afflicted Saul at certain seasons. By Samuel he was anointed king during the life-time of Saul, who soon began to regard him as a dangerous enemy, and persecuted him. A kind of intermittent war between the two was the consequence, in which D. was often reduced to great straits. At first, he was simply in the position of a guerrilla chief, and his comrades were mainly persons in desperate circumstances—"all who were in distress, in debt, or discontented." Latterly, he lived among the Philistines as one of themselves, and from the Philistine prince of Gath obtained a present of the strong fortress of Ziklag, after which he was joined by a class very different from his original outlaws—men of consideration, and tried warriors, from various tribes. The contest between him and Saul now assumed the dignity of a civil war. It was only closed by the death of the latter, whereupon D. ascended the throne of Judah, with the city of Hebron as his capital. The other tribes elected Ishbosheth, a son of Saul, to be their king, after whose murder D. first acquired possession of the entire kingdom, over which he ruled from 1055 until his death in 1015 B.C. His first undertaking in his new office was a war against the Jebusites. He took their chief city, Jerusalem, and made it his residence, as also the center of the religious worship of the Hebrews. Subsequently, he subjugated the Philistines, Amalekites, Edomites, Moabites, Ammonites, and, after a long war, the Syrians. His kingdom now stretched from the Euphrates to the Mediterranean, and from Syria to the Red sea, and contained a pop. of 5,000,000. He fostered navigation and trade, especially with Tyre, and sought to instruct the Hebrews in the arts. No less careful was he of the religion of his countrymen. He divided the priests and Levites into classes, and appointed sacred singers and poets for the musical service of God. Law and justice likewise received improvements at his hands, through the institution of higher and lower judiciary courts, while he secured the stability of his power by the formation of a standing army. Besides this, there were 12 governors over the tribes of Israel, "who may perhaps be compared to the lord-lieutenants of English counties." D. was not, however, without his trials. Two conspiracies were formed against him in his own family, and although both failed, they greatly imbittered his life. His sensual excesses also drove him into acts of criminality, the memory of which haunted him forever. "My sin is continually before me." Yet we cannot help recognizing in the man, in spite of all his errors and sins, a sincerity of moral feeling rarely equaled in history. His passions might lead him astray, but they never blinded his conscience. The crime once committed, D. never tried to find excuses for it, and so blunt the edge of his deserved misery. The Psalms which he has left reveal to us the naked soul of the royal poet wrestling with a host of black troubles, fears, and doubts, out of which, however, as from the seething bosom of chaos, there emerges at last a "full-orbed faith," made perfect by suffering and much tribulation. There has never been trust in God more clear, unwavering, and tender than that expressed in the 23d Psalm. It is this many-sided experience of life that has made the "Psalms of David" (though it is uncertain who made the collection, which contains many not written by David himself) the most precious heritage of the afflicted and tried in all ages of the Christian church.—By those theologians who look upon Jewish history as having a *typical* or *allegorical* meaning as well as a literal one, D. is regarded as a type of Christ.

DAVID I. (often called ST. DAVID), king of Scotland, was the youngest of the six sons of king Malcolm Ceanmohr, by his second wife, the Anglo-Saxon princess, St. Margaret (q.v.). He was b. about the year 1080. During the fierce struggle for the Scottish crown, which followed the death of his father in 1093, the youthful D. seems to have found refuge in England, along with his sister, Eadgyth or Matilda, who, in 1100, married Henry I., king of England. The residence of D. at the court of this accomplished monarch would appear to have been prolonged for several years, and the assertion of a contemporary English annalist may well be credited, that "it freed him from the rust of Scottish barbarity."

In 1170, his elder brother, Alexander, succeeded to the throne, and D. became prince of Cumbria, a territory which comprised what are now the shires of Cumberland, Dumfries, Roxburgh, Selkirk, Peebles, Lanark, Dumbarton, Renfrew, and Ayr, and was held of the English king by the heir of the king of the Scots. Along with this great principality, he seems to have held lands in Lothian; and by his marriage in 1110 with Matilda, widow of the earl of Northampton, he acquired possession of that earldom, together with a claim to the rest of the vast domains of her father, Waltheof, earl of Huntingdon, of Northampton, and of Northumberland. The first act of D., as prince of Cumbria, was to restore the fallen bishopric of Glasgow, which he committed to the charge of his old preceptor, John. His next act was to bring a colony of Benedictine monks from the newly-founded monastery of Tiron, in France, and to plant them beside his forest castle of Selkirk. This was in 1113; and even thus early, as his charters show, he had gathered round him the Bruces, the Lindsays, the Morvilles, the Umfravilles, the Percies, the Riddels, and other Anglo-Norman knights, through whose help he was to effect such a momentous change in Scotland.

In 1124, he succeeded to the Scottish throne, on the death of his brother, king Alexander I. That prince had had to fight for his crown against the heirs of the old Celtic dynasties, supported by the wild tribes of the north and west. They renewed the struggle with his successor, first in 1130, when they advanced almost to the gates of Brechin; and again, about twenty years later, when they appear to have been encountered on the plains of Murray. On both occasions, the Anglo Norman chivalry with which D. had garrisoned the southern provinces, gave him decisive, but far from easy victories. He was less fortunate in his wars beyond the Tweed. In 1127, he had sworn, along with the other great barons of England, to maintain the right of his niece, Matilda, as heir of the English crown, should her father, Henry I., die without male issue of his own body. The event thus contemplated came to pass in 1135, and when Stephen mounted the English throne, D. took arms in behalf of Matilda, and subdued almost all the country to the s. of Durham. Peace was restored by the grant of the earldom of Huntingdon, and the promise of the earldom of Northumberland, to D.'s son Henry, then in his 20th year. But the war was soon resumed; and in 1138, the king of Scots, deserted by Bruce and others of his Anglo-Norman vassals, was signally defeated in "the battle of the Standard," near Northallerton. The next year, a second peace was concluded between the two kings, when the promised earldom of Northumberland was bestowed on D.'s son Henry. In 1141, the Scottish king marched into England for the third time to assert the rights of Matilda. He was a third time defeated, and only regained his own country with difficulty.

The rest of his reign was devoted to the accomplishment of the great revolution which had been begun by his father, king Malcolm, and his mother, St. Margaret, and continued by his brothers, king Edgar and king Alexander—the establishment in Scotland of the civilization which obtained in England. By building castles, he secured the peace and safety of the country; by erecting burghs, he promoted its trade, shipping, and manufactures, and laid the foundations of its freedom; by endowing bishoprics and monasteries, he provided homes for the only men of learning and enlightenment known in his time. His descendant, king James I., standing by his tomb in Dunfermline, is said to have complained that "he was ane sore sanct for the crown," but the remark, if it was ever made, would only show that the sloth and ignorance of the clergy in the 15th c. had blotted out the remembrance of the great services which they rendered to mankind in the 12th c., when they were the schoolmasters, the statesmen, the lawyers, the physicians, the bankers, the engineers, the artists, the builders, the glaziers, the agriculturists, and the gardeners of the age. One who was a hard judge of monarchs—the great scholar, Buchanan—said with much more truth, "that if men were to set themselves to draw the image of a good king, they would fall short of what David showed himself throughout the whole course of his life."

King D. died at Carlisle on the 24th May, 1153. His son Henry had died in the previous June, and he was succeeded by his grandson, Malcolm, then in his twelfth year. The oldest Scottish painting now known to exist—an illuminated charter to the monks of Kelso, written in 1159—preserves rude miniatures of the young king and his saintly grandfather. It is engraved in facsimile in the *Liber S. Marie de Calchou*, presented to the Bannatyne club by the duke of Roxburghe in 1846. Some pleasing traits of king D.'s personal character—which seems to have been in many ways truly admirable—are preserved in the *Eulogium Davidis Regis Scotorum*, by his friend St. Ailred, abbot of Rievaux, printed in Pinkerton's *Vitæ Antiquæ Sanctorum Scotiæ* (Lond. 1789). Other instructive materials for the king's life are supplied by the same writer in his tract *De Bello Standardi*, printed (together with other contemporary accounts of the battle) in Twysden's *Historiæ Anglicanæ Scriptores Decem* (Lond. 1652); and by Joceline of Furnes in his *Vita S. Walthevi* (abbot of Melrose, and D.'s stepson), printed by the Bollandists in the *Acta Sanctorum*, and in a less perfect state in Fordun's *Scotichronicon*. The remains of D.'s legislation, including the interesting code of the *Leges Burgorum*, have been carefully collected in the first volume of *The Acts of the Parliaments of Scotland* (Edin. 1844).

King D. is often called St. David. He was never formally canonized, or placed in the roll of saints of the Roman Catholic church; but his name was inserted in the calendar prefixed to king Charles Prayer-book for Scotland, printed at Edinburgh in 1637.

DAVID II. See BRUCE.

DAVID, FÉLICIEN, a French composer, was b. 8th Mar., 1810, at Cadenet, in the department of Vaucluse. He was at first a chorister in the cathedral of Aix, and at the age of 20 entered the Paris conservatoire. He threw himself earnestly into the social speculations of his day; became an ardent disciple of St. Simon, and afterwards of Enfantin; and finally, on the break-up of the brotherhood attempted at Ménilmontant in 1832, he betook himself, along with eleven of his fellow-dreamers, to the east, there to realize his theory of life in undisturbed peace. The little knot of enthusiasts reached Constantinople, whence they made their way to Smyrna and Cairo. As they had no means, they suffered greatly from want, sickness, and ill-usage. The plague forced them to flee from Egypt, through the desert, to the coasts of Syria. It is said that they dragged a piano with them over the sands, and often, when they rested on their toilsome march among the wild tribes of the wilderness, D., whose ear was quick to catch

the native airs of the east, sent forth enchanting strains from the instrument, and made his comrades forget their misfortunes. In 1835, he reached France, and published his *Mélodies Orientales* for the pianoforte. They were unsuccessful; and D. remained in obscurity till 1844, when he brought out at the conservatoire his *Désert*, a grand *Ode-symphonie*, as he called it, the words of which were furnished by his friend and fellow-wanderer, M. Auguste Colin. Its success was sudden and complete. D. was declared a master at once, and his *Désert* was performed in all the theaters. Subsequently, he traveled through Belgium and Germany, and was everywhere greeted with applause. Less successful works were—*Moïse sur le Sinaï* (1846); *Christophe Colombe;* and *Le Paradis* (1847); and *La Perle du Brésil* (1851); *Herculaneum* (1859); and *Lalla Rookh* (1862). Appointed an officer of the legion of honor in 1862; and in 1869, librarian to the Paris conservatoire de musique, D. died 29th Aug., 1876.

DAVID, Jacques Louis, the founder of the modern French school of painting, and, according to his countrymen, "the regenerator of French art," was b. at Paris, 30th Aug., 1748, and studied under Vien both at Paris and Rome. His first efforts by no means indicated the latent tendencies of his mind. His devotion to the classic style of art was first perceptible to any extent after his second visit to Rome in 1784, where he executed his "Horatii." It excited the greatest enthusiasm. In 1787, he painted "The Death of Socrates;" in 1788, "The Loves of Paris and Helen;" and in 1789, "Brutus condemning his Son." During the revolution, he was artistic superintendent of those grand national fêtes and solemnities that recalled (but rather theatrically) the customs of ancient Greece. As a member of the convention, he voted for the death of Louis XVI.; he was a hot Jacobin, and a member of the committee of public safety, in all the atrocities of which he shared, and, in consequence, was twice imprisoned after the fall of Robespierre. To the period of the revolution belong his "Murder of Marat," "Murder of Pelletier," and his "Oath taken in the Tennis Court." His genius culminated in the "Rape of the Sabines" (1799). In 1804, Napoleon appointed him his first painter, and gave him a number of commissions, and among his best and most celebrated works are several historic portraits of the emperor, such as "Napoleon crossing the Alps." D. was warmly attached to Napoleon, and in 1814, when the duke of Wellington paid a visit to his studio, and expressed a wish that the artist would paint his portrait, he coldly replied, "I never paint Englishmen." As one of the regicides of Louis XVI., he was banished in 1816 from France, and he died in exile at Brussels, Dec. 29, 1825. D.'s later style is more free and natural than his earlier, in which his figures, although manifesting quite an ideal beauty of form, have all the rigidity of sculpture, and lack that vital expression which creates a sympathy in the mind of the beholder. Among the paintings executed by him during his banishment were—"Love and Psyche," "The Wrath of Achilles," and "Mars disarmed by Venus." The number of his pupils who acquired distinction was very great.

DAVID, Pierre Jean, a French sculptor, commonly called David d'Angers, was born at Angers, 12th Mar., 1789; went to Paris when very young; and studied art under his namesake, Jacques Louis David (q. v.). In 1811, his "Death of Epaminondas" obtained the first prize for sculpture given by the academy of arts. D. now visited Rome, where he formed a friendship with Canova. In 1816, he returned to France. A statue of the great Condé, which he executed about this time, established his reputation. In 1826, he was named a member of the institute, and appointed a professor in the school of the fine arts. Two years later, he went to Germany, where he executed a colossal bust of Goethe for the library at Weimar; and in a second tour in 1834, similar busts of Dannecker, Schelling, Tieck, and Rauch, as well as many portrait-statues of life size. During the July revolution, D. had fought in the ranks of the people, and, in consequence, he was employed by the new government to execute the frontispiece of the Pantheon in 1835. He finished it in 1837. By many it is considered his *chef-d'œuvre.* In 1848, the well-known republicanism of the artist procured for him the honor of a seat in the constituent assembly. After the *coup-d'état,* he was sent into exile, and went to Greece, but soon after returned to France. He died 5th Jan., 1856. It would be impossible to enumerate all D.'s works. The principal are—"A Young Girl at the Tomb of Botzaris," "A Monument of Bonchamp," "A Virgin at the Foot of the Cross," a "Saint John," statues of Gen. Foy, Marshal St. Cyr, Corneille, Fénelon, and Racine, and busts of La Lafayette, Béranger, Rossini, Chateaubriand, Balzac, and Casimir Delavigne. There is great force of expression in many of D.'s works, but the drawing and execution are not always accurate.

DAVID, or **DEWI,** Saint, the patron saint of Wales, was, according to tradition, the son of the Prince of Ceretica (Cardiganshire), and was born about the end of the 5th or beginning of the 6th century. Having resolved on a religious life, he spent, as was customary in those days, a probationary period in solitude, after which he commenced preaching to his countrymen. He built a chapel at Glastonbury, and founded twelve monasteries, the chief of which was at Menevia, in the vale of Ross. At the synod of Brevy, in Cardiganshire, held in 519, St. D. showed himself a strong opponent of the Pelagian heresy. Subsequently, he became archbishop of Caerleon-upon-Usk, but transferred his see to Menevia, now called St. Davids, where he died about the year 601. St. D. was celebrated for his eloquence and success in conversion. Several works have

been ascribed to him, but these are no longer extant. His life was written by Ricemarch, bishop of St. David's, who died about the year 1099. The *Historia S. Davidis*, by Giraldus Cambrensis, written about 1175, and published in Wharton's *Anglia Sacra*, is little more than an abridgment of Ricemarch's work.

DAVIDISTS, the name of two distinct sects in the Christian church. 1. Followers of David of Dinant, whose work was condemned by the synod of Paris in 1209. His fundamental idea was that the Deity alone had any real existence, being the *materia prima* of all things. 2. DAVIDISTS, or DAVID GEORGIANS, followers of David George, or Joris, a native of Delft, Holland. In 1530, he was whipped, had his tongue bored, and was imprisoned for obstructing a Roman Catholic procession. He founded a sect of his own, and in 1542, published his *Book of Wonders*, detailing the visions which he professed to have received. After his death, his body was dug up and burned by order of the senate of Basel, where he had passed the latter part of his life as a merchant under an assumed name. The sect, under the leadership of Henry Nicholas, became known in Holland and England as the "Familists. They interpreted the whole of Scripture allegorically, and maintained that as Moses had taught hope and Christ had taught faith, it was their mission to teach love, the service of which was the highest and best of the dispensations. The result was an extreme Antinomianism in practice, which attracted the notice of the authorities in both countries. Early in the 17th c., the sect was suppressed or absorbed by others.

DAVIDS, ST., an ancient but now decayed episcopal city, in the w. of Pembrokeshire, the westmost town in Wales. It is situated on the streamlet Allan, a mile from its mouth, near St. David's Head, on the n. side of St. Bride's bay. It has been the seat of a bishopric since about 519, when St. David transferred the archbishop's see to St. D. (before called Mynyw, and by the Romans Menevia) from Caerleon. It was in the middle ages a large city—the great resort of pilgrims to St. David's shrine; it is now a small village, with only a few good houses, besides those of the clergy. It has a fine cathedral, and splendid remains of religious houses, episcopal palace, and St. Mary's college (founded by John of Gaunt), within a high embattled wall nearly a mile in circuit. These were several times pillaged and burned by the Danes and others during the 9th and two following centuries. The cathedral, founded in 1180, on the site of the monastery of St. David, is cruciform. Its dimensions, in the interior, are as follows: length, 290 ft.; breadth, 76; nave, 124; choir, 80; transept, 120; central tower, 127 ft. high. It contains a curious movable pulpit, an elaborately worked bishop's throne; the tomb of the earl of Richmond, father of Henry VII.; and also sepulchral monuments of the early bishops of the see, as Giraldus Cambrensis, Anselm, etc. Among the former bishops may be named Laud, Bull, South, and Horsley; and a very recent occupant of the see was Connop Thirlwall, the historian of Greece. The cathedral establishment includes a bishop, a dean, 4 canons, 5 vicars choral, and other officers residentiary, with 4 archdeacons, and 12 prebendaries, or honorary canons, non-resident. The bishop has £4,500 a year, and lives at Abergwili, near Caermarthen. Pop. '71, 2,131, chiefly agricultural laborers. William the conqueror made an offering as a pilgrim at St. David's shrine. Cairns, tumuli, holy wells, chapels, crosses, etc., abound around St. D., and especially at ST. DAVID'S HEAD, a high rugged promontory 2 m. n.w. of the city, and the westmost point in Wales, in lat. 51° 54′ n., and long. 5° 20′ west.

DAVID'S ISLAND, in Long Island sound, a few miles e. of New York, occupied by the federal government for military purposes. Its extent is about 100 acres.

DAVISON, a co. in s.e. Dakota, intersected by the Dakota river; 432 sq. miles. Not included in the census of 1870. Pop. '80, 1256.

DAVIDSON, a co. in w. North Carolina, on the Yadkin river, crossed by the North Carolina railroad; 620 sq.m.; pop. '80, 20,333—3,993 colored. Gold and silver have been found, but the chief productions are agricultural. Co. seat, Lexington.

DAVIDSON, a co. in n. Tennessee, intersected by the Cumberland river, and crossed by four railroads; 750 sq.m.; pop. '80, 79,137—31,460 colored. It is a fertile agricultural region. Co. seat, Nashville, the capital of the state.

DAVIDSON, LUCRETIA MARIA, 1808–25; b. N. Y.; remarkable for precocity in rhyming. The first of her writings preserved were done when she was nine years old. At 16 she attended school in Troy, but health failed and she died the next year. Many of her pieces were lost or destroyed, but nearly 300 were published in a volume.

DAVIDSON, MARGARET MILLER, 1823–38; sister of Lucretia Maria, and like her a precocious verse writer. At the age of 10 she composed and acted in a drama of New York society. Washington Irving was her literary patron, and under his supervision the works of both sisters were published in 1850.

DAVIDSON, WILLIAM, b. Penn., 1746, of Irish extraction; removed to North Carolina, 1750; educated in the liberty-loving Mecklenburg co.; a major in one of the first regiments raised in North Carolina for the revolutionary war. He was in the engagements at Monmouth, Brandywine, and Germantown, and advanced to the rank of lieut.col. He was killed in a skirmish with the British troops under Tarleton near

the Catawba river, but had previously been promoted to the rank of gen. Davidson college (N. C.) is named after him.

DAVIE, a co. in w. North Carolina, on the Yadkin river; 250 sq.m.; pop. '80, 11,097—3,327 colored. The productions are wheat, corn, oats, tobacco, etc. Co. seat, Mocksville.

DAVIES, CHARLES, LL.D., b. Conn., 1798. He graduated from the West Point military academy in 1815, and the next year became a teacher there. He rose rapidly to become professor of mathematics, and began to prepare text-books. In 1845, he took the chair of mathematics and natural philosophy in the university of New York. His mathematical works are widely known and used. They make a sequence from primary arithmetic to the higher mathematics, and include Bourdon's *Algebra* and Legendre's *Geometry*. Of his own works the more important are those on *Surveying and Trigonometry*, the *Logic of Mathematics*, and *Dictionary and Cyclopædia of Mathematical Science*.

DAVIES, Sir JOHN, a poet and statesman of some reputation, was the son of a legal practitioner in Wiltshire, and was b. in 1570. At the age of 15, he was sent to Queen's college, Oxford, where five years after, he took his degree of B.A., having spent two of these years in the Middle Temple, where he studied law. He was called to the bar In 1595, but forfeited his privileges, and eventually was expelled from the Temple on account of certain indiscretions. He began his political career in 1601. In 1603, he was sent by James I. as solicitor-general to Ireland, and almost immediately after, he became attorney-general. He was called to the degree of sergeant-at-law in 1606, and in the spring of the following year received the honor of knighthood. On the assembling of the Irish parliament, called in 1613, D. was chosen speaker of the house of commons. In 1620, he took his seat in the English parliament as member for Newcastle-under-Lyne. He died suddenly of apoplexy, Dec. 7, 1626.

As a lawyer, the character of D. is that of a man of great learning and talent. His *Reports of Cases adjudged in the King's Courts in Ireland*, published in 1615, were the first reports of Irish cases ever published, and had a preface from the pen of D., which was esteemed by an old critic as the best that was ever prefixed to a law-book. But it is as a poet that he is chiefly notable. His *Orchestra, or a Poem on Dancing* (1596), was followed by his great work, the *Nosce Teipsum, a Poem on the Soul and the Immortality Thereof* (1599). His verse is elegant without being artificial, and flowing without being careless, while its compact structure is remarkable for his times. Among his miscellaneous works may be mentioned his *Discovery of the True Cause why Ireland was never Subdued entirely until the Reign of King James I.* (Lond. 1612), a work which has always been considered of great value to political inquirers.

DAVIES, HENRY E., jr., b. N. Y., 1836; educated at Harvard, Williams, and Columbia colleges, and admitted to the bar in 1857. He was an early volunteer in the service of the union when the war of the rebellion broke out, and rose to be maj.gen. of volunteers.

DAVIES, SAMUEL, D.D., 1724–61; b. Del.; licensed to preach, 1746. In 1753, he was sent to England to solicit funds for the college of New Jersey, and was successful. On return, he resumed his pastoral work, and after the defeat of Braddock in the Indian war, he published a sermon on the disaster, in a note to which he wrote: "That heroic youth col. Washington, whom I cannot but hope Providence has hitherto preserved for some important service to his country." In 1759, he succeeded Jonathan Edwards as president of the college of New Jersey.

DAVIES, THOMAS A., b. N. Y., 1809; graduate of West Point. In the war of the rebellion he served on the union side, and at its close held the rank of brevet maj.gen. of volunteers.

DAVIESS, a co. in s.w. Indiana, between the branches of the White river, traversed by the Wabash and Erie canal and the Ohio and Mississippi railroad; 423 sq.m.; pop. '80, 21,552. The surface is rolling or level, and limestone and coal are found. Agriculture is the principal business. Co. seat, Washington.

DAVIESS, a co. in n.w. Kentucky on the Ohio river; 400 sq.m.; pop. '80, 27,724—4,902 colored. The surface is level and the soil good. Productions agricultural. Co. seat, Owenborough.

DAVIESS, a co. in n.w. Missouri on Grand river; 576 sq.m.; pop. '80, 19,174—451 colored. Surface uneven and soil fertile; productions agricultural. Co. seat, Gallatin.

DAVIESS, JOSEPH HAMILTON, 1774–1811; b. Va., but taken at an early age to Kentucky, widely known and remembered there as "Jo Daviess." His eccentricities gave him much notoriety. On one occasion he appeared as an advocate before the supreme court in the most dilapidated attire, won an important case, and disappeared in the same garb. He married a sister of chief-justice Marshall, and became U. S. attorney for the state. He was killed at the battle of Tippecanoe while leading a cavalry charge against the Indians.

DA'VILA, ENRICO CATERINO, a celebrated Italian historian, was b. at Pieve di Sacco, in the vicinity of Padua, Oct. 30, 1576. D., when seven years old, was taken to France for his education. At the age of 18, he entered the service of Henry IV., which he afterwards exchanged for the military service of Venice. He was shot on his way to Crema, to take command of the garrison, in 1631. D. has been rendered famous by his great work, entitled *Storia delle Guerre Civili di Francia* (Venice, 1630), a history comprising that eventful period from the death of Henry II., 1559, to the peace of Vervins in 1598.

DA VIN'CI, LEONARDO. See LEONARDO DA VINCI.

DAVIS, a co. in s.e. Iowa, bordering on Missouri, intersected by Fox river and two railroads; 480 sq.m.; pop. '80, 16,468. Productions agricultural. Co. seat, Bloomfield.

DAVIS, a co. in n.w. Kansas, intersected by the Kansas river and three railroads; 386 sq.m.; pop. '80, 6,994. Agriculture is the chief business. Co. seat, Junction City.

DAVIS, a co. in n. Utah, lying along Great Salt lake, in part occupied by the Wahsatch mountains; 320 sq.m.; pop. '80, 5,026. It is crossed by the Union Pacific and Utah Central railroads. Productions chiefly agricultural. Co. seat, Yarmington.

DAVIS, ANDREW JACKSON, b. N. Y., 1826. He has long been prominent as a leader in modern spiritualism, and at the age of 19 published *The Principles of Nature, her Divine Revelations,* which he claims were dictated to him by spiritual influence. He has also published *The Great Harmonica; The Magic Staff;* and many papers of less consequence.

DAVIS, CHARLES HENRY, LL.D., b. Boston, 1807; entered the navy in 1823, and rose to rear-admiral in 1863. In 1859, he was made superintendent of the American *Nautical Almanac.* He was one of the board of officers assembled in 1861 to consider measures for an attack along the coast of the states then beginning the rebellion, which consultation resulted in the expedition against Port Royal. In May, 1862, he had command on the flotilla off fort Pillow, on the Mississippi river, and on the 10th of that month resisted a fleet of 8 rebel iron-clads which came against him, disabling three of the rebel gun-boats. The confederates abandoned fort Pillow early in June. On the 8th of that month, Davis came up with their iron-clads opposite Memphis. He attacked them at once, captured or destroyed all but one, and the surrender of the city of Memphis immediately followed. For this and other services Davis was made rear-admiral. Subsequently he was chief of the bureau of navigation, and immediately after the war he was made superintendent of the national observatory. In 1867, he commanded the Brazil squadron, and in 1870 took command of the Norfolk navy yard.

DAVIS, DAVID, LL.D., b. Md., 1815; graduated from Kenyon college, and settled in law practice in Illinois, where he was successively chosen to the legislature, to the constitutional convention, and as district judge. In 1862, he was appointed one of the justices of the U. S. supreme court. He resigned in 1877, after 15 years' service, and was chosen U. S. senator from Illinois. His political affiliations, which have been in question, are undoubtedly democratic.

DAVIS, EDWIN HAMILTON, b. Ohio, 1811; a physician and archæologist; graduate of Kenyon college, 1833. Occupied the chair of materia medica and therapeutics in New York medical college. Among other works, he has published *Monuments of the Mississippi Valley.*

DAVIS, EMERSON, D.D., 1798–1866; b. Mass.; a graduate of and for a time tutor in Williams college. In 1836, he became pastor of the First church (Congregational) in Westfield, where he remained until his death. Among his works are *The Teacher Taught; History of Westfield; The Half Century;* and essays and sermons.

DAVIS, HENRY, D.D., 1770–1852; a native of Long island, graduate at Yale, and tutor in Yale and Williams colleges, and held the Greek professorship at Union college. In 1809, he was elected president of Middlebury college, and in 1817, of Hamilton college, resigning in 1833 on account of difficulties with the trustees.

DAVIS, HENRY WINTER, LL.D., 1817–65; b. Md., graduate of Kenyon college, studying law at the university of Virginia. In 1850, he settled in Baltimore, and in 1855 was elected to congress, and was twice re-elected. He was a vigorous opponent of secession, and in 1863 was once more sent to congress. His work, *The War of Ormuzd and Ahriman in the Nineteenth Century,* appeared in 1852.

DAVIS, JEFFERSON, b. in Kentucky, June 3, 1808, first made himself conspicuous as a member of the house of representatives, and afterwards of the national senate, in which he represented the state of Mississippi. At the commencement of the Mexican war, he left congress, and engaged actively in the contest. Having the advantage of a military training, and having served in the regular army, he soon acquired distinction. When Pierce was elected president in 1853, D. was appointed secretary of war, and at this period he exercised a powerful influence in the administration—ruling, in fact, the president as well as the greater number of the members of the cabinet. When Buchanan became president, he left the cabinet, but was returned to the senate by the legislature of Mississippi, which position he retained till the secession of his state. On the 18th

Feb., 1861, D. was chosen president of the confederate states, and re-elected for six years in 1862. The manner in which the new constitution was drawn up by D., his military skill, administrative capacity, and unwearied activity very fully justified the choice; and his disinterestedness and personal bearing endeared him to all classes in the southern states. After the fall of Richmond, D. was captured when endeavoring to escape in 1865, and was kept a prisoner in fortress Monroe for two years. He was released on bail in 1867, and finally set at liberty by the general amnesty of Dec. 25, 1868. After a visit to Europe, D. settled at Memphis, Tenn. See UNITED STATES.

DAVIS, JEFFERSON C., b. Ind., 1828. He was a volunteer in the Mexican war, and subsequently became a lieut. in the regular army. He was stationed at fort Sumter during the bombardment in 1861. He served on the union side through the war of the rebellion, receiving the brevet rank of maj.gen. In 1873, he commanded the forces sent to subdue the Modocs after the murder of gen. Canby.

DAVIS, JOHN, an eminent navigator of the latter part of the 16th c., was b. at Sandridge, near Dartmouth, and is principally distinguished for having, between 1585 and 1588, undertaken three voyages to the northern seas in search of a northwest passage. In the first voyage, he sailed as far n. as the 73d degree of latitude, and discovered the strait which bears his name. He afterwards made five voyages to the East Indies, in the last of which he was killed in a fight with some Japanese on the coast of Malacca. This event took place in 1605. He is the author of several works, among which the chief are—*The World's Hydrographical Description* (Lond. 1595); and *The Seaman's Secrets*, 8vo (Lond. 1595).

DAVIS, JOHN, an English navigator of the 16th century. He made three voyages in search of the northwest passage, but went no further than Baffin's bay. In 1591, he joined Cavendish in his second voyage to the South sea; and after the most of the expedition had returned unsuccessful, he remained and discovered the Falkland islands. In 1598, he took a merchant fleet from Holland to the East Indies. He made another voyage in 1605, and on his way home was killed by pirates.

DAVIS, JOHN, LL.D., 1787—1854; b. Mass.; graduate of Harvard in 1781, and began law practice in Plymouth. He was several times chosen to the legislature. In 1795, he was made comptroller of the U. S. treasury, and was the next year appointed district-attorney for Massachusetts. In 1801, he was appointed judge of the district court, holding the place more than 40 years. He was eminent as an antiquary, and was president of the state historical society.

DAVIS, JOHN CHANDLER BANCROFT, b. Mass., 1822; a lawyer, educated at Harvard. In 1849, he was secretary of legation in London, returning in 1852. In 1869–71, he was assistant secretary of state, and agent of the government at the Geneva arbitration.

DAVIS, Sir JOHN FRANCIS, Bart., b. in London, 1795, long resident in China as chief superintendent of Canton, and afterwards as governor and commander-in-chief of the colony of Hong-Kong, is one of the best and most trustworthy authorities on China and the Chinese. In 1845, D. was created a baronet, and received the order of knight grand cross of the Bath in 1854. He is the author of numerous valuable works, a *Description of China; China during the War; Chinese Miscellanies*, etc. In 1876, he founded a Chinese scholarship at Oxford, and was made D.C.L.

DAVIS, MATTHEW L., 1766–1850; b. New York; for many years a newspaper correspondent in Washington. He was strongly attached to the fortunes of Aaron Burr, and wrote a memoir of him, besides editing his private journal. He was among the first to make letters from the national capital an especial newspaper feature. "The Old Boy in Specs" was his favorite signature.

DAVIS, NOAH, b. N. H., 1818. He became a lawyer in western New York; justice of the supreme court; member of congress; and in 1873 was elected a judge of the supreme court.

DA'VIS' STRAIT, so called from the navigator who discovered it, forms the southern part of that inlet of the Atlantic which washes the western coast of Greenland. It thus connects Baffin's bay, and also, in some sense, Hudson's strait, with the open ocean. At its narrowest point, it measures 160 m. across. It is largely frequented by whaling-ships. A constant current, bringing with it, of course, much ice, flows down D. S. from the circumpolar waters. Recently, however, it has been maintained, on apparently good grounds, that, on the eastern side, an opposite current, similarly freighted, sweeps round cape Farewell, on its way from Spitzbergen.

DA'VIT, in ship-building, is a piece of timber projecting over the bow or front-part of a vessel, and used as a crane for hoisting the anchor clear of her bow; two such pieces of timber or iron, on her side, or stern, are used for hoisting or lowering the boats. See BOAT-LOWERING APPARATUS.

DAVORS, Jo (probably a fictitious name), author of a rare work called *The Secret of Angling*, quoted by Walton.

DAVOS, a valley in the Canton Grison, Switzerland, among the Rhætian Alps, about 20 m. long; pop. '70, 1726. It is famous as a resort for persons affected with diseases of the chest.

DAVOUD PASHA, b. 1816; a Roman Catholic Armenian, minister of the Turkish empire. He was professor in the military college in Constantinople; became secretary of the embassy at Berlin; superintended the construction of telegraphs; and, in 1861, at the time of the trouble between the Druses and Maronites, was made governor of Lebanon. Resigning in 1868, he was appointed minister of public works.

DAVOUT (not DAVOUST, as commonly written), LOUIS NICOLAS, a French marshal, was b. 10th May, 1770, at Annoux, in the old province of Burgundy; was educated along with Bonaparte at the military school of Brienne; and in 1785, became sub-lieut. in a cavalry regiment. During the revolutionary wars, he rose to the rank of gen. He accompanied Bonaparte to the east, where he mainly contributed to the victory at Aboukir, and otherwise distinguished himself both in upper and lower Egypt. On his return to France, he was named general of division in 1800, commander-in-chief of the consular grenadier guards in 1801, and marshal of the empire in 1804. In the campaigns of 1805, 1806, and 1807, he acted a brilliant part in the great victories obtained by the French at Ulm, Austerlitz, Jena, Auerstadt, Eylau, and Friedland. In reward of his bravery, Bonaparte created him duke of Auerstadt (July 2, 1808). On the renewal of the war with Austria in 1809, D.'s star was again in the ascendant, and he was created prince of Eckmühl for his services at the battle of Eckmühl. At Wagram, he performed prodigies of valor. Appointed governor of Poland, he ruled that country in a spirit of the harshest despotism, and provoked the reproaches of the emperor, but, nevertheless, did not change his system. In the Russian campaign of 1812, he gathered fresh laurels on the fields of Mohilow and Borodino. After the retreat from Moscow, D. became governor-general of the Hanse towns, and established himself at Hamburg, where he gallantly maintained himself till the first restoration of the Bourbons. On the return of Bonaparte from Elba, D. was appointed war-minister, and in this office showed a remarkable genius for the rapid organization of troops and supplies. After the battle of Waterloo, he received the command of the relics of the French army under the walls of Paris. He would have continued the contest, had he not been ordered by the provisional government in the capital to conclude a military convention with the allies. In 1819, he was made a peer of France. His death took place June 1, 1823. Firmness of character and dauntless courage were D.'s leading characteristics; but his military severities often went the length of harshness, and even cruelty, while his rapacity had in it something akin to barbarism.

DAVY, Sir HUMPHRY, one of the greatest chemists of his own or of any age, was b. on the 17th Dec., 1778, at Penzance, in Cornwall, where his father was a carver in wood. At the school of Truro, where he was educated until he was 15, he showed little relish for classical learning, but he was distinguished for a highly retentive memory and an early passion for poetry, which never forsook him. Another prominent trait of his character was equally early developed: as a child, he would angle even in the gutters of the streets; and only two years before his death, and after his health had given way, he published his interesting volume, *Salmonia, or Days of Fly-fishing*. Soon after leaving school, he became apprentice to a surgeon and apothecary in Penzance. He at the same time entered upon a course of study all but universal. "Speculations on religion and politics, on metaphysics and morals, are placed in his note-books in juxtaposition with stanzas of poetry and fragments of romance." A system of mathematical study, skeptical philosophy, Scotch metaphysics, and German transcendentalism, successively engaged his attention. The study of natural philosophy brought him nearer to that department which was to be his own; but it was not till he had reached his 19th year, that he entered seriously upon the study of chemistry. He now made the acquaintance of Dr. Beddoes, who had established a pneumatic institution at Clifton, and who took him as his assistant. Here D. carried on a course of experiments on the respiration of different gases, in which he had more than once nearly sacrificed his life. He thus discovered the singular exhilarating effect of nitrous oxide when breathed. The account which he published of his researches, established his reputation, and led to his appointment, at the age of 22, as lecturer to the royal institution of London. He delivered his first lecture in 1801; and his eloquence, and the novelty and variety of his experiments, soon attracted crowded and brilliant audiences. In 1803, he began researches connected with agriculture, on which he delivered a course of lectures. These were published in 1813, under the title of *Elements of Agricultural Chemistry*, and form an era in that science. The discoveries, however, on which D.'s fame as a chemist chiefly rests, took their origin in the views which he developed in 1806, in his Bakerian lecture, *On Some Chemical Agencies of Electricity*. This essay was universally regarded as one of the most valuable contributions ever made to chemical science, and obtained the prize of the French institute. Following out his principle, he was led to the grand discovery, that the alkalies and earths are compound substances, formed by oxygen united with metallic bases. It was potash that he first succeeded in decomposing, on the 8th Oct., 1807. When he first saw the globules of the new metal, *potassium*, his delight is said to have been so ecstatic that it required some time for him to compose himself to continue the experiment. He next decomposed soda and the alkaline earths, baryta, strontia, lime, and magnesia; and discovered the new metals, *sodium*, *barium*, *strontium*, *calcium*, and *magnesium*. With regard to the earths proper, he suc-

ceeded in proving that they consist of bases united to oxygen. It was reserved for Wöhler and others to exhibit the bases by themselves.

In 1812, D. was knighted, married a lady of considerable wealth, and resigned the chemical chair of the royal institution. That he might investigate his new theory of volcanic action, he received permission from the French government—though the two countries were then at war—to visit the continent, and was received with the greatest distinction by the scientific men of France. On returning to England in 1815, he entered on the investigation of the nature of fire-damp, which is the cause of explosions in coal mines. This resulted in the invention of the safety-lamp (q.v.)—one of the most valuable presents ever made by science to humanity. Though the value of the invention was everywhere acknowledged, the only national reward was a baronetcy after a lapse of three years. This has been contrasted with the pension of £1200 a year bestowed by the same government on sir William Congreve, for the invention of his rocket. On the death of sir Joseph Banks, in 1820, sir Humphry D. was elected president of the royal society. His attention was shortly after called to the important object of preserving the copper sheathing of vessels from corrosion by the action of sea-water. This he effected by altering the electric condition of the copper by means of bands of zinc; but the bottoms of the vessels became so foul from the adhesion of weeds, shells, etc., that the plan had to be abandoned.

Early in 1825, sir Humphry D. had begun to complain of the loss of strength, and, in 1826, he had a paralytic attack affecting his right side. He made two journeys to the continent for the recovery of his health, and died at Geneva on the 29th May, 1829, at the early age of 51. The Genevese government evinced their respect by a public funeral. So widely spread was the reputation of sir Humphry D., that he was a member of almost all the scientific institutions in the world. Cuvier, in his *Eloge*, says: "Mr. Davy, not yet 52 years of age, occupied, in the opinion of all that could judge of such labors, the first rank among the chemists of this or of any other age." Besides the works already mentioned, and a great number of contributions to the Philosophical Transactions, sir Humphry D. published *Elements of Chemical Philosophy* (Lond. 1812); and *Consolations in Travel, or the Last Days of a Philosopher* (3d ed., Lond. 1831), appeared after his death. See *Memoirs of the Life of sir Humphry D.*, by his brother (Lond. 1836, 2 vols.); and *The Life of Sir Humphry D.*, by Dr. Paris (Lond. 1831).

DAVY'S SAFETY-LAMP. See SAFETY-LAMP.

DAW. See JACKDAW, *ante*.

DAWAL'LA, *Hypophthalmus dawalla*, a fish of the family *Siluridæ*, found in the rivers of Guiana, and highly estimated for the delicacy of its flesh. It is sometimes 2½ ft. long, and has a snout somewhat like that of a pike, but the mouth is furnished only with very minute teeth. The skin is destitute of scales, and the colors have that brightness so often seen in tropical fishes, green, brown, and carmine. The D. has become shy in the waters of the more populous and long-settled parts of Guiana, although easily captured in more remote regions.

DAWES, HENRY LAURENS, b. Mass., 1816; graduated at Yale, and became an editor. He resides in Pittsfield. He has been in both houses of the state legislature, district attorney, and member of congress. In the house of representatives he was chairman of the committee on appropriations and the committee of ways and means. He was made senator in 1875.

DAWISON, BOGUMIL, 1818–72; a native of Poland, of Jewish parentage, who, through his own talents and exertions, gained such eminence on the stage as to be deemed by many the greatest actor of his time. In 1866, he came to America, where he had great success through two years. Soon after his return he became insane, and never recovered.

DAWK, or DAK, a method of traveling in India which consists in posting by palanquin from station to station, or for any distance. The traveler must first purchase a strong palanquin, which he can have for from 40 to 100 rupes (£4 to £10), but which he can always dispose of when his journey has been completed, and generally at a profit. His clothes, together with whatever articles he may not immediately need, are carried in tin-boxes or wicker-baskets called *petturahs*, by separate bearers, who precede or accompany the palanquin; whatever he considers necessary, however, he keeps beside himself inside. At all the stages, which are from 9 to 11 m. apart, there are relays of bearers, previously provided by the postmaster, the usual number for one palanquin being eleven. All arrangements as to cost are made with the postmaster of each presidency before starting, but the traveler is also expected to give some small sum to his bearers at the end of each stage: eight annas (one shilling) among the entire set of bearers is as much as is expected in the way of gratuity. The horse-dawk, a kind of carriage with seats for four, and capable of being used as a bed in which two can sleep, the baggage being conveyed on the top, set on wheels, and drawn by horses, is in use on the great trunk road from Calcutta to the upper provinces, but has not been established throughout the country generally.

DAWLEY MAGNA, a t. in Shropshire, 2½ m. n. by w. from the Madeley station of the Wellington and Madeley railway. It has one church belonging to the establishment,

and 7 dissenting chapels. A new market-hall was erected in 1867. The inhabitants are chiefly employed in blast-furnaces, colleries, and bar-iron mills. Pop. '61, 6,365; '71, 11,254.

DAWL'ISH, a flourishing and picturesque watering-place, on the s. coast of Devonshire, 12 m. s. of Exeter. It lies in a valley running e. and w. between the mouths of the Exe and Teign. It has recently built public baths. Pop. '71, 3,622.

DAWN. See TWILIGHT.

DAWSON, a co. in n. Georgia, drained by the Etowah; 200 sq.m.; pop. '80, 5,837—358 colored. It is hilly and fertile, producing corn and cotton. Co. seat, Dawsonville.

DAWSON, a co. in n.e. Montana, bordering on Dakota and British America, intersected by the Missouri; about 30,000 sq.m.; pop. '80, 180.

DAWSON, a co. in central Nebraska, on the Platte river, intersected by the Union Pacific railroad; 1450 sq.m.; pop. '80, 2,909. It is sterile and little cultivated. Co. seat, Dawson.

DAWSON, JOHN WILLIAM, LL.D., b. 1820, in Picton, Nova Scotia; a geologist; graduate of the university of Edinburgh. In 1841, he made explorations in Nova Scotia, and describes its geology in *Proceedings of the Geological Society of London*. In 1850, he was superintendent of education in Nova Scotia, and in 1855, became principal of McGill college at Montreal. Some of his works are *Handbook of the Geography and Natural History of Nova Scotia; Hints to the Farmers of Nova Scotia; Acadian Geology; Archaia, or Studies of the Cosmogony and Natural History of the Hebrew Scriptures; the Story of the Earth and Man*, a treatise on geology. He has also written many geological articles in the *Proceedings of the Geological Society of London*, *The Canadian Naturalist*, and other journals.

DAX, a t. of France, in the department of Landes, pleasantly situated on the left bank of the Adour, 20 m. n.e. of Bayonne. Among its principal buildings are the high church, once a cathedral, and the bishop's palace. It is an intermediate depot for goods forwarded to Spain, and has some manufactures of earthenware, wine, and brandy; but it is chiefly remarkable for its hot saline springs, the temperature of which at the source is 158° F. The water, which is medicinal and nearly tasteless, was used for bathing purposes by the Romans, who conferred upon the springs the name Aquæ Augustæ Tarbellicæ. Pop. '76, 9,085.

DAY (probably allied to the Lat. *dies*, day, *divum*, the sky, from the root *div*, to shine) originally meant the space of time during which it is light, in opposition to the space of darkness or night; it now more usually denotes a complete alternation of light and darkness. It is the earth's rotation that causes the vicissitude of day and night. The earth being a globe, only one half of it can be in the sun's light at once; to that half it is day, while the other half is in its own shadow, or in night. But by the earth's rotation, the several portions of the surface have each their turn of light and of darkness. This happens because the position of the earth is such that the equator is on the whole presented towards the sun; had either pole been towards the sun, that hemisphere would have revolved in continual light, the other in continual darkness.

One complete rotation of the earth does not make a day, in the usual sense. If the time is noted when a particular fixed star is exactly s. or on the meridian, when the same star comes again to the meridian the next day, the earth has made exactly one rotation, and the time that has elapsed is called a *sidereal day*. This portion of time is always of the same length; for the motion of the earth on its axis is strictly uniform, and is, in fact, the only strictly uniform motion that nature presents us with. Sidereal time, or star-time, from its unvarying uniformity, is much used by astronomers. But the passage of a star across the meridian is not a conspicuous enough event for regulating the movements of men in general. It is not a complete rotation of the earth, but a complete alternation of light and darkness that constitutes their day. This, which is called the *civil* or the *solar* day, is measured between two meridian passages of the sun, and is about four minutes longer than the sidereal day. The cause of the greater length is this: When the earth has made one complete turn, so as to bring the meridian of the place to the same position among the fixed stars as when it was noon the day before, the sun has in the meantime (apparently) moved eastward nearly one degree among the stars, and it takes the earth about four minutes more move round so as to overtake him. If this eastward motion of the sun were uniform, the length of the solar day would be as simple and as easily determined as that of the sidereal. But the ecliptic or sun's path crosses the earth's equator, and is therefore more oblique to the direction of the earth's rotation at one time than another; and besides, as the earth moves in her orbit with varying speed, the rate of the sun's apparent motion in the ecliptic, which is caused by that of the earth, must also vary. The consequence is, that the length of the solar day is constantly fluctuating; and to get a fixed measure of solar time, astronomers have to imagine a sun moving uniformly in the celestial equator, and completing its circuit in the same time as the real sun. The time marked by this imaginary sun is called *mean solar time;* when the imaginary sun is on the meridian, it is *mean noon;* when the real sun is on the meridian, it is *apparent* noon. It is obvious that a sun-dial must show apparent time, while clocks and watches keep mean time. Only in four days of the year do these two kinds of time

coincide. In the intervals, the sun is always either too fast or too slow; and the difference is called *the equation of time*, because, when added to or substracted from apparent time, it makes it equal to mean time. The mean solar day is divided into twenty-four hours, the hours into minutes and seconds. A sidereal day, we have seen, is shorter; its exact length is 23 hours, 56 minutes, 4 seconds of mean solar or common time. Astronomers divide the sidereal day also into twenty-four hours, which are of course shorter than common hours. In the course of a civil year of 365 days, the earth turns on its axis 366 times, or there are 366 sidereal days. Astronomers reckon the day as beginning at noon, and count the hours from 1 to 24. The civil day begins at midnight, and the hours are counted in two divisions of twelve each. The ecclesiastical day was reckoned from sunset to sunset. See INTERNATIONAL DATE LINE.

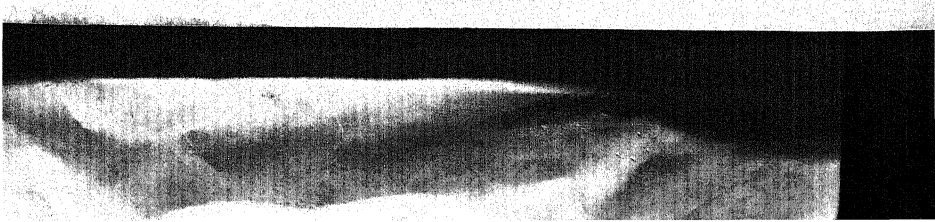
A day, in law, includes the whole twenty-four hours, without any reference to the season of the year, or the amount of light or darkness. Where there is no qualifying stipulation, therefore, the obligation to pay on a certain day is discharged, if the money be paid before twelve o'clock at night, or the commencement of the following day. On the same principle, if anything is to be done within a certain time from or after the doing of a certain other thing, the day on which the first act or occurrence takes place is excluded. If A binds himself to pay money ten days after B's death, and B dies on the 1st, the money will not be be due till the night of the 11th at twelve o'clock. Where it is not absolutely necessary, for the purposes of justice, the law excludes fractional portions of time; thus, half a year consists of 182 days, and a quarter of a year of 91.

A *lawful day* is a day on which there is no legal impediment to the execution of a writ—i.e., all days except Sundays and fast-days appointed by government. Criminal warrants are an exception to this rule, and may be both granted and executed on Sundays and fast days. By 29 Car. II. c. 7, all contracts made by persons in their ordinary calling on a Sunday are void. The exceptions to this rule will be explained under LORD'S DAY. In England, Christmas-day, Good Friday, and Easter-day generally stand on the same footing with days appointed by royal proclamation for public fasting and humiliation; but in Scotland, there is no exception made in favor of any of the feast or fast days of the church.

Days of Grace. The time at which a bill is actually *due*, or *at maturity*, is in general three days after the time expressed on the face of it. The three additional days which are generally allowed by the custom of merchants, and which the laws of the United Kingdom recognize and protect, are called days of grace. If the third day of grace fall on a Sunday, the bill is payable the day before. If it fall on any of the bank holidays, the bill is payable the day after. See BILL.

DAY, GEORGE EDWARD, D.D., b. Mass. 1815; graduate of Yale, and the Yale theological seminary, where he was assistant instructor in sacred literature. Afterwards he was in the ministry; from 1851 to 1866, occupied the chair of biblical literature in Lane theological seminary, and afterwards that of the Hebrew language and biblical theology in the divinity school of Yale college. He has published a number of translated and original works.

DAY, JEREMIAH, D.D., LL.D., 1773–1867; b. Conn.; graduate of Yale; professor of mathematics and natural philosophy; and president of the college from 1817 to 1846. He published *An Introduction to Algebra; Navigation and Surveying;* etc.



DAY, THOMAS, a political writer and poet, was born in London, June 22, 1748, and studied at Oxford. The American war of independence, with which he strongly sympathized, seems to have roused his poetical energies. In 1773, he published *The Dying Negro;* in 1776, *The Devoted Legions;* and in 1777, *The Desolation of America.* But he is chiefly remarkable as the author of the famous *History of Sandford and Merton*, as also the *History of Little Jack.* He was killed by being thrown from a horse, 28th Sept., 1789.

DAYAKS. See BORNEO, and BROOKE, Sir JAMES.

DAY, or DAYE, STEPHEN, 1611–68; b. England; the first printer in the New England colonies. He came over in 1638, and began printing at Cambridge the next year, producing first *The Freeman's Oath*, but what freemen were meant does not appear. Then came an almanac, and afterwards the Psalms in the rude meter of the age. He printed also a catechism, *The Body of Liberties*, and many of the laws enacted.

DAY OR DAYS. DARK DAY in New England; see DARK DAY.—DECORATION DAY the 30th of May, when in the cities and large towns of northern states there are processions to the various cemeteries, and the decorating of the graves of union soldiers with flowers. There is a similar custom in some of the southern states, usually somewhat earlier in the season.—ELECTION DAY, in nearly all the states of the union, comes on the Tuesday following the first Monday in Nov.—mostly a legal holiday.—EMANCIPATION DAY (in the British colonies), Aug. 1, 1834, when 770,280 slaves became free. The day is still celebrated by colored people in the West Indies and the United States.—EMANCIPATION DAY (in the United States), Jan. 1, 1863, when president Lincoln proclaimed freedom to nearly 4,000,000 of slaves.—EVACUATION DAY, Nov. 25 (local to New York). The British troops held the city during the revolutionary war, but on the conclusion of peace were withdrawn, Nov. 25, 1783. The annual celebration was long kept up with

great spirit, but is now falling out of use.—GENERAL TRAINING DAY, once important as the annual turnout and drill of the rural militia, and kept as high holiday. It was usually in the latter part of the summer. In recent times the more complete organization of the militia has had the effect of doing away with general town and county muster.—HUNDRED DAYS, the period betwen Mar. 20, 1815, when Napoleon left Elba, and June 22 of the same year, when he was forced to abdicate, and was sent a prisoner to St. Helena.—LUCKY DAYS, certain recurring periods which people fancy are peculiarly fortunate for themselves; especially those which may be called "recurrent" days, as in the case of Thomas à Becket, who was born, baptized, fled to France, returned to England, was assassinated, and 700 years later had a church dedicated to him by cardinal Manning, each event occurring on Tuesday. Cromwell's peculiar day was the 13th of Sept., on which day in successive years he was born, won the battle of Worcester, and died. Harold, last of the Saxon kings, was born, lost his kingdom, and died on Oct. 14. Napoleon's day was the 2d of the month, on which date he was made consul, crowned, won at Austerlitz, and married Maria Theresa. The last Napoleon effected the *coup d'état* Dec. 2, was made emperor the same day, began the war on Germany Aug. 2, and surrendered his sword Sept. 2. Some of the greatest rulers of France of the house of Bourbon have been curiously connected with the 14th of the month, and also with 14 as a simple number. On May 14, 1026, the first king of France named Henry was consecrated, and on May 14, 1610, the last Henry was assassinated. Fourteen letters enter into the name of Henri de Bourbon, who was the 14th king bearing the titles of France and Navarre. Dec. 14, 1553, that is, 14 centuries, 14 decades, and 14 years after the birth of Christ, Henry IV. was born; the ciphers of the date 1553, when added together, give the number 14. May 14, 1552, was the date of the birth of Marguerite de Valois, first wife of Henry IV. May 14, 1588, the Parisians revolted against Henry III., at the instigation of the duke of Guise. Mar. 14, 1590, Henry IV. gained the battle of Ivry. May 14, 1590, Henry was repulsed from the Faubourgs of Paris. Nov. 14, 1590, the Sixteen took an oath to die rather than serve Henry. Nov. 14, 1592, the parliament registered the papal bull giving power to the legate to nominate a king to the exclusion of Henry. Dec. 14, 1599, the duke of Savoy was reconciled to Henry IV. Sept. 14, 1606, the dauphin, afterwards Louis XIII., was baptized. May 14, 1610, the king was assassinated by Ravaillac. Henry IV. lived four times 14 years, 14 weeks, and four times 14 days. May 14, 1643, died Louis XIII., son of Henry IV.; not only on the same day of the same month as his father, but the date, 1643, when its ciphers are added together, gives the number 14, just as the ciphers of the date of the birth of his father gave 14. Louis XIV. mounted the throne in 1643; 1, 6, 4, 3 = 14. He died in the year 1715; 1, 7, 1, 5 = 14. He lived 77 years; 7 and 7 = 14.—RED LETTER DAY is so called from the practice of early printers of almanacs denoting holidays and fasts and festivals by red ink, all others being in black. THANKSGIVING DAY, at first a purely New England institution, within recent years has become national. It is supposed to have been in some degree a successor of the Hebrew feast of the tabernacles. Beginning almost with the beginning of the pilgrim colony, amid privations which seemed to offer small material for thankfulness, it rapidly spread over all New England, and has at last established itself in all the states, through the recommendation of governors and of the president in annual proclamations. By usage, the date appointed is the Thursday last in November.—UNLUCKY DAYS vary with different people. The most noted among nations speaking English is Friday, as the day on which the Saviour was crucified, to which day, by common consent, until recently, were assigned all capital executions of the law on criminals. It is not many years since it was almost impossible to induce sailors to start on long voyages on this day; but the history of the great discoverer Columbus gives a remarkable refutation of this superstition. On Friday, Aug. 21, 1492, he sailed on his voyage of discovery. On Friday, Oct. 12, he first discovered land. On Friday, Jan. 4, 1493, he sailed on his return to Spain, which if he had not reached in safety, the happy discovery might never have been known. On Friday, Mar. 15, he arrived at Palos. On Friday, Nov. 22, he arrived at Hispaniola, on his second voyage to America. On Friday, June 13, 1494, he discovered the continent of America, though unknown as such to him. Among the events of success and importance occurring on Friday, are the founding of St. Augustine, Fla., the oldest city in the United States; the arrival of the Mayflower (old style date) at the harbor of Provincetown, and the signing of the compact by the pilgrims on the same day; their landing on Plymouth rock (new style); George Washington born; Bunker hill seized and fortified; British surrender at Saratoga; Arnold's treason discovered; and the final surrender of the British forces at Yorktown. In the war with Mexico, the battle of Palo Alto began on Friday, and the treaty of peace between the two countries was ratified on Friday. In the same year, the question of our northwestern boundary, with its menace of war, was settled by a treaty signed on Friday. In the war of the rebellion the main events occurring on Friday were: Fort Sumter captured by the confederates; Port Royal forts taken by the unionists; close of the battle of Pea Ridge; slavery abolished in the district of Columbia; Fort Pulaski taken by unionists; Memphis taken by unionists; Fredericksburg bombarded; battle of Gettysburgh ended; Vicksburg bombarded; president Lincoln offered amnesty to all except the chief leaders of the rebellion; Lee defeated at Five Forks (three days' fighting); the

union flag restored on Fort Sumter, and the assassination of Lincoln—both on Good Friday, April 14, 1865. A little knowledge and reflection must suffice to remand to the list of foolish superstitions the assignment of luck to days.

DAY-FLY. See EPHEMERA.

DAY-LILY, *Hemerocallis*, a genus of plants of the natural order *liliaceæ*, having a perianth with bell-shaped limb, and sub-cylindrical tube, and globose seeds with soft *testa*. Several species are cultivated in our flower-gardens, especially the fragrant yellow day-lily (*H. flava*), a native of Hungary, Siberia, and the n. of China. It has also been recommended to farmers as affording a supply of a most acceptable green-food to cattle. But *H. fulva*, a native of the Levant, produces more abundant foliage, and cattle are equally fond of it. Both species are fibrous-rooted perennials with linear leaves.

DAYSMAN, a name formerly given in England (and still in use in some of the northern counties) to an arbitrator, umpire, or elected judge. It has its origin in the judicial language of the middle ages, when the word *day* was specially applied to the day appointed for hearing a cause, or for the meeting of an assembly. A D. was thus a judge appointed to decide between parties at a judicial hearing. The word occurs in Scripture, where Job sorrowfully says, in reference to his relation to God: "Neither is there any daysman betwixt us, that might lay his hand upon us both" (Job ix. 33).

DAYTON, one of the most populous and wealthy cities of Ohio, in the United States, stands at the confluence of the Miami and the Mad, in lat. 39° 44′ n., and long. 84° 11′ west. It is connected with Cincinnati, the commercial capital of the state, on the Ohio, by the Miami canal—the distance being 52 m.; and it is the terminus of six railways, which radiate in every direction. In the variety and extent of its manufactures, D. stands foremost among western towns in proportion to its size. The population has very rapidly increased. In 1850, it amounted to 10,976, having almost quadrupled within the preceding 20 years; in 1853, it had risen to 16,562, showing an addition of more than 50 per cent in three years; in 1860, it amounted to 20,482; and in 1870, to 30,473.

DAYTON (*ante*), a prosperous and pleasant city, the seat of justice of Montgomery co., Ohio; on Great Miami river where Mad river comes in; it is also on the Miami canal; on the Atlantic and Great Western; the Cincinnati, Hannibal and Dayton; the Cleveland, Columbus, Cincinnati and Indianapolis; the Dayton and Union; the Pittsburg, Cincinnati and St. Louis; the Dayton and South-eastern, and some other railroads; pop. 40,000. The city has a fine court-house modeled after the Parthenon; nearly 50 churches, a seminary for girls, a Roman Catholic institute for boys; a good public library, eight or ten newspapers, a large manufactory of railroad cars, agricultural-implement works, breweries, distilleries, and many other manufactories. The rivers afford abundant water-power. Limestone quarries are a feature of the neighborhood. The streets are very wide and well paved, and the private residences are notable for quiet elegance. The Miami valley, in the midst of which Dayton is situated, is one of the most fruitful sections of the state. The city is the location of the national home for disabled soldiers and sailors, having a good hospital, a library, and extensive grounds. There have been as many as 2,000 inmates.

DAYTON, ELIAS, 1737–1807; b. N. J. He was among the British in the expedition against Canada. When the revolution broke out, he became one of a committee of safety, served as colonel in the army, was appointed commander of a brigade, and remained in active service through the war. After peace he was in the state legislature, and in congress. He had intimate friendship with Washington.

DAYTON, JONATHAN, LL.D., 1760–1824; b. N. J., son of Elias; a graduate of the college of New Jersey. He was a member of the legislature and speaker of the assembly; delegate to the convention to frame the federal constitution; representative in congress three terms, being speaker of the house during the last two terms; and in 1799, he was chosen U. S. senator.

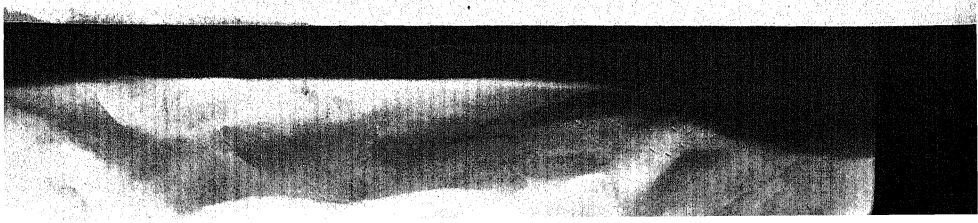
DAYTON, WILLIAM LEWIS, LL.D., 1807–64; b. N. J., nephew of Jonathan; a graduate of the college of New Jersey, and a lawyer. He was in the state senate, and in 1842, a vacancy occurring in the U. S. senate, he was called to fill it. He was re-elected and took an active part in the leading questions of the day. In 1856, he was the republican candidate for vice-president. In 1857, he was attorney-general of New Jersey, and in 1861 was sent as minister to France, where he died.

DAY OF THE WEEK. To find the day of the week for any date, past or future, there are several methods, but the simplest and most easily understood is as follows: First, there is a "constant" for the *style*—for new style it is 6; for old style, 4. (In English chronology, new style begins 1752, Sept. 15.) Then there is a "constant" for each month: in new style, Jan., 1; Feb., 4; Mar., 4; April, 0; May, 2; June, 5; July, 0; Aug., 3; Sept., 6; Oct., 1; Nov., 4; Dec., 6; (on leap years the constants for Jan. and Feb. are one less, that is, for Jan., 0; for Feb., 3). Now (for new style), multiply the number representing the century by 5, and add one fourth to the product (omitting fractions). For instance: in 1880 the century number is 18, which multiplied by 5 makes 90, and one fourth of 18 (omitting fractions) is 4; hence the product is 94. Next add the number of the odd years (besides the century number), and add one fourth (omitting

fractions) to their total. Next add the day of the month. Then add all these figures together, and finally, divide the sum by 7: the remainder will show the day of the week; remainder of 1 showing the first day of the week, or Sunday; remainder of 2 showing the second day of the week, or Monday, etc.; no remainder showing the 7th day of the week, or Saturday. Illustration: What is the day of the week for Jan. 1, 1881?

Constant for new style	6	Odd years	81
Constant for the month (Jan.)	1	Add one fourth of 81	20
Century (18) multiplied by 5	90	Day of the month	1
Add one fourth of 18	4		
Total			203

Divide 203 by 7, and there is no remainder; so the year 1881 must begin on the 7th day of the week, or Saturday.



For old style the constant is 4, and the number of the century is multiplied by 6, without addition of the one fourth. The constants for months are the same as in new style, and one fourth (omitting fractions) is added to the odd years. Example for old style: On what day of the week did Columbus land on his voyage of discovery (Oct. 12, 1492)?

Constant for old style	4	Odd years (92) one fourth added	115
Constant for Oct	1	Day of the month	12
Century (14) multiplied by 6	84		
Total			216

Divide by 7, and the remainder is 6—the 6th day of the week, or Friday. For leap years, care must be taken in both old and new style to reduce the constants for Jan. and Feb. by one, for each of those two months.

D'AZA'RA, Don FELIX, a very eminent naturalist, was b. at Barbunales, in Aragon, 18th May, 1746, was educated at the university of Huesca, obtained a commission in the Spanish army, was severely wounded in the attack upon Algiers, and in 1781, was appointed one of the commissioners for fixing the boundaries of the Spanish and Portuguese possessions in South America. He proceeded immediately to that country, and did not return to Spain till 1801, encountering many difficulties in the discharge of his duties, in which he showed the greatest faithfulness and perseverance. He devoted himself also to the investigation of the geography, ethnology, and natural history of the regions in which he spent so many years, and published an account of his travels, and an important work on quadrupeds and birds, under the modest title of *Notes on the Natural History of Paraguay and La Plata* (Madrid, 1802, *et seq.*).—D.'s elder brother was eminent as a diplomatist.

DEACONS, literally *servants*, meant, in apostolic times, properly those officers of a congregation or church that had the charge of collecting and distributing the alms, and of taking care of the poor and the sick. The office, therefore, was not a clerical one, though the term deacon or servant may have been at times applied to teachers as *minister* was, which has the same meaning. The limitations of the office of deacon to the functions above specified, continued to be recognized as late as the council of Trullanam, 692. The church of Jerusalem chose at first seven deacons, individuals of whom, no doubt, as Philip, also taught and baptized, but only because they were evangelists as well as deacons. The number seven continued to be adhered to in all churches. During the 2d and 3d centuries, the duties falling to the deacons had considerably increased; and since as confidential attendants and helpers of the bishops, they had risen into consequence, it became necessary to divide the various functions among an archdeacon, deacons, and subdeacons. Deacons might now dispense the bread and wine at the communion, but not consecrate them. They had to receive the offerings and presents for the bishop, to keep the sacred vessels, to chant the introductory formulas of public worship, and to take the oversight of the morals of the congregation; and they were allowed, in many cases, with the leave of the bishop, to preach and baptize, and receive penitents into the communion of the church. At an early period, the offices of archdeacon and deacon were considered to belong to the higher orders of consecration (*ordines majores*); this was not the case with that of subdeacon till after the 12th century. At the consecration of a deacon, the sacred vessels are handed to him as symbols of his office. The peculiar robes are the dalmatica and the stole. In Protestant churches, the position of deacons varies. Among Presbyterians, their place is usually supplied by the elders; but in some Presbyterian churches (e.g., the Free church of Scotland), the offices of elder and deacon are kept distinct. In the church of England, a deacon is a clergyman receiving a special form of ordination, but differing in effect from a regular priest only from not being allowed to consecrate the elements at the communion, or pronounce the absolution or benediction. For this, as well as for holding any benefice or church-preferment, priest's orders are necessary. The office is of little importance, except as affording an interval of probation before admission to priest's orders. Before a person can be appointed deacon in

the English church, he must have reached the age of 23, and he usually remains in this office one year at least.

DEACONESSES (*ancillæ, ministræ, viduæ, virgines, episcopæ, presbyteræ*), female ministers or servants of the church or Christian society in the time of the apostles (Rom. xvi. 1). They co-operated with the deacons, showed the women their place in the church-assemblies, assisted at the baptism of persons of their own sex, instructed those who were about to be baptized as to the answers they should give to the baptismal questions, arranged the *agapæ* or love-feasts, and took care of the sick. In the 3d c., it seems to have been also part of their duty to visit all Christian females who were suffering imprisonment, and to be hospitable to such as had come from afar. In very early times, they were consecrated to their office by ordination in the same manner as other ecclesiastical or spiritual personages; later, however, they were inducted into their office by prayer without the imposition of hands. Until the 4th c., the D. had to be either maidens or widows who had been only once married, and 60 years of age; but after the council of Chalcedon, the age was fixed at 40. Their assistants were called *sub-deaconesses*. After the 6th c., in the Latin church, and after the 12th c., in the Greek church, the office of deaconess was discontinued; but the former has retained the name. In monasteries, for example, the nuns who have the care of the altar are called deaconesses. In the Reformed church of the Netherlands, also, those elderly females are called D. who take care of lying-in women and of the poor. The advantages resulting to a Christian community from such an order are too obvious to require exposition. It has been a serious misfortune to the church at large, that the office has been allowed to fall into disuse; and the wide-spread institution at the present day in the churches of Great Britain and America of ladies' district-visiting societies, Dorcas societies, etc., satisfactorily shows the necessity of practically supplying, to some extent at least, the want of this primitive office. There is a movement going on at present for the introduction of the order of deaconesses into the church of England.

DEACON OF A **TRADE**, the president, for the time being, of certain incorporations in Scotland, in which country, before the passing of the Burgh reform act (3 and 4 Will. IV. c. 76), the deacons of trades or crafts represented the trades in the respective town-councils. They were elected by the incorporations, but generally under the control of the town-council. The subordinate incorporation presented a list of six of its members to the town-council, by whom three of the names were struck off. The leet, thus shortened, was returned, in order that the deacon for the ensuing year should be chosen from it. By the act just referred to (s. 19), it is enacted that the deacons shall no longer be recognized as official and constituent members of the town-council, the power of the crafts to elect deacons and other officers for the management of their affairs being reserved (s. 21). This more limited privilege is now exercised independently of the town-council. The deacon-convener of the trades in Edinburgh and Glasgow (s. 22), is still a member of the town-council. One of the duties of the deacon in former times was to essay, or try, the work of apprentices, previous to their being admitted to the freedom of the trade. See DEAN OF GUILD. After this explanation, it need hardly be added that these deacons have no connection with ecclesiastical affairs, and are in no respect to be addressed like deacons in a spiritual sense.

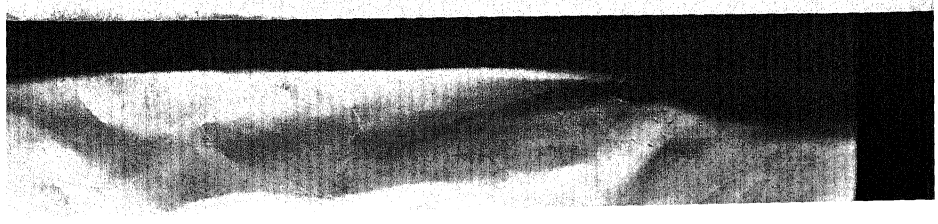
DEAD, in seafaring language, is very frequently employed as part of a designation or phrase having, in general, a meaning somewhat opposite to that of *active, effective*, or *real*. The chief of such phrases are the following: *D. eyes* are circular, flattish wooden blocks, which, with other apparatus, form a purchase or tackle for extending the standing rigging and other purposes. *D. flat* is the name for one of the midship-timbers. *D. lights* are strong wooden shutters to close cabin-windows: on the approach of a storm, it is customary to take out the glass-windows, as being too fragile, and replace them with D. lights. *D. rising* is a name for that part of a ship's bottom where the floor-timbers terminate, and the lower futtocks or foot-hooks begin. *D. ropes* are such as do not run in blocks. *D. wood* consists of blocks of timber laid upon the keel, especially fore and aft; it is piled up, and fastened to the keel with iron spike-nails; the chief object is to give solidity and strength to the ends of the ship. To these may be added *D. wind*, a seaman's designation for a wind blowing directly against a ship's course.

DEAD, BURNING OF THE. See BURIAL.

DEAD, JUDGMENT OF THE (in ancient Egypt). The papyrus rolls found with the Egyptian mummies contain a description of the fate of the departed subsequent to their death. Even in the least complete specimens, the most important scene is seldom wanting—that, namely, in which the dead is led by the hand of Ma, the goddess of truth and justice, into the judgment-hall of the nether world, before Osiris, the judge of the dead. The god's throne faces the entrance. In the middle of the hall stands a huge balance, with an ostrich feather, the symbol of truth, in one scale, and a vessel in the form of a human heart in the other. A female hippopotamus appears as accuser. Above sit 42 gods, each of whom specially presides over one of the 42 sins from which the deceased has to clear himself. The gods Horus and Anubis attend to the balance, while the ibis-headed Thoth-Hermes, the justifier, writes down the result, which is naturally assumed to be favorable. Such is the judgment of the dead in the Egyptian Hades. But, according to Diodorus, a human judgment had already been passed upon the

departed previous to burial. Before the sarcophagus was launched upon the holy lake over which it was to be ferried by Charon, the friends and relatives of the dead, together with 42 judges, assembled on the shore. Each was permitted to bring an accusation against him, and if it were proved, the solemnities of burial were withheld. A false accuser, however, was severely punished. Even unjust and unpopular monarchs were often deprived of sepulture by this process.

DEAD, PRAYING FOR THE. See PRAYER.



DEAD COLOR, in painting, any color that has no gloss, or reflecting quality.

DEADENING OF NOISE. An easy method of preventing annoyance from the noise of machinery is to place rubber cushions under the legs of work-benches, sewing-machines, or other appliances whence noise may proceed. *Chambers's Journal* describes a factory where the hammering of fifty coppersmiths was scarcely audible in the room below, their benches having under each leg a rubber cushion. Kegs of sand or sawdust may be used for the same purpose. A few inches of sand or sawdust is first poured into each keg; on this is laid a board or block upon which the leg rests, and around the leg and block is poured fine dry sand or sawdust. Not only all noise, but all vibration and shock are prevented; and an ordinary anvil, so mounted, may be used in a dwelling-house without annoying the inhabitants. To amateurs, whose workshops are usually placed in dwelling-houses, this device affords a cheap and simple relief from a great annoyance.

DEAD-FREIGHT, the compensation paid by the merchant who freights a whole ship to the ship-master for the space which he fails to occupy. It is rather a claim for damages for the loss of freight, than freight itself, and consequently, apart from positive stipulation, the ship-master has no lien for dead-freight over the goods on board. His claim must, consequently, be made effectual by a personal action against the freighter.

DEADHEAD, the superfluous length which is given to a gun in the casting, so that dross may be disposed of while the gun is left in a perfect state, which is accomplished by sawing off the extra length.

DEAD-LETTER OFFICE, a division in the United States post-office department at Washington for the reception, care, and disposition of letters and packages (except newspapers) that are uncalled for or cannot be delivered to the parties to whom they are directed at the various post-offices of the country. A statement of the business of this office for the year 1879, will give an idea of its importance and efficiency: The whole number of dead letters and packages received and disposed of during the year was 2,996,513, a decrease of 190,292 from last year's receipts. The fact that while there has been an increased number of letters mailed annually in this country, a reduced number has been sent to the department as dead, presents an anomaly which can be explained only upon the theory of increasing efficiency of the delivery service, and the growing popularity of the return-request system. The extent of the latter will be illustrated by the statement that of the 533,934 letters mailed in a single day at Baltimore, Boston, New York, and Philadelphia, 287,835 bore upon the envelope some clew by which they could be restored to the writer if undelivered, without the intervention of the dead-letter office. Of the letters opened, 16,007 contained $31,591.49½; 13,755 contained drafts, checks, notes, money-orders, etc., to the value of $1,105,762.07; 47,797 contained postage-stamps to the value of $2,387.53; 24,372 contained receipts, certificates, paid notes, etc.; 24,024 contained photographs; and in 38,306 letters and parcels were found jewelry, books, clothing, merchandise, and miscellaneous articles in endless variety, from a small bottle of choice perfumery, to a large box of Limburger cheese. The increase in the number of letters containing money-orders and postage-stamps, and the decrease of those containing money, is attributed to the retirement of fractional currency, which formerly furnished a convenient means of making small remittances by mail. The mode of treating insufficient prepaid letters has been slightly modified during the past year, and the present system seems to be the most satisfactory of any which has yet been devised for disposing of that unfortunate class of correspondence. It is as follows: Those that bear a name and address, or a business card, post-office box, or other designation by which the writer can be identified, are immediately restored to the owner, or his attention invited to the deficiency of postage, by the postmaster at the mailing office. Of the balance, all "local" or "drop" letters are delivered by the postmasters to the persons addressed, upon payment by them of the necessary postage, after due notice of the fact and cause of detention. The remainder are sent to the dead-letter office, and are at once examined by an expert, who, taking into consideration the places of origin and destination of each letter, determines whether it can be returned to the writer in less time than would be required to collect the postage from the addressee and forward the letter to destination. And each letter is then treated in the way decided to be the quicker. Whenever a doubt exists, or where the difference is very small, the postage is collected and the letter forwarded, thus preserving the seal intact. The amount of money deposited to the credit of the post-office department from letters which could not be restored to the owners was $3,323.39. The value of stamps received for postage on unpaid and short-paid matter forwarded to address, and upon unclaimed third and fourth class matter returned to senders, was $4,471.70. Of the whole number (5,262,241) of

registered letters and packages mailed in this country during the year, but 2,193 found their way into the dead-letter office, and of these 1,982 were successfully restored to their owners, 177 were filed subject to identification, and 34 outstanding; that is, opened and sent to postmasters for delivery, and the result not yet reported. The number of undelivered foreign registered letters was 3,685, which were all returned unopened to the countries of origin, and receipt was acknowledged. The number of ordinary foreign dead letters was 147,886, while those mailed in the United States and returned unclaimed by foreign governments was 94,669. This difference is accounted for by the migratory habits of foreigners, who, upon reaching this country, either fail to furnish a correct post-office address to their kinsmen in the old country, or do not profit by their privilege to have mail-matter forwarded from one place to another without additional postage charge.

DEADLY NIGHTSHADE. See BELLADONNA.

DEAD NETTLE, *Lamium*, a genus of plants of the natural order *labiatæ*, having a 5-toothed calyx and a 2-lipped corolla, the upper lip arched, the lower lip trifid. The name D. N.—popularly in some parts both of England and Scotland, *Dee nettle*—is also often extended to the genera *galeopsis* and *galeobdolon*, genera very similar to *lamium*, the first of which is sometimes distinguished by botanists as hemp-nettle, the second as weasel-snout. *Lamium purpureum*, *L. incisum*, *L. album*, and *galeopsis tetrahit*, are very common British weeds, some of them appearing in almost every garden, cornfield, or piece of waste-ground. *L. purpureum* and *L. album* are sometimes boiled as pot-herbs in Sweden. It is probably to *G. tetrahit*, or *G. versicolor*, also very common in Scotland, much larger plants, and rough with strong hairs, rather than to any species of *lamium*, that the popular belief relates of a power residing in the hairs of the D. N., particularly when the plant is dried, as in haymaking, of causing irritation in the hands of persons handling them, which, extending throughout the system, occasionally terminates in death. They do not, however, seem to possess any poisonous property. The subject is one perhaps deserving of more attention than it has received.

DEAD-RECKONING, a term in navigation, signifying the calculation of a ship's place at sea, made independently of celestial observations. The chief elements from which the reckoning is made are: The point of *departure*, i.e., the latitude and longitude sailed from, or last determined; the *course* or direction sailed in (ascertained by the compass), the rate of sailing—measured from time to time by the log (q.v.); and the time elapsed. The various principles or methods followed in arriving at the reckoning from these data are known as *plain-sailing*, *middle-latitude sailing*, etc. See SAILINGS. But the data themselves are liable to numerous uncertainties and errors, owing to currents, leeway (q.v.), fluctuations of the wind, changes in the declination of the compass, etc.; and therefore the results arrived at by the dead-reckoning have to be corrected as often as is possible by observation of the heavenly bodies. See NAVIGATION, LATITUDE, LONGITUDE.

DEAD SEA (anc. *Lacus Asphaltites*), called by the Arabs Bahr Loot, or *Sea of Lot*, is situated in the s.e. of Palestine, in lat. 31° 10′ to 31° 47′ n., and occupies a central position between long 35° and 36° east. It is about 40 m. long, with an average breadth of 9 miles. The depth of the D. S. varies considerably: soundings in the n. have given about 220 fathoms; this depth, however, gradually lessens towards the southern extremity, where the water is shallow. Its surface, which is lower than that of any water known, is 1312 ft. below the level of the Mediterranean. The shape is that of an elongated oval, interrupted by a promontory which projects into it from the s.e. The D. S. is fed by the Jordan from the n., and by many other streams, but has no apparent outlet, its superfluous water being supposed to be entirely carried off by evaporation. Along the eastern and western borders of the D. S., there are lines of bold, and in some cases perpendicular cliffs, rising in general to an elevation of upwards of 1000 ft. on the w., and 2,000 ft. on the east. These cliffs are chiefly composed of limestone, and are destitute of vegetation save on the e. side, where there are ravines, traversed by fresh-water springs. The n. shores of the lake form an extensive and desolate muddy flat, marked by the blackened trunks and branches of trees, strewn about, and incrusted with salt, as everything is that is exposed to the spray of the Dead sea. The southern shore is low, level, and marshy, and desolate and dreary in the highest degree; the air is choking, and no living thing to be seen. On this shore is the remarkable mass of rock called Usdum (Sodom). It is a narrow rugged ridge of hill, extending 5 m. n.w., and consisting of rock-salt. Large blocks have broken off from this hill, and lie strewn in all directions along the shore, adding to its dreary and death-like aspect. To the n. of Usdum, and at no great distance, is the supposed site of the ancient Sodom. Although the hills surrounding the D. S. are principally composed of stratified rock, yet igneous rocks are also seen; there are also quantities of post-tertiary lava, pumice-stone, warm springs, sulphur, and volcanic slag, clearly proving the presence here of volcanic agencies at some period. The neighborhood of the D. S. is frequently visited by earthquakes, on which occasions it has been observed that this lake casts up to its surface large masses of asphaltum, of which substance the cups, crosses, and other ornaments that are made and sold to pilgrims at Jerusalem chiefly consist. The long-entertained belief, that the exhalations from this lake were fatal, is not founded upon fact; birds have been seen

flying over, and even sitting upon its surface. Within the thickets of tamarisk and oleander, which here and there may be seen upon its brink, the birds sing as sweetly as in more highly favored quarters. A curious plant grows on the borders of the D. S., the *asclepias procera*, which yields fruit called the apples of Sodom, beautiful on the outside, but bitter to the taste, and when mature, filled with fiber and dust.

The *water* of the D. S. is characterized by the presence of a large quantity of magnesian and soda salts. Its specific gravity ranges from 1172 to 1227 (pure water being 1000). The proportion of saline matter is so great, that whilst sea-water only contains 30 parts of salts in the 1000 parts, the water of the D. S. contains about 250, or eight times more than that of the ocean. The saltness of the D. S. has been explained in several ways; but there is no need to advert to more than one. It is a circumstance attending all lakes or collections of water without any outflow, that the water acquires an infusion of salt, its feeders constantly bringing in this material, while none can go off by evaporation. It may, moreover, be remarked that, if the D. S. was formerly at a higher level, and brought down to its present pitch by evaporation, a deposit of salt, such as we see on its banks, would be the natural consequence. Considerable deposits of common salt, sulphate of lime, and carbonate of lime have been formed along the bottom of the lake; and there is reason to believe that the deposits of rock-salt which occur in Cheshire, Poland, and other places, have been formed at remote periods by depositions in lakes similar to those of the Dead sea.

DEAD'S PART. The portion of the movable estate of the deceased which remains over, after satisfying the legal claims of his wife and children, should he have left such, is known in Scotland as the dead's part. It is so called, because it is with reference to this portion of his possessions alone that he possessed the power of disposal by will or testament. The D. P. may be increased by renunciations or discharges of their legal rights by the wife or the children, so as to include the whole movable estate, but these discharges must be express. The D. P. may also be increased or diminished by the conventional provisions of a marriage contract. See MARRIAGE CONTRACT, and SUCCESSION, MOVABLE, IN SCOTLAND.

A distribution of the personal estate of the deceased, similar to that which is still followed in Scotland, prevailed, in accordance with the ancient customs, within the city of London and the province of York, and was probably common to the whole island (see Stephen's *Com.* ii. 222, and note). These customs have now been abolished by 19 and 20 Vict. c. 94. See SUCCESSION, PERSONAL, IN ENGLAND.

DEAF AND DUMB. Persons who are born deaf, or who lose their hearing at a very early age, are dumb also; hence the compound term deaf-*and*-dumb. But the primary defect is deafness; dumbness is only the consequence of it. Children ordinarily hear sounds, and then learn to imitate them; that is, they learn to repeat what they hear other persons say. It is thus that every one of us has learned to speak. But the deaf child hears nothing; cannot therefore imitate, and remains dumb.

Persons who lose their hearing later in life are not to be classed among the deaf and dumb. Having learned to speak before their hearing was lost, they can readily communicate with others, though deaf themselves; and if they are educated, there are still open to them all the stores of knowledge contained in books, from which the juvenile deaf and dumb, ignorant of all written and spoken language, are utterly excluded. It is this latter class alone which we have to deal with in our statistics, which is contemplated in our census enumerations, and for which our institutions for the education of the deaf and dumb are specially designed.

The term "deaf and dumb" is somewhat unfortunate, as embodying and repeating the error that the affliction is twofold. It affects two organs, certainly, but only, as above described, in the way of cause and effect. The organ or hearing is wanting, but the organs of speech are present; they merely lack the means of exercise. The ear is the guide and directress of the tongue; and when she is doomed to perpetual silence, the tongue is included in the ban; though, if we could by any means give to the ear the faculty of hearing, the tongue would soon learn for itself to fulfill its proper office. To correct the error involved in this apparent misnomer, some authorities use the terms *deaf-dumb* and *deaf-mute*. The latter seems to be a customary expression in America, as in France it is *sourds-muets*. In the Holy Scriptures, the same original word is translated "*deaf*" in some places (as in St. Mark vii. 32), and "*dumb*" or "*speechless*" in others. (See Matt. ix. 33, and Luke i. 22.).

This affliction is very much more common than, for a long time, and up to a recent period, it was supposed to be. Happily, however, along with the knowledge of its extensive prevalence, have come the means of alleviating it, by education. It was only when the schools now in existence began their usual work, and caused inquiries to be made, that the actual numbers of the deaf and dumb began to appear. In every place where it was proposed to establish a school—in Paris, London, Liverpool, Manchester, Yorkshire, and in New York—the objection was immediately started, that children could not be found in sufficient numbers to require such schools. Their promoters, however, knew better than this, and persisted in their design. They soon had the satisfaction of converting the objectors into their warmest supporters; and the institu-

tions thus established, in the localities just named, are now the largest, the most useful, and the most prosperous in the world.

The facts thus ascertained, and the calculations based upon them, continued to be the only statistics upon the subject of deaf-dumbness in Great Britain and Ireland until the census of 1851: then, for the first time in this country, the number and ages of the deaf and dumb formed a part of the inquiry. In Ireland, further investigations were subsequently made, which resulted in the collection of a mass of valuable information upon the causes of deafness, the social condition of the deaf-mute, and other kindred subjects, which were published in *Reports on the Status of Disease* in that country. There, each inquiry was conducted under a special commission; in Great Britain, it was directed by the registrar-general, and its first purpose was to ascertain the number and ages of the deaf and dumb of each sex. It would have been well if it had been limited to this, for the educational statistics were grossly incorrect and deceptive.

The returns gave the following particulars of the number of the deaf and dumb at that date, and the proportion which they bore to the whole population:

TABLE A—FOR 1851.

	Number of Deaf and Dumb.	Total population.	Proportion.
England	9,543	16,758,695	1 in 1,754
Scotland	2,155	2,888,742	1 " 1,340
Ireland	4,747	6,552,324	1 " 1,380
Wales	771	1,188,914	1 " 1,542
Islands in the British seas	84	143,126	1 " 1,704
Total	17,300	27,511,801	1 in 1,590

This result of 1 in 1590 for all the British population was very remarkable, on account of its close approximation to the average for the whole of Europe, which was stated in the same returns to be 1 in 1593. In the course of the next ten years, the whole population had increased from 27,511,801 to 29,321,288, and the deaf and dumb had also increased, from 17,300 to 20,311.

TABLE B—FOR 1861.

	Number of Deaf and Dumb.	Proportion
England and Wales	12,236	1 in 1,640
Scotland	2,335	1 " 1,311
Ireland	5,653	1 " 1,176
Islands, etc	87	1 " 1,649
Total	20,311	1 in 1,432

Another period of ten years is passed. The total of the population has increased to 31,845,379, but the deaf and dumb have decreased; they have become absolutely fewer in number; and the diminution is found to exist in every registration district in England except two. In Yorkshire, the number is scarcely altered.

TABLE C—FOR 1871.

	Number of Deaf and Dumb.	Proportion.
England and Wales	11,518	1 in 1,972
Scotland	2,088	1 " 1,609
Ireland	5,554	1 " 975
Islands	77	1 " 1,873
Total	19,237	1 in 1,644

The distribution of the deaf and dumb, varying, as it does, so much in different districts, has always pointed to the fact that the affliction must be to some extent influenced by local causes, whatever these may be. The census of 1851 showed that, for one deaf-mute in Lancashire, there were two in Herefordshire; for one in Huntingdonshire, three in Herefordshire; for one in the east riding of Yorkshire, two in Worcestershire; for one in Durham, two in Derbyshire and two in Cornwall.

The results of the inquiry made ten years later, were, in the main, conformable to these. Then, as previously, the south-western division showed the largest proportion of the deaf and dumb in all England, and Herefordshire occupied the same position among the counties; and though, in the next decennial period (1861–71), the absolute number of the deaf and dumb had actually decreased, the relative distribution of the whole remained about the same. The numerical decrease, as compared with 1861, was found in every district in England, except the north-western (Lancashire and Cheshire), the northern, and Yorkshire. In London, and some other places, the ratio of the deaf and dumb to the whole population was affected by the residence of large numbers of deaf-mute children, collected from various parts of the country, into the institutions there established for their education. Taking the general proportion for the whole of

England and Wales (as shown in table C) to have been one deaf person in 1972, we find the average was considerably exceeded in the counties of Worcester, Cornwall, Derby, Sussex, Hereford, Devon—then, in a somewhat less degree in Bucks, Westmoreland, Northumberland, Somerset, Gloucester; with a still further reduction in Salop, Suffolk, South Wales, Norfolk, Hertford, Dorset, west riding of York, Lincoln, Rutland, and Oxford. After this, the proportions are considerably below the average in Huntingdon, Leicester, Durham, Surrey (extra-metropolitan), Hants, Middlesex (extra-metropolitan), north riding of York, Berks, and Notts. How are these differences to be explained? Is this affliction inevitable? Or is it in any degree preventable? The fact that in 1871 there were fewer deaf-mutes in the united kingdom by more than a thousand (1074, actually) than there were ten years before, though the general population had increased more than two millions and a half in the same time, is very significant. If we may regard it as the consequence of direct sanitary improvements, general attention to the laws of health, a more skillful treatment of the diseases which result in deafness, and the avoidance of consanguineous and other undesirable marriages, we have certainly gained a great blessing, and made a grand discovery for posterity to profit by. Guided by the light thus given, we may hope to see the number of this afflicted class brought down to the point at which it may be considered due to causes which are beyond man's control, subject alone to the will of the All-wise, who revealed himself in the earliest ages of the world as the maker of man's mouth, of the dumb and the deaf, the seeing and the blind (Exod. iv. 11). But while social science is prosecuting this important inquiry, philanthropy has before her the work of educating these "children of silence," to whom the ordinary means of instruction are obviously inapplicable, and for whom, until a century ago, there existed no available means of education at all. Mentioned, as we have just seen, at the outset of man's history, by Moses, spoken of frequently in the writings both of the Old and New Testaments; alluded to by the poets, philosophers, and lawgivers of antiquity—we have no account of any attempt at educating the deaf until the 15th c.; no school existed for them until the middle of the 18th; nor could it be said that education was freely offered, and readily accessible, until within the last fifty years. There are now in Europe and America more than 200 schools for the deaf and dumb. In the same countries where this provision is made, there cannot be fewer than 100,000 deaf-mutes. Of these about 16 per cent are children of the proper age to be at school. Nowhere is this proportion fully reached, nor can it fairly be expected, but there has been a great improvement within the twenty years from 1851-71. The children at the schools of the united kingdom rose from 1300 in 1851 to 1640 in 1861; and had almost reached a total of 2000 in 1871. In Scotland, the proportion rose from 11½ per cent in 1851 to 14 per cent in 1871. England, which stood at 8 per cent, and Ireland, as low as 5 per cent, at the earlier date, had both reached 10 per cent and upwards, in 1871. The actual number at school at the three dates was as follows, as nearly as can be ascertained:

	1851.	1861.	1871.
England and Wales	816	1001	1200
Scotland	250	240	301
Ireland	234	399	478
	1300	1640	1979

In the United States, within the same period, the number of persons under instruction increased from 1162 to 3,836, and altogether the work of education is advancing with very rapid strides. In this country, 12,000 or 13,000 pupils have been educated since 1792—when the first public institution was opened—and at least an equal number in the United States since 1817. Add to these the pupils of the various continental institutions since 1760, when De l'Epée collected his little group of children in the environs of Paris, and Thomas Braidwood opened his school in Edinburgh, and we shall then see that the fruits of these men's labors have not been meager, but great and marvelous. Some isolated attempts had previously been made, by different men, in different countries, and at long intervals, to give instruction to one or two deaf and dumb persons, and their endeavors had been attended with various degrees of success. These several cases excited some attention at the time; but after the wonder at their novelty had subsided they seem to have been almost forgotten, even in the countries where the experiments were made. Bede speaks of a dumb youth being taught by one of the early English bishops, known in history as St. John of Beverley, to repeat after him letters and syllables, and then some words and sentences. The fact was regarded as a miracle, and was classed with others alleged to have been wrought by the same hand. From this time, eight centuries elapsed before any record of an instructed deaf-mute occurs. Rodolphus Agricola, a native of Grüningen, born in 1442, mentions as within his knowledge the fact that a deaf-mute had been taught to write, and to note down his thoughts. Fifty years afterwards this statement was controverted, and the alleged fact pronounced to be impossible, on the ground that no instruction could be conveyed to the mind of any one who could not hear words addressed to the ear. But the discovery which was to give the key to this long-concealed mystery was now at hand. In 1501, was born, at Pavia, Jerome Cardan (q.v.), a man of great but ill-regulated talents, who, among the

numerous speculations to which his restless mind prompted him, certainly discovered the theoretical principle upon which the instruction of the deaf and dumb is founded. He says: "Writing is associated with speech, and speech with thought; but written characters and ideas may be connected together *without* the intervention of sounds," and he argues that, on this principle, "the instruction of the deaf and dumb is difficult, but it *is possible*." All this, which to us is obvious and familiar, was a novel speculation in the 16th century. With us it is a common thing for a man to teach himself to *read* a language though he cannot pronounce it. There are, for instance, hundreds of persons who can read French who do not and cannot speak it. Now, it is evident in this case that written or printed words do impart ideas independently of sounds, yet this was a discovery which the world owes to Jerome Cardan; and it was for want of seeing this truth, which to us is so familiar, that the education of the deaf and dumb was never attempted, but was considered for so many centuries to be a thing impossible. It was in Spain that these principles were first put into practice by Pedro Ponce, a Benedictine monk, born at Valladolid in 1520, and again a century afterwards by another monk of the same order, Juan Paulo Bonet, who also published a work upon the subject, which was the first step towards making the education of the deaf and dumb permanent, by recording the experience of one teacher for the instruction of others. This book, published in 1620, was of service to De l'Epée 150 years later; and it contains, besides much valuable information, a manual alphabet identical in the main with that one-handed alphabet which is now in common use in the schools on the continent and in America. From this time there was a general awakening of the attention of intellectual men, not only to the importance of the subject, but to the practicability of instructing the deaf-mute. One of Bonet's pupils was seen by Charles I., when yrince of Wales; and the case is described by sir Kenelm Digby, who was in attendance upon the prince, on his memorable matrimonial journey into Spain. When the art died away in that country, it was taken up by Englishmen, and began forthwith to assume an entirely new aspect. Dr. John Bulwer published, in 1648, his *Philocophus, or the Deafe and Dumbe Man's Friend;* Dr. William Holder published his *Elements of Speech, with an Appendix concerning Persons Deaf and Dumb*, in 1669; and Dr. John Wallis, Savilian professor of mathematics in the university of Oxford, both taught the deaf and dumb with great success, and wrote copiously upon the subject. In 1662, one of the most proficient of his pupils was exhibited before the royal society, and in the presence of the king. The *Philosophical Transactions* of 1670 contain a description of his mode of instruction, which was destined to bear ample fruits long after his death.

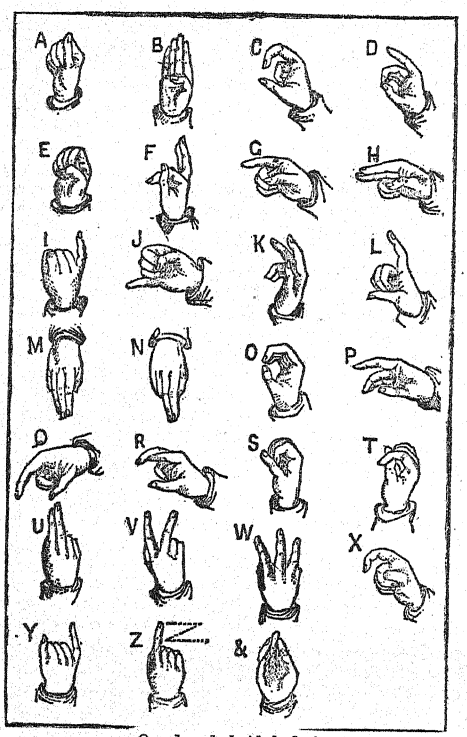
Before the close of the 17th c., many works of considerable merit appeared, the chief of which are the *Surdus Loquens* (the Speaking Deaf Man) of John Conrad Amman, a physician of Haarlem; and the *Didascolocophus*, or Deaf and Dumb Man's Tutor, of George Dalgarno. This treatise, published in 1680, and reprinted some years ago by the Maitland Club, is eminently sound and practical, which is the more remarkable, as the author speaks of it as being, for aught he knows, the first that had been written on the subject. He is the first English writer who gives a manual alphabet. The one described by him, and of which he was the inventor, is, most probably, the one from which our present two-handed alphabet is derived. Dalgarno was by birth a Scotchman, but was long resident at Oxford. He died in 1687, and Dr. Wallis in 1703. From that time until 1760, nothing more was done in this country—though the subject was beginning to excite some attention in France—to resume the work which had been thus far prosecuted and helped on by the writings and labors of these eminent men. In 1760, when the abbé De l'Epée was opening his little school in Paris, the first school in the British dominions was also established in Edinburgh, by Thomas Braidwood. He commenced with one pupil, the son of a merchant in Leith, who had strongly urged him to carry into effect the plan of instruction followed by Dr. Wallis, and described in the *Philosophical Transactions* 90 years before. This school, the parent and model of the earlier British institutions, was visited and spoken of by many of the influential men of that day, and its history and associations are imperishable. Its local name of *Dumbiedikes* suggested to sir Walter Scott a designation for one of his most popular characters in the *Heart of Midlothian*. A visit paid to it in 1773, by Dr. Johnson and his biographer Boswell, supplies one of the most suggestive and characteristic passages in the *Journey to the Western Islands*. In the year 1783, Mr. Braidwood removed to Hackney, near London, and the presence of his establishment so near to the metropolis undoubtedly led to the foundation of the London Asylum in 1792. Dr. Watson, its first principal, was a nephew, and had been an assistant, of Mr. Braidwood; and he states that, some 10 or 15 years previously, the necessity for the establishment of a public institution had been plainly seen, and some few but insufficient steps taken towards the accomplishment of such a design. From its foundation in 1792 until 1829, it was directed with great ability by Dr. Joseph Watson, in whose work on the *Instruction of the Deaf and Dumb* this statement is given. On his decease, he was succeeded by his son, Mr. Thomas James Watson, of Clare Hall, Cambridge, and he again was followed in 1857 by his eldest son, the Rev. James H. Watson, of Pembroke college, Cambridge.

The following table shows, in the most concise manner, the position and date of the various institutions in Great Britain and Ireland, and the number of inmates in 1871·

Locality.	Date.	Principal.	Inmates.
England and Wales:			
London	1792	Rev. Jas. H. Watson, M.A.	259
Margate branch	1862		58
Birmingham	1812	Mr. Arthur Hopper, B.A.	108
Manchester	1823	Mr. A. Patterson	138
Liverpool	1825	Dr. D. Buxton, F.R.S.L.	100
Exeter	1827	Dr. W. B. Scott	65
Doncaster	1829	Dr. Chas. Baker (d. 1874)	105
Newcastle	1839	Mr. William Neill	77
Brighton	1841	Mr. William Sleight	97
Bristol	1841	Mr. Wm. B. Smith (1873)	33
Bath	1842	Lady instructors	20
Swansea	1847	Mr. A. R. Molison	26
Llandaff	1862	Mr. A. Melville	21
British asylum (Hackney)	1851	Mr. D. Murray, B.A.	36
Scotland:			
Edinburgh	1810	Mr. William Hutchinson	63
" Donaldson's hosp'l.	1850	Mr. Alfred Large	83
Glasgow	1819	Mr. John Thomson	99
Aberdeen	1819	Mr. Franklin Bill	26
Dundee	1846	Mr. A. Drysdale	30
Ireland:			
Dublin, Claremont	1816	Mr. E. J. Chidley	50
" St. Mary's	1846	Religious orders	156
" St. Joseph's			175
Belfast	1831	Rev. John Kinghan	82
Strabane	1846	Mr. A. F. Woodbridge	15

These details are based upon the census returns of 1871, to which, however, many additions are here made, from personal inquiry and knowledge. There were, and are, several educational establishments in active and successful working; as, for instance, the Jews' school in London, the Roman Catholic school near Sheffield, the Llandaff institution named above, some private seminaries, and one or two day-schools, which are not included in the census returns at all. On the other hand, the Strabane institution is now united to the one at Claremont, near Dublin.

If we add the numbers thus omitted, we shall raise the English total to more than 1200, and as the numbers in Scotland and Ireland were 301 and 478 respectively, it is evident that at least 2,000 deaf-mute children must have been under instruction in the United Kingdom in 1871. That number is certainly exceeded now. And, let it be remembered that it is to the present century that the honorable distinction belongs of having done so much for the deaf and dumb. This has not been by inventing the art of teaching, or by raising up the earliest laborers in this field of usefulness, but by founding and supporting public institutions for this purpose. De l'Epée, when he opened his school in 1760, had no foreknowledge of the work he was commencing. As his labors increased, he invited others to his assistance, and they were thus enabled to carry the light of instruction elsewhere, and to keep it alive when he was no more. His death took place in 1789, and his assistant, Sicard, succeeded him. Four years afterwards, this school was adopted by the French government, and now exists as the *Institution Nationale* of Paris. A pupil of this institution, M. Laurent Clerc, on being applied to in 1816, consented to go the United States with the founder and first principal of the American asylum, and he became, like De l'Epée, *le père des sourds-muets* (the father of the deaf and dumb) in the new world. From these small beginnings of Braidwood and De l'Epée, of Heinicke in Germany, and Gallaudet in America, have arisen, within about a century, more than 200 schools for the deaf and dumb. In Great Britain and Ireland there are 25 institutions, 39 in the United States, 4 in British America, and 2 in our Australian colonies. Among the English-speaking races, the increase of energy in this direction is very striking. The figures for foreign countries are not of so recent date, but it is believed that there are about 60 institutions in Austria, Prussia, and the smaller kingdoms and states of Germany, 50 in France, 20 in Italy and in Switzerland, 10 in Holland and Belgium, 2 in Russia, with one or two others in the less populous and enterprising of the European nations.



The mental condition of the deaf and dumb is so peculiar—so entirely unlike that of any other branch of the human family—that it is extremely difficult, without very close thought, to obtain an accurate conception of it. While almost every one will readily admit that there is a wide difference between a deaf and a hearing child, very few, who have not had their attention painfully drawn to the subject, possess any adequate notion of the difference, or could tell wherein it consists. Sometimes the deaf

are compared with the blind, though there exists no proper ground of comparison between them. Except that the blind are more *dependent* than the deaf and dumb, the relative disadvantages of the two classes do not admit of a moment's comparison. The blind man can be talked with and read to, and is thus placed in direct intercourse with the world around him: domestic converse, literary pleasures, political excitement, intellectual research, are all within his reach. The person born deaf is utterly excluded from every one of them. The two afflictions are so essentially dissimilar, that they can only be considered and spoken of together by way of contrast. Each of them affects both the physical and the mental constitution; but blindness, which is a grievous bodily affliction, falls but lightly on the mind; while the effect of deafness is the extreme reverse of this—it touches only one bodily organ, and that not visibly, but the calamity which befalls the mind is one of the most desperate in "the catalogue of human woes." The deprivation under which the born-deaf labor is not merely, or so much, the exclusion of sound, as it is the complete exclusion of all that information and instruction which are conveyed to our minds, and all the ideas which are suggested to them, by means of sound. The deaf know almost nothing, because they hear nothing. We, who do hear, acquire knowledge through the medium of language—through the sounds we hear, and the words we read—ever hour. But as regards the deaf and dumb, speech tells them nothing, because they cannot hear; and books teach them nothing, because they cannot read; so that their original condition is far worse than that of persons who "can neither read nor write" (one of our most common expressions for extreme ignorance); it is that of persons who can neither read, nor write, nor hear, nor speak; who cannot ask you for information when they want it, and could not understand you, if you wished to give it to them. *Your* difficulty is to understand *their* difficulty; and the difficulty which first meets the teacher is, how to simplify and dilute his instructions down to their capacity for receiving them.

A class thus cut off from all communication through the ear, can only be addressed through the eye; and the means employed in the instruction of the deaf and dumb are —1. The *visible* language of pictures, and of signs and gestures; 2. The finger-alphabet (or dactylology), and writing, which make them acquainted with our own *written* language; and in some cases, 3. Articulation, and reading on the lips, which introduce them to the use of *spoken* language. The education of the deaf and dumb must be twofold—you must awaken and inform their minds by giving them ideas and knowledge, and you must cultivate them by means of language. The use of signs will give them a knowledge of things; but to this must be added a knowledge of words. They are therefore taught, from the first, that words convey the same ideas to our minds which pictures and signs do to theirs; they are therefore required to change signs for words until the written or printed character is as readily understood as the picture or the sign. This, of course, is a long process, as it has to be repeated with every word. Names of visible objects (nouns), of visible qualities (adjectives), and of visible actions (verbs), are gradually taught, and are readily acquired; but the syntax of language, abstract and metaphorical terms, a copious diction, idiomatic phraseology, the nice distinctions between words called synonymous, and those which are identical in form, but of different signification—these are far more difficult of attainment; they can only be mastered through indomitable perseverance and application on the part of the pupil, in addition to the utmost skill and ingenuity of the teacher. The wonder, therefore, surely is, seeing the point of starting, that this degree of advancement is ever reached at all.

Yet it has been set forth by otherwise respectable authority, that the deaf and dumb are a "*gifted* race;" that they are remarkable for "their promptitude in defining abstract terms;" and those who ought to have known better, have strengthened this delusion, by putting forth, as the *bonâ-fide* answers of deaf-mutes, those brilliant aphorisms and definitions of Massieu and Clerc, which are so often quoted at public meetings, by eloquent speakers who know nothing of the subject. It is very well known to those who *are* acquainted with the subject, that the so-called definitions of *Hope, Gratitude, Time, Eternity*, etc., were not Massieu's at all, but those of his master, the abbé Sicard. The influence of these fallacies has been most mischievous; they raise expectation to an unreasonable height, for it is thought that what was done by "the celebrated pupil of the abbé Sicard," may be done every day: and disappointment is the inevitable consequence. The honest, laborious teacher who cannot produce these marvelous results, and will not stoop to deception, has often to labor on without that appreciation and encouragement which are so eminently his due; the cause of deaf-mute instruction suffers, and a young institution is sometimes crippled by the failure of support, which was first given from one impulse, and is now withdrawn from another—not a whit more unreasonable than the first, but very unfortunate in its consequences.

The course of instruction is very much the same in all the public schools of this country, but a vigorous effort is now being made, by the advocates of what is called the "German system," to teach by oral instruction only. If they can produce, *on an extensive scale*, the results which have been obtained in some special and exceptional cases, they will assuredly deserve all the success they hope for, and merit the highest commendation. But it will not be sufficient merely to show that their system is superior to the one in present use, unless they can also show that it can be as extensively applied. The dispensers of the funds of our institutions are bound to uphold that

One-handed Alphabet.

Two-handed Alphabet.

system which will confer the largest practicable amount of benefit upon the largest possible number of persons. To make a few brilliant scholars, and to produce a number of ready and intelligible speakers, will certainly be a very creditable achievement; but that will not justify any claim to *supersede* the humbler but more useful system under which so many thousands of our deaf-mute fellow-citizens have been rendered competent for the duties of life, in the workshop, in their families, and in society, and to "walk in the house of God as friends."

The manual alphabet in common use in the schools of this country is the two-handed one, though the other is used in some of the Irish institutions, and is regarded with favor by a few of the English teachers. The arguments in its favor, like those for the decimal currency, may probably be admitted; it would be better if we had it. But the rival system has got possession, and is in familiar use, and persons are apt to think that the inconveniences of making the change would outweigh the advantages to be expected from it. The institutions in Great Britain are supported by annual subscriptions, donations, and legacies, and by the payments of pupils for their board. The larger benefactions are invested, where the annual income from ordinary sources will admit of it. Committees, chosen from the body of subscribers, direct the affairs of these institutions, the executive officers being the head-master and the secretary; but in some cases the sole charge is intrusted to the principal. The gentlemen who fill this office have devoted their whole lives to the work; some of them have also done good service by their writings upon the subject. The census report, 1871, specially mentions the works of Messrs. Baker of Doncaster, Scott of Exeter, and Buxton of Liverpool, each of whom has helped to make it better known and better understood than it could possibly be when it was treated by men with no practical knowledge, as a merely literary topic, or a subject of philosophical curiosity. Justice also requires the mention here of the valuable writings of the late Dr. H. P. Peet, of New York, and other American instructors of the deaf and dumb. The institutions in the western world are munificently supported by grants from the states, and appear to be admirably managed. The staff of teachers is numerous, able, and efficient, and a high degree of success may fairly be expected where the work is carried on under advantages which are unknown in the schools of Great Britain. At Washington, a college has

been established, and is in successful operation, under the presidency of Dr. E. M. Gallaudet, the youngest son of the founder of the American asylum. In New York, an elder brother of this gentleman, the Rev. Dr. Thomas H. Gallaudet, has ever since 1852 conducted services in his church in the sign language, and in 1872, organized a commission to promote the temporal and spiritual welfare of adult deaf mutes, in which he has the co-operation of three clergymen and one layman, who, during the year ending Oct. 29, 1873, held services for deaf-mutes in 31 churches in the principal cities of the United States.

In London, a church has been built to meet the same necessity, and religious services are conducted by two chaplains and four laymen, in various parts of the metropolis; Manchester also posseses a chaplain and lay-helpers employed in the same work; in Edinburgh, Glasgow, and Dublin, also in Birmingham, and the large manufacturing towns of Yorkshire, special funds are raised, and special agents employed, to promote in like manner the social and religious benefit of the deaf and dumb. In Liverpool the same results are aimed at by voluntary agency, where, besides the Sunday services, lectures are given during the week, when a library and reading-room are thrown open, a penny-bank has been brought into successful operation, and a benevolent society visits the sick, helps the needy, and buries the dead.

These are the means at present employed for the benefit of the deaf and dumb, and it is no small honor to the present century, which has won so many proud distinctions in other fields of enterprise and usefulness, that it should have done so much for those who for so many generations were utterly excluded from light and knowledge.

DEAF AND DUMB (*ante*). The organization of institutions to educate the deaf and dumb in the United States dates from the early part of this century. An essay on *Teaching the Deaf to Speak*, by Dr. W. Thornton, of Philadelphia, was published in 1793, and in 1811, a grandson of Braidwood tried to establish a school in New York and Virginia, but failed in both instances. The circumstances which led to the opening of the Connecticut asylum at Hartford, April 15, 1817, are as follows: A deaf-mute little girl in the family of Dr. Cogswell, an eminent physician in Hartford, attracting some attention, it was soon afterward found that there were other deaf-mutes in the country. It was decided to send some one abroad to acquire the art of educating them; and to establish a school for this purpose funds were raised, and the Rev. F. F. Gallaudet, D.D., was selected for this work. He left the United States May 15, 1816, to execute this mission. The institution was incorporated by the Connecticut legislature in May, 1816, with an appropriation of $5,000. Dr. Gallaudet returned to America in August of the same year, accompanied by Laurent Clerc, a deaf-mute pupil of the abbé Sicard, and they immediately commenced collecting funds to start the school. The enterprise excited general interest; individuals and churches contributed liberally, and the sum of $12,000 was raised in the course of a few months. Early in 1819, the government of Massachusetts followed the example of Connecticut by providing for the education in the asylum of twenty indigent pupils from that state. The appropriation was afterwards enlarged so as to meet the demands of this entire class. New Hampshire made a similar provision in 1821, and Vermont and Maine in 1825. In 1834, South Carolina and Georgia decided to send their indigent deaf-mutes to the asylum, and in 1848, Rhode Island came into the same arrangement. In 1819, congress made a grant to the institution of 23 acres of wild land, the proceeds of which now form a fund of $239,000. It was owing to this munificent gift that the name of the school was changed to the "American Asylum." Before the school at Hartford was in operation, efforts had been made to establish a similar institution in the city of New York; a society was formed which was incorporated April 15, 1817, as the "New York Institution for Instruction of the Deaf and Dumb." Watson's book was taken as a guide, and articulation was taught in cases where the scholar appeared to possess the necessary aptitude, but this method did not prove very successful; and in 1827, the legislature, which had provided since 1822 for the support of 32 pupils, authorized an investigation by the superintendent of common schools of the state, who recommended in his report the introduction into the New York school of the improved methods in use at Hartford and Philadelphia. In consequence of that recommendation the directors finally succeeded in engaging, in 1831, the permanent services of Harvey P. Peet, LL.D., then one of the most efficient instructors in the American asylum. He served as principal from 1831 to 1867, and has a worthy successor in his son Isaac Lewis Peet, LL.D. Under the management of these two able teachers the institution has taken its place among the most successful schools for deaf-mutes in the world. Its grounds comprise about 26 acres, upon the banks of the Hudson river at Washington heights. The institution has a shoe-shop, tailor-shop, and carpenter-shop, a printing-office, garden, and seamstress rooms connected with the school, in which the pupils receive competent instruction to prepare them for self-support by manual labor, as in all our large asylums. Prof. E. Henry Currier, a leading teacher of this establishment, has secured better results than are usually met with in giving articulation to the dumb and lip-reading to the deaf. Most of his pupils have attained such distinctness of pronunciation and such quickness in recognizing the fleeting indications of words which are made in ordinary utterance, that they have given their instructor a reputation which is attracting more and more pupils of this class to

the institution. The method of teaching articulation by visible speech was invented by A. Mellville Bell in England about 1848, and consists of a species of phonetic writing based on the action of the vocal organs in producing sound. The Pennsylvania institution was organized at Philadelphia in 1820 by Joseph Seixas, a Jew of Portuguese descent. Among its first instructors were Laurent Clerc and Lewis Weld, the latter filling the office of principal till 1830, when he was recalled to Hartford to succeed Dr. Gallaudet. The Kentucky asylum at Danville was incorporated in 1823, and the Ohio asylum at Columbus was opened in 1829. Virginia, Indiana, Tennessee, Illinois, North Carolina, Georgia, South Carolina, Missouri, Wisconsin, and Michigan incorporated institutions, in the course of the next 25 years, and at the present time every state has provided for the education of the deaf and dumb who are adopted "as wards of the commonwealth;" the state regarding it as a primary duty that they shall not be excluded from those educational privileges accorded to every member of the community. Most of these institutions derive their whole income from annual legislative appropriations. The usual term of attendance is 5 years, but the legal term of instruction in most states is 7 years, and may be extended in cases of good scholarship; the average annual cost for board, lodging, and tuition for each pupil supported by the state is $325. There are 51 institutions in the United States, a national college at Washington organized by E. M. Gallaudet, LL.D., and 6 institutions in Canada. Religious services have been conducted since 1850 by the Rev. Thomas H. Gallaudet, D.D., eldest son of the founder of the American asylum, at St. Ann's chapel for deaf-mutes, in New York city, but he and his assistants preach frequently in other parts of the country. The *American Annals of the Deaf and Dumb*, a quarterly periodical, has been published since 1847; conventions of the principals and instructors have been held every few years since 1850, at which papers containing valuable information have been read. Elementary manuals for the deaf-mute have been written in this country by H. B. Peet, J. S. Hutton, Jacobs, Keep, and others. An enumeration of the deaf and dumb is made in the decennial census of the United States, and the proportion is about 1 in 2,000. Of the post-natal causes it has been found that scarlet fever has since 1830 produced 20 to 25 per cent of the total cases; scrofula and spotted fever have also caused a large proportion. The following table gives statistics for the year 1879:

INSTITUTIONS FOR THE INSTRUCTION OF THE DEAF AND DUMB, 1879.

DEAF AND DUMB (in law). From the imperfect methods formerly in use for the education of the deaf and dumb, they were almost everywhere held to be legally in the same position as idiots and madmen. The Roman law held them to be incapable of consent, and consequently unable to enter into a legal obligation or contract. Both in England and Scotland the amount of their capacity is now a question of fact, which, in cases of doubt, will be referred to a jury. In the same manner, a mute will be examined as a witness in regard to a fact to which he is capable of bearing testimony, and the examination will be conducted in the manner which seems most likely to elicit the truth. (Best, *Law of Evidence*, p. 201.) The same principle will govern the estimate of his responsibility for crime. (Stephen's *Com.* iv. 461.) It is of course legally, as it is physically, impossible that a mute should act as a juror.

DEAFNESS may be complete or partial, may affect both ears or only one, may date from birth, be permanent or only temporary, and is but too often one of the distressing symptoms of advancing age. The causes of deafness are numerous. On glancing at the article AUDITORY NERVE, the reader will at once remark the extraordinary intricacy of the hearing-apparatus there described, and will easily conceive that although it be contained in a little nut of densest bone (the petrous portion of the temporal), still it is exposed to many deteriorating influences, and that very slight causes may disarrange the exquisite adjustment of its parts. 1. The auditory nerve may itself be unsusceptible to the stimulus of sound, from some diseased condition at its origin in the brain, or at its final subdivision in the labyrinth. This is termed nervous deafness. 2. The structures which conduct the vibrations of sound to the labyrinth may be faulty, from accident or disease. 3. The passage leading to the tympanum or drum may be blocked up. 4. The cavity of the drum may have ceased to be resonant, owing to deposits from inflammatory attacks, to loss of its membrane, or air being excluded, from obstructions in the passage between it and the gullet (the Eustachian tube).

Nervous deafness may be caused by a sudden concussion, as from a "box on the ear," or a general shock to the whole body, as in the case of the celebrated Dr. Kitto, who lost his hearing, when a boy, by a fall from the top of a house. The concussion from loud sounds suddenly taking the ear unawares, before its small muscles have time to prepare themselves for the shock, causes the deafness which follows the firing of cannon. Even a loud yell close to the ear has been sufficient to destroy the hearing power on that side. As such an accident is generally accompanied by an increased flow of blood to the part injured, it may be relieved by the application of leeches, applied behind the auricle, and the ear should for some time be protected from loud sounds as carefully as possible. In some of these cases the nerve gradually recovers its sensibility, but in many the deafness continues, and is accompanied by a distressing singing in the

ears. Exposure to cold affects the auditory nerve; and gouty persons, or those who are suffering from the poisons of typhus fever, scarlatina, measles, mumps, etc., frequently become deaf. Some medicines, as quinine, produce nervous deafness; so do debility and mental excitement; but all these causes seem to act in one way—viz., to increase the flow of blood to the ear, and should be treated accordingly.

The solid conductors of sound to the auditory nerve may be injured or diseased, so that the vibrations are interrupted. One curious cause of deafness has been recently shown to exist by Mr. Joseph Toynbee of London—viz., an increasing stiffness in the little joint by which the stirrup-bone moves in the oval window of the vestibule; this stiffness prevents the base of the stirrup pressing inwards sufficiently to affect the contents of the labyrinth, therefore it ceases to keep the auditory nerve *en rapport* with the membrane of the drum. This condition may be recognized during life by the patient losing the power of adapting his hearing to varying sounds. Two persons speaking at once prevents his hearing the voice of either; there is a constant buzzing in the ear, and he gets deafer and deafer day by day. This curious disease is frequently associated with gout and rheumatism, and in its earlier stages may be influenced by the same remedies as these; but if once established, it is incurable.

Sound reaches the auditory nerve through the vibrations of the bones of the head, but chiefly through the external opening in the auricle, the passage leading from which is shut at the depth of an inch and a quarter from the surface by the membrane of the drum stretching across it. Should this passage be blocked up, so that the sounds can no longer pass along it to impinge upon the membrane, either total or partial deafness must result.

The most common obstruction is an accumulation of the wax secreted by a small ring of glands near the orifice. The object of this cerumen or wax is to catch the particles of dust floating in the atmosphere; but sometimes it is harder than usual, and is no longer gradually expelled by the movements of the jaw in speaking and eating. At last, it fills the passage in the form of a hard plug, and sounds can neither pass through it nor by its side; if left, it gradually causes serious changes in the shape of the passage, and even symptoms resembling diseases of the brain. Sometimes foreign bodies find their way into this passage, or tumors grow in it, and no unprofessional attempts should be made to remove them, lest the membrane of the drum be injured. It is but seldom that any instruments are necessary in addition to a stream of water thrown briskly in by means of a syringe, with a nozzle smaller than the circumference of the passage. Should the wax be very firm and hard, is is well to soften it by dropping in some oil or an alkaline solution. But even a stream of water, unless great care be taken, may injure or burst the delicate membrana tympani, and the proceeding leave the patient suffering from a more serious condition than before.

A membrane, to be resonant, must have air on both sides of it, and the membrana tympani obtains this essential by means of the Eustachian tube, the lower orifice of which, on each side of the gullet, opens for a brief period at each act of swallowing, and admits a small quantity of air, which ascends into the tympanic cavity, if the tube is in a healthy condition; but frequently in persons suffering from relaxed mucous membrane, the Eustachian passage becomes swollen and impassable, or blocked up by some thickened mucous secretion. During a common cold, persons often suffer from this cause of deafness. It has been supposed by some, that enlarged tonsils may interfere with the pharyngeal opening of the tube, and with that view they cut portions off them occasionally with great benefit to the condition of throat in which these glands are enlarged; but the latter are situated below and in front of the Eustachian tubes, and cannot be the immediate causes of the obstruction.

In some cases, the membrane of the drum may be perforated; and though the mere perforation is not sufficient to cause more than a slight degree of deafness, if the mucous membrane lining the tympanic cavity be thickened at the same time, the person is usually able to hear only the loudest sounds. If the perforation be stopped up, however, the air confined in the tympanic cavity vibrates sufficiently to stimulate the auditory nerve, through the round window of the labyrinth, and a useful degree of hearing is restored. In 1848, Mr. Yearsley of London showed that a small pellet of cotton-wool might be used for this purpose. It should be moistened with fine oil, and inserted on the end of a probe. Patients generally learn how to stick it neatly into the aperture themselves. It should be removed every three or four days, or oftener, should cleanliness require it.

Mr. Toynbee has invented an artificial membrana tympani of vulcanized india-rubber, attached to the end of a fine silver wire, by which it can be inserted or withdrawn. These beautiful little instruments may now be obtained of every surgical instrument maker, and are at least worth trying in cases of perforated membrana tympani, as they often do good, can do no harm, and are very cheap. The india-rubber having been pared to the size likely to fit the individual's ear, it is moistened with warm water, and gently passed down the auditory passage; the sensations of the patient will easily decide when it has gone far enough, and he gladly discovers, by the sound of his own voice or that of the surgeon, that his hearing has been suddenly improved.

The deafness of aged persons has been shown, by Mr. Toynbee, to be generally caused by the effects of previous inflammatory attacks, and may frequently be much

relieved by counter-irritation behind the ear, alterative medicines, and washes which restore the healthy condition of the throat and the external auditory passage.

There are numerous "cures for deafness" advertised from time to time; some are harmless if useless, others are useless, but very dangerous, owing to the readiness with which inflammation may be set up, and the liability of the latter to extend to the brain or its membranes. The diseases which affect the ear are the same as affect other organs, and require to be treated upon the same principles. It is advisable, as soon as the first symptoms of approaching deafness are felt, to apply to one of the regularly qualified practitioners who devote themselves entirely to the subject, and to have nothing to do with these so-called *cures*, which benefit only the vendors.

The best English works on the subject are *Practical Observations on Aural Surgery*, by William R. Wilde of Dublin, and *The Diseases of the Ear*, by Joseph Toynbee of London.

DEAK, FRANZ, Hungarian politician, was b. in 1803 at Kehida, in the Hungarian co. of Zala. Having studied law at Raab, he began to practice as an advocate in his native county, and soon became noted for his eloquence and enlightened patriotism. Elected in 1832, to the national diet, he, as leader of the liberal opposition, opposed, by legal and constitutional means, every attempt of the imperial government to infringe on the constitutional rights of his country. This firm and moderate policy enabled him to effect more than one reconciliation between Hungary and the Austrian emperor as her king—temporarily in 1840, and in 1867 more permanently. While upholding the independence of his country, he labored for its internal improvement, promoting measures for the elevation of the peasantry, and advocating the abolition of the odious exemption from taxes enjoyed by the nobility. His views on this last point displeased the party of the nobles, and for some years after 1840, his county did not return him to the diet. He still, however, continued to guide the councils of the moderate liberal party, and in spite of his aversion to extreme measures, he promoted the association for national defense, in the view of a possible struggle with Austria. After the revolution of March, 1848, he became minister of justice in the cabinet of count Batthyanyi (q.v.), and had formed the project of effecting a general reform in the administration of justice in Hungary, which, however, the war rendered impossible. D. used every effort to ward off the war, and come to an arrangement with Austria. On Kossuth's coming into power (Sept. 17, 1848), D. resigned his portfolio, and retained only his place in the diet. In the last months of 1849, at the approach of prince Windischgrätz, he proposed to sue for peace, and was one of the deputies sent for this purpose to the Austrian gen. It is well known that that step failed, and that D. was even for some time a prisoner at Pesth; he then withdrew from public affairs, and retired to his estate. When the Hungarian revolution was suppressed, he refused the invitation sent him by M. de Schmerling, minister of justice at Vienna, to take part in the legislative conferences, as he disapproved of the Austrian policy with regard to Hungary. He did not return to public life till 1860, when a constitution was granted to his country.

On hearing of the arrest of count Ladislas Téléki, D. set out for Vienna with M. Eötvös, and procured the release of his countryman, as well as the promise of an independent Hungarian ministry. Returned by the city of Pesth to the diet in 1861, he became in it the leader of the moderate party, at the same time that the extreme party collected round count Téléki. The death of the latter (8th May) destroyed the only influence which could counterbalance that of D.; and the diet appointed him to draw up the address to the emperor. D. demanded, in that paper, the constitution of 1848, a Hungarian ministry resident in Pesth, the return, without restriction, of the exiles, and the restitution of their property. Rejected at first by the emperor, this address was again drawn up with some modifications in the details; the emperor answered it by a rescript which with difficulty dissimulated his repugnance to such an arrangement; and in his turn, D., in name of the diet, protested publicly against the imperial rescript. On the 23d, the emperor pronounced the dissolution of the Hungarian diet, which protested anew, under the direction of D., against the illegality of the measure which dispersed them. Among the events consequent on the war between Austria and Prussia in 1866, was the final triumph of D.'s policy in the establishment of a constitutional relation between Hungary and Austria. At a general election in 1869, the results of which were favorable to his policy, D. was, by an overwhelming majority, returned again for the city of Pesth. D. died in 1876. His funeral was a truly national event, and was attended by every Hungarian of note.

DEAL, a municipal borough, and member of the parliamentary borough of Sandwich, maritime t. and sea-bathing place, in the e. of Kent, on a bold open beach, near the s. extremity of the Downs, between North and South Foreland, 18 m. e.s.e. of Canterbury, and 8 m. n.n.e. of Dover. It has three streets running parallel to the beach, and others stretching into the country. A fine anchorage extends 7 or 8 m. between D. and the Goodwin Sands. D. has mainly arisen to supply the wants of vessels which are often detained by the winds in the Downs to the number of 400 or 500 at a time. The chief branches of industry are connected with maritime pursuits, boat building, sail-making, piloting or hoveling, victualing, and naval stores. Pop. '71, 8,009. D. returns two members to parliament with Sandwich and Walmer. It has been one of

the Cinque ports since the 13th century. The coast near D. is defended by Deal castle, near the town; Sandown castle and three batteries on the n.; and by Walmer castle, a mile to the south. Walmer castle is the official residence of the warden of the Cinque ports, and here the duke of Wellington died in 1852. Henry VIII. built Deal castle in 1539. Julius Cæsar, with two legions, in 82 ships, landed near D. in 55 B.C. In 1877, 168 vessels, of 11,285 tons, entered the port.

The DEAL BOATMEN, who are an enterprising and courageous body of men, are like some of the other boatmen on that coast, locally known as "hovelers." They have become noted for giving assistance to ships in distress, and for saving the lives of crews and passengers. Besides performing these services, they have been useful in carrying off provisions to outward-bound vessels, and in bringing ashore mail-bags requiring to be forwarded by express. Latterly, in consequence of steam-tugs being much employed in expediting outward and inward bound vessels, and also from the mails from many foreign countries being landed at Falmouth and other places, to be forwarded to London by railways, the occupation of the Deal boatmen is nearly gone, and the community has sunk into poverty. Their case being made known by the press, some benevolent exertions were made to succor them. The community may be expected to diminish in proportion to the actual wants of navigation on the coast.

DEALFISH, *Trachypterus*, a genus of fishes of the ribbon-fish family, having the body much compressed, and so named D. from the resemblance of the form to a piece of deal —a resemblance which is increased by the dorsal fin extending along the whole length of the back. The tail-fin exhibits a remarkable peculiarity, rising almost vertically from the horizontal line of the vertebral column, as if it had met with some accident, and assumed a new position. One species (*T. bogmarus*), the VAAGMAER of the Icelanders and Norwegians, sometimes occurs on the most northerly British coasts. It is not common even on those of Iceland, and is apparently a deep-sea fish. It is a large fish, 4 to 8 ft. in length, of a silvery color, with minute scales. Other species are found in the Mediterranean.

DEAL ISLAND, an island in Bass's strait, between Australia and Tasmania, is worthy of notice chiefly as having a light-house at an elevation of 880 ft. above the sea.

DEALS, the trade-name for fir-boards exceeding 6 ft. in length and 7 in. in width. They are also occasionally called "planks," though this term is now somewhat loosely applied. Pieces of smaller dimensions are called "battens." D. are usually 3 in. thick, and when sawed into thinner pieces, these are called "boards." When a deal is sawed into twelve or more thin planks, they are called "leaves." Most of the D. imported into this country are from the Baltic ports, North America, Sweden, and Norway. Drammen is the principal Norwegian timber-port, though the general name for the D. from Norway is "Christiania deals," so named from the Norwegian capital, where the principal timber-merchants reside, and through which the business of the trade is chiefly transacted. The duty on imported timber was finally abolished in the year 1866. For the various qualities of deals, and their applications, see TIMBER.

DEAN. The institution of deaneries, as of other ecclesiastical offices of dignity, bears a resemblance to the methods of ancient civil government. Thus, for the preservation of civil order, every hundred consisted of ten districts, called tithings, and in every tithing was a constable or civil dean. In conformity to this, the spiritual governors, the bishops, divided each diocese into deaneries or decennaries (Lat. *decem*, ten), corresponding to tithings, each of which was the district of ten parishes or churches, over every one of which a D. was appointed, who in the cities or large towns was called the D. of the city or town, and in the country, *rural dean*. It has been supposed, but on no certain authority, that the D. of a chapter was appointed to superintend ten canons; but it is more probable that the name was given to the office from its analogy to those above described. In the English church, there are the following dignitaries who bear this name:

1. In the province of Canterbury, it is part of the dignity of the archbishop to have prelates to be his officers, and of these the bishop of London is his provincial D.; and when a convocation is assembled, the archbishop sends to him his mandate for summoning the bishops of the province. This is the sole example of the kind.

2. *Honorary deans*, as the D. of the chapel royal of St. James's.

3. *Deans of peculiars*, as of Battle in Sussex, founded by William the conqueror in memory of his conquest. There are also the deans of the Arches in London, of Bocking in Essex, and of Croydon in Surrey, who have jurisdiction, but no cure of souls.

4. *Deans of chapters*, as at Canterbury, St. Paul's, etc., who are governors over the canons in cathedrals and collegiate churches. Their appointment is in the direct patronage of the crown, which may appoint by letters-patent; and the D. so appointed is entitled to be installed. The D. of a chapter must reside eight months in the year, and he may hold one benefice with his deanery. The income of the office is, in the case of Durham, £3,000; of St. Paul's, Westminster, York, and Manchester, £2,000; of other cathedrals, £1000, except St. Davids and Llandaff, which have £700. See CATHEDRAL.

5. *Rural deans.* These are very ancient officers of the church, but custom gradually

transferred their duties to the archdeacon, as in the visitation of churches, parsonage-houses, etc. They may, however, act as deputies to the bishop and archdeacon; and of late the office has been revived with great advantage; and in well-ordered dioceses affords a useful channel of communication between the bishop and his clergy, and a means of joint action in matters affecting the church. There are altogether nearly 600 rural deaneries in England and Wales.

In the universities of Oxford and Cambridge, the D. is the officer who superintends the discipline of the college and the chapel services. At Christ church, which is a cathedral, the D. is master of the college.

DEAN, WILLIAM, D.D., b. N. Y., 1807; became a missionary in 1834, under the direction of the American Baptist missionary union. His labors have been almost entirely among the Chinese in their own country and in Siam.

DEAN OF THE CHAPEL ROYAL (Scotland), an office held by six (formerly three) clergymen of the established church, to which they are appointed by the crown. The benefice of the chapel royal, which was instituted by James V., was richly endowed, but it has been disputed whether the revenues now enjoyed by the deans belonged originally to the chapel royal of Stirling or to the chapel royal of Holyrood. It is known that the existing revenues were once attached to the see of Dunblane; and an act of parliament was passed in 1621, sanctioning the annexation of the revenues of the chapel royal of *Stirling* to the bishopric of Dunblane, which was the poorest bishopric in Scotland. Hence it is assumed that the whole existing deanery revenues belonged to the chapel royal of Stirling. But there are some facts which prove that the benefice was connected with the chapel at Holyrood equally with that at Stirling. William Couper, bishop of Galloway, held the office of dean of the chapel royal from 1615 to the commencement of 1619. He resided at the foot of the Canongate, and preached regularly in the royal chapel of Holyrood. This individual drew part of his revenue from the parishes of Kirkinner and Kirkcowan in the co. of Wigton, and part of the present deanery revenues is likewise drawn from the same parishes. Dr. Adam Bellenden, who was bishop of Dunblane when the act above mentioned was passed annexing the revenues of the chapel royal of Stirling to his bishopric, performed the duties of dean of the chapel royal at Holyrood for many years subsequent to 1621. It seems clear, therefore, that if the revenues of the benefice were ever divided between the two chapels, they were united to the see of Dunblane during the incumbency of Dr. Bellenden. The state of the case probably is, that at its institution by James V., who resided frequently at Stirling, the benefice was held by ecclesiastics chiefly resident there. The chapel royal is noticed as in full operation in Stirling in 1540. During the reign of queen Mary, the chapel royal seems to have been at Holyrood. In 1574, again, after the reformation, the name of Johne Duncaneson appears as minister of the chapell royall, or king's house at Stirling, where James VI., then very young, resided; while at Holyrood the minister was apparently the regular parish minister of Canongate, and not connected with the chapel royal. Afterwards, when the royal residence became fixed at Holyrood, the dean of the chapel royal officiated in the chapel, of which abundant proof exists in the history of the period. The chapel at Stirling was left to decay; whereas during the reigns of James VI., Charles I., Charles II., and James VII., the chapel royal of Holyrood was repaired and embellished. The last of the Stuarts laid out considerable sums for the purpose only the year before the revolution. The revenues of the benefice fell to the crown, *jure coronæ*, on the abolition of episcopacy in 1690, and have since been gifted at the royal pleasure. For a long period, the emoluments were not at all considerable, owing to the practice which existed of giving tacks or leases of the teinds (*q.v.*) to the proprietors of the lands at nominal rents. In consequence of the termination of some of those leases in 1841, and the deans being debarred in the gift of the appointment from accepting anything but the full yearly value of the revenues, a very great increase took place in the emoluments, which, however, were again somewhat diminished by augmentations made to the parochial clergy out of the teinds in question. A large portion of the revenue is drawn from the parishes of Yarrow and Ettrick, and the remainder from Wigtown, Kirkcudbright, and Ayr shires. In 1841, the annual rental divided among the three deans was £252; in 1858, £2618. The duties of the office used to be nearly nominal; but on the foundation of the chair of biblical criticism in the university of Edinburgh in 1846, it was endowed with one third of the revenues, the professor becoming one of the three deans. The universities commission, 1858, recommended that when the requisite vacancies occurred, the revenues should be divided into six parts, attached respectively to the chairs of divinity and Biblical criticism in Edinburgh university (the latter receiving $\frac{2}{3}$ths of the whole), Biblical criticism in Aberdeen university, biblical criticism in Glasgow university, and church history in St. Andrews university. This arrangement has now come fully into operation, the result being that the revenues of the chapel royal are divided among the incumbents of the above mentioned chairs. Besides these five deans, the dean of the order of the thistle bears the title of dean of the chapel royal, but draws none of the revenues.

DEANE, JAMES, 1748–1823; b. Conn.; graduate of Dartmouth, and for many years a missionary among the New York and Canadian Indians. He was an officer in the revolutionary war, and later in life, a judge in Oneida co., N. Y.

DEANE, JAMES, 1801–58; b. Mass.; a physician and surgeon. He was the discoverer, 1835, of the fossil foot-prints in the red sandstone of the Connecticut valley, and at the time of his death was engaged upon an elaborate memoir on the subject for the Smithsonian institution. He wrote much on medical subjects.

DEANE, SILAS, 1737–89; b. Conn.; graduate of Yale, and member of the first continental congress. He was sent to Paris as political and financial agent of the colonies. Benjamin Franklin and Arthur Lee joined him afterwards, and he was on the committee which negotiated the treaty of peace with France. He was recalled in 1777 in consequence of extravagant contracts in which he had involved the colonies. An account of his doings was demanded on the floor of congress, but a full explanation was declined on the ground that his papers were in Europe. The affair put him under a cloud, and after many defensive and aggressive publications on the subject, he returned to Europe, 1784, and died in poverty.

DEAN OF FAC'ULTY, the president of the incorporation of advocates in Scotland. Like the other officers of the faculty, the dean is elected annually. As a rule, he is re-elected till promoted to the bench, when he ceases to share in the deliberations, though not to be a member, of the body. See ADVOCATE.

DEAN FOR'EST, a picturesque hilly tract, 22,000 acres in extent, in the w. of Gloucestershire, between the Severn and the Wye. It is mostly crown-property, and about half of it is inclosed for the growth of timber for the navy. It contains oak, beech, etc., woods; orchards, yielding the famous Styre apple-cider; coal and iron mines; and stone-quarries for building, grinding, and making troughs and rollers. It is divided into six walks. The population is chiefly miners, once a lawless set. The former inhabitants had many ancient privileges—acquired by birth, and by working a year and a day in the forest—viz., exemption from rates and taxes, free pasturage, right of mining—a sixth of the produce being due to the sovereign, and access to the woods for timber for their works. D. F. is governed by a lord-warden, six deputy-wardens, and other officials.

DEAN OF GUILD, in Scotch burghs, was the head of the mercantile body called the guild-brethren. See GUILD. In former times (1593, c. 180), he was a judge in mercantile and maritime causes within the burgh, but for a very long period he has been rather what might be called a kind of Scotch edile (q.v.). His chief duty is now to see that buildings within the burgh are erected according to law, that they are sufficient, and, in case of their falling into a ruinous condition, to order them to be pulled down. Though in some of the larger burghs the D. of G. is still (3 and 4 Will. IV. c. 76, s. 22) a member of the town-council, *ex officio*, his jurisdiction is altogether separate from that of the bailie-court. In Edinburgh, the D. of G. court, in addition to the D. of G., consists of a council of merchants and tradesmen chosen annually, and of the old or former dean of guild. They are assisted by the law assessors of the magistrates of the city. No building can be either erected or demolished, or even materially altered, without a warrant from this court. Opposition to the issuing of the warrant may be offered, either by a private party, or by the procurator-fiscal of the court itself, acting for the public interest. The enforcement of the act 1698, c. 8, as to the height of buildings, the thickness of the walls, etc., lies within the province of the D. of G. court. The judgments of the D. of G. court may be reviewed by the court of session.

DEARBORN, a co. in s.e. Indiana, on the Ohio river; traversed by the Whitewater canal, the Ohio and Mississippi and three other railroads; 291 sq.m.; pop. '80, 26,656. Chief productions, wheat, corn, oats, barley, hay, butter, etc. Co. seat, Lawrenceburg.

DEARBORN, HENRY, 1751–1829; b. N. H.; a general in the revolutionary war. When news came to Portsmouth of the battle of Lexington, he quitted his practice as a physician, and marched with 60 volunteers so speedily as to arrive at Cambridge (65 m.) early the next day. He was in the battle of Bunker Hill, and with Arnold's expedition to Quebec, where he was taken prisoner. He was with Gates at the capture of Burgoyne, at Monmouth, and at Yorktown. Washington appointed him marshal for the district of Maine in 1789. In 1812, he was made senior maj.gen. of the federal army, and put in command of the northern department. In 1813, he captured York, Canada, and fort George, at the mouth of the Niagara river. He resigned in 1815, and in 1822 was sent as minister to Portugal. Two years afterwards, at his own request, he was recalled.

DEATH. It is one of the fundamental doctrines of physiology, that every part of the organism has its own definite term of vitality, and that there is a continuous succession of the destruction of old cells and the formation of new ones in all tissues, and especially in those in which the most active vital changes are going on, as, for example, in the nervous and muscular tissues. Even the most solid portions of the animal frame, such as the bones and (to a less extent) the teeth, are undergoing a perpetual although a slower change of this nature: and throughout the whole body, there is a continuous removal of effete or worn-out tissues, and a corresponding deposition of new matter. Every blow we strike, every thought we think, is accompanied by the death and disintegration of a certain amount of muscular or nervous tissue as its necessary condition; and thus every action of our corporeal life, from its beginning to its close, takes place at the

expense of the vitality of a certain amount of organized structure. This is termed *molecular D.*, and, within its proper limits, is obviously essential to the life and well-being of the organism.

The cessation of the circulation and respiration may be regarded as constituting *somatic D.*, or the D. of the entire organism, which must obviously be shortly followed by the molecular D. of every portion of the body.

We shall now briefly notice the principal modes in which D. occurs. D. happens either from the natural decay of the organism, as in old age, or (and much more frequently) from some of these derangements or lesions of the vital organs which occur in the course of the diseases and injuries to which we are liable. These derangements of the vital organs may occasion various modes of dying. Dr. Watson remarks in his *Lectures on the Principles and Practice of Physic*, that life rests on a tripod, whose three vital supports are the *heart*, the *brain*, and the *lungs*. Through the impaired functions of one or more of these organs, the tendency to D. is expressed. This is much the same as Bichat's statement, that "the mode of dying may begin at the head, the heart, or the lungs." The functions of these organs are, however, so mutually dependent upon each other, that impairment in the functions of one of them may lead to D., while the mode of dying is chiefly expressed through the functions of another.

When a person loses blood to such an extent that he faints, if the flow of blood be not arrested, the state of fainting or *syncope* continues, and the heart's action ceases. The cause of D. here is, not that the heart is unable to contract, but because its natural stimulus, the blood, does not enter it in sufficient quantity to excite contraction. This is termed D. by *anæmia*. In other cases, the stimulus from blood may be sufficient, but the heart may have lost its contractile power. Such a mode of death is said to be by *asthenia* (Gr. want of power). Many poisons and diseases, due to morbid materials in the blood (as, for example, cholera), prove fatal in this way.

D. may likewise be produced by suspension of the functions of respiration, as when access of the air to the lungs is impeded, or when the actions of the muscles of respiration cease, in consequence of disease or injury of the brain or spinal cord. The first of those modes is known as suffocation or *apnœa*, and we have examples of it in drowning, smothering, choking, strangulation, etc. Forcible pressure upon the chest, such as sometimes happens in great crowds, or as occurs to workmen partially buried by the fall of earth, etc., will cause D. in a few minutes, if movement of the lungs is prevented by the pressure. Tetanus and the poison of strychnine prove fatal in this way.

D. by coma, or beginning at the brain, is caused by obstruction to the circulation through that organ by pressure (as, for example, when there is effused blood within the cranium, or when a portion of bone is depressed in a fractured skull); by clots of blood within the vessels; by various narcotic poisons, such as opium, alcohol in excessive quantity, carbonic acid, etc.

To these forms of dying may be added (according to Dr. C. J. B. Williams) *necræmia*, or D. beginning in the blood, such as occurs in typhoid fevers and in other diseases of a malignant or pestilential kind. In this case, there is complete and general prostration of all the living powers. The blood, the natural source of life to the whole body, is itself dead, and spreads death instead of life. Almost simultaneously, the heart loses its power; the vessels, and especially the capillaries, lose their tone, and congestion takes place in various organs; the medulla oblongata, from which the chief respiratory nerves arise, is torpid; the powers of respiration fail; voluntary motion is almost suspended; molecular nutrition ceases, and is very rapidly followed by general molecular D.; that is to say, structures and even organs die, and begin to undergo decomposition as soon as the pulse and breath have ceased; and indeed, a partial change of this kind may even precede somatic D., as, for example, when parts become gangrenous, etc.

The signs of approaching D. require a brief notice. The mind may be affected in various ways; there may be dullness of the senses, vacancy of the intellect, and extinction of the sentiments, as in natural D. from old age; or there may be a peculiar delirium, closely resembling dreaming, which usually is of a pleasing and cheerful character.

> Saw ye not even now a blessed troop
> Invite me to a banquet, whose bright faces
> Cast thousand beams upon me like the sun?
> *King Henry VIII.*, Act iv. Scene 2.

In dreadful contrast with such visions, are those which haunt the dying minds of others, when it would sometimes almost appear as if the sinner's retribution commenced even on his death-bed.

Dementia or imbecility sometimes comes on shortly before D., and manifests itself by an incapacity of concentrating the ideas upon any one subject, and by an almost total failure of memory. The mental weakness is often exhibited by the pleasure which is derived from puerile amusements. The great dramatist from whom we have just quoted, notices "playing with flowers" as a token of approaching dissolution. In the form of delirium, ocular spectra seem frequently to be present, the patient apparently trying to catch some imaginary object.

There is generally well-marked relaxation and incapacity of the muscular system,

and the voice is usually weak and low as D. approaches, often dwindling to a mere whisper. The mode in which the action of the heart declines is various; in most diseases of long standing, the cessation of the heart's action is gradual, the rate of the pulsations being much increased, but their energy being very much impaired. In some acute affections, the failure is shown by the irregularity of the pulse, while the force is little altered. In other cases (especially in cerebral diseases), the heart, before finally ceasing to beat, contracts violently, and suddenly stops.

The respiration is sometimes hurried and panting till just before D., while in other cases it is slow, laborious, and stertorous. The accumulation of mucus, etc., in the air-passages increases the difficulty of breathing; the sound known as the "death rattle" being produced by the passage of the air from the lungs through the fluid collected in the trachea and upper respiratory passages.

There is a loss of animal heat, beginning at the extremities. For further information on this subject, we may refer to the article DEATH in *The Cyclopædia of Anatomy and Physiology*, from which we have borrowed some of the matter of the preceding paragraphs.

The *signs of actual D.* may be arranged under three heads: 1. Signs of the extinction of the vital functions; 2. Changes in the tissues; 3. Changes in the external appearance of the body.

1. The arrest of the circulation and respiration would at first sight appear to afford decisive evidence of D.; but these functions, as in the case of hybernating animals, may be reduced to so low a condition that it is by no means easy to decide whether or not they are completely annihilated. In cases of apparent drowning, these functions are frequently suspended and again restored; and cases like that of col. Townsend (see any standard work on medical jurisprudence) occasionally occur, in which the patient has the power of voluntarily suspending these functions for a considerable period.

The loss of irritability in the muscular fibers (a fact which may readily be ascertained by a galvanic current) is a sign of far greater importance than either the apparent stoppage of the circulation or of the respiration. The contractility of the skin is also lost after death. When a cut is made through the skin of a dead body, the edges of the wound collapse, while a similar lesion inflicted during life presents an open or gaping appearance.

2. Among the changes in the tissues, the *rigor mortis*, or rigidity of the muscles, which ensues at a varying period after D., is the most important. It may appear within half an hour after D., or may be delayed 20 or 30 hours, according to the nature of the disease; and its mean duration is from 24 to 36 hours. It commences in the neck and trunk, then appears in the lower, and lastly in the upper extremities, and disappears in the same order.

3. Various changes in the external appearance of the body have been regarded as indicative of D. by different writers; of these, the most important unquestionably is the altered color of the surface. Livid spots of various sizes may occur from local congestions during life; but the appearance of a green tint on the skin of the abdomen, accompanied by a separation of the epidermis, is a certain sign that life is extinct.

The discrimination of true from apparent D. is obviously not a matter of mere physiological interest. The case of Vesalius, the eminent anatomist, who opened an apparently dead body in which the exposed heart was seen to be still beating, is well known, as also that of the abbé Prevost, who, having been struck down by apoplexy, was regarded as dead, but recovered his consciousness under the scalpel, and died immediately afterwards; and a French author of the last century, Bruhier, in a work *On the Danger of Premature Interment*, collected 54 cases of persons buried alive, 4 of persons dissected while still living, 53 of persons who recovered without assistance after they were laid in their coffins, and 72 falsely considered dead.

DEATH, PUNISHMENT OF. See CAPITAL PUNISHMENT.

DEATH ADDER. See ACANTHOPHIS.

DEATH-BED, LAW OF, IN SCOTLAND. As the law stood till recently, if any man, whilst suffering from the disease of which he ultimately died, burdened or conveyed away his heritable estate, to the prejudice of his lawful heir, he was presumed to have so acted in consequence of his inability to resist importunity in the state of feebleness to which he was reduced, and his heir was entitled to reduce the deed. This rule belonged to the most ancient consuetudinary law of Scotland. As lord Stair suggests (1, 12, 34, and 4, 20, 38), it probably was intended as a protection to the dying and their lawful heirs against the notorious propensities of the priesthood; and was thus referable to the same principle as the prohibition to convey heritage by will. Two tests were fixed upon by the law as establishing the existence of that degree of vigor which is technically called *liege poustie* (supposed to be a corruption for *legitima potestate*)—viz., survivance for 60 days, and going unsupported to kirk or market, and conducting himself in the ordinary manner. It was decided that it is of no consequence though the object of the visit were neither to worship nor to buy and sell, but simply to evade the law of death-bed. If the individual was in a condition to take part in the service of the church, or in the trade of the market, that was sufficient. Extreme old age, accompanied by manifest indications of the approach of death, were held equivalent to

disease. But the deed of the oldest or most infirm man, or of the man who was laboring under the most mortal sickness, was not reducible, if another disease had supervened, of which he died, or if he were killed by accident. Reductions *ex capite lecti*, i.e., on the ground of death-bed, were abolished by act 34 and 35 Vict. c. 81.

DEATHS, REGISTRATION OF. See REGISTRATION.

DEATH'S-HEAD MOTH, *Acherontia atropos*, a species of Hawk-moth (q.v.), or lepidopterous insect of the family *sphingidæ*, not uncommon in some parts of England and of the continent of Europe, and very widely distributed over the world, being found in Africa, the Mauritius, and the East Indies. It measures almost 5 in. from tip to tip of the extended wings; is of a dark color, the body yellow with black markings, the thorax with pale markings which have some resemblance to a skull, and from which it derives its name; the upper wings mottled with brown, black, and yellow. The caterpillar is greenish-yellow, the back speckled with black, with transverse lines partly blue and partly white; and in countries where the potato is cultivated, is often to be found feeding on the leaves of that plant. This insect is most frequently seen flying about in autumn, and only in the mornings and evenings. It is remarkable for emitting a plaintive squeaking sound, which, with its dark color, and the skull-like mark on the thorax, has led to its being regarded with superstitious dislike, the sudden appearance of large numbers being popularly held ominous of evil; whilst, in the Mauritius, a notion prevails that it casts a dust from its wings which produces blindness in persons on whom it falls, and its entering an apartment is therefore regarded with dread. How the noise which it emits is produced, is not satisfactorily known. If the insect is taken and confined in the hand, this sound is sent forth sharply and strongly. The D. H. M. is interesting upon still another account, as one of those insects which enter and plunder beehives, feeding upon the honey; and although apparently quite defenseless, it enjoys perfect impunity whilst ravaging the stores of creatures so well provided with formidable weapons, and generally so ready to use them against an intruder. No explanation of this fact has yet been found.

DEATH-WATCH, a ticking sound produced by certain insects, inmates of human dwellings, and which, being most readily heard in that stillness which attends times of sickness and anxiety, has become associated with superstitious notions and fears, being regarded as indicative of an approaching death in a house. The most common form of this very prevalent superstition is the belief that when the death-watch is heard, some member of the household will die within twelve months. The tickings of the death-watch were formerly attributed to species of wood-louse and of spider, and it is probable that they are not all produced by insects of the same kind; but the most common death-watch of Britain is a species of borer (q.v.), (*anobium tesselatum*). It is of a dusky or grayish-brown color, and about a quarter of an inch in length. It is generally in summer that its noise is heard, the number of raps given in quick succession varying from several to more than a hundred. These are repeated at uncertain intervals. The noise exactly resembles that made by beating with the nail upon a table; and when this is done, the insect is not unfrequently induced to reply to it. It is the perfect insect, not the larva, which produces this sound. It seems, indeed, to be a call by which the sexes are attracted to each other, and is produced by the insect's beating upon some hard substance with its head, in doing which it raises itself upon its hind-legs, and with the body somewhat inclined, beats its head with great force and agility against the substance on which it stands. One of them was seen by Mr. Stackhouse thus to beat upon a sedge-bottomed chair with such force that its strokes made little indentations in the outer coat of the sedge.

DE AUGMENTIS SCIENTIARUM, a treatise by lord Bacon, which forms the opening chapter of his *Instauratio Magna;* and after the *Novum Organum*, his most important treatise.

DEBACLE, a French word, meaning in that language the breaking up of the ice in a harbor or river, but introduced into English by geologists to express any sudden flood of water, which bears before it opposing obstacles, and leaves its path marked with confused and scattered fragments of rocks, stone, and other débris.

DEBATABLE LAND, a tract of land chiefly level and of a moory character, but now in course of improvement, on the western border of England and Scotland. This tract of country, situated between the Esk and Sark, was at one time claimed by both kingdoms, and hence its name. In 1542, "it was divided by royal commissioners, appointed by the two crowns. By their award, this land of contention was separated by a line drawn from e. to w. betwixt the two rivers. The upper half was adjudged to Scotland, and the more eastern part to England. Yet the Debatable Land continued long after to be the residence of the thieves and banditti to whom its dubious state had afforded a refuge.—The jest of James VI. is well known, who, when a favorite cow had found her way from London back to her native country of Fife, observed 'that nothing surprised him so much as her passing uninterrupted through the Debatable Land.'"—Scott's *Minstrelsy of the Scottish Border*. The Græmes, a troublesome clan of freebooters who inhabited the D. L., were transported to Ireland at the beginning of the 17th c., and prohibited from returning on pain of death. See BORDER.

DEBATE is an exchange of opinions, differing from conversation in this, that the speakers succeed one another according to certain regulations, and that the subject is treated formally, and in general with a view to coming to some practical conclusion. The term is usually understood of the discussions of political representative bodies. The debates of the English parliament are divided into two stages. The first concerns the general principle of the measure, and is conducted with strict parliamentary formalities; when this is carried, the details are discussed in a committee of the whole house, when a less formal and more free interchange of opinions is admitted. Parliamentary debates are sometimes decried by men of absolute tendencies as useless, and even mischievous. How, it is said, can a couple of speeches, *pro* and *con*, produce a rational conviction on any subject; it is more likely that the judgment will be run away with by specious oratory. But this proceeds upon a false conception of the great object of public D., which, though it seldom influences the votes on the actual question, serves to justify the proceedings of public men to their constituents, and forms one of the chief aliments of public opinion and of the political life of a community.

DE BAY, MICHAEL. See BAJUS, *ante*.

DEBENTURE. There are two kinds of documents to which this term is applied, which may be described separately.

Excise General D.—This is a certificate authorizing the exporter of certain classes of goods to receive a drawback equal in amount to the excise duties which had been paid on them. The object of the document is to certify two things—first, that the excise duties had actually been paid; and, second, that by a certificate from an officer of customs the goods had been shipped, and *bonâ fide* exported to foreign parts, and not relanded in Great Britain. This kind of D. is executed by an officer of excise (inland revenue); it is partly printed and partly written on a sheet of stamped paper, for which the exporter pays. As concerns the export of beer, there is an excise D. slightly differing in form.

Railway D.—This is the term applied to a deed of mortgage given by a railway company for borrowed money. By virtue of acts of parliament constituting, and giving additional powers to, a railway company, the company is authorized to borrow a specified sum (see CAPITAL ACCOUNT, also RAILWAYS, Legislation and Management). The deed by which the loan is effected is simple in its appearance and nature. It consists of a sheet of paper duly stamped; and its contents, embraced in a single page, are partly printed and partly written. All expenses connected with it, brokerage included, are borne by the company. At the head of the deed is the name of the railway company, in large letters, with the words Mortgage, No. —, and the amount in figures. It then proceeds: "By virtue and in terms of an act, etc. [the act or acts being recited], We, the —— railway company, in consideration of the sum of ————, paid to us by ————, mortgage the said undertaking, and all the tolls and sums of money arising by virtue of the said acts, and all the estate, right, title, and interest of the company in the same, to hold unto our said assignee, ————, until the said sum of ———— ——, together with interest for the same, at the rate of ———— for every hundred pounds by the year, payable as hereinafter mentioned, be satisfied. And it is hereby stipulated that the said principal sum shall be repayable, and the said company are hereby bound to repay the same on the [here date of repayment is inserted]. But if the parties hereto shall mutually think fit, the same shall thereafter remain as a loan to the said company, for such further period, and at any such rate of interest, as shall be mutually agreed upon by a minute indorsed hereon to that effect, and signed by us and our said assignee, or ————. And in respect of the interest to become due on the said principal sum at and prior to the said [date of repayment], the said company shall pay to the bearer of the interest-warrants herewith issued, the several sums contained in such warrants, at the times therein respectively specified. In witness whereof, these presents written, in so far as not being printed, on the face of this sheet of stamped paper by [here follow the name of secretary of the railway company, the name of place, date, and the signatures of three directors, with the signatures of witnesses]." Such is a railway debenture. Along with it are given warrants for the payment of interest at the periods specified, which are paid on presentation. These interest-warrants, which are sometimes called coupons (q.v.), are small slips of paper bearing the sum, date, and signatures. The object in giving them to the debenture-holder is to save him all trouble. They are paid to any one presenting them.

Brief, simple, and effective, a railway D., with its accompanying interest-warrants, is perhaps the most convenient deed of mortgage ever invented. In few and unequivocal words, it pledges the whole railway for the loan, and it must necessarily be redeemed before any shareholder can claim a dividend from the undertaking—each D. ranking according to its number. Railway debentures are, therefore, reckoned a safe form of investment, and are eagerly taken up by individuals who have sums of a few hundred pounds to lend for several years at a stipulated rate of interest. These debentures possess the further advantage of being salable, and through the agency of stock-brokers they pass from hand to hand. In the event of neither interest nor principal being paid, the holder is entitled to enforce the mortgage. Similar debentures are

issued by various public trusts under statutory authority, and by joint-stock companies, in virtue of contracts pledging the credit of the undertaking. W. C.

DEBENTURE (*ante*), in the United States, a certificate given in pursuance of law for a sum due by the United States, payable at the time specified, to an importer for drawback of duties on merchandise imported or exported by him, provided the duties chargeable on the importation or exportation of such merchandise shall have been discharged prior to the time aforesaid.

DEBLAI', in fortification, is any hollow space or excavation in the ground made during the construction of fortifications or siege-works. The cavity itself is the D., while the earth taken from it is the *remblai*.

DEB'ORAH (Heb. signifies a *bee*), a Hebrew prophetess, the wife of Lapidoth, who lived in the time of the judges. She dwelt in Mt. Ephraim, and uttered her judicial oracles from her tent under the palm-tree between Bethel and Ramah. To deliver her land from the oppressive yoke of the Canaanites, under which it had groaned for 20 years, D. called to her aid Barak, son of Abinoam, probably a man of heroic temper. An army was raised among the tribes of Naphtali and Zebulon, and a battle took place in the plain of Esdraëlon, where the Canaanitish host was completely routed, and Sisera during his flight, as D. had predicted, was murdered by a woman. This victory secured to the Israelites a peace of 40 years' duration. The "Song of Deborah" (as it is generally called, though its composition is not ascribed to her in the book of Judges) is a choice fragment of primitive Hebrew poetry.

DEBOUCH ING, in military tactics or evolutions, is the marching out of a body of troops from a wood, defile, or other confined spot, into open ground.

DEBREC'ZIN, a large straggling t. of Eastern Hungary, situated in the midst of an extensive plain, about 120 m. e. of Pesth. Like many of the Hungarian towns, D. is a mere collection of villages, united on no particular plan. The houses for the most part are mean structures of not more than one story in height, and the streets, if such they can be called, being unpaved, are exceedingly dirty; in certain seasons of the year, planks are laid down to enable passengers to cross. Notwithstanding its generally squalid character, however, D. is possessed of some very handsome public buildings, including a town-hall, a Protestant college, with a staff of 24 professors and 2,000 students, and several churches, monasteries, and charitable institutions. A bronze statue to the popular poet, Csokonaij, was erected in 1871, and there is also a monument, consisting of a dying lion on a pedestal of rock, to the Honvéds, who fell at the battle of D. in 1849. The inhabitants, who are very industrious, are dependent chiefly on agriculture, but a number of them are engaged in the manufacture of coarse woolens, sheepskins, leather, earthenware, soap, saltpeter, and tobacco-pipes, which are famous throughout Hungary. The cattle and swine markets of D. are among the most extensive in Europe, and its grain market is also large. The pop. of D. in 1869 was 46,111. With the exception of 2,000, its inhabitants are all Protestants. They have suffered much on account of their faith, especially in 1567 and 1686. D. took a prominent part in the revolution of 1849, and was for some months in that year the seat of the national diet, after it had been forced to remove from Pesth.

DEBRUISED, a term peculiar to English heraldry, used to indicate the grievous restraint of an animal, and its being debarred of its natural freedom by having any of the ordinaries laid over it (*Dictionary of Display*).

DEBT, that which one person owes to another, or the duty which, as responsible beings, all owe towards God. Life is figuratively spoken of as a loan, and the act of dying is called "paying the debt of nature." More commonly, however, the term D. is limited to money legally due, and exigible by process of law. To speak in legal phraseology, D. may originate either in agreement or by operation of law, or as a consequence of injury, though in the latter case it more commonly assumes the form of a claim for damages (q.v.). Liquidated D. (in Scotland, liquid), is where the exact amount has been ascertained; contingent D., is where the liability depends on the occurrence of an event which may or may not happen; future D., is where the liability is existing, but the time for payment has not yet arrived. This may, in Scotland, be secured by certain legal processes, entitled arrestment and adjudication (q.v.): but in England there is, in general, no method of affixing a liability upon property before the D. becomes payable, except in the case of bankruptcy, when a future or contingent D. may be proved against the estate, as in Scotland. The main division of debts in Scotland, however, is into movable and heritable—the former being in themselves chargeable only upon the debtor's personal funds, although they may, by certain forms of law, be made also a charge upon his real estate; and the latter being directly and immediately a charge upon his real estate. The former are, accordihgly, esteemed as personal estate so far as regards succession, while the latter are considered as heritable or real property. In England, also, a D. may be secured on the debtor's real estate, as by mortgage; but the distinction is less material as regards succession, for even mortgages are accounted personal estate in the hands of the creditor. In Scotland, on the other hand, there is no distinction corresponding to the fundamental division of debts in England into simple contract debts and specialty debts. The former are all debts which arise without the interven-

tion of a *deed* (q.v.), or before judgment; and it is only of late years that they have been made recoverable against the heir of the debtor. Such a D. does not by law carry interest. A specialty D. is one constituted by deed (q.v.), or by a record of court, as a recognizance, or by a judgment of a court. The former carries interest from its date, and a judgment D. carries interest from the date of the judgment at 4 per cent. It binds all lands of which the defendant is possessed, either in law or equity; but to make this effectual against purchasers, the judgment must have been registered in the common pleas, and the registration must be renewed every five years.

DEBT (*ante*), as in England so in the United States, a debt is "something owed;" in contracts, a sum of money due by certain and express agreement; in general, all that is due a man in any form of obligation or promise, or any claim for money. An *active* debt is one due a person. A *doubtful* debt is one the payment of which is uncertain. A *hypothecate* debt is one which constitutes a lien upon an estate; a *judgment* debt is one which is evidenced by matter of record; a *liquid* debt is one which is immediately and unconditionally due; a *passive* debt is any one which a person owes; a *privileged* debt is one which is to be paid before others in case a debtor is insolvent; the privilege may result from the character of the creditor, as where the debt is due the United States, or from the nature of the debt, as when it is for funeral expenses. A debt may be evidenced by writing under seal, or by a simple contract. The distinguishing and necessary feature is that a fixed and specific quantity or sum is owing, and no future valuation is required to settle it.

DEBT, ACTION OF, in England. This lies for the recovery of a debt in its technical sense, of money ascertained in amount due by one to another. Where this has been ascertained by a bond for the amount, or by a judgment of a court, action of debt is in general the only proper action; but in the case of the debt arising from breach of contract under seal, it may generally be sued for either by an action of debt, or by one of covenant; or where the contract was not under seal, by an action of debt, or one of assumpsit. Actions of debt, when on contract under seal, must be brought within 20 years; on other contracts, within six years. The time in both cases is taken from the accruing of the cause of action—i.e., the breach of contract; but if a subsequent acknowledgment in writing has been made by the party liable, or he has paid the debt in part, or paid interest, the time will run from such subsequent act. In an action of debt, the writ by which it is commenced must be indorsed with a note of the amount of the debt, and of the costs of the writ, and an intimation that, if these are paid within four days, no further proceedings will be taken.

DEBT, NATIONAL, is the amount which any state admits itself to owe to those who may have advanced money for the use of the government on occasions when its expenditure has exceeded its ordinary income. As in the case of individual debtors who sometimes engage to pay more than they obtain from the lender, the amount of a national debt may not be the amount which the nation has borrowed; it is often greater, from the necessity of holding out to capitalists, as an inducement to make a large advance, that they will be set down as creditors for more than they have given. On the other hand, it may happen, though of rare occurrence on a large scale, when money is bearing low interest, a nation may give its creditors the alternative of receiving payment, or allowing a deduction from the nominal amount of their debt, and they may prefer the latter alternative. When the term, "the national debt," is used by itself, it is always understood to refer to that of our own country, which until recently was the heaviest in the world. It amounts, in round numbers, to 731 millions of pounds. It is now exceeded by that of France. That country having been entirely bankrupt during the first revolution (see ASSIGNAT), its existing debt may be said to date no further back than the consulate, when credit was restored. On the first return of the Bourbons, before the battle of Waterloo, it amounted to 123 millions of pounds; it had increased before the Franco-German war to 460 millions; and between 1870 and 1876, it mounted up to 936 millions. The debt of the kingdom of Italy is very large in proportion to its resources, amounting to 395 millions at the end of 1874. That of the Austrian empire, exclusive of the special debt of Hungary, amounted, on 1st July, 1873, to 306 millions, and a foreign loan of 12 millions was added in Nov., 1873. The separate debt of Hungary amounted, in Nov., 1873, to 27 millions. Spain, the most heavily indebted country in Europe, in proportion to its resources, had, in 1875, a debt of about 375 millions, an increase of 114 millions in two years. Turkey is believed to have a debt of about 197 millions, of which 184 millions consist of foreign loans. The debt of Russia is estimated at 133 millions. Holland had not long since a debt of 100 millions; it is being rapidly reduced from year to year, and now amounts to 78 millions. The debt of Prussia in 1874 was 45 millions; that of the annexed states, which it was arranged, on the enlargement of Prussia, should bear only the burden of the obligations incurred on their behalf, 7 millions. At the end of 1871, the German empire had a debt of 35 millions, incurred for extraordinary expenditure on the army and navy, the whole of which has since been discharged. The debt of the United States of America, in 1862, was 107 millions. In 1866, at the close of the civil war, it had mounted up to 580 millions. Since that time, the surplus of every year's revenue has been devoted to its gradual reduction, and on 1st July, 1877, its amount was 412 millions of pounds.

The national debt of the United Kingdom has risen along with the supremacy of parliament and the necessity for a standing army. Through the reigns of the Tudors and the Stuarts, the nation's protection against the power of the crown was the absence of a standing army, whose existence was regarded with great jealousy by the commons. But when the control of parliament over the prerogative was strengthened, jealousy in this direction was no longer necessary. Accordingly, it was when parliament triumphed in the revolution settlement that the national D. began. The first regular loan was obtained in 1693; it consisted of the capital of the newly created bank of England, amounting to £1,200,000. This accommodation to the government was, in fact, the price paid by the bank for its privileges. As the nation was engaged in an expensive war, this beginning was rapidly followed up, and at the peace of Ryswick, in 1697, the national D. exceeded 20 millions. Before the accession of the house of Hanover in 1714, it had exceeded 50 millions, and the rapid rise of this burden was a strong argument in the hands of the Jacobites against the revolutionary settlement. Whenever a loan was negotiated by the government, special terms were offered according to circumstances. In one case, there might be a terminable annuity, say of 60 or 100 years—that is to say, a certain percentage being paid during that period, at the end the D. was to be extinguished by such payments. See ANNUITY. In other instances, there was a perpetual annuity. In a loan negotiated on the latter terms, that annuity was always rather under than above what a borrower would give to a private lender, although such a borrower was bound to repay the money, while the nation was not. It came to pass, in fact, through one of the most curious processes in the whole mystery of finance, that a loan never to be repaid was considered a more eligible investment than a loan to be repaid. The government made this gain—for a distinct gain it was—by the convenience to the public, who, always having money for which they were glad to get the secure interest of the funds, were always ready with a new lender when the old one wanted to be paid. Hence has come the perpetual shifting of the fundholders. And as long as there are moneyed persons who will buy thus into the stocks without any considerable reduction, there is a sure test that the debt is not beyond the capacity of the nation. Raised, however, as we have seen, by special loans, each on its own conditions, the different funds became exceedingly varied and complicated. It was one of the projects of the great South sea schemers of 1720, to conjoin them all into one uniform fund, but this plan was interrupted by the failure of the whole affair. Afterwards, in 1751, a general uniform arrangement was carried out, and the stocks were then called the consolidated fund. See CONSOLS. Meanwhile, the progress of the national D. was in round numbers as follows: In 1756, when the war of the Austrian succession began, it was 75 millions; and seven years afterwards, when this war ended, it was 140 millions. Increased by the American war and the war with France and Spain, memorable by the defense of Gibraltar, it had increased to the amount of 260 millions when, in 1793, the great European war of the French revolution broke out. At the peace of Amiens in 1803, the D. was 620 millions. When the treaty of Vienna was resumed, after the battle of Waterloo, the amount had risen to 885 millions. It has since decreased, although some further loans have been incurred. The largest of these is connected with one of the most honorable actions of which the British empire, with all its traditions of glory, can boast—the advance of 20 millions, in 1834, for the emancipation of the colonial slaves. The latest considerable addition made to the national D. was during the Russian war of 1854, when 16 millions were raised by loan. In 1857, the amount of the D. was close to 812 millions, but till 1878 has steadily decreased. In that year the unfunded D. (owing to the war in the east and the inelasticity of the revenue) became nearly as large as in 1858. In 1878, the "funded debt" was £710,843,007; unfunded (exclusive of annuities), £20,603,000. The distinction between the two is, that the government do not profess to repay the former—they only give the creditor an annuity, terminable or perpetual, and if he wants payment of his money, he can only get it by selling his right to this annuity; the other consists of temporary loans, liable to fluctuation, and renewed from time to time.

It must be kept in view, however, that from a peculiarity of phraseology, the enormous amount of the national D. is partly fictitious, the whole sum neither having been borrowed nor being virtually due. When capitalists have advanced money, they have been content with a small percentage—3 or 3½—but they have often insisted that for each £100 advanced by them, they should have more than £100 of actual stock. If the condition of the market were such that the capitalist wanted 4½ per cent, and the interest or annuity obtained by him was only 3 per cent, he would insist on having stock to the extent of £150 for his £100. If 5 per cent interest were paid on the nominal amount of the national D., it would be a charge of more than 40 millions a year—the actual burden is between 26 and 27 millions. Such is, however, the reliance on the national credit, and the convenience of having the stocks for investment, that the stockholders are content with little more than 3 per cent interest, the right to an annuity of £3 being actually to be procured for somewhere about £90.

The literature of the country has teemed with projects for getting rid of the incumbrance of the national debt, many of which go far wide of the mark, from the supposition that the debt is the incumbrance. In fact, the incumbrance is in the expenditure—the sacrifice of the nation's capital which has caused the debt—the debt itself is merely the shape in which that loss presses, and it must press in some shape. The millions

have been exploded in powder and shot, and in other extravagances, and can never be recalled; all that we can do is, by industry and frugality, to make new millions, and replace the loss. Hence it is the supremest folly to suppose that the nation would profit by abolishing or wiping off the national debt—by repudiation, as it is called. Such an event would only be ruin to a large number of people who are in the position of being the nation's creditors, and would perhaps bring ill-gotten gain to a small number. It would be difficult to estimate precisely how such a calamity would act. In the first place, if it were seen to be in prospect, the funds would go rapidly down by the holders selling out, so that as long as the chances of stability would induce any one to buy at a very reduced price, the circle of sufferers would be, as it were, widening. The poorest of those interested would be the chief sufferers in the awful scramble. The working-classes, besides any savings which they might have directly invested in the funds, would lose about 40 millions, which they have invested through savings-banks and friendly societies. Widows and unmarried women with narrow fixed incomes would be the next sufferers. It is unnecessary to go further; for the general paralysis of capital and stoppage of manufacturing industry, along with loss of national reputation, would be incalculably disastrous. There is no way of reducing the national debt, except by saving up through taxation from the expenditure of the country. The process of reduction in this form is, however, always met by the consideration, whether the repeal of a disadvantageous tax, or the reduction of the interest of the D., is the better alternative. One thing is very clear, that from the progress of general wealth and increase of population, the national debt, assuming it to remain at its present amount, is always pressing with less and less severity on the country, and is therefore becoming more and more manageable. Some persons, looking at only one side of the matter, have gone the length of saying that, as a ready and safe means of investment, the national D. is a kind of blessing; though the slightest consideration would have shown, that it can never be advantageous for the community at large to be taxed to pay interest to a limited number of individuals. Whatever be the incidence of taxation to pay the interest, now amounting in the aggregate to about £27,000,000 per annum, it is the proud boast of England that she has ever kept faith with the national creditors—never, under all her embarrassments, repudiated a farthing of her debt. As a natural consequence, the British funds are sought as a secure means of investment by people of capital in all lands. On the reduction of the D., see the article FUND.

DEBT, NATIONAL (*ante*). The public debt of the United States was first reported, 1791, two years after the organization of the government, at $75,463,476.52. In 1812, at the commencement of the second war with England, it had fallen to $45,209,737.90. That war brought it up to a total of $127,334,933.74. After peace, the reduction was from $3,000,000, to $10,000,000 per year until in 1836 it reached its lowest point, being only $37,515.05. Thenceforward it increased one year and decreased the next, until in 1860, the year before the rebellion, it was $64,842,287.88, and the annual interest was $3,443,687. This was a rate per capita on the whole population of $1.91 debt and 11 cts. interest. The most powerful rebellion which ever rose against a modern government, made the raising of enormous sums of money an imperative necessity. Two small loans had been made just before; in 1858, $20,000,000 in 5 per cts., and in 1860, $21,000,000 in 6 per cts., the first to run 15, and the last 20 years. Of the last loan, only $7,022,000 was issued. Of the loans made necessary by the war of the rebellion, the first was Feb. 8, 1861, $25,000,000 at 6 per ct., to run 20 years, of which $18,415,000 was reissued. Mar. 2, 1861, six per ct. treasury notes were authorized, and $35,264,450 issued. Same date, $1,095,850 reissued to pay the Oregon war debt. July 17, 1861, $250,000,000, at 7 per ct., to run 20 years, with authority to issue any part in the form of treasury notes running three years at 7 3-10 per ct. interest, or on notes not bearing interest, but payable on demand, or in treasury certificates for one year bearing 3 65-100 per ct. interest; the whole amount of demand notes not to exceed $50,000,000. An act of Aug. 5, 1861, authorized the issue of 6 per ct. bonds, running 20 years, to exchange for the one and three year notes just mentioned, with accumulated interest, at any time before their maturity; and the demand notes were made receivable for all dues to the government. Before the close of the year, the demand notes, at first rejected by the banks, were at a premium, and the interest-bearing notes were readily convertible into permanent 6 per ct. bonds. Feb. 12, 1862, $10,000,000 more of demand notes were issued. In the same month the first great war loan was authorized—$500,000,000 of 6 per ct. bonds, redeemable after five and payable after 20 years. The loan was readily taken, and the full amount was issued. In 1864–65, $15,000,000 more was authorized of the same loan. In Feb., 1862, $150,000,000 of legal-tender notes were authorized, of which $50,000,000 were to take the place of demand notes. In July, 1862, $150,000,000 more were authorized; and an equal amount in addition in Mar. 1863; making $450,000,000 in all. Those issues formed the currency known as "greenbacks," from the color of the paper. An act in Feb., 1862, authorized the acceptance of $25,000,000 of deposits, increased in Mar. to $100,000,000, on which 5 per ct. interest was paid. In June, 1864, $50,000,000 more was authorized at 6 per cent. This was a temporary loan, to be repaid on ten days' notice, and was all redeemed before the close

of 1866. In Mar., 1862, congress authorized the issue of certificates of indebtedness to public creditors in the adjustment of claims, running one year at 6 per cent. There were $561,753,241 issued, all redeemed before 1866. In July, 1862, postage-stamps were issued for currency, and made a legal tender for sums less than $5. In Mar., 1863, fractional currency was authorized in place of postage-stamps, the amount limited to $50,000,000. In Mar., 1863, a loan of $900,000,000 was authorized, principal and interest payable in coin; but only $75,000,000 was issued. The same act authorized $400,000,000 in one, two, and three year treasury notes, interest not over 6 per ct., payable in ordinary money, and to be a legal tender for their face value. The actual issues were: of one-year notes at 5 per ct., $44,520,000; two-year notes at 5 per ct., $166,430,000; three-year notes at 6 per ct., $266,595,440, making the whole issue $477,595,400; all canceled or exchanged before May 15, 1868. In Mar., 1864, a loan of $200,000,000 was authorized at 5 or 6 per ct., principal and interest payable in coin; $196,117,300 were issued at 5 per ct. to run 40 years (the 10-40s of 1864), and $3,882,500 at 6 per cent. Most of the 5 per cts. brought premiums from 1 to 7 per cent. In June, 1864, a loan of $400,000,000 was authorized at 6 per ct. (the 5-20s of 1864), of which $121,561,300 was issued. In June, 1864, congress authorized the issue of $200,000,000 in 7-30 treasury notes, and in Mar., 1865, the sum was increased to $600,000,000 more. The whole issue was $829,992,500 of 7-30 interest-bearing notes, and the whole loan was redeemed by the middle of July, 1868. In Mar., 1865, a loan was authorized of $600,000,000 in 6 per ct. 5-20 bonds, to be used only for the payment of treasury notes or other obligations of the nation. Two issues were made: July 1, $322,988,950; and Nov. 1, $203,327,250. Under the same act, an issue was made in July, 1867, of $379,616,050, and in July, 1868, $42,539,350, all to redeem treasury notes and other obligations; but in no case to increase the public debt. In Mar., 1867, and July, 1868, there were issued $85,150,000 of temporary loan certificates of deposit, bearing interest at 3 per ct., to redeem compound-interest notes. In July, 1870, the great refunding act was passed. The secretary of the treasury was authorized to issue $200,000,000 at 5 per ct.; $500,000,000 at 4½ per ct.; and $1,000,000,000 at 4 per ct. of 30-year bonds, principal and interest payable in coin, to be used only to redeem the 6 per ct. or other early bonds. Besides these issues, there were guarantee bonds issued to the Pacific and other railroads, secured by mortgage on the roads. In Jan., 1871, the 5 per ct. bonds were increased to $500,000,000.

These enormous financial transactions have no parallel for extent in the world's history. Yet for a time there was much fear that such loans could not be floated; but when they were proved possible without recourse to the capitalists of foreign countries, the loyal people of the union had abundant cause for congratulation. The loan of 1862, $515,000,000, was the greatest in amount and the most successful thus far attempted. Afterwards, however, loans were not easily made, and the government was compelled to resort to currency and treasury notes, and also compound-interest notes, and certificates of indebtedness. The greatest test of the financial strength of the nation fiercely struggling to maintain its political existence, was in 1864. On the 11th of July, in that year, gold touched its highest point, $2.85; and a paper dollar was worth in gold only about 38 cents. Holders of government securities became uneasy, and even small temporary loans were placed with difficulty. Towards the close of the year, however, there was a gradual reaction; it was plain that the rebellion must soon collapse; gold fell rapidly, and currency rose correspondingly; and it became evident that no more large loans would be required.

The various bonds constituting the bulk of the public debt have always borne a premium in current money, and have steadily increased in gold value, thus affording a striking proof of the stability of the credit of the nation. When the first purchases in extinguishment of the principal of the debt were made, May, 1869, the net cost of the bonds in gold was 83 per cent of par value; Jan. 5, 1870, 93½ per cent; Jan. 4, 1871, 97 per cent; and ever since practically at par.

Progress of the Debt.—In the following table, prepared at the treasury department, will be seen the rapid rise and gradual declension of the vast debt of the country, due entirely to the southern rebellion:

ANALYSIS OF THE NATIONAL DEBT FROM JULY 1, 1856, TO JULY 1, 1879.

Year.	Total interest-bearing debt.	Annual interest charge.	Debt bearing no interest.	Outstanding principal.	Total debt, less cash in Treasury.	Population of the United States.	Debt per capita.	Interest per capita.
1856—July 1	$31,762,761 77	$1,860,445 70	.....	$31,972,597 90	$10,965,955 01	28,668,000	$0 96	$0 07
1857	28,460,558 93	1,672,707 53	.....	28,699,891 85	9,598,621 76	28,916,000	55	06
1858	44,700,898 11	2,446,670 28	.....	44,911,881 03	37,900,191 72	29,753,000	28	07
1859	58,290,738 11	3,126,166 33	.....	58,496,897 88	53,405,594 19	30,596,000	1 75	10
1860	64,640,898 11	3,443,687 29	.....	64,842,287 88	59,964,402 01	31,443,321	1 91	11
1861	90,390,573 95	5,092,630 43	.....	90,580,873 72	87,718,660 89	32,064,000	2 74	16
1862	365,304,826 92	22,048,509 89	$158,591,300 00	524,176,412 13	505,312,752 17	32,704,000	15 45	67
1863	707,591,634 47	41,854,148 01	411,767,456 00	1,119,772,138 63	1,111,350,737 41	33,365,000	33 31	1 25
1864	1,359,930,703 50	78,853,487 24	455,437,571 21	1,815,784,370 57	1,709,492,877 01	34,046,000	50 21	2 32
1865—August 31	2,221,311,918 29	137,742,617 43	458,090,180 35	2,680,647,879 74	2,674,815,856 76	34,748,000	76 98	3 97
1865—August 31	2,381,530,394 96	150,977,697 87	461,610,311 51	2,844,649,656 56	2,756,491,571 43	35,328,000	78 25	4 29
1866—July 1	2,332,331,307 60	146,068,196 39	430,969,874 04	2,773,296,173 69	2,696,696,169 84	35,469,000	74 32	4 12
1867	2,248,067,387 60	138,893,451 59	428,218,101 20	2,678,126,103 87	2,598,151,911 69	35,911,000	69 26	3 84
1868	2,202,088,727 60	133,459,598 14	408,401,783 61	2,611,687,851 19	2,480,853,413 93	36,973,000	67 10	3 58
1869	2,162,050,523 30	125,523,998 34	421,191,510 55	2,588,482,213 94	2,432,771,873 09	37,756,000	64 43	3 32
1870	2,046,455,723 30	118,784,960 34	420,508,064 42	2,480,672,427 81	2,331,169,956 21	38,558,371	60 46	3 08
1871	1,934,696,750 00	111,918,399 50	416,565,680 06	2,353,211,232 32	2,246,964,008 67	39,555,000	56 81	2 83
1872	1,814,594,100 00	103,988,463 00	430,550,431 52	2,253,251,228 78	2,149,780,530 75	40,404,000	52 95	2 56
1873	1,710,483,950 00	98,049,804 00	472,669,332 44	2,234,482,993 20	2,165,462,003 73	41,704,000	50 49	2 35
1874	1,728,920,750 00	98,596,004 50	500,549,128 17	2,251,090,408 43	2,104,149,153 69	42,856,000	49 10	2 31
1875	1,723,676,500 00	96,856,690 50	498,182,411 60	2,232,294,591 95	2,090,041,170 12	44,060,000	47 44	2 19
1876	1,710,685,450 00	95,704,369 00	495,867,196 63	2,189,595,196 95	2,060,925,850 25	45,316,000	45 46	2 10
1877	1,711,888,500 00	95,160,633 50	476,764,681 84	2,205,301,392 10	2,019,275,491 97	46,624,000	43 31	2 00
1878	1,784,735,950 00	94,654,472 50	455,875,682 37	2,256,205,832 53	1,999,382,970 45	47,982,000	41 67	1 97
1879	1,797,613,700 00	83,773,778 50	410,895,741 73	2,245,495,672 04	1,996,414,905 03	49,385,000	40 42	1 69

The progress of refunding is shown by the statement that on July 1, 1879, there had been issued of 4 per cent bonds, $741,523,000; of 4½ per cent, $250,000,000. The other bonds then out were, of 3 per cent (navy pension fund), $14,000,000; of 5 per cent, $508,440,000; of 6 per cent, $283,681,350, the total of all being the interest-bearing debt. By reference to the last two columns of the table a clearer idea may be had of the effect of the debt on the people than by the study of the great mass of figures. The very highest point of the national debt was reached on the last day of Aug., 1865, when the total was (less cash in the treasury) $2,756,431,571.43. This gave as the average of national debt for every person in the United States, $78.25, in addition to which there was the annual interest charge of $4.29 for each person. In 14 years (less one month) the debt was brought down to $1,996,414,907.03—a reduction of $760,016,664.40; a decrease of more than 27 per cent, while the interest charge, mainly through refunding at lower rates, had been brought down from $4.29 to $1.69 per capita, a reduction of nearly 40 per cent.

DEBTOR AND CREDITOR, LAWS OF. In the history of this, as of almost every other branch of jurisprudence, we may, if we will, trace the march of social progress in general. In the earlier stages of life in the state, the arrangements for borrowing and lending are rarely such as to enable the citizens to avail themselves with security of

their mutual resources, or to assign such limits to the powers of the creditor as either the claims of humanity or his own true interests demand. On the one hand, lending is confounded with alms-giving; and the exaction of interest, and even of capital, is regarded as an act of inhumanity towards the poor. On the other hand, no sooner do the creditor's rights come to be recognized in anything like a legal sense, than there seem to be no logical grounds on which any limits can be set to them. If he is entitled to exact the debt at all, he is entitled to seize the goods of the debtor; and if the debtor has no goods, he is entitled to his services. But the possession of his services implies the possession of his person; and the possession of his person implies the possession of his life. Moreover, from the exaggerated notions of the domestic ties which usually prevail in early times, the person of the individual, where that individual is the father of a family, brings along with it that of his wife, his children, and his slaves. The creditor thus becomes the absolute master of the life and liberty of his debtor, and of all those who are dependent upon him. The arrangements of the Mosaic law are an illustration of the manner in which, in the ruder forms of society, the laws of debt thus combine a degree of lenity with a degree of severity which are equally alien to modern views. In this as in many other respects, they are, as Michaelis has pointed out (vol. ii. p. 300), a recognition of the consuetudinary law of the stage of society to which they belonged, rather than a system special to the Jews. If an Israelite became poor, it was a duty to lend to him, and no interest was to be exacted either in money or in produce. If he was a foreigner, the case was different, and the taking of interest was legal (Exod. xxii. 25; Deut. xxiii. 19, 20; Lev. xxv. 35–38). When the Sabbatical year arrived—i.e., at the end of every seven years—there was a general remission of debts as between Israelite and Israelite; and the near approach of the year of remission was not to be recognized as an apology for declining to lend to an indigent brother (Deut. xv. 1–11). Pledges, it is true, might be taken, but even here the same humane principles prevailed. The upper millstone was sacred, for to take it would be to deprive the debtor of the means of subsistence. If raiment was the pledge, it must be returned before nightfall, when it might be required for a covering; and the widow's garment could not be taken in pledge (Exod. xxii. 26, 27). In strange contrast to this is the provision (Lev. xxv. 39) that a poor Israelite may be sold to one possessed of substance, even when modified by the special provision that he shall serve as a hired servant, not as a bond-servant, and shall be set at liberty when the year of jubilee arrived. Michaelis says that the judicial procedure for debt was quite summary, the most important causes being decided probably in a single quarter of an hour; and he remarks that Moses nowhere thinks it necessary to mention how a debt was to be proved before a judge. There was, however, an extensive system of appeal; from the judge over 10, the case was carried to the judges over 50, 100, and 1000, and finally to Moses himself. As every Israelite was entitled to claim the land of his fathers at the jubilee year, and thus to place matters on the footing on which they were after the settlement in Palestine, debts and burdens on land were limited to claims to the fruits of forty-two harvests; but houses, with the exception of those of the Levites, might be sold in perpetuity (Lev. xxv. 29, 30, 32, 33). Children were often given in pledge (Job xxiv. 9), and ultimately into slavery, in payment of debt (2d Kings iv. 1). Subsequent to the captivity, the pressure of debts upon the poor became so intolerable, that Nehemiah espoused their cause, and insisted on a general remission (Nehem. v.), exacting from the rich an oath that they would never afterwards press for payment. Debts of the character here alluded to probably resembled those which the recipients of parochial relief in our own day owe to the community, rather than debts in the commercial sense. In Matt. xviii., Christ refers to the custom of selling the debtor, his wife and children, and all that he had, in payment, rather as a general custom of all nations, than as one peculiar to the Jews—the "certain king" being a typical instance of a man of substance.

Both in Greece (Plut. Vita Solonis 15) and in Rome (A. Gell. xx. 1, 19; Liv. ii. 23) the creditor had a claim to the person of the debtor. Previous to the time of Solon, this arrangement had produced consequences at Athens closely analogous to those which afterwards led to the struggles between the patricians and plebeians at Rome; and his abolition of it forms one of Solon's many claims to the character of an enlightened legislator. By the Twelve Tables, it was enacted at Rome that if the debtor admitted the debt, or had had judgment pronounced against him for it, thirty days should be allowed him for payment. At the expiration of that period, he was liable to be given into the hands of his creditor, who kept him sixty days in chains, exposing him from time to time publicly, and proclaiming his debt. If no one stepped in to release him, the debtor at the end of that time might be sold for a slave, or put to death. If there were several creditors, the letter of the law permitted them to cut their debtor in pieces, sharing him in proportion to their claims; but Gellius tells us that no Shylock ever was found at Rome. To treat him as a slave, however, and make him work out the debt, was the common practice; and the children in his power, in accordance with the whole constitution of society at Rome, followed his condition. The lex Pœtelia (326 B.C.) alleviated the condition of the debtors (*nexi*) to the extent, at least, of preventing summary imprisonment, and relieving all debtors, for the future, from being put in chains. There do not seem to have been any public prisons for debtors at Rome, and each creditor, consequently, was the jailer of his own debtor. In this circum-

stance we probably see the reason of the prominence which was given by the plebeians to a change in the laws of debtor and creditor, on the occasion of their first secession, in 494 B.C.; and subsequently during the whole course of the struggles between the two orders. Whatever we may think of the policy of limiting the rate of interest, as was afterwards done by the laws of Licinius, and had previously been done by those of Solon at Athens, there can be but one opinion in modern times as to the propriety of abolishing the right of private imprisonment.

During the feudal period, the person in general was not attachable for debt, imprisonment being inconsistent with the duties of warlike service, to which every man was bound; and it was for the encouragement of commerce, and in consideration of the merchant having to deal with strangers and foreigners, that it was first introduced by the mercantile communities of Europe (Bell's *Commentaries*, Shaw's ed. ii. p. 1067). By the statute of merchants, it was enacted, at Acton Burnel, in 1282, that in lending money, a merchant might bring the borrower before the lord mayor of London, or the chief warden of another good town, and cause him to acknowledge his debt and day of payment. A recognizance was then enrolled, and an obligation written by the clerk, and sealed with the king's seal and the debtor's. Failing payment, the creditor was entitled to produce this obligation, and to demand a warrant to seize the person of his debtor, and to commit him to the Tower. The history of the law of imprisonment for debt in this country is stated with great clearness by Mr. Bell in the section of his *Commentaries* to which we have just referred, but it is impossible to condense it within the limits of the present article. Further information on the subject will be found under IMPRISONMENT, DILIGENCE, EXECUTION, SANCTUARY, INSOLVENCY, etc. Generally, it may be stated here, that up to the passing of the later bankrupt acts, the prisons of this country were crowded with debtors. It was ascertained by parliamentary returns, that in the 18 months subsequent to the commercial panic of 1825, 101,000 writs for debt were issued from the English courts. In the year ending 5th Jan., 1830, there were 7,114 debtors sent to prison in London, and on that day 1545 of these were still in confinement. The returns for 1870, which do not distinguish between debtors and other civil prisoners, are as follows: The number of debtors and others under civil process in prison was for England and Wales, 8,804; Ireland, 694; Scotland, 727. See DEBTS, RECOVERY OF.

DEBTOR AND CREDITOR, LAWS OF (*ante*). In the United States, debtors find relief under insolvency laws, besides that afforded by a national bankrupt law when such is in existence. The laws vary somewhat. In California, Maryland, Minnesota, New York, and Wisconsin, an insolvent debtor may be discharged upon petition and upon making an assignment of all his property (except certain articles necessary for the support of himself or his family) for the benefit of his creditors equally. The same benefits are secured: in Alabama, to one imprisoned on a judgment for not paying a fine; in Arkansas and Illinois, to one imprisoned or liable to be arrested; in Connecticut, to one owing $100; in Delaware, to a resident of the state for one year who is imprisoned, unless committed by the chancery court; in Georgia, to one who has not within a year lost money by gambling; in Massachusetts, to an inhabitant who owes more than $200; in Missouri, to one imprisoned for fines, costs, or breach of the peace; in North Carolina, to one imprisoned 20 days; in Ohio, to a resident of the state for two years, or of the county for six months, or in custody after 60 days; in Pennsylvania, to a resident of the state for six months, or who had been in jail three months, or is detained on civil process, held on bail prise, or not arrested; in Rhode Island, to an inhabitant for three years owing more than $100 (but the court may ignore the residence); in South Carolina, to one sued, or within one month after being in custody; in Texas, to a bankrupt citizen, males at 21, females at 18. In all states, some considerable property is reserved to the debtor for the support of himself and family. When debts are fraudulently contracted, or where payment is sought to be evaded by fraud, the perpetrators of the fraud are excluded from bankruptcy and insolvency laws. With regard to the arrest of debtors, the law of the state of New York has been followed by most of the states. In New York, imprisonment for debt, except in certain cases, was abolished in 1831. In the code adopted in 1849, arrest is prohibited in civil actions, except in certain specified cases, viz.: in actions for injury to the person or character, or for injury or wrongfully taking or detaining property; embezzlement by public officers, or persons acting in a private judiciary capacity; for misconduct in office, or in any professional employment; in actions to recover possession of personal property, where it is concealed or kept out of the reach of the sheriff; and where the defendant has been guilty of fraud in contracting the debt or in avoiding payment. Women are exempt from arrest in all cases except actions for willful injury to person, character, or property.

DEBTORS, ABSCONDING. The existing laws for the arrest of debtors absconding from England having been found insufficient, in consequence of the delay which was occasioned in obtaining the necessary process, the "act to facilitate the more speedy arrest of absconding debtors" (14 and 15 Vict. c. 52) was passed in 1851. The evil was felt chiefly by creditors residing at a distance from London, whose debtors were able to perpetrate frauds upon them by embarking for distant countries from various towns and seaports in England; and authority was given to county-court judges to issue warrants

to arrest the debtors till judgment could be obtained, or the debtors found bail to meet any judgment likely to be obtained. But the legislature having since changed its views as to the general expediency of arresting and imprisoning persons for debt, the above act was repealed in 1839, and the debtors act, 32 and 33 Vict. c. 62, contains the only enactment now in force on this subject. By the 6th section, where the plaintiff in any action in a superior court of law proves, at any time before final judgment, by evidence on oath, to the satisfaction of a judge of one of those courts, that the plaintiff has good cause of action against the defendant to the amount of £50 or upwards, and that there is probable cause for believing that the defendant is about to quit England unless he be apprehended, and that the absence of the defendant from England will materially prejudice the plaintiff in the prosecution of his action, such judge may, in the prescribed manner, order such defendant to be arrested and imprisoned for a period not exceeding six months, unless and until he has sooner given the prescribed security, not exceeding the amount claimed in the action, that he will not go out of England without the leave of the court. But if the action is for a sum in the nature of a penalty, it shall not be necessary to prove that the absence of the defendant from England will prejudice the plaintiff, and the security given (instead of being that the defendant will not go out of England) shall be to the effect that any sum recovered against the defendant in the action shall be paid, or that the defendant shall be rendered to prison.

Absconding shareholders may be arrested under the provisions of the joint-stock companies act of 1857 (21 and 22 Vict. c. 14, s. 11 and 12), or their goods and chattels may be seized, if there be probable cause for believing that it is their intention to leave the country, or to carry off or conceal their effects.—As to the mode of dealing with absconding debtors in Scotland, see MEDITATIO FUGÆ.

DEBTORS, ABSCONDING (*ante*). In all the states of the union there are statutes defining this offense. It has been decided that a person who has been but transiently in a state, with no intention of making it his permanent home, or one who openly changes his residence, is not an absconding debtor, and cannot be so treated.

DEBTORS, IMPRISONMENT OF. Except in the case of fraud, no debtor can be imprisoned in England for a debt below £20, exclusive of costs. But such debtors, if ordered by an insolvent or county court to pay the debt by installments, or otherwise, may, if they make default, be committed by the court to prison for forty days. In Scotland, the limit below which imprisonment for debt is incompetent is £8 6*s.* 8*d.* In both countries, if a debtor escapes after arrest, and before imprisonment, the officer of the law charged with the execution of the process is liable for the debt.

DEBTORS, IMPRISONMENT OF (*ante*). There is little left of imprisonment for debt in any of the United States. In New York, an act for its abolition was passed in 1831. Its main provisions are that no person shall be imprisoned in civil service, at law or in execution in equity founded on contracts, except in the following cases: In actions for fines and penalties, or on promises to marry, or for moneys collected by any public officer, and in actions for any misconduct or neglect in office, or in any professional employment. Moreover, in cases of debt claimed in any suit or founded upon any judgment or decree of a court of record, the defendant may be arrested upon an affidavit of the plaintiff stating the sum due to be more than $50, and charging the commission of certain fraudulent acts; as, that the defendant is about to remove any of his property out of the jurisdiction of the court to defraud his creditors, that he fraudulently conceals property, or has assigned, removed, or disposed of it with like intent, or that the debt was fraudulently contracted. The defendant is thereupon committed to prison, unless he pay the debt and costs of the suit or give security to pay them within a certain time, or unless he make an assignment of his property for the benefit of his creditors, or give security that he will make such an assignment, or that he will not dispose of any of his property until the demands against him are satisfied. If he make such an assignment of his property, there are provisions in the act by which he may be discharged from his indebtedness. Further provisions of an analogous nature to those contained in this act were embodied in the New York code, adopted 1848. The debtor may be arrested and imprisoned either on mesne or on final process. The principal grounds of arrest are, with few exceptions, the same as those enumerated in the previous act. The defendant, when arrested upon mesne process, may be admitted to bail. The imprisonment upon final process is for the same causes, and is applicable when the execution against the debtor's property has been returned unsatisfied, in whole or in part. The most important difference between these provisions and those of the earlier statute is that, in the recent act, means are provided only for securing the payment of the debt of an individual creditor, and there is no assignment provided for in behalf of all the creditors, or any means afforded of obtaining a discharge of the debtor from all his obligations. A large number of the states have adopted similar statutes.

DEBTS, RECOVERY OF. Courts of law, besides serving to decide cases in which questions of fact or law are really in dispute, serve an important purpose in facilitating the recovery of debts, against which the debtor has no defense other than that he is unable, or unwilling, to pay. The great majority of the cases in which the services of courts are required is of this kind. The statistics of the English county courts give a striking illustration of this. Of the number of cases which are entered for judgment,

it appears that about 95 per cent end in favor of the plaintiff; whereas, had there been any question really in dispute, the defendants, with the advantages they possess, might have been expected to be at least as often right as the plaintiffs. The knowledge of this has had much to do with modifying judicial proceedings. Another cause which has operated in the same direction is, that the consequences of issuing a decree are now much less serious, as a creditor holding a judgment has not now the exorbitant powers over his debtor that he once had. The theory, accordingly, on which judicial proceedings are based, has very much changed. Formerly, lawyers thought that every case should come into court, prepared for being disputed on every point, and thus a great deal of expense was incurred before it was known whether there was to be any dispute at all. The end now in view is, that there should be a cheap means of obtaining judgment in undisputed causes; and that, at the same time, every precaution should be taken, that if the defender has any good ground of defense, he should have the opportunity of stating it; and that, when stated, it should receive due attention. Various law reforms have been carried to facilitate the recovery of debts with this end tacitly, at least, in view. In England, as might have been expected from the courts of law being situated in a great commercial capital, law reform has proceeded further in this direction than in Scotland; but in both countries, it has made great progress.

Understanding by debt the price of services rendered, or goods furnished, it may be useful to point out shortly the proceedings that must be taken to recover it. If the debt exceed £50 in amount, the creditor must, in England, proceed in one of the superior courts of law; and, in Scotland, he may proceed either before the superior court or before one of the sheriff-courts; but in any view, he must prepare for considerable expense—the services of professional advisers being in practice unavoidable—and for a more or less tedious litigation. If the debt do not exceed £50, the creditor may proceed in the English or Scotch county courts (in Scotland called the sheriff-courts), and the proceedings are simple and expeditious.

In *England*, the first step to recover a debt not exceeding £50 in the county court, is for the creditor to go to the registrar of the district within which the defender resides, or to the jurisdiction of which he is on some other ground amenable (30 and 31 Vict. c. 142 *). He there fills up a printed form, called a plaint, shortly stating the claim and the ground of it. The registrar upon this issues a summons, and gives it to the bailiff of the court, who serves a copy of it on the defendant. This summons names a day on which the parties must appear before the judge. No written pleadings are in general necessary; but if the debtor has any special defense—such as, that he has a counter-claim against the plaintiff, or that he (the defendant) was a minor at the time the debt was contracted, or that he has been discharged under the bankruptcy acts—he must give the creditor notice in writing five days before the hearing. If he simply denies the debt, he has nothing to do but to attend the hearing, with what witnesses he may require. If the witnesses are not likely to come voluntarily, summonses to enforce their attendance (as well as the production of documents) may be obtained at the registrar's office. At the hearing, the judge (unless a jury have been required) proceeds himself in a summary way to try the cause. He examines the witnesses on oath, keeping no record of the evidence; and, on hearing the parties, gives judgment at once. If he decides for the plaintiff, he may make the sum payable at once, or by installments. The costs are according to a fixed scale, which may be seen in the court or in the registrar's office.

There are provisions for parties having their case tried by jury, and also for appeal on questions of law. Either party who wishes it, may ask for a jury; and if the sum claimed exceed £5, the demand must be complied with. If there be a jury, the number of jurymen is five, and their verdict must be unanimous. The party dissatisfied with the verdict may ask for a new trial, and the judge, if he thinks right, may grant it on such terms as he thinks reasonable. This power to try by jury is used very rarely indeed—less than one per cent of all the cases which go to trial being tried in that manner. The right to appeal is against decisions in point of law, and against the admission and rejection of evidence. The appeal is to the superior courts of law at Westminster. It is taken by requiring the judge to state a case for the opinion of the higher court, and thereafter entering it for discussion there. The appellant must give security for the costs of the appeal, and (if defendant) for the amount (both of principal and costs) contained in the judgment. The right of appeal is not much exercised, and the parties have it in their power to agree beforehand (in writing) that there is to be none.

When judgment is for the creditor, and the order for payment is not complied with, execution may issue against the goods of the debtor. Although imprisonment for debt was (in the general case) abolished in England in 1869, it still remains the law that in the county courts, in certain cases, the debtor may also be imprisoned. The debtor is summoned to show cause why he has not obeyed the judgment. At this hearing (whether the debtor attend or not), the creditor may get an order to commit, if he can show to the judge's satisfaction that the debtor obtained credit on false pretences, or by fraud, or that he willfully incurred the debt without a reasonable expectation of being able to pay it, or if he have made away with or concealed any of his property to defraud

* This act contains a schedule enumerating the statutes regulating proceedings in the English county courts.

his creditors, or if he has had, since the judgment, sufficient means to pay it without defrauding other creditors, and has refused to do so. Imprisonment for debt is no longer in the option of the creditor, as it was before 1869; the power is reposed in the discretion of a judge, and can be exercised only on proof that the defaulter has the means, and refuses to pay.

Although it is competent to proceed in the county courts for sums as large as £50, they are not much used for sums above £20. When the debt does not exceed £20, there is a certain compulsitor or the creditor to resort to the county court, for if he resort to a superior court, and recover no more than that sum, he will have no costs, unless he satisfies the court that he had sufficient reason for taking that course. In point of fact, there is only about one case for a sum exceeding £20, for a hundred which do not exceed it; and the average amount sued for is between £2 and £3.

In *Scotland*, debts not exceeding £12 may be recovered in the sheriff small-debt court. The creditor takes two copies of his account to the office of the sheriff-clerk for the circuit in which the debtor lives; from him he obtains a summons, in which the day for the trial is fixed; and this summons he takes to an officer of the court (sheriff-officer), who serves a notice, with one of the copies of the account, on the debtor, at least six days before the trial. Both parties may employ an officer to cite such witnesses as they require. The creditor must appear at the trial, either by himself or by one of his family, or by such other person as the sheriff may permit. Law-agents require special permission to appear, unless where both parties consent. If the defender intend to plead a counter-claim, he must cause a sheriff-officer to give a copy of it to the pursuer, at least one free day before the trial; otherwise, there are no written pleadings. On the day fixed for the trial, if the debtor does not appear, decree is given against him, with expenses, as a matter of course; against which he can afterwards be "reponed" only on consignment of the expenses and a sum of 10*s*. If both parties appear, the judge hears the case. If the pursuer or the defender have clearly no good ground of action or defense, he disposes of it at once; but if not, he examines the witnesses on oath. No record of the evidence is taken. At any time before judgment, the case may be remitted to the "ordinary court" of the sheriff, where it is conducted by agents on written pleadings and written proof. Otherwise, the whole proceedings are concluded in one day, adjournments not being permitted, except in special cases. After judgment, there is no appeal, except on the ground of want of jurisdiction, malice, oppression, or willful neglect of the statutory forms, in which cases there is an appeal to the court of justiciary. If the sum decerned for, together with the expenses, do not exceed £8 6*s*. 8*d*., there is only execution against the debtor's goods; above that amount, there is also execution against the person.

The Debts Recovery Act, 1867 (30 and 31 Vict. c. 96), has extended the Scottish small-debt jurisdiction, with important alterations, to £50. The class of debts that may be sued for between £12 and £50, has been limited to those which most require summary proceedings—namely, those which prescribe if not sued for within 3 years, such as all ordinary merchants' accounts, and accounts for professional services or for servants' wages. The principal differences between this and the proper small-debt proceedings are, that agents are allowed to appear; that there are two days in court, one at which the grounds of action and defense are stated, and an adjourned one, at which the witnesses are examined; that the judge makes a note of the pleas of the parties; that a record is kept (if required) of the admissions in fact and of the evidence; and that there is a right of appeal, if the debt does not exceed £25, from the sheriff-substitute to the sheriff, and if it exceed £25, also to the court of session. If the judge be not asked to take a note of the evidence, there is no appeal in matters of fact. All the fees and costs, whether payable to the sheriff-clerk, the officers of the court, or the law-agents, are distinctly stated in the act, and must be hung up in every court. In other respects, the proceedings are analogous to those in the small-debt court, and, like them, may proceed either at the principal town of the county, or at one of the towns at which sheriff's circuit-courts are held.

In England and in Scotland, there are other courts which deal with the recovery of debts besides the county courts. The sheriff's court of the city of London has a jurisdiction similar in general to that of the English county courts; and there are local courts, such as the court of passage at Liverpool, and the manor court at Bradford, which exercise jurisdiction in small as well as other debts. In Scotland, the magistrates of royal burghs, and the justices of peace, possess a small-debt jurisdiction for debts not exceeding £5 in amount. The procedure in them is similar to that of the sheriff small-debt court.

DEBTS, Recovery of (*ante*), in the United States ordinarily by an action at law. Such action lies where even the sum due is certain or ascertained in such a manner as to be readily reduced to a certainty, without regard to the manner in which the obligation was incurred or is evidenced. It is thus distinguished from *assumpsit*, which lies as well where the sum due is uncertain as where it is certain, and from *covenant*, which lies only upon contracts evidenced in a certain manner. It is said to lie in the *debet* and *detinet*. Debt in the *detinet* for goods differs from detinue, because it is not essential in this action, as in detinue, that the specific property in the goods should have been

vested in the plaintiff at the time the action is brought. The declaration, when the action is founded on a record, need not aver consideration. When it is founded on a specialty, it must contain the specialty, but need not aver the consideration; but when the action is for rent the deed must be declared on. When it is founded on a simple contract, the consideration must be averred; and a liability or agreement, though not necessarily an express promise to pay, must be stated. The plea of "no debt" is the general issue upon the action on a simple contract, on statutes, or where a specialty is matter of inducement merely. "It is not true," is the common plea when on specialty, denying the execution of the instrument; and "not on record," when denying the existence of the record. The judgment is, generally, when for the plaintiff, that the plaintiff receive his debt and costs; and when for the defendant, that the defendant receive his debt and costs. A judgment in an action for the recovery of a debt itself constitutes a new debt, on which another action may be brought, unless there be some statutory restriction, as there is in some of the states. Under the codes of procedure in some states the technical action for debt no longer exists, as there is but one civil action.

DEBTS, SMALL. See SMALL DEBTS.

DEBUT (*début*), a French word which has been adopted into the English language, and signifies generally a beginning, or entrance, but is specially applied to the first appearance of an actor or actress on the stage at all, or to a first appearance in a particular theater. In these circumstances, the actor is called a *débutant;* the actress, a *débutante.*

DEC'A, Gr. signifying "ten," is of frequent occurrence in composition; as in *decapolis,* a union of ten cities; *decalogue,* the ten commandments; *decamètre,* a measure of ten mètres, etc. From *deca* is formed

DE'CADE, a collection or group of ten. As applied to time, decade was used in the calendar of the French republic to designate their week of ten days. Each month, of 30 days, was divided into three decades. The days of each decade were named *primidi, duodi, tridi, quartidi, quintidi, sextidi, septidi, octidi, nonidi,* and *decadi.* The tenth, or *decadi,* was the day of rest; and, as the republic acknowledged no definite religion, was devoted to the practice of and exhortation to virtue. The republican year numbered 36 decades, and had thus only 360 days. The remaining five (in leap years, six) were devoted as holidays at the end of the year without being numbered.

DEC'ACHORD, a kind of guitar with ten strings, similar to the common guitar, only larger in the body, and with a broader finger-board. The lower strings have no frets, being only used as open notes.

DECA'DENCE (Fr.), a term used with reference to works of art belonging to a school which had passed the period of its highest excellence before they were produced. In Greece, art in all its forms reached its acme in the time of Pericles; and though there are many exquisite works which were produced at a later period, they all belong, more or less conspicuously, to the decadence of Greek art. In Rome, again, both art and literature culminated in the time of Augustus, and from that time we have a decadence; which soon becomes very obvious and rapid. The school of the *Renaissance,* again, came to perfection with Raphael; even the Caracci belong to its decadence; and the decline was continuous through the *rococo* of Louis Quinze, till art became almost extinct all over Europe. In the beginning of the reign of George IV., it probably reached as low a point in England as it ever attained in any civilized country; and it is only within the last 30 years that it has begun to revive. Let us hope that its decadence is far distant.

DEC'AGON is a plane geometrical figure of ten sides. When the sides are equal, the figure is called a regular decagon. A decagon may be formed from a pentagon (q.v.), by forming any irregular triangles on its sides in such a way that no two of them shall have their sides in the same straight line. A regular decagon is got from a regular pentagon by describing a circle round the latter, bisecting the arcs between its angular points, and drawing lines joining the angular points to the points of section.

DECAIS'NËA, a genus of plants of the natural order *lardizabalaceæ,* nearly allied to *Stauntonia.* It contains only one known species, recently discovered, a native of the Himalaya mountains, where it grows at an elevation of 7,000 feet. It is a very remarkable plant, and the only one of its natural order which is not a climber. It sends up from the root several straight erect branches like walking-sticks, which bear spreading pinnated leaves, 2 ft. long, standing out horizontally. The flowers are unisexual, green, and in racemes. The fruit is yellow, resembles a short cucumber, being about 4 in. long, and 1 in. in diameter. It is full of a soft, milky pulp, and large black seeds. Two or three fruits grow together. The pulp is sweet and wholesome, much eaten by the natives of the Himalayas.

DECALOGUE (Gr. *dekalogos,* "ten discourses"), is the term usually applied by the Greek fathers to the law of the two "tables of testimony" given by God to Moses on Mount Sinai. These tables were made of stone, and the commandments inscribed thereon are said to have been "written by the finger of God." The commandments are not numerically divided in the Pentateuch, and it has been supposed by some that

the number *ten* was chosen, because ten was considered the most perfect number. As, however, there *are* ten distinct injunctions, it is superfluous to allege any other reason for the division than the simple fact, that this is the correct enumeration. Philo-Judæus divides them into two *pentads*, the first ending with "honor thy father and mother," etc.; but the general opinion among Christians is, that the first table contained those which enjoin upon us our duty to God (comprising the first four), and the second, those which enjoin upon us our duty to our fellow-creatures (comprising the last six). The Talmudists make the introductory words, "I am the Lord thy God, who brought thee out of the land of Egypt, out of the house of bondage," to be the first commandment, and in consequence, to keep the number *ten*, are obliged to run the next two into one. But the words quoted obviously contain no *command* at all, but merely express the grand general reason why the Israelites should yield implicit obedience to the injunctions which follow. Hence Origen commences the D. with, "Thou shalt have no other gods before me." His division is that in use in the Greek, and in all the Protestant churches except the Lutheran; while from the writings of Philo and Josephus, it appears that such was also the received division of the Jewish church. The Masoretic division is that which is adhered to in the Roman Catholic and Lutheran churches. According to it, the first two commandments, that concerning the worship of God, and that concerning the worship of graven images, constitute but one. The number ten, however, is here also preserved by dividing the tenth into two, the first of which is made to be, "Thou shalt not covet thy neighbor's house," and the second, "Thou shalt not covet thy neighbor's wife, nor his man-servant," etc., to the end. There are two versions of the D. in the Pentateuch; the first is contained in Exodus xx., the second in Deuteronomy v. These are substantially and almost verbally the same, except in regard to the fourth commandment, for the observance of which the reason assigned in the former differs entirely from that in the latter.

DECAMERON, the title of a collection of stories written by Boccaccio, and supposed to have been told in successive nights by guests who were escaping from a plague then raging in Florence, about 1348.

DE CAMP, JOHN C., b. N. J., 1812; midshipman, 1827; captain, 1862; served with distinction in the war of the rebellion under Farragut, and was retired in 1870 with the rank of rear-admiral.

DECAMPS, ALEXANDRE-GABRIEL, a celebrated French painter, was b. at Paris in 1803. He was a pupil of M. Abel de Pujol, the well-known historical painter, but he seems not to have been very amenable to tuition. He was one of those who cannot be made to imitate approved models, and he soon began to strike out a style of his own, which was new to the public, and was long in becoming popular. About 1830, he made a tour in the east, which had a considerable effect upon the character of his works. For several years after his return he painted chiefly eastern subjects. Either the novelty of his subjects—eastern scenes and customs being then comparatively unfamiliar to Europeans—or the novelties of his manner, made the public hesitate in its verdict upon these works; while they were not unfrequently rejected by the jury at the academy of paintings. Gradually, however, they grew into favor; and the prices fetched by these and the other works of D. show that he is now among the most esteemed of the artists of his time. He painted landscapes, genre-pieces, and historical pictures; but though he has produced works in each of these kinds which are of the highest order of merit, his animal pictures are those which first attained to popularity among his countrymen. D. had a great deal of humor; and he loved to paint animals of all kinds. The monkey was his specialty; and a series of humorous pictures in which the monkey, or groups of monkeys, are introduced—now widely known by engravings or lithographs—were among his best and most popular works. In one of this series, *Les Singes Experts*, he managed to convey a stinging criticism upon the judges at the academy who were so slow to admit his merit as an artist. Successful as he was in animal painting, D. was much chagrined by the preference shown by the public for his genre over his historical pieces—which, by English critics at least, are now considered among the finest productions of the French school. Of his landscapes, and even of his historical works, the majority are taken from eastern subjects. It was perhaps a consequence of the tardy recognition given to him by critics and other authorities, that not more than one of his pictures is now in a public collection in France. His works are in private hands; but at the exposition universelle of 1855, sixty of them were brought together, and an opportunity was thus afforded of comparing them with the more accessible works of other contemporary painters. His pictures divided attention with those of Ingres, Delacroix, and Vernet, and received the award of a medal. D. was made a chevalier of the legion of honor in 1839, and was promoted to the grade of officer in 1851. He died at Fontainebleau on the 22d of Aug., 1860, of injuries which he sustained by falling from his horse.

Humor, as has been indicated already, was one of the principal characteristics of D.'s most popular works. His really great—his historical—works were remarkable for the fineness, in many cases the grandness, of the conceptions, and for a large and free style of treatment deemed over-daring and irregular by connoisseurs, but usually resulting, nevertheless, in a very impressive *tout ensemble*. Undoubtedly, his execution had

considerable faults, but they were closely associated with its merits. His drawing was often careless, and when some favorite effect was to be produced, he never hesitated to set perspective at defiance. The boldness of his coloring, and the startling light-effects introduced in his pictures, were what critics at first found most fault with. These are, however, the peculiarities of his manner, and now that they are no longer strange, they find not only apologists but admirers. If they were merits, they were of a kind which, in the hands of imitators, were very apt to degenerate into faults, and the French artists who have taken D. for their model, have, by their exaggerations, done not a little to imperil the reputation of their master.

DECANDÔLLE, AUGUSTIN PYRAME, one of the most eminent of botanists, was born at Geneva, 4th Feb., 1878, and was descended from an ancient noble family of Provence, which was compelled to seek refuge in Geneva from religious persecution about 1558. His father was a syndic of Geneva, and had an estate near Yverdun, where much of D.'s boyhood was spent. He received his education in the gymnasium of Geneva, distinguished himself by his attainments in classical scholarship and his love of poetry, as well as by his delight in the study of history, to which and to the profession of law he proposed to devote himself. But after he had begun his studies for this profession, the union of Geneva with the French republic in 1798 made such a change in his prospects, that he thought proper to relinquish it for that of medicine; having also in the meantime learned to delight in the physical sciences, particularly chemistry and botany, to which the lectures of Vaucher at Geneva in 1796 very much contributed. From this time forth, these were the great pursuits of his life, and he never ceased to study and investigate the relations of these two sciences to each other. He went to Paris, where he prosecuted his studies, and where his botanical publications soon won for him a distinguished place among the scientific men of his time. A work on succulent plants (Par. 1799–1803), one of the species of *astragalus* (Par. 1802), and some less important works, were followed by his extremely valuable *Essai sur les Propriétés Médicales des Plantes* (Essay on the Medicinal Properties of Plants), (Par. 1804). In 1802, he was called to a professorship in the academy of Geneva, but preferred to remain in Paris, and delivered his first botanical lectures in the collége de France. In 1804, appeared the first volume of his *Flore Française.* Employed by the government, he visited all parts of France and of the kingdom of Italy in 1806–12, investigating their botany and agriculture; but the events of 1814 prevented the production of the great statistical work in which it was intended to embody the results of these investigations. On the fall of Napoleon, he was compelled to retreat to Geneva, where a professorship of botany was founded for him, and where he spent the remainder of his life. His *Théorie Elémentaire de Botanique* (Par. 1813) was followed by two other works, the fruits of his studies in systematic botany and the properties and natural affinities of plants, and by which the true knowledge of that science has been wonderfully promoted, his *Regni Vegetabilis Systema Naturale* (2 vols., Par. 1818–21), and his *Prodromus Systematis Naturalis Regni Vegetabilis* (vols. 1–10, Par. 1824–46). D.'s labors established on a surer basis, and improved in many of its most important respects, the natural system of botany which Jussieu had attempted to found. See BOTANY. The latter years of D.'s life were years of sickness and suffering, and he died of dropsy on 9th Sept., 1841. He bequeathed his collections—including a herbarium of more than 70,000 species of plants—to his son, ALPHONSE DECANDOLLE, on condition of his keeping them open to the public, and of his carrying on the *Prodromus.* The younger D. accordingly devoted himself to this work, which he completed with the 17th volume. He also is a botanist of no mean fame, and author of several botanical works, among which are an *Introduction à la Botanique* (1835), and the *Géographie Botanique* (1855); also an *Histoire des Sciences* (1872).

DECAPITATION. See CAPITAL PUNISHMENT.

DECAPODA. See CRAB and CRUSTACEA.

DECAP'OLIS, a district of Palestine anciently containing, as its name implies, ten cities that were classed together not because of their geographical position, but because of their political resemblance. Soon after the Romans had conquered Syria (65 B.C.) they rebuilt ten cities, placed colonies in them, and endowed them with special privileges. Writers are not agreed concerning the names of all the ten, and it is probable that the original number was enlarged. Pliny names them as Damascus, Philadelphia, Raphana, Gadara, Hippo, Dion, Pella, Canatha, Galasa (Gerasa) on the e. of the Jordan, and Scythopolis on the west. At the time of Christ they were all prosperous and contained large numbers of Gentile inhabitants; but at present Damascus only retains its importance. Scythopolis, or Beth-Shean, anciently next in size, still exists as the village of Beisan: others are of interest only for their ruins, those of Gerasa being especially magnificent.

DECA'TUR, a co. in s.w. Georgia, on the Florida border; bounded w. by the Chattahoochee; reached by the Atlantic and Gulf railroad, which terminates at the co. seat; 1062 sq.m.; pop. '80, 19,071—10,183 colored. The soil is moderately fertile, producing corn, cotton, tobacco, rice, molasses, etc. Co. seat, Bainbridge,

DECA'TUR, a co. in s.e. Indiana, intersected by the Indianapolis, Cincinnati, and Lafayette railroad; 372 sq.m.; pop. '80, 19,779. Surface level or undulating, with rich soil, producing wheat, corn, oats, hay, potatoes, butter, and wool. Co. seat, Greensburg.

DECA'TUR, a co. in s. Iowa, on the Missouri; 528 sq.m.; pop. '80, 15,336. It is a prairie region, and agriculture is the chief business. Co. seat, Leon.

DECA'TUR, a co. in s.w. Tennessee, on the Tennessee river; intersected by Beach river; 325 sq.m.; pop. '80, 8,498—1221 colored. It is level, with fertile soil, producing corn, wheat, cotton, butter, tobacco, etc. Co. seat, Decaturville.

DECA'TUR, a village in Georgia; the seat of justice of De Kalb co.; on the Georgia railroad, 5 m. e. of Atlanta; pop. '70, 401. The place is noted for fine climate and beautiful situation. It was here that the confederates under Hood fell upon the unionists under Thomas and Schofield in the hope of hindering the approach of Sherman to Atlanta in the famous "march to the sea." They failed, however, losing 5,000 men; the loss on the other side was 1500.

DECA'TUR, a city and seat of justice in Macon co., Ill., on Sangamon river, very near the middle of the state, at the junction of five or six railroads; 38 m. from Springfield, and 160 from Chicago; pop. about 12,000. It is in a fine agricultural region, and has many manufactories, including a large rolling-mill.

DECA'TUR, STEPHEN, 1751–1808; b. R. I. He was early engaged in sea-faring, and during the revolution had command of several privateers. In 1798, he became a capt. in the navy and was put in charge of the *Delaware*, 20 guns, with which he captured two French privateers. He was discharged from service, 1801.

DECA'TUR, STEPHEN, Jr., 1779–1820; b, Md.; son of capt. Stephen, and like him a sea-farer, though in the regular navy. He served in the smaller offices from 1798 to 1803 without special distinction. In Nov. of the latter year he had command of the *Argus*, in commodore Preble's squadron, and afterwards of the *Enterprise*. At this time he made a dash into the harbor of Tripoli and burnt the frigate *Philadelphia*, which had fallen into the hands of the Algerine enemy. In recognition of this act he was made capt., and presented with a sword. Decatur had much more hard fighting in the harbor and neighborhood of Tripoli, and in all cases showed the utmost daring and bravery. The war with Tripoli ended 1805, and from that time until the war with England, Decatur was in various duties of small importance. In 1812, he was in command of a squadron off the Atlantic coast, and Oct. 25, in the *United States*, captured the English frigate *Macedonian*. In May, 1813, he found himself blockaded in Long Island sound, and was forced to remain more than a year in the harbor of New London. In Jan., 1815, he attempted to escape from his blockade in the frigate *President*, but his ship struck on the bar at Sandy Hook, and, after a determined contest with four of the enemy's ships, he surrendered and was taken to Bermuda with his frigate as a prize. He was soon paroled, and in May, 1815, sailed from New York with three frigates, one sloop, and six brigs and schooners to operate against Algiers. He captured two important vessels; but the war was soon concluded by a treaty abolishing demand upon the United States for tribute, and giving up all prisoners. He made arrangements to the same effect with the rulers of Tunis and Tripoli, and thus put an end to the enslaving of the Americans by the corsairs of those countries. In Nov., 1815, he was made navy commissioner, holding the office until his death, which occurred in a duel with commodore James Barron.

DECAZES, ÉLIE, Duc, 1780–1860; a French lawyer and statesman. He was secretary to Letitia Bonaparte, but went over to the Bourbons in 1814, and became prefect of police in Paris. In 1815, he was made minister of police; in 1818, minister of the interior; and in 1819, prime-minister. In 1820, he was appointed ambassador to England. He was a strong opponent to the extreme measures of the government during the reign of Charles X., and after 1830 adhered to Louis Philippe.

DECAZEVILLE, a t. in the department of Aveyron, s. of France. It has extensive blast-furnaces and iron-works, said to be superior to any in France, and which, with the iron and coal mines of the neighborhood, afford employment to the mass of the inhabitants. Pop. '76, 5,968.

DEC'CAN (Sans. *Dakshina*, the south), a term applied sometimes to the whole peninsula of Hindustan to the s. of the Vindhya mountains, which separate it from the basin of the Ganges, and sometimes restricted to that portion of the same which is rather vaguely bounded on the n. by the Nerbudda, which falls into the gulf of Cambay, and on the s. by the Kistna or Krishna, a tributary of the bay of Bengal. Independently of this indefiniteness of meaning, the name, like that of the Carnatic (q.v.), is rather of historical interest than of actual use.

DECEMBER, the last month of the year. In the old Roman calendar, before the time of Julius Cæsar, the year began with March, and that which is now the twelfth, was then the tenth month; hence the name (*decem*, ten). Our Saxon ancestors called it *Mid-winter-month* and *Yule-month*.

DECEM'VIRI. The most famous body known under this title were the ten persons who were appointed as a sort of legislative committee, to draw up a code of laws at Rome. The groundwork on which the D. proceeded, was the information which had been previously collected by three commissioners who were sent for that purpose to Greece. On the return of the commissioners, after a year's absence, a violent dispute arose between the patricians and plebeians as to which of the orders should be intrusted with the revision of the laws. The dispute ended in favor of the patricians, and ten patrician lawgivers were consequently appointed, to whom, moreover, the whole government of the state was intrusted during the year for which they were to hold office. The experiment was eminently successful; the work of legislation was carried on with zeal and success, and the state was governed with prudence and moderation. Their labors not being quite finished, a new body of D. was appointed; only *one*, the notorious Appius Claudius, belonging to the previous commission. In their magisterial and executive capacities, the new D. acted in the most tyrannical manner. In place of the fasces alone being carried before the decemvir who presided for the day, as on the former occasion, each of the ten was now attended by twelve lictors, who carried not only the rods, but the axe which was the emblem of sovereign power. Every species of outrage was committed on the persons and families of the plebeians, and when the term of their appointment expired, the D. refused either to resign or to allow successors to be appointed to them. At length, the iniquitous decision of Appius Claudius (q.v.) in the matter of Virginia brought affairs to a climax. A popular insurrection broke forth, the D. were driven from their office, and the tribunes and other ordinary magistrates of the republic were reappointed. The occurrence is the subject of one of Macaulay's most spirited *Lays of Ancient Rome.*

DECEN'NARY. See TITHING.

DECEN'NIAL GAMES, celebrated in Rome once in ten years, commemorating the nominal refusal of Augustus to be emperor for life, and his preference for re-election once in ten years. They were kept up as a popular amusement until the last days of the empire.

DECEPTION ISLAND, near South Shetland, in the Antarctic ocean, is worthy of notice for the contrarieties which it presents. Under the reign of all but perpetual winter, it possesses hot springs and a volcano. In these contrasts it so far resembles Iceland with its Hecla and its geysers. But D. I. seems to be peculiar in this, that its very material consists of alternate layers of ashes and ice. It contains a deep lake of 5 m. in circuit.

DE CHARMS, RICHARD, 1796–1864; b. Philadelphia, author and clergyman. He was a Swedenborgian pastor in Cincinnati, Philadelphia, and Baltimore. He established the *New Jerusalem Magazine*, the first three numbers of which he set up in type and printed, having been a printer. He was editor of the *Precursor* and *The New Churchman.* His principal work is *The New Churchman Extra*, a treatise on polemics and church history.

DECID'UOUS TREES (Lat. *de*, and *cado*, falling off) are those which annually lose and renew their leaves. In cold and temperate countries, the fall of the leaf in autumn, and the restoration of verdure to the woods in spring, are among the most familiar phenomena of nature, connecting themselves also very intimately with the feelings, habits, and circumstances of mankind. The greater part of the trees and shrubs of temperate regions are deciduous; but within the tropics, the forest retains always its luxuriance of foliage, except in countries where the diversities of condition, occasioned by the wet and dry seasons, are extreme, and there many trees lose their leaves in the dry season, from causes apparently the same with those which produce the same effect on the approach of winter in colder countries, and which are connected with a sort of rest of the plant, or partial suspension of the active functions of vegetable life. Trees not deciduous are called evergreen (q.v.).

DECIMAL FRACTIONS (Lat. *decem*, ten) are such as have for their denominator any of the numbers 10, 100, 1000, etc., i.e., any power of 10. See FRACTION. Thus, $\frac{7}{10}$, $\frac{23}{100}$, $\frac{19}{1000}$, are decimal fractions. In writing such fractions, the denominator is omitted, and the above stand thus: 0.7, or .7, .23, .019. That these numbers do not express integers is intimated by the point to the left; and the denominator is always 1, with as many ciphers annexed as there are figures in the decimal. A cipher is prefixed to 19, because otherwise it would read as if it stood for $\frac{19}{100}$. The expression £5.647 is read, five pounds and 647-thousandths of a pound; or, five pounds, and six-tenths, four-hundredths, and seven-thousandths of a pound. That these two readings are equivalent appears from this, that $\frac{647}{1000} = \frac{600}{1000} + \frac{40}{1000} + \frac{7}{1000} = \frac{6}{10} + \frac{4}{100} + \frac{7}{1000}$. It thus appears that the first figure of a decimal to the left expresses tenths of the unit; the second, hundredths; the third, thousandths, etc. In this property lies the great advantage of decimal fractions; they form merely a continuation of the system of notation for integers, and undergo the common operations of addition, multiplication, etc., exactly as integers do. To explain the principles which determine the position of the decimal point after these operations, belongs to a treatise on arithmetic.

The disadvantage attending decimal fractions is, that comparatively few fractional

quantities or remainders can be exactly expressed by them; in other words, the greater number of common fractions cannot be *reduced*, as it is called, to decimal fractions, without leaving a remainder. Common fractions, such as $\frac{1}{2}$, $\frac{3}{5}$, $\frac{1}{4}$, $\frac{9}{25}$, $\frac{9}{20}$, for instance, can be reduced to decimal fractions only by multiplying the numerator and denominator of each by such a number as will convert the denominator into 10, or 100, 1000, etc. (The common process is merely an abridgment of this.) But that is possible only when the denominator divides 10, or 100, etc., without remainder. Thus, of the above denominators, 2 is contained in 10, 5 times; 4 in 100, 25 times; and 25 in 100, 4 times; therefore, $\frac{1}{2} = \frac{1 \times 5}{2 \times 5} = \frac{5}{10} = .5$; $\frac{1}{4} = \frac{1 \times 25}{4 \times 25} = \frac{25}{100} = .25$; $\frac{9}{25} = \frac{9 \times 4}{25 \times 4} = \frac{36}{100} = .36$. But neither 3 nor 7 will divide 10 or any power of 10; and therefore these numbers cannot produce powers of 10 by multiplication. In such cases, we can only approximate to the value of the fraction. Thus, 10, 100, 1000, etc., divided by 3, give 3, 33, 333, with a remainder in each case; and $\frac{2}{3} = \frac{2 \times 333}{3 \times 333} = \frac{666}{999}$. As this denominator is nearly equal to 1000, $\frac{2}{3} = \frac{666}{1000}$, or .666 nearly. As 10, and therefore its powers, are composed of the two factors 2 and 5, it is obvious that any fraction whose denominator contains any other factor than these, cannot be reduced exactly to a decimal fraction.

DECIMAL NOTATION. See NOTATION.

DECIMAL SYSTEM. This name is applied to any system of weights, measures, money, etc., in which the standard unit is divided into tenths, hundredths, etc., for the denominations below it, and multiplied by 10, 100, etc., for those above it. The nature of this method of division will be best explained by an example from the French system, where it has been most rigidly carried out. The *meter* (= 39.37 English inches) is the unit of length, and the foundation of the whole system. For the higher denominations of length, the Greek words *déca*, *hecto*, *kilo*, and *myria*, are prefixed to signify *multiplying* by 10, 100, 1000, 10,000; so that *décameter* = 10 meters, *kilometer* = 1000 meters, etc. The Latin words *déci*, *centi*, *milli*, on the other hand, are used to express *division* by 10, 100, etc., and thus furnish names for the lower denominations; *décimeter* = $\frac{1}{10}$ of a meter, *centimeter* = $\frac{1}{100}$ of a meter, etc. Similarly with money; the *franc* being the unit, a *décime* is the tenth part of a franc; and a *centime*, the hundredth part.

Belgium and Switzerland have adopted both the French franc as the standard unit and the division into tenths. The Italian *lira* is the same as the franc. The decimal system in regard to money, with various units of reckoning, is now in use also in Germany, the Netherlands, Sweden, Russia, Austria, Spain, Portugal, Greece, Turkey, the United States, China, and Japan. The French metrical system of weights and measures has been introduced into Germany, Belgium, Switzerland, Spain, Portugal, etc.

This plan of decimal gradation in weights and measures is the only rational one, because it is in accordance with the universally adopted decimal notation. If thoroughly carried out, the facilities it would afford in every department of life are scarcely calculable. For one thing, it is not too much to say that one-half the time now spent in Great Britain in learning arithmetic might be saved. That study might, in addition, be made an effective means of intellectual discipline; whereas at present the time must be spent in acquiring something like a ready but blind application of complicated rules.

The most striking instance, perhaps, of the inconvenience of the arbitrary mode of division is furnished by the thermometer. In this case, nature has fixed the fundamental measure, and made it the same for all nations—the interval, namely, between the freezing and boiling points of water. And yet, in England, this space is divided into 180 parts or degrees; in Germany and the continent generally, into 80°; and only in France has it been divided into 100°. Thus, the basis of uniformity made to our hand has been thrown away, and every observation of temperature made in one country has to be painfully translated before it can be understood in another. See METER.

DECIMA'TION, a military punishment, rarely inflicted in the present day. When a considerable body of troops committed some grave military offense, which would be punished with death if committed by an individual, the punishment was awarded to one tenth of them by lot, instead of to the whole number, in order that the army might not be too much weakened.

DEC'IMI, in music, is an interval of ten diatonic degrees, as from C to E, or third above the octave, as which it is always treated in harmony. There are only two cases in which it is treated differently from the third: 1st, in double counterpoint, where a necessary difference must be made although the same harmonic rules apply; and 2d, in thorough-bass, where the figure 9 shall rise a degree to 10, instead of falling a degree to 8.

DE'CIUS, C. MESSIUS QUINTUS TRAJANUS, a Roman emperor, was b. at Bubalia, in Lower Pannonia, towards the close of the 2d c., and was the first of a line of monarchs who claimed descent from an Illyrian stock. Being sent in 249 A.D. by Philippus, the ruling emperor, to restore to subordination the army of Mœsia, which was in a state of revolt, the troops proclaimed him emperor against his will, and forced him to march upon Italy. Philippus encountered the forces of D. near Verona, but was defeated and

slain. D. assumed the government of the empire in the end of the year 249 A.D., but his brief reign was one of restless warring with the Goths, fighting against whom he was killed near Abricium, in the close of the year 251. During the reign of D., it was determined to revive the censorship, and to persecute the Christians, in order by the first to check the growing immorality of the state, and by the second to bring back the purity of the Roman religion, and regain for Rome the favor of the gods. The censorship was never fully restored, but a barbarous persecution of the Christians took place. In Rome, Antioch, and Jerusalem, the several bishops were massacred; Origen, famous among the early fathers, was subjected to the most acute tortures; dreadful cruelties were also perpetrated at Alexandria. Many Christians, in Africa, disowned their religion, until the persecution had passed.

DE'CIUS MUS, PUBLIUS, father, son, and grandson, all Roman consuls and mythical heroes. It is told of the first two that before a battle which might be decisive they had visions simultaneous in time and import, that one of them must be devoted to the infernal gods. Instead of casting lots to decide which, they agreed that the infernal gods should have the man whose columns first wavered in the fight. The columns of Decius wavered first, and rushing upon the enemy in a spirit of self-immolation he perished. But a moment afterwards his men recovered and won the victory. Similar stories are told of the third, and of some others of the family.

DECK, is a nearly flat-planked covering to a ship, forming a flooring to the persons above it, and a shelter to those below it. There may be several such in a ship, one under another; not only does each serve the purposes here named, but it helps to strengthen the vessel, by holding the sides together. In ships of war, the number of decks varies with the rate or size. First and second rates have four whole decks, stretching throughout from stem to stern. Smaller ships have two whole and one half decks; while a still smaller class have only one of each.

Where there are several decks in a ship, they are distinguished by different names. Thus, the *upper* or *spar* D., open to the sky, stretches from stem to bow, and is conventionally divided into *quarter-deck*, *waist*, and *forecastle*. The *main* or *gun* D. is immediately below the upper deck. The *middle* D. is next under the main D., and is rather thicker and stronger. The *lower* D. is in the broadest part of the ship, and is made very strong, to receive the heaviest guns. The *orlop* D. is the lowest of all, and is often only temporary; it is chiefly occupied as store-rooms. Some of the above are wanting in all but the largest ships; and other names are occasionally substituted. A *flush* D. is a continued floor from stem to stern, upon one range, without any break.

DECKANEE' HEMP. See HIBISCUS.

DECK'ER, Sir MATTHEW, Bart., a political economist, was b. at Amsterdam towards the close of the 17th century. He came to London in 1702, was naturalized as an English subject in the following year, and having embarked in commerce, attained the greatest success; received a baronetcy in 1716, and three years afterwards, took his seat in parliament as member for Bishop's Castle. He sat in the house, however, only for four years. His death took place Mar. 18, 1749; the baronetcy then became extinct, and his daughters succeeded to his estates.

D., in 1743, published a pamphlet, which in twelve years ran through seven editions, in which he proposed to raise all the public supplies from one single tax—namely, a tax upon houses. According to D.'s calculation, there were then in England, exclusive of Wales, 1,200,000 houses; of these he meant to tax only one half, counting off 500,000 as inhabited by the working-classes, and 100,000 as being uninhabited. By this means he proposed to raise an annual revenue of £6,000,000, which sum was £1,000,000 more than the expenses of the government of that day required. The surplus was to be applied as a sinking-fund for the purpose of discharging debt.

DECLAMA'TION (Lat. *declamare*, to speak loudly, hence to exercise one's self in rhetorical delivery), is the art of speaking according to rules, whereby the sense of the words, as well as the feeling and sentiment, is naturally and characteristically represented. Recitation, therefore, whether spoken or sung, is subject to the laws of D., from which it derives its value and significance. Perfect D. implies correctness of speech, distinctness and clearness of enunciation, and a well-toned voice. D. is therefore clearly of a musical nature. In music, however, D. is so far different from the D. of speaking, that the singer must adhere to what the composer has written, as it is the latter who fixes the whole of the intonation, modulation, and phrasing, and also the *tempi* and expression, and who not unfrequently sacrifices the correctness of the D. to the charm of some peculiar melodic phrase or pleasing rhythm, or a vocal musical embellishment. The truth and beauty of correct musical D. are always endangered by a translation of the original words into another language, a work which, with the greatest care and ability, it is in many cases almost impossible to accomplish word for word, or syllable for syllable, so as to fit accurately to the accent of the music. The master-works of many great composers suffer much in this respect, at which our musical public seem quite indifferent, while listening to translations of operas so carelessly executed as to destroy their greatest beauties, and frequently altogether to distort the sentiment. In earlier times, as well as now, considerable trouble has been taken to

establish D. as a science. The ancients had a kind of note, or sign of intonation, which they placed over or under the words, possibly to decide whether the accent should be given by a high or by a low tone, and thus to regulate the modulation of the voice. That the theatrical D. of the ancients resembled the musical recitative of the present day, is generally admitted. In the German language, there are numerous works written on the art of declamation.

DECLARATION, in common law, was the pleading in which the plaintiff in an action at law sets forth his case against the defendant. The plaintiff might declare as soon as the defendant had made appearance in answer to the writ of summons (q.v.), or, where the summons was not specially indorsed (see INDORSEMENT), on failure of the defendant to make appearance. If the plaintiff failed to declare within a certain time, the defendant might obtain judgment of *Non Pros.;* and if the failure continued for a year after the writ of summons is returnable, the plaintiff was deemed out of court. On application to a judge, a plaintiff, if not prepared, might obtain time to declare; and a defective D. might be amended. Since the judicature act of 1875, the D. is no longer used in actions, and the *Statement of Claim* takes the place both of it and of the former BILL IN CHANCERY. By ord. xix. of the judicature act it is provided that, "unless the defendant in an action shall state that he does not require the delivery of a statement of complaint, the plaintiff shall, within such time and in such manner as hereinafter prescribed, deliver to the defendant after his appearance a statement of his complaint and of the relief or remedy to which he claims to be entitled;" and within eight days the defendant must give the plaintiff his defense or counter-claim. Such statements are to be as brief as the nature of the case admits.

DECLARATION, in lieu of an oath. Quakers, Moravians, and Separatists, who object to swear on religious grounds, have been permitted by several statutes to substitute a simple D., or *affirmation,* as it is called, for an oath. See AFFIRMATION. The members of all other Christian sects may still be compelled to swear, whatever be their scruples, in criminal cases. But as regards civil cases, it was enacted by the common-law procedure act of 1854 (17 and 18 Vict. c. 125, s. 20), that any person who should declare that the taking of an oath is, according to his religious belief, unlawful, should be entitled to substitute an affirmation, or D., and that persons making a false affirmation should be subject to the same punishment as for perjury. In the following year (1855), these provisions were extended to Scotland by 18 Vict. c. 25, s. 1; and by s. 2, the queen is empowered, by an order in council, to direct the provisions of the act to be applied to all courts in Scotland; by which would seem to be meant all courts other than the "courts of civil judicature" mentioned in the first section, i.e., to all criminal courts.

DECLARATION IN CRIMINAL PROCEEDINGS. In Scotland, the statement made by the prisoner before the magistrate (see STATEMENT) is called his declaration. It is the duty of the magistrate to take this D. immediately on the prisoner being brought to him —that is to say, if he is in his sober senses. The magistrate must previously inform him that it is entirely at his own option to declare or not, but that if he chooses to declare, the D. may be used in evidence against him on his trial. In practice, the examination is generally conducted by the procurator-fiscal, who knows more of the facts of the case than the presiding magistrate. It is taken down by the clerk of court, the magistrate usually dictating to him the form of words which he conceives will most accurately convey the meaning of the prisoner, in case of his statement being of such a rambling description as to render the writing down of the very words impossible. The D. ought to contain the name, age, and designation of the prisoner, the parish and county in which the crime is said to have been committed, and all similar particulars. When completed, it must be read over to the prisoner, who, if he is able to write, signs every page of it along with the magistrate. If he cannot or will not write, the magistrate signs it in his stead. There must, moreover, be two witnesses present, who shall sign the D., and who, if necessary, can speak to the manner in which it was taken. If the prisoner does not understand English, a sworn interpreter must be employed. The D. will be incompetent to be produced as evidence if the magistrate has delegated the duty of taking it to his clerk, or to any one not a magistrate. As the D. is not emitted on oath, it will not be allowed to be produced or used for the purpose of criminating any one else whom the prisoner may have named as a participator in his crime.

DECLARATION, DYING. The rule that secondary or hearsay evidence is inadmissible, suffers an exception, both in England and Scotland, in the case of a declaration made by a person under the conviction of his impending death, and who does not survive the trial. Such declarations are of peculiar value for the ends of justice, where the party emitting them dies of injuries which are the subject of the prosecution. In cases of murder, the dying D. of the sufferer as to the circumstances of the crime is always admitted as evidence on the trial of the prisoner, provided that it was deliberately emitted while the deceased was in possession of his faculties, and that it is proved by credible witnesses. If it be possible, the dying D. should always be committed to writing, and tested in the most complete manner that is consistent with the circumstances in which it is emitted. In cases of necessity, however, it may be proved by

parole evidence. As to the other cases in which secondary or hearsay evidence is admissible, see EVIDENCE.

DECLARATION OF INDEPENDENCE, AMERICAN, agreed upon July 4, 1776, by the thirteen American colonies then in revolt against England. Its history is brief but important. Early in 1776, the delegates in congress from Massachusetts were directed to vote for independence of England. Soon afterwards several other colonies sent similar instructions. Washington wrote: "A reconciliation with Great Britain is impossible. When I took command of the army I abhorred the idea of independence; but I am now fully satisfied that nothing else will save us." Pennsylvania and New York were the last to acquiesce in the demand for a declaration. The tenor of these instructions to the delegates from their constituents was in favor of cutting loose from Great Britain entirely and forming an independent government. June 7, 1776, Richard Henry Lee moved in congress that "these united colonies are and of right ought to be free and independent states." Four days later the motion was adopted, and two committees were raised to present a declaration and the plan of a confederation. On the declaration committee were Jefferson, Franklin, John Adams, and Roger Sherman. They reported June 28, but action was delayed, as the New York and Pennsylvania congressmen having received no special instruction, thought they had no authority to vote for the declaration. The Declaration of Independence was drafted by Thomas Jefferson, and but very slightly changed from his copy. When it came up for final action it received the vote of every delegate. The vote was taken by colonies, and every colony gave unanimous approval. It was immediately signed by the names of 56 members present, and as soon as the slow means of printing and circulating in those days could spread it, it went forth not only as the defiant answer of the colonies to the demands of the mother country, but as a claim for the political emancipation of mankind. It ought to be known by heart by every boy and girl in America. Not many years ago the reading in full of the Declaration of Independence was considered as necessary in any social celebration of the 4th of July as a prayer in religious services; but in these days, partly from carelessness, but more from the large infusion of foreigners whose habits and ideas have greatly modified the primitive notions of our own people, the custom has fallen into disuse.

DECLARATION OF INDEPENDENCE, MECKLENBURG. See MECKLENBURG, DECLARATION OF INDEPENDENCE.

DECLARATION OF PARIS, a protocol signed by the representatives of all the powers present at the congress of Paris in 1856, and subsequently accepted as a binding engagement of public law by all the other powers (except the United States, Spain, and Mexico) for the purpose of settling and defining certain rules of maritime law, in time of war, on points of great moment to belligerent and neutral states. The four propositions agreed to were: 1. Privateering is and remains abolished. 2. The neutral flag covers enemies' good, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under an enemy's flag. 4. Blockades, in order to be binding, must be effective—that is to say, maintained by a force sufficient readily to prevent access to the coast of the enemy. (From *Encyclopædia Britannica.*)

DECLARATION OF RIGHTS. See RIGHTS.

DECLARATOR, a form of action in the court of session in Scotland, the object of which is judicially to ascertain a fact, leaving its legal consequences to follow as a matter of course. Such are declarators of property, of contravention under an irritancy in an entail (q.v.), of non-entry, of marriage, of bastardy, and many others. The declaratory conclusions of such actions are generally followed by petitory or possessory ones, for the purpose of giving effect to the right declared; but this is by no means necessarily so. A substantial interest on the part of the pursuer must, however, in all cases be shown, as it is not competent to ask the court to declare a mere abstract fact or right. The existence of this special form of action has contributed to diffuse in Scotland a false view as to the nature of actions and judicial proceedings generally from which many even eminent lawyers have not been free. It is said that decrees upon actions properly declaratory "confer no new right, but only declare that a right exists in the pursuer," as if in this case they were an exception to decrees in general, whereas it is obvious that no decree can confer a new right on the pursuer, otherwise than by committing an act of injustice against the defender. In England, there are no actions of D., an arrangement often wondered at in Scotland, but in which the English seems to be more logical than the Scotch law, inasmuch as all actions are actions of declarator.

DECLENSION, a grammatical term applied to the system of modifications called *cases*, which nouns, pronouns, and adjectives undergo in many languages. How the words declension (Lat. *declinatio*, a declining, or leaning away) and case (Lat. *casus*, a fall) came to be applied to this species of inflection, has never been made altogether clear. The relations in which one thing stands to other things may be expressed in either of two ways. Some languages make use of separate words, called prepositions; in others, the relations are expressed by changes in the termination of the name of the thing. Thus, in Latin, *reg* being the root or crude form of the word for "king," *regs*,

or *rex*, is the word in the nominative case, signifying "a king" as subject or agent; *regis*, in the genitive case, "of a king;" *regi*, in the dative, "to a king," etc. An adjective joined to a noun usually takes a corresponding change. The number of cases is very different in different languages. The further we go back in the history of the Indo-European languages, the richer do we find them in these modifications. Sanscrit had eight cases, Latin six, and Greek five. The names of the Latin cases, which are often used also in regard to the English language, are the nominative, which names the subject or actor; the genitive, expressing the source whence something proceeds, or to which it belongs; the dative, that to which something is given, or for which it is done; the accusative, the object towards which an action is directed; the vocative, the person addressed or called; and the ablative, that from which something is taken. The Greek has no ablative case. The Sanscrit, in addition to the Latin cases, has an instrumental case and a locative case. The grammar of the inflecting languages is complicated by the circumstance that all nouns do not form their cases in the same way. This makes it necessary to distribute nouns into various classes, called "declensions." In Latin, as many as five declensions are usually given. See INFLECTION. As we descend the stream of time, the case-endings become rubbed off, as it were, and prepositions are used in their stead. The languages descended from the Latin (French, Italian, etc.) have lost all the cases of nouns and adjectives. The Gothic languages, of which Anglo-Saxon is one, had cases almost as numerous and perplexing as those of the Latin. German is still to a great extent encumbered with them. English has only one case in nouns different from the nominative—namely, the genitive, or possessive. See NOUN. The declension of pronouns (q.v.) has been more persistent than that of nouns and adjectives. Languages of the agglutining order have, in general, a great abundance of cases. In Finnish, nouns have fifteen cases. Thus, *karhu*, a bear; *karhun*, of a bear; *karhuna*, as a bear; *karhutta*, without bear; *karhussa*, in the bear; *karhusta*, out of the bear, etc. In the Magyar, twenty cases may be reckoned; and the languages of the North American Indians are richer still—perhaps we should say more embarrassed. What case endings and other inflectional terminations were in their origin, as well as the comparative merits of the highly inflected and the analytic languages, will be considered under INFLECTION.

DECLINA'TION. If a great circle be drawn through the pole of the heavens and any star, the D. of the star is the portion of the circle intercepted between the star and the equator. See POLE. The place of a point in the heavens is determined by its right ascension and D., just as a point in the earth's surface is determined by its latitude and longitude.

DECLINATION NEEDLE. When a magnetic needle is suspended or made to rest on a point so as to be free to move in a horizontal plane, it finds its position of rest in a line joining two fixed points on the horizon; and when made to leave that position, after several oscillations, it returns to it again. At certain places on the earth's surface, these two points are the n. and s. points of the horizon; but generally, though near, they do not coincide with these. A vertical plane passing through the points on the horizon indicated by the needle, is called the magnetic meridian, in the same way that a similar plane, passing through the n. and s. points, is known as the astronomical meridian of the place. The angle between the magnetic and astronomical meridian is termed the declination or variation of the needle. The declination is e. or w., according as the magnetic n. lies e. or w. of the true north. Instruments for determining magnetic declination are called declination needles, or declinometers. In this instrument there are two things essential—the means of ascertaining the astronomical meridian, and a needle for showing the magnetic meridian. The common form of declinometer consists of a tripod provided with leveling screws, and supporting a pillar, to which is fixed a graduated azimuthal circle. A compass-box, with vernier attached, moves on the azimuthal circle by means of a pivot at the top of the pillar. Two uprights are fixed to the side of the compass-box, on which rests the axis of a telescope. A graduated arc is fixed to the bot om of one of the uprights, and the angle of elevation of the telescope is marked by a vernier on the arm attached to the axis of the telescope. A level is also hung on the axis of the telescope, for adjusting the instrument. Inside the compass-box is another graduated circle, the line joining the zero-points of which is parallel to the axis of the telescope. All the fittings are in brass or copper, iron, of course, being unsuitable. The compass-box and telescope move round as one piece on an axis passing through the center of the azimuthal circle. When an observation is made, the telescope is pointed to a star whose position with regard to the astronomical meridian is known at the time of observation. The telescope with the compass-box is then brought the proper number of degrees on the azimuthal circle, until its axis is in the meridian of the place. If, when the telescope is in this position, the n. end of the needle stand at the zero-point of the inner circle, the declination would be 0°; but if it lie e. or w. of this point, the declination is shown by the degree at which the needle stands. It is difficult to construct a needle so that the line joining its poles exactly coincides with the line joining its visible extremities. If this coincidence be not perfect, the geometrical axis of the needle according to which the reading is made lies to the right or left of the magnetic axis, and consequently of the true reading. To remedy this, the needle is so made that it can rest either on its lower or upper surface. In

finding the true reading, the position of the needle is marked, and then it is turned upside down, and again marked, the mean of the two readings giving the true one. The declination of the needle may be also ascertained by the "dipping needle"(q.v.). The ordinary compass which must be used by making allowance for declination, is a declination compass. See MAGNETISM.

DECLIN'ATURE, in Scotch law, a preliminary plea, declining the jurisdiction of the judge, either on the ground of his being interested in the suit, or of the case being beyond his province. In England, it is spoken of as a plea to the jurisdiction on the ground of interest, etc.

DECLINOM'ETER. See DECLINATION NEEDLE, *ante.*

DECOCTION is the term applied in pharmacy to the solution procured by boiling an organic substance with water.

DECOLORIM'ETER is an instrument for determining the power of portions of bone-black, or animal charcoal, to abstract coloring matter. See BONE-BLACK.

DECOMPOSI'TION is a term employed in chemistry to signify the separation of more simple substances from a compound. Thus, when the red oxide of mercury (HgO) is heated, it suffers D., and is resolved into mercury (Hg) and oxygen (O); and water (HO), when subjected to a current of voltaic electricity, is decomposed into hydrogen (H) and oxygen (O).

DECOMPOSITION OF FORCES. See COMPOSITION.

DECO'RAH, a city, the seat of justice in Winneshiek co., Iowa, on a branch of the Milwaukee and St. Paul railroad; and on the upper Iowa river; pop. '75, 2,596. It is the seat of the Norwegian Lutheran college, and has many important manufactures.

DECORATED STYLE of Gothic architecture. During the reigns of the first three Edwards, from the latter part of the 13th till nearly the end of the 14th c., Gothic architecture may be said to have been in full bloom in England. It attained perfection somewhat earlier in France and Germany, and somewhat later in Scotland, and consequently the buildings on the continent which correspond to what is called the D. S. in England, belong, for the most part, to the beginning, and those in Scotland, for the most part, to the end of the 14th century. The D. S. arose so gradually out of the style which preceded it, and merged so gradually into that which followed it, that it is not wonderful that different periods of duration should be assigned to it by different writers. The longest, probably, is that mentioned by Britton, from 1272 to 1461; and the shortest by Rickman, from 1307 to 1392. In fixing on the middle of the 14th c. as its highest point, however, they are all pretty much agreed, and the same agreement is exhibited in recognizing it as the most perfect of the Gothic styles. The decorated was a higher development of the early English style, all the peculiarities of which, both in its forms and in its adornments, it exhibited in greater perfection and richness; and it is remarkable that when we pass from it to the more elaborately florid style which succeeded it, the degeneracy in sculpture is as perceptible as in architecture. It seems, indeed, as if the school of art which we regard as the peculiar production of the middle age, then attained, in all its branches, to a point which admitted of no further progress in that direction. Nor is this remark confined to art, as addressed to the eye, for that it applies equally to poetry will be at once admitted, when it is remembered that the era which we have assigned to the D S. throws it almost entirely within the period which is covered by the long life of Chaucer. It is a striking instance, moreover, of the intimate relation which subsists between the æsthetic and the general life of a nation, that it was at this very same period that the social, political, and religious institutions of mediæval life culminated. Chivalry and feudality were in the fullness of their vigor, and the church had only just begun to give employment to the innovating minds of the first reformers. Of all the epithets which have been employed to characterize this style—absolute Gothic, pure Gothic, complete Gothic, and the like—that of the "middle pointed" is, perhaps, the most descriptive; the simple pointed arch, described from an equilateral or obtuse-angled triangle, being retained, but the window being enlarged, divided by mullions into several lights, and the heads filled with tracery. Of this, as of all the other styles of architecture, the most characteristic feature of all is unquestionably the capitals of the pillars. Of the foliage which is employed in the decorated capital, Mr. Bloxam remarks, that it "may generally be distinguished from that of the early English by its not rising from the neck molding with stiff stems, but being carried round the bell in something of a wreath-like form. . . . It often exhibits much of natural freedom; and we frequently find the oak, the ivy, the hazel, the vine, the fern, etc., very beautifully and closely copied from the natural leaves.

DECOUPLÉ, or UNCOUPLED, in heraldry, is severed or disjoined, so that the ends stand at a distance from one another, as a *chevron decouplé.*

DECOYING OF CHILDREN. The crime of stealing human creatures, the *plagium* of the Roman law and of the law of Scotland, is severely punished by the legislation of every civilized country. In countries where slavery does not exist, the theft of a human adult is a crime which can scarcely occur. Where a free man is wrongously captured or detained, the crime is not theft, but wrongous imprisonment, which will be dealt

with by the criminal law as an injury to the public, while at the same time the individual will be entitled to recover damages for the injury which he has personally sustained. Formerly, it was regarded as treason to the king, inasmuch as it was a wrongful detaining of his free liegeman without his license or commission, and as such was punishable with death, both in England and Scotland (Hume's *Com.* i. p. 83). The only form in which the crime has been dealt with in modern times is that of child-stealing, for which sentence of death was pronounced in Scotland so lately as 1817; but the libel is now invariably restricted, in which case sentence of transportation has usually been pronounced. In England the offense is statutory, it being enacted by 9 Geo. IV. c. 31, s. 24, "That if any one shall maliciously, either by force or fraud, lead or take away, or decoy or entice away, or detain any child under the age of ten years, with intent to deprive the parent or parents, or any person having the lawful care of such child, of its custody, or to steal any article upon or about its person; or if any person shall receive or harbor such child for such purposes, every such offender shall be guilty of felony, and liable to be transported for seven, or to be imprisoned for two years; and if a male, to be thrice whipped." The act does not apply to any person who shall have claimed to be the father of an illegitimate child.

DECREE', in theology. See PREDESTINATION.

DECREE, or, as it is frequently called in Scotland, a decreet, is a final judgment of a court, whereby the question at issue is set at rest. In England, it is more commonly applied to the final judgments of courts of equity.

DECREE IN ABSENCE, in Scotland, is equivalent to a judgment by default in a common law court, or a decree *pro confesso* in chancery.

DECREMENT, DECRESCENT, and DECOURS, are heraldic terms by which the wane of the moon is indicated. A *moon decrescent* is a half-moon with her horns turned to the sinister.

DECREPITATION is the term applied to the crackling sound heard when a substance like common salt is thrown upon a fire. A series of minute explosions occur, owing to the water between the plates of the crystalline particles becoming expanded by the heat, and ultimately bursting them.

DECRESCEN'DO, in music, is the reverse of crescendo—viz., a gradual diminishing of the sound. The executing of the D. is very difficult, whether on one or more notes. Like the crescendo, it is also frequently combined with a slight ritardando, especially in descending passages. It is frequently marked thus 

DECRE'TALS. The body of the canon law consists: 1st, of the decretalium, a collection made by Gratian, a Benedictine monk, after the middle of the 12th c., in imitation of the Roman pandects, and drawn from the opinions of the fathers, popes, and church councils; 2d, of the decretalia, collected by pope Gregory IX., nearly a century later, from the decretal rescripts or epistles of the popes, as the code of Justinian was from the constitutions of the emperors. To these, additions were made by several succeeding popes. See CANON LAW.

DECRE'TALS (*ante*) are the answers sent by the pope to applications made to him as the head of the church, chiefly by bishops, but also by synods, and even by private individuals, for guidance in cases involving points of doctrine or discipline. In the early days of the church these replies, as circulated through the various dioceses, furnished precedents to be observed in analogous circumstances. From the 4th c. onward they formed the most prolific source of canon law. FALSE DECRETALS is the term applied to what are supposed to be some of the most famous of literary forgeries, including a collection of papal letters, canons, etc., of which some are probably genuine, but the greater part spurious. The first edition appeared about the middle of the 9th c., and from the preface is supposed to be the work of Isidorus Mercator, a fictitious name thought by some to indicate bishop Isidore, of Seville. After the preface and some minor apocryphal documents, the first part contains 50 of the apostolic canons, and 60 spurious decretals from Clement (101 A.D.) to Melchiades (314), chronologically arranged. The second part consists chiefly of canons taken from the *Hispania*, a collection made towards the close of the 7th century. The third part contains 35 fictitious decretals. These false decretals were received everywhere as true, until cardinal Nicolas de Cusa, in the 15th c., first expressed doubts of their genuineness. They were fiercely attacked by the reformers, and not long afterwards the stigma of "false" was fairly fixed upon them.

DEC'TAUN, a t. of India, in a detached portion of the native state of Gwalior, belonging to Scindia, on the route from Mow to Baroda, 20 m. w. from Mow. It is the capital of a pergunnah of the same name. It is 1881 ft. above the sea. Pop. estimated at 6,000.

DECU'RIO, a Roman cavalry officer, commanding 10 men. DECURIONES MUNICIPALES were Roman provincial magistrates who had the same power in free and corporate towns as the senate had in Rome. At first numbering 10, as their name implies, they frequently numbered 100 in later times. Their duty was to watch over the interests of their fellow-citizens, and increase the revenues of the commonwealth. They were required to be 25 years of age, and to possess a certain income.

DECUSSA'TION, in anatomy, the crossing of nervous filaments. Certain fibers of the anterior pyramids and lateral columns of the medulla oblongata are so crossed freely from side to side; so that disease on one side of the brain often leads to paralysis on the other side of the body.

DEDHAM, the seat of justice of Norfolk co., Mass., on Charles river, 10 m. s.w. of Boston; pop. '80, 6,224. There is railroad connection with Boston and Providence. By a canal from the Charles to the Neponset river ample water-power is obtained for a number of important manufactories. The court-house is a handsome granite building. Dedham is a favorite place of residence for business men of Boston.

DEDICATION, in literature, the address of a book, or any literary work, to a person or party; *vide* Shakespeare's note to the right honorable Henry Wriothesly prefaced to *Venus and Adonis*. The custom is as old as literature, and doubtless originated in a desire to win the favor of some powerful patron. Occasionally may be found such a dedication as "To My Mother," or "To My Wife," but usually they are to public persons. Of late years the custom has to a great extent fallen into disuse, as not accordant with the independent spirit of our times.

DEDUCTION is a particular kind of reasoning or inference. In ordinary language, to deduce means to trace one thing to another as its cause, to show that one proposition follows from some other proposition or propositions. In logic, its signification is more definite. It is usual to oppose deduction to induction (q.v.), and to say that the latter consists in reasoning from particulars to generals, the former in reasoning from generals to particulars. In fact, however, every step in a deduction is also an induction. The several steps of a train of deductive reasoning consist of syllogisms (q.v.), and the major proposition of a syllogism is an induction, or a general proposition expressing the result of a previous induction. The whole object of this kind of reasoning is to show that some particular case or phenomenon really has the marks which bring it under the class to which the general proposition was meant to apply. Thus, the equality of the angles at the base of an isosceles triangle is deduced from the general proposition, "That magnitudes which can be applied to one another so as to coincide are equal," by showing that the angles in question can be so applied.

Deduction is more properly opposed to experiment. Suppose the question to be as to the relation between the spaces and times in falling bodies, the point may be determined in two ways. We may institute experiments, and observe how far bodies *do* fall in different times, and conclude a general proposition from the particular instances we observed; or we may bring the case under two general principles already established, those, namely, expressed in the first law of motion, and in the nature of gravity as a moving force, and calculate from these how far bodies *will* or *must* fall in given times. The conclusion or law arrived at in both cases is the same; but in the one case it is experimental, in the other deductive. It is the tendency of all sciences to become more and more deductive. Knowledge put on a deductive basis is sometimes spoken of as science, *par excellence*, and the immediate results of observation as empiricism. Mathematics is essentially a deductive science, and most of the truths in natural philosophy have been gradually put on similar grounds. Chemistry remains almost wholly experimental; it can predict or deduce little or nothing regarding an untried case, except, perhaps, the proportion in which two bodies will combine. See REASONING.

DEE, the name of two rivers in Scotland. The larger and more important rises in five wells 4,000 ft. above the sea, near the top of Braeriach mountain, in the neighborhood of Cairntoul and Ben Macdhui, 25 m. n.w. of Castleton of Braemar. After flowing 12 m. s.s.e., it joins the Geauley, at the height of 1294 ft. above the sea. It then tumbles through a narrow chasm in the gneiss rock, called the Linn of Dee, across which a person can leap. After this it runs e.n.e. through Aberdeenshire and a small part of Kincardineshire, and ends in the German ocean at the harbor of Aberdeen. In this course, 96 m. in all, it receives a number of tributaries—the Lui, Muic, Feugh, etc. The basin of the Dee, which is about 1000 sq.m. in area, consists of granite and gneiss in nearly equal areas. In the gneiss occur many beds of primitive limestone, and some masses of trap-rock and serpentine. On the Dee are Balmoral castle and several villages much resorted to in summer—Castleton of Braemar, Ballater, Aboyne, Kincardine O'Neil, Banchory-Ternan, and Cults. The soil on the Dee is light and sandy and requires much rain. A railway extends up Deeside for 43 m., from Aberdeen to Ballater. See BALMORAL and BRAEMAR.—The smaller Dee rises in Kirkcudbrightshire, near the northern boundary of that county. Its general direction for the first 40 m. is southeasterly, after which it flows w. to the Solway Firth, into which it falls at Kirkcudbright bay. The D. divides Kirkcudbright into two nearly equal portions, and near the center of the county it expands to about the average breadth of a quarter of a mile, preserving this appearance for about 10 m. of its course, and forming successively Loch Ken, Loch Dee, and Long Loch. It is about 50 m. in length, and is navigable for the last 7 miles. The waters of the D. are noted for their salmon, which are of a darker hue, and are fatter than those of most rivers in the s. of Scotland.

DEE, a river in England, draining parts of the shires of Merioneth, Denbigh, Flint, and Salop, in Wales, and the w. of Cheshire. Near Trevor, it is crossed by the Elles-

mere canal, on an aqueduct 1007 ft. long and 120 high; and also by the stone viaduct of the Chester and Shrewsbury railway, of 19 arches, each 90 ft. span, and 150 ft. high. Below Trevor, the D. winds first s.e., and then n.e., and u. to Chester, which city it nearly encircles. At Chester, it is 100 yards broad, and runs alongside marshes in an artificial tidal canal 9 m. long, and admitting ships of 600 tons. It ends in the Irish sea, in a tidal estuary 9 m. long and 3 to 6 m. broad, and forming at high-water a noble arm of the sea; but at low-water a dreary waste of sand and ooze, with the river flowing through it in a narrow stream. Its whole course is 80 m. long, and its chief tributaries are the Treveryn, Alwen, Ceirog, Clyweddog, and Alyn. Its upper basin chiefly consists of Silurian strata, and its lower of new red sandstone. Canals connect the D. with the rivers of central England. The ancient Britons held its waters sacred.

DEE, JOHN, a celebrated astrologer and mathematician, was the son of Rowland Dee, "gentleman-sewer" to Henry VIII., b. in London, 13th July, 1527, and educated at St. John's College, Cambridge. After residing for some time at the university of Louvain, he went in 1550 to Paris, where, at the college of Rheims, he read lectures on the *Elements* of Euclid with very great success. In 1551, he returned to England, was presented by Cecil to Edward VI., and pensioned; but during the reign of the "Bloody Mary" he nearly lost his life. He again set out for the continent in 1564, ostensibly for the purpose of presenting to the emperor Maximilian a book which he had previously dedicated to him. Lilly, however, in his *Memoirs* (p. 224), affirms that he acted as queen Elizabeth's "intelligencer" or spy, and this theory is probably the true one. Lilly says that he was "a ready-witted man, quick of apprehension . . . . and excellent in all kinds of learning;" while the professional mask which he wore, the pretensions he made of being able to raise and converse with spirits, served to prevent all suspicion.

The impression that Dee had dealings with the devil, seems to have become more prevalent the longer he lived. In 1576, a mob assembled around Mortlake, his country residence, and, attacking the house, broke his instruments, and destroyed his library, which was large and costly, Dee and his family escaping with difficulty.

In the year 1581, having taken into his service an apothecary of the name of Kelly as assistant, Dee visited various continental courts, pretending to be able to raise spirits. Whether he took to this strange profession through a sincere belief in what he professed, or adopted it merely as a blind, a pretext for visiting foreign courts at which he had more serious business to transact, it is impossible to say. In 1595, he was appointed warden of Manchester college, where he resided nine years, and whence he returned to Mortlake. His death took place in 1608, in the 81st year of his age. He died very poor. Dee's writings are very numerous; they are chiefly scientific treatises, and many of them are still in manuscript in the Cottonian and other collections. In 1842, the Cambridge society published the Private Diary of Dr. John Dee, with a catalogue of his library of scientific MSS. made by himself.

DEED, in law, is a formal written expression of something done by the party or parties from whom it proceeds. The term is applied to almost every form of legal writing, and will consequently be treated under various heads. See INDENTURE, CHARTER, WILL, DISPOSITION. As to the manner in which deeds are executed in England, see SIGNING, SEALING, AND DELIVERING; and in Scotland, see TESTING CLAUSE, WITNESS, HOLOGRAPH, REGISTRATION OF DEEDS AND WRITS.

DEEMS, CHARLES F., D.D., b. Baltimore, 1820; a graduate of Dickinson college 1839, and not long afterwards agent in North Carolina for the American Bible society. In 1840, he accepted the professorship of logic and rhetoric in the university of that state. In 1846, he was a Methodist preacher at New Berne, and delegate to the general conference. He was for five years principal of the Gainsboro college for women; he was presiding elder of the Wilmington and New Berne districts 1858 to 1865. In 1865, he went to New York, where he was employed in journalism, and took great interest in the founding of the "Church of the Strangers" (undenominational), of which he became and still remains pastor, with great success in a peculiar field. He has published *Annals of Southern Methodism; Life of Jesus; The Home Altar;* etc.

DEEM'STER, DEMPSTER, or DOOMSTER, the name of an officer formerly attached to the high court of justiciary in Scotland, who pronounced the doom or sentence of condemned persons. The office was held along with that of executioner. At the conclusion of a trial, this dread official was produced in open court, in presence of the wretched criminal, as is graphically described by Scott in his tale of *Old Mortality.* See notes to that work, and also notes to *Heart of Mid-Lothian.* The office of deemster has been long abolished. In the isle of Man (q.v.) and Jersey (q.v.), deemsters are a kind of judges.

DEEP BOTTOM, on the n. side of James river, 12 m. by land and 20 by water below Richmond, near the battle-ground of Malvern hill. Several important actions were fought near this point in 1864, generally resulting favorably to the unionists.

DEEP RIVER, a tributary of Cape Fear river, North Carolina, rising in Guilford co., and running through Randolph and Chatham counties to join the Haw. Its length

is about 120 m., and it is navigable as far as the coal-mines. The coal-beds in its valley have been long known, but little worked. Their productive area is more than 40 sq.m., and the total deposit estimated at 240,000,000 tons. The coal is in part highly bituminous, in part semi-bituminous, in part anthracite; all good. In places it is metamorphosed into graphite. Iron and copper ores are found near the coal.

DEER (Ger. *thier*, meaning "beast"—a sense which the Eng. *deer* once had; Gr. *thēr*, Lat. *fera*), a Linnæan genus of ruminant quadrupeds, now constituting the family *cervidæ*, which some naturalists have divided into a number of genera, whilst others still regard it as forming only one, the distinctions between its groups not seeming to them sufficiently marked or important for generic characters. Deer are animals of graceful form, combining much compactness and strength with slenderness of limb and fleetness. They use their powerful horns for weapons of defense, and sometimes of offense; but in general they trust to flight for their safety. They have a long neck, a small head, which they carry high, large ears, and large full eyes. In most of them there is, below each eye, a sac or fold of the skin, sometimes very small, sometimes of considerable size, called the *suborbital sinus*, *lachrymal sinus*, or *tear-pit*, the use of which is not well known. Deer have no cutting teeth in the upper, but eight in the lower jaw; the males have usually two short canines in the upper, but neither sex has any in the lower jaw; the præmolars are three, and the true molars three on each side in each jaw. They are distinguished from all other ruminants by their branching horns (antlers), which in most of the species exist in the male sex only; they are solid and deciduous, i.e., fall off annually, and are renewed with increase of size, and of breadth of palmation, and number of branches, according to the kind, until the animal has reached old age, when the size of the horns begins to diminish on each annual renewal. The size and development of the horns are indeed closely connected with the sexual system, and their annual renewal takes place just in time for the rutting season, when they are much used in fierce combats. Females with diseased ovaries sometimes exhibit horns like those of the male.

The horn of a deer is a continuation of bone from the outer table of the skull, and is at first clothed with a velvet-like covering (the "*velvet*"), continuous with the outer integuments of the head, which, however, is soon rubbed off—the animal appearing to be impelled by some irritation to rub it against trees or rocks—leaving the horn hard and solid, with traces of the course of the many vessels which were employed for its production. The growth of the horn is very rapid. When the old horn has been cast, there is a wound which bleeds a little, but is soon skinned over with a fine film, and the new horn almost immediately begins to sprout. Cast-horns are very rarely found in deer-forests, a circumstance that has never been quite satisfactorily accounted for. The growth of the horn is attended with much heat, and the blood-vessels which supply the head enlarge in size. The last part of the process is the formation of a rough circle of bony tubercles (the *burr* or *pearl*) at the base of the horn, bearing some proportion to the size of the horn and the age of the animal. It is by these, as they enlarge, that the nutritive vessels of the "velvet" are compressed and obliterated.—Deer are pretty uniformly clothed with hair, longer and thicker in those which inhabit cold, than in those which inhabit warm climates. The tail of all the species is short. The horns of some are broadly palmated, those of others are rounded; and importance has been attached in classification to their having or wanting a distinct *snag* or short branch projecting in front from the base of the antler; which is present, for example, in the stag, fallow-deer, reindeer, and axis, and wanting in the roebuck, elk, and cariacou. The broad palmation of the horns of species inhabiting the coldest climates has been supposed to be intended for turning over the snow in search of food. One of the most beautiful adaptations in nature is a peculiarity of the foot of the reindeer, by which the hoofs separate to a remarkable width, and the greater extent of surface prevents the foot from sinking in soft snow. Deer are found in almost all parts of the globe except Australia and the s. of Africa, their place in the latter region being supplied by antelopes in extraordinary number and variety. Some of them live amidst the snows of very northerly regions, and some in tropical forests; the greater number inhabit the warmer temperate countries, and they are chiefly found in wide plains and hills of moderate height, none dwelling on those lofty mountain summits which are the chosen abode of some animals of the kindred families of *antilopidæ*, *capridæ*, and *moschidæ*, as the chamois, the bouquetin, and the musk. The flesh (venison) of most kinds of deer is highly esteemed for the table, and they have long been regarded as among the noblest objects of the chase. Only one species, the reindeer, can be said to have been fully domesticated and reduced to the service of man; although individuals of many species have been rendered very tame.

See AXIS, CARIACOU, ELK, FALLOW-DEER, MUNTJAK, REINDEER, RUSA, STAG, WAPITI, etc.—The musk (q.v.), although sometimes called musk-deer, is not of the deer family.

DEER, or DEIR, OLD, a village and parish in the n.e. of Aberdeenshire, in the district of Buchan. Here are vestiges of a Cistercian monastery founded about the year 1219, by William Cumyn, earl of Buchan, on the site of a church believed to have been planted by St. Columba, and his disciple, St. Drostan, about the year 580. A few

MSS. which had belonged to the monks of Deir, found their way, after the reformation, to the university library at Cambridge; and among them one has been recently discovered, which has come to be known among archæologists and philologists as the *Book of Deir*. It contains a copy of the gospels (in the Latin version of St. Jerome) and of the Apostles' Creed, in the handwriting of the 9th c., with a portion of a *Missa de Infirmis*, or "Communion of the Sick" (containing a Celtic or Gaelic rubric), in a later hand. On the blank leaves at the beginning, in the handwriting of the early part of the 12th c., are a few notes or memorials, in the Celtic or Gaelic language, recording "How Columcille and Drostan came from Hi to Aberdour, and how Bede the Pict, who was than Maormohr of Buchan, gave them the towns of Aberdoura nd Deir," and how succeeding maormohrs, chiefs of clans, kings, and others, added to the immunities and endowments of the church of Deir. These notes or memorials are of great philological interest, as the only known examples of the Celtic speech of Scotland in the 12th century. They are also of great historical interest, as opening up glimpses of the social state of the country during the obscure period between the 7th and 12th centuries. The *Book of Deir* has been edited for the Spalding club, by John Stuart, LL.D., the secretary. To Mr. Bradshaw of King's college, Cambridge, we owe the discovery of the MS.

DEERFIELD, a t. on the Connecticut river, in Franklin co., Mass., on the Connecticut River railroad, 90 m. w. by n. from Boston; pop. '80, 3,543. The village is regularly built and well shaded. There is a bridge over the Deerfield river, and some hills near by give extended and beautiful views. The place, or rather the vicinity, was settled in 1670, and five years later was the scene of an Indian massacre in which capt. Lathrop and 84 men were caught in ambuscade and 76 of them killed, the captain included. In the winter of 1704, the French and Indians fell upon Deerfield, burned all except the church and one house, killed 36 people, and carried the remainder, 108, into captivity. They were hurried off towards Canada, but many were killed or died on the way. The survivors were liberated in 1706, but a daughter of Mr. Williams, the minister, refused her liberty, and married an Indian chief.

DEER GRASS, plants of the order *melastomaceæ*, eight species of which are found in the United States. The flowers are conspicious and showy, having bright purple petals. It is sometimes called the "meadow beauty."

DEER ISLE, a t. in Hancock co., Me., 130 m. from Portland, embracing Great and Little Deer and other islands, and having important fisheries, especially of lobsters. Pop. '70, 3,414.

DEER LODGE, a co. in n.w. Montana, bordering on British America; 15,300 sq.m.; pop. '80, 8,876. It is the richest mining section in the territory, and is also well adapted to grazing. Co. seat, Deer Lodge.

DEERMOUSE, or JUMPING MOUSE (*meriones*), a genus of American rodent quadrupeds allied to mice and to jerboas, and differing from the gerbils of the warm parts of the old world only in the greater length of their hind-legs, the nakedness of the tail, and the existence of a very small tooth in front of the molars of the upper jaw. The D. or jumping mouse of Canada (*M. Canadensis*), common in that country, and often seen in summer and autumn, is a beautiful agile little creature, of the size of a mouse, with a very long tail, and very long slender hind-legs. It is capable of taking leaps of four or five yards. It burrows, and passes the winter in a state of lethargy.—Another species, the Labrador jumping mouse (*M. Labradoricus*), inhabits the still more northerly parts of North America.

DEER-STALKING is the art of following the red deer by cautious maneuvering, for the purpose of shooting it with the rifle; and as practiced in the Highlands of Scotland, is perhaps unequaled as a sport in fatigue as well as in excitement. The extensive tracts of hill-land over which deer roam, and on which they are stalked, are termed "deer-forests," few of which, however, notwithstanding the appellation, can boast of a single tree; and where these "forests" belong to noblemen and others peculiarly addicted to the sport, deer are strictly preserved, to the almost total exclusion of sheep and cattle. This sport is more highly esteemed, and greater sums are paid for it by its devotees, than for any other in Scotland. This arises chiefly from two causes: 1st, from the intense excitement occasioned in the pursuit of the red deer; and 2d, from the comparative scarceness of good forests. Deer-stalking demands many expensive accessories, among which may be mentioned—deer-hounds, to pursue and bring to bay wounded game; one or more guides to accompany the stalker; and hill-men to *drive* the deer, when that method of obtaining shots is determined upon, etc. However excellent a marksman the deer-stalker may be, and though he may be tolerably conversant with the general "lie" and bearings of the ground, he is almost always accompanied by an experienced guide, upon whose cool judgment, keen eye, and thorough knowledge of every knoll and rock of the "forest," depends greatly his chance of obtaining a shot. A dress resembling in color as nearly as possible that of the ground to be gone over; a rifle of first-rate make, and previously practiced with at various distances; a deer-hound or more, that watch constantly in perfect silence for the slightest look or sign from their master; a robust constitution, to stand the fatigue of walking, crouching (sometimes in water), crawling, and advancing

on the back, feet first, are some of the requisites the deer-stalker must possess. And when we add to these the most unflinching perseverance and untiring patience, we have not said all, for unless he is gifted by nature or experienced with *nerve* to take instant and careful advantage of the rare opportunities a day's stalk may offer, his previous care and toil must go for nothing. The deer-stalker should always be provided with a good telescope. The season for killing red deer begins on the 20th of Oct., and closes on the 9th of June. This sport depends more upon the vicissitudes of wind and weather than perhaps any other. Deer are gifted with very keen scent, a fact of which the stalker is well aware, and for which he must allow by advancing upon his game *up* the wind. They are also far-sighted, and exceedingly prone to take alarm at the slightest sound, faculties which warn the stalker never to let himself or his attendant be seen, and to observe the strictest silence. Deer, if disturbed, for the most part look for the cause as proceeding from the *low grounds*, and rarely from above; this peculiarity is duly taken advantage of by the sportsman, who accordingly advances upon his game, wind permitting (frequently by the most circuitous and precipitous paths), *down* hill. When thus approaching deer that are feeding in the valley below, the utmost caution is requisite, both as regards speed and the mode of progression. The stalker must advance inch by inch on his back, by resting himself on his elbows, and drawing himself forward by his heels; he must observe every motion of the deer, stopping when they stop feeding, and retaining his position, irksome though it be, till his game recommence pasturing; he must never, even for an instant, display the slightest unusual motion during his toilsome and stealthy advance, and must submit implicitly to every signal and whisper from his guide. During protracted stalks, especially when the nature of the ground between man and deer is free from sheltering knolls, the stalker's patience is tried to the utmost by his having to pause so frequently in his progress; the stalk, however, is usually directed not so much *directly* towards the deer, as for some intervening knoll or rock where a little relaxation of limb and breathing-time may be obtained ere firing. Thus, if fortunate in properly winding the deer, and if the stalk has been successfully accomplished, the herd may be reached within 50 or 100 yards. The game may possibly consist of either a single stag, or some hinds and one or two stags; the finest of the latter is usually the aim of the true stalker, and the most deadly spot to aim at is behind the shoulder. If mortally hit, the animal frequently bounds away for twenty or more yards, and then falls dead; if not mortally struck, it will sometimes fall at the shot, and spring up again, and follow the retreating herd. It is then the deer-hound is slipped. When a deer is killed, and cannot be immediately conveyed home, the attendant instantly disembowels it, that the venison may not be tainted. This operation is termed *gralloching*. The best stag in the herd is that which is the fattest, and has the finest antlers. See DEER. When there are more than one sportsman, or where the peculiarities of the ground are such as to render the task of stalking unusually difficult, hill-men are employed to drive the deer towards certain passes, behind which the shooters are previously concealed. On such occasions, the excitement produced by the gradually approaching and unsuspecting herd, mingled with the grandeur of the whole scene, as they at length rush through the fatal pass, is enough to try the nerves even of the most experienced stalkers. The Black Mount, belonging to the earl of Breadalbane, and the Forest of Athole, belonging to the duke of Athole, are the finest deer-forests in Scotland. The best work we know of on the subject of deer-stalking is Scrope's treatise, published in 1838; 3d edit. 1847.

DEER-STEALING. By 24 and 25 Vict. c. 96, s. 13, it is enacted that any person who shall unlawfully hunt, snare, or carry away, kill or wound any deer kept in the inclosed part of a park, chase, or other inclosure, shall be guilty of felony, and shall be liable to two years' imprisonment, and hard labor. If the deer be in the uninclosed portion of the park, the punishment is a fine not exceeding £50, which the justice may modify as he shall see fit. The second offense, in every case, is to be considered felony. Suspected persons found in possession of venison, or of the head or skin of a deer, or of snares or engines for taking deer, who shall not be able to satisfy the justice that they came lawfully by the venison, or had a lawful occasion for the snare, may be fined a sum not exceeding £20. A like penalty is imposed (s. 15) for setting engines for taking deer, and pulling down park-fences. By s. 16, deer-keepers and their assistants may seize the guns, snares, dogs, etc., of offenders who do not deliver them up on demand, and resistance on their part is declared to be felony. In Scotland, the offense of breaking into a deer-park and shooting deer is punishable as theft. Shooting a stray deer without the owner's consent, is punishable by fine. Though not entitled to kill deer trespassing on his property, the proprietor may drive them off (Stair, ii. 3, 68; Ersk. ii. 6, 14); and one of two co-proprietors may drive off deer against the will of another (Irvine, *Game-laws*, p. 13). There is a reference to deer in the present acts which regulate the duty on game licenses, and persons shooting them are always liable to the penalties imposed by these statutes. Hunting them with hounds is, however, excepted (see Paterson's *Game-laws*, p. 130).

DE FACTO, a Latin phrase much used in English to express "in reality," or possession. A king *de facto* is one actually ruling, although the place may rightfully belong to another, who therefore is king *de jure*.

DEFAMATION. See LIBEL.

DEFAULT, JUDGMENT BY. Where the defendant in a cause has failed to make appearance or to lodge a sufficient plea, or other pleading, in due time the plaintiff may proceed to sign judgment by default. Where a writ of summons has been specially indorsed (see INDORSEMENT), the plaintiff, on lodging an affidavit (q.v.) of the service, may immediately sign judgment by default, and in eight days from the last day for appearance, execution may issue against the defendant. If the writ of summons have not been specially indorsed, the plaintiff may file an affidavit of service, or notice in lieu of service, and a statement of the particulars of his claim, and may after the expiration of five days enter final judgment for the amount. Judgment by default, for want of a plea, etc., may in like manner be signed on failure of the defendant to deliver a sufficient plea in the prescribed time. Judgment by default is not necessarily final. In case of non-appearance, it will be set aside on the defendant making affidavit as to the cause of non-appearance, and disclosing a ground of defense on the merits. If judgment have been for want of a plea, etc., it may also in general be set aside on an affidavit of merits. But in both cases, the defendant must suffer the costs of the proceedings.

DEFEASANCE, DEED OF (in English law). An instrument which defeats the force or operation of some other deed or estate; and that which in the same deed is called a condition, in a separate deed is called a defeasance. Defeasance is of two sorts, one applicable to freehold estates, the other to terms of years and other executory interests. —*Bythewood.* Defeasance of the freehold is a collateral deed made at the same time with a feoffment (q.v.), or other conveyance, containing certain conditions, upon the performance of which the estate thus created may be defeated or totally undone.—Stephen's *Commentaries.* This deed owes its origin to the restrictions on the conveyance of land imposed by the feudal law. Under that system, every tenant of land was, by virtue of his tenancy, vassal under a superior lord, to whom he owed suit and service. The consent of the lord was necessary for every change of vassal; and the law would not recognize a condition whereby, in a particular event, the land should revert to the original tenant, and the over-lord be thus forced to change his vassal. Hence, when a holder of land wished to obtain money on the security of his land, the conveyance to the lender was *ex facie* absolute; but a deed of defeasance was executed, in virtue of which the borrower, on payment of his money, could recover his land. In this manner mortgages were originally effected. In process of time, the practice of inserting conditions in the original conveyance became established, and from that period, deeds of defeasance have ceased to be in general use. Lord Talbot, in the case of Cotterel *v.* Purchase (Ca. tem. Talbot 61), said he should always discourage the practice of drawing absolute deeds, and making a defeasance which wore the face of fraud.*

Defeasance of executory interests may be made at any time after the creation of the estate to which it refers. It must be made with the same formalities as those which created the estate, and between the same parties or their representatives.

DEFENDER OF THE FAITH, a title conferred on Henry VIII. by pope Leo X., as a reward for writing against Martin Luther, in 1521. When the king afterwards suppressed the religious houses at the reformation, the pope not only recalled the title, but deposed him. The title was afterwards confirmed by parliament (35 Henry VIII. c. 3), and has ever since been used by the sovereigns of this country. The corresponding title in Spain is, Most Catholic, and in France was, Most Christian King.

DEFERENT, an old term in astronomy, signifying a circle on which the center of another circle moves, while a body is supposed to be moving on the latter itself. If we suppose the sun to be moving round a center in space, while the earth moves, say, in a circle round the sun, then the sun is moving in the deferent. The term originated in the Ptolemaic system (q.v.).

DEFFAND, MARIA DE VICHY-CHAMROND, Marquise du, 1697-1780; a leader in the fashionable literary society of Paris during the greater part of the 18th century. She was born of a noble family in Burgundy, and educated in a convent in Paris, and soon developed the cynical and skeptical turn of mind which so well suited the part she was afterwards to fill in the philosophical circles of the capital. At the age of 21, her parents married her to the marquis du Deffand, without consulting her inclinations. The union was unhappy, and a separation soon followed. Young and beautiful, she did not, according to the common belief, keep herself uncontaminated by the abounding vices of the age, and it was said that she was for a time the mistress of the regent. A reconciliation with her husband was made, but of short duration. Without heart and without enthusiasm, she was incapable of any strong attachment; but her intelligence, her cynicism, and her *esprit*, made her the center of attraction to a circle which included nearly all the famous philosophers and literary men of Paris, besides not a few distinguished visitors from abroad. In 1752, she became blind, and took up her abode in apartments in the convent of St. Joseph, her rooms having a separate entrance from the street. This became the frequent resort of such men as Choiseul, Boufflers, Montes-

*The mode of conveying land in security in Scotland was formerly almost identical with that which in England was effected by a defeasance. The Scotch deed was called the absolute disposition with a back bond. See WADSET, DISPOSITION, HERITABLE SECURITIES.

quieu, Voltaire, D'Alembert, David Hume, and Horace Walpole. In 1764, the society was divided into two parties by the defection of her companion, Mlle. de L'Espinasse, who took with her D'Alembert and several others. Madame Deffand had most affinity of nature with Walpole, who made several visits to Paris for the purpose of enjoying her society, and who maintained a close and interesting correspondence with her for 18 years. Of her innumerable witty sayings, the best known is her remark on the cardinal de Polignac's account of St. Denis' miraculous walk of two miles with his decapitated head in his hands: "It is only the first step that costs."

DEFIANCE, a co. in n.w. Ohio, on the Indiana border, intersected by the Miami canal, and the Toledo, Wabash and Western railroad; 414 sq.m.; pop. '70, 15,719. The surface is level and timber is abundant. Chief productions, wheat, corn, oats, butter, wool, tobacco, etc. Co. seat, Defiance.

DEFIANCE, a village and seat of justice of Defiance co., Ohio, on the Maumee river, at the junction of the Auglaise, 50 m. n.w. of Toledo, with which it is connected by rail; pop. '70, 2,750. There are several flouring mills and other important manufacturing establishments.

DEFICIENT NUMBERS. A number is said to be deficient whose aliquot parts, or factors, added together, make a sum less than the number itself: thus, 16, whose parts, 1, 2, 4, 8, make together only 15, is a deficient number.

DEFILADING is that part of the art of fortification which consists in determining the directions and heights of the lines of rampart, so that the interior may not be commanded by the fire of any works which the enemy may raise. Defilading is divided into horizontal and vertical. The object of the first is to prevent the lines being commanded in the direction of their length, or enfiladed; the prolongations of the lines, therefore, must avoid all points where hostile works could be erected. Vertical defilading determines the height of rampart necessary to protect the interior from direct fire.

DEFILE, in military language, is the name given to any passage which is of such a nature that it must be traversed by troops only in column with a narrow front. Wherever free lateral movement is obstructed, is a defile; and a defile is a "pass" when it cannot be avoided, without making a long circuit.

DEFINITE PROPORTIONS, LAWS OF, in chemistry. See ATOMIC THEORY.

DEFINITION is the explanation or statement of the meaning of a word, viz., either the meaning it usually bears, or that which the speaker or writer, for the particular purposes of his discourse, intends to annex to it. To give merely another synonymous name—to say, for instance, that "man is a human being"—is not commonly considered a definition at all. Names requiring definition mostly imply, or connote, a set of attributes. To define such a name, then, is to enumerate all the attributes connoted by it. Hence, definition is a kind of analysis. If we were to define "man" as "a rational animal," the definition would be imperfect; for no one would call such beings as Swift's Houyhnhms men, which shows that, in the common acceptation of the word man, it connotes among other things a certain form. Definition, then, is of the nature of essential propositions; it conveys no information about the object to any one who is aware of the connotation of its name; it is only a statement of all the attributes, the absence of any one of which would make the object cease to be called by that name.

The definition, "Man is a rational animal," though incomplete, is correct so far as it goes; though it does not enumerate all the essential attributes—i.e., all the attributes connoted by the name man, yet those it does enumerate are connoted by the name, and are sufficient to mark out its denotation—that is, to distinguish all the beings known to exist to whom it can properly be applied. Such is generally held, therefore, to be a complete definition, though logically imperfect; but to say that "Man is a featherless biped," involves a different kind of imperfection. The attribute featherless, though actually true of all men, and therefore serving to distinguish them from the only other bipeds, the birds, is no part of the meaning of the word, but is what logicians call an *accidental* attribute. This kind of imperfect definition is called a description. Such definitions are very common in science, and serve special purposes of classification. In Cuvier's *Animal Kingdom,* man is defined or described as "a mammiferous animal having two hands."

A distinction is generally drawn between definitions of names and definitions of things, or *nominal* and *real* definitions. A real definition is intended, it is said, "to explain and unfold the nature of the thing." In objection to this view, it is replied, that no definition can unfold the whole nature of a thing, and every true proposition respecting it unfolds some part of its nature: of all the propositions, then, unfolding its nature, how shall we distinguish those that define it from the others? This question has never been answered. The fact seems to be that "all definitions are definitions of names, and of names only," but that many expressions that pass for definitions, are something more. They not only define the name of the thing, but they comprise a tacit assumption, that a thing with such attributes does or may exist. This is the case with the definitions of geometry; and it is from these tacit postulates that the consequences are deduced, and not from the mere definition of the meaning of a word.

As there can be no accurate discussion unless all the terms employed have a distinct

meaning recognized by all parties, it is often necessary to have recourse to formal definitions of important names. One of the most effectual devices ever yet discovered for settling the signification of terms, is to declare the meaning *opposed* to what is intended; in this way any ambiguity in the language is at once done away with. Thus, the word "natural" conveys no clear meaning of itself; but if we state what we mean to *exclude* when we use it, we narrow the variety of significations to some one. We may oppose it to "moral," and then it means something connected with the world of matter; we may oppose it to "constrained" or compelled, giving it the meaning of spontaneous or free; other contrasts are the "artificial," the "distorted," in copying or representing things, etc.

The scholastic logicians made definition consist in stating, first, the "genus" that a thing belonged to, and secondly, the "difference" or peculiarities that separate it from all the other members of the same genus. This suits for natural history, and for all subjects analogous thereto. For example, if we were attempting to define "poetry," we could not do better than proceed *per genus et differentiam*. Poetry belongs to the class of fine arts: it has all the characters common to painting, sculpture, architecture, music, etc. Consequently, if we are well acquainted with these other subjects, we can draw from them part of the characteristics that belong to poetry; for example, its having for its end refined pleasure. We then inquire into the *difference* between it and the others, which we find to be the use of a peculiar medium or instrumentality—viz., thoughts expressed in language. If we would give a more particular account of the meaning, we should find it necessary to specify the *kinds* of poetry, or to find out the *differences* of epic, dramatic, lyric, etc.; which would be to define, not the subject itself, but its subordinate species. See J. S. Mill's *Logic*, vol. i. 182.

DEFLAGRATION is applied to the rapid combustion of ignited charcoal when a nitrate (such as nitrate of potash) or a chlorate (such as chlorate of potash) is thrown thereon. As chlorates do not occur naturally, it follows that deflagration with a natural salt indicates a nitrate; and if the deflagration be accompanied by a violet flame, it is characteristic of nitrate of potash (ordinary niter or saltpeter); and if by a strong yellow flame, it is indicative of nitrate of soda (cubical niter).

DEFLECTION is, generally, a change of course or line of motion of a moving body. The word deflection is also used as synonymous with diffraction (q.v.).

DEFLUXION (Lat. *defluxio*), a discharge from a mucous membrane, especially of the air-passages. It is synonymous with catarrh (q.v.).

DE FOE, DANIEL, was b. in London, 1661, and was the son of James Foe, a butcher. The prefix De was not added to the family name of Foe by our author until he had reached manhood. De F., whose father was a dissenter, was educated at a dissenting academy at Newington Green, where he remained until he had nearly reached the age of nineteen. In 1682, he began his career as author, publishing a pamphlet which contained strictures upon the clergy of that day. This was followed, in 1683, by another pamphlet, entitled *A Treatise against the Turks*. In 1685, he took part in the rebellion of the duke of Monmouth, but luckily escaped being punished on its suppression. After this he engaged in trade, but a series of misfortunes finally determined him to forsake it.

In 1701, he published his famous satirical poem, *The True-born Englishman*, which was written in vindication of king William, and in answer to a poem in which he had been attacked, called *The Foreigners*. This poem proved a wonderful success; 80,000 pirated copies of it were sold on the streets at a trifling price. During the same year, when the deputation that presented the famous petition of the freeholders of Kent to the house of commons were illegally thrown into prison, De F. drew up, a few days after, a remonstrance, known in history as the *Legion Memorial;* and is said to have himself, in the disguise of a woman, presented it to the speaker as he entered the house. In 1703, a complaint being made in the house of commons regarding one of his recent publications, called *The Shortest Way with Dissenters* (1702), the whole tenor of which seems to have been misunderstood, he was apprehended, tried, found guilty, pilloried, fined, and imprisoned. While in prison, he wrote a *Hymn to the Pillory;* and here also he projected *The Review*, a periodical which he established on his release in Aug., 1704, and continued to conduct for nine years. In 1706, lord Godolphin, who admired the practical talent and literary vigor of De F., employed him as one of the staff of the commissioners to Scotland to bring about the union. De F.'s knowledge of revenue, trade, and taxes was found to be of great value; and it is supposed that he was rewarded with a pension for his services on that occasion. His visit to Scotland enabled him to write a *History of the Union*. For some years after, De F. seems to have lived in comfortable circumstances, but gradually his numerous political enemies gathered voice again, and De F. was literally silenced by noise and obloquy; at last, however, roused by the insolence of the Jacobite party, he was once more tempted to write unwarily, and the result was that he was again (1713) apprehended, fined in £800, and committed to Newgate. After his release, De F. became sick of politics, and, fortunately for the world, sought rest in the sphere of imaginative literature. In 1719, appeared the famous *Robinson Crusoe*—the most popular of all his works. Its success was immediate. The publisher, who had accepted the book after all the others had refused it, is said to have cleared £1000 by its publication—no small sum in those days. De F., in rapid succession, pro-

duced his other notable works of fiction. *Moll Flanders* (1721), *Journal of the Plague* (1722), *Colonel Jack* (1721), *Adventures of Roxana* (1724), and the *Memoirs of a Cavalier*, the last of which Chatham used to recommend as the best account of the civil wars extant, bear witness to De F.'s industry during these years. He died in April, 1731. D.'s style, both in his political and imaginative works, is simple, clear, and vigorous. His fictitious narratives are characterized by an unparalleled appearance of truth. This is pre-eminently the case in the *Journal of the Plague*, which for a long time imposed upon the well-known Dr. Mead as genuine. See *Life and recently discovered Writings of De F.*, by Lee.

DEFORCE'MENT, in English law, is an ouster of the freehold (q.v.). It is the holding of any lands or tenements to which another person has right. In this sense, it includes as well an abatement, intrusion, disseisin, or discontinuance (q.v.), as any other species of wrong whatsoever, whereby he that hath right to the freehold is kept out of possession. But in its strict sense, it is only such a detainer of the freehold from him that hath the right of property, but never had any possession under that right, as falls within none of those injuries.—*Co. Litt.*, by Butler, 331 b. n. (1). The party thus wrongfully retaining possession was called the deforciant, and was said by Blackstone (2 *Comm.* 196) to have an *apparent right of possession*. There was this difference between a party retaining possession of the freehold by means of deforcement, and one who occupied by either of the other modes of ouster, that in the former case the party ousted had no right of entry (q.v.). This, previous to the reign of William IV., was a matter of some importance, inasmuch as the claimant was thereby debarred from recovering possession by means of entry or ejectment, and was driven to the more tedious process of asserting his right by a real action (q.v.). But by 3 and 4 Will. IV. c. 27, all real actions, except four, having been abolished, this distinction between deforcement and the other means of ouster has ceased to have the same practical importance.

DEFOR'CIANT, a title of the defendant in a suit for levying a fine of lands (q.v.).—The party wrongfully retaining possession of a freehold by deforcement (q.v.).

DE FOREST, JOHN WILLIAM, b. Conn., 1826. While yet young, he passed several years in Europe and western Asia. In the war of the rebellion he served as captain of volunteers, and was promoted to major. For a time he was commander of what was known as a "Freedman's bureau district." Among his books are *Oriental Sketches; European Acquaintances; Seacliff; The Wetherel Affair; Miss Ravenel; Overland;* and *Kate Beaumont.*

DEFORMITIES. Varieties of form which mar the external appearance, may be *congenital* or *acquired*, according as they occur before or after birth. The former class were considered by the ancients to carry some important meaning in their mysterious shapes, and to show the anger of the gods; hence, they termed them *monsters*, from *monstrare*, to show; and even in later times, they were popularly believed to be the result of the most hideously unnatural combinations. Modern scientific writers have, however, made them a subject of special study, under the name teratology (*teras*, monster, and *logos*, science), and their researches have shown that D. generally depend on some arrest of development of the fetus, or some accidental position it has got into, or some inflammatory disease which has caused unnatural adhesion of parts. It has been found that in 3,000 births in Paris, there occurs about one monster. They generally follow some definite law. D. are more common among domestic than wild animals, among mammalia than birds, and very rare among fishes and the invertebrata.

It is a common belief, that the mind of the female parent has an influence over the shape of her infant; but although some singular coincidences have occurred, there is no scientific proof that such is really the case. This theory, however absurd, was eagerly adopted in the middle ages; it was, in fact, often appealed to in the interest of mercy as a loophole of escape for pregnant women, who, by the barbarous ignorance of the time, might be condemned to torture; and so universal has the popular belief in this theory become, that even at the present day no scientific demonstration to the contrary has proved sufficient to undermine it. D. are, however, in many cases, hereditary, as may be seen in the instances of additional fingers and toes, and of harelips.

It seems uncertain whether the male or female parent chiefly influences the occurrence of deformity in the offspring. One rarely sees a case of harelip without being able to recognize a sort of tuck or shortening in the same feature of the mother; but the writer of this article knows a family of three with harelips, whose father alone is similarly deformed; and another family of three, with perfectly formed mouths, whose mother has an uncured and extremely unsightly harelip.

The chief congenital D. may be classed under the following heads:

Deformity as regards *number* of parts; as, for instance, the Sirens, who have *apparently* but a single inferior extremity, which tapers to a point; the Cyclops, with but one eye; or the head itself may be absent, or some organ, as the brain. Such D., from a deficiency of parts, may also result from amputation of portions of the limbs of the fetus when still within the uterus by the pressure of the umbilical cord. Curiously enough, however, it often happens that this intra-uterine amputation of parts leads indirectly to an exactly opposite condition—namely, a multiplication of parts arising from the stumps left by these uterine amputations; the fetus in the early

stages of its growth appearing to possess something of the power of reproduction of parts observed in most of the lower orders of animals. The parts most commonly reproduced are fingers and toes, or, most commonly of all, only abortive portions of these, as little projections from the stump of the limb, with traces of nail, and sometimes a single joint with an imperfect bony development. We see a new growth of little fingers or toes according to the member lost, and this power shows itself sometimes without being preceded by such an injury, in additional fingers, toes, etc. These parts are generally close to the similar natural ones, but not always, as, for instance, an ear in the neck.

Deformity with regard to *size*. This may involve the whole body, as in dwarfs, of whom there have been some remarkable peripatetic specimens: the Corsican fairy was only 2 ft. 7¼ in. high; Mlle. Crachami, the smallest lady who ever lived, died at 10 years of age, only 20 in. in height. This kind of deformity is not necessarily hereditary; the father of Borowlaski, who was only 39 in. when 30 years old, had six children alternately short and tall; and dwarf women have brought forth infants as long, when extended, as their mothers. One limb only may be diminutive. Of course, D. the opposite of these exist, such as giants, or instances of premature or excessive local growth. O'Byrne, the Irish giant, measured 8 ft. 4 in. when he died, at the age of 22. Such individuals are generally subject to premature decay.

Deformity as regards *shape;* this results generally from retarded growth, the parts of the embryo not consolidating as growth advances, as in harelip; or from irregular muscular contractions, as in club-foot (q.v.); or by two or more parts coalescing, as two fingers; or in cyclopy, when both the eyes run into one.

D. of *color* are frequently coexistent with tendency to, or the presence of, some disease. There may be deficiency of coloring matter, as in albinos; or an apparent increase, as in *blue disease*, arising from the partition between the right and left sides of the heart not being completed; or from some coloring matter produced in the body, as in the mottled individuals shown in caravans.

D. of *continuity* occur from the lateral halves of the embryo not completely closing, as seen in clefts of the back, the palate, etc.

Acquired deformities will be noticed under their special names.

DEFREGGER, Franz, an Austrian painter; b. 1855, at Stronach, in the Tyrol. He gave early evidence of talent, but had no opportunity for instruction till 1860; when, after studying drawing with the sculptor Stolz at Junsbrack, he was admitted to the Munich academy of fine arts, and afterwards, 1863–65, pursued his studies in Paris. In 1867, he began a series of paintings illustrating scenes of everyday life in the Tyrol that have justly made him famous. Among the best known are: "The Forester Returning Home for the Last Time;" "Wrestlers in the Tyrol;" "The Poachers;" "Dancing on the Alin;" and "The Last Call of 1809." He stands high among living genre painters.

DEFTER-DAR, a title of the Turkish minister of finance, who has a seat in the divan and disburses the public money. The title may be translated "book-keeper."

DEGER, Ernst, b. 1809; a German painter who studied at Düsseldorf under Von Schadow. He painted the frescos in the church of Apollonaris on the Rhine; on the completion of which William IV. employed him to adorn the chapel in the castle of Stolzenfels. He has held for a number of years a professorship in the academy of fine arts in Munich.

DEGERANDO, Jos. Marie, Baron, author and philanthropist, was b. 29th Feb., 1772, at Lyons, France. His family was originally from Italy. He studied at the college of the Oratoire of Lyons, with a view to becoming a priest; but the persecutions of the revolutionists altered his plans. In 1797, he went to Paris. The *coup d'état* of the 18th Fructidor compelled him to flee to Germany, where he entered the army of Massena as a common soldier. While at Colmar with his regiment, D. wrote a treatise, which was "crowned" by the academy, and which was afterwards enlarged and published under the title of *Des Signes et de l'Art de penser, considérés dans leurs Rapports Mutuels* (Par. 1800). In 1802, appeared his *De la Génération des Connaissances Humaines*, a precursor of his *Histoire comparée des Systèmes de Philosophie relativement aux Principes des Connaissances Humaines* (Par. 1803; German, by *Tennemann*), which is reckoned the best French work on the history of philosophy. It procured him, in the following year, admission into the académie des inscriptions et des belles-lettres. About the same time, he was appointed secretary-general to the ministry of the interior, and subsequently held a variety of high offices under Napoleon. But D. is even better known, and has done more service, by his philanthropic than his philosophic writings. To the former class belong his excellent work, *Le Visiteur du Pauvre* (Par. 1820), which obtained the Montyon prize, as did also his *Du Perfectionnement Moral*, etc. (Par. 1824); his *Cours Normal des Instituteurs Primaires* (Par. 1832); *Institutions du Droit Administratif* (Par. 1825); *Education des Sourds-muets de Naissance* (Par. 1827); *Des Progrès de l'Industrie* (1841). D. was elevated to the peerage in 1837, and died 12th Nov., 1842, vice-president of the council of state.—His son, A. Degerando, has written two interesting works—*Essai Historique sur l'Origine des Hongrois* (Par. 1841); and *Transylvanie et ses Habitants* (Par. 1845).

DEGGENDORF, a t. of Lower Bavaria, situated on the Danube, 29 m. n.w. of Passau. It is well built, and has several churches, an hospital, an orphan-house, and a poor-house. D. has pottery and linen factories, and carries on a brisk trade in these articles, as well as in cattle, fruit, wood, etc. There is a remarkable church on the Geiersberg, possessed of a miraculous wafer, and having "doors of grace," which are only opened once in the year. Many pilgrims (often numbering more than 30,000 annually) flock hither, pope Innocent VIII. having promised general absolution to all such as visited the church. Pop. '75, 6,758.

DEGLUTI'TION. See SWALLOWING.

DEGRA'DED, in heraldry, means placed upon steps or degrees, as in a *Cross Calvary.*

DEGREE, in a college or university (Fr. *degré,* from Lat. *gradus,* a step), is a recognition of the student having made a certain step in advance, and having attained, as it were, to a certain resting-place in his academical career. The evidence of a D. is usually called a diploma (q.v.). Degrees may be divided into various classes, according to the privileges which they confer. 1. They are either simple certificates of attainment granted by a competent authority; attesting either that the college or university granting them has ascertained the fact by examination—in which case they are ordinary degrees—or that the common fame of the individual is such that the learned body conferring the D. is willing to take it for granted, in which case they are honorary degrees. To this class belong our degrees in arts, and the honorary degrees of LL.D., D.C.L., and D.D., which are granted by most universities. 2. They are licenses to teach the branch of knowledge with which the holder is certified to be acquainted. To this class belonged all doctors', and probably all masters' degrees in the universities of the middle ages. See DOCTOR. 3. They are licenses to practice a certain profession or art. As the latter privilege is one in which the general community is more deeply interested than in either of the others, it is generally requisite to its full exercise that the university D. should be accompanied by a government license. These latter degrees—of which the D. of M.D. and D.C.L. (see DOCTORS-COMMONS) are the only ones known in this country—in this case resolve themselves into one or other of the former classes.

University degrees, like most institutions which have held their place in society long, arose out of public exigencies, and are not traceable to any single founder or to any single act. There is every reason to suppose that, substantially, they have existed for ages. The doctors or teachers of the law (*nomodidáskaloi*), so often mentioned in the New Testament—and probably the scribes also—were a class, taken, it would seem, very frequently from the sect of the Pharisees, but essentially distinct from them (Luke v. 17), possessing privileges very closely resembling those which were attached to the D. of a teaching doctor in after times. In classical Greece, though far less formal than it afterwards became, education was probably more systematic than is commonly supposed. In the schools of Isocrates and Plato, Mr. Kirkpatrick, in his ingenious book on the *Historically-received Conception of the University,* has traced not only substantially the function, but much even of the external organization of the university. He has shown also, very clearly, that it was the systematic training which had become necessary for success in public life that called the Sophists into existence, and gave to them the marvelous social influence which they possessed. It was the ambition, not of the higher class of orators and statesmen alone, but of every noisy demagogue who aspired to notoriety, to come before the public with the prestige of having been the pupil of some famous Sophist, or, as we should say, of having been to a good school, and taken a good degree. All the appliances of modern teaching existed unquestionably in the museum at Alexandria, and it is inconceivable that those who had passed through the *kuklos* or cycle of studies, should not have carried away some testimonial of proficiency very much resembling a degree. As there was a distribution both of teachers and students into what we should call the faculties of philosophy, philology, and medicine, it is probable, moreover, that there were distinct degrees corresponding to each of them. During the three centuries which intervened between Alexander and Augustus, Athens continued to be the great school of philosophy, as Rhodes was of oratory, and Alexandria of philology and medicine. The importance of an education in the Greek schools rather increased than diminished during the period of the Roman empire. So entirely, indeed, was the success of the young provincial in public life also dependent upon his literary acquirements, that, as Mr. Kirkpatrick informs us, students, before leaving the provinces for Rome, were obliged to obtain a written permission from a magistrate, and that a record of the proficiency of each student was sent in to the government, in order that the latter might be thereby guided in the selection of fit individuals for the public service. In Constantinople, moreover, down to the very last, lifeless and unproductive though the intellectual life unquestionably was, it was formally organized to an extent which reminds one of China rather than of any existing European nation. The worthless and contemptible Byzantines, male and female, like the Chinese, passed endless examinations, and took abundance of degrees. After the incursion of the northern nations, the extreme rudeness of the general community of western Europe caused the learned class to stand out from it with a prominence unknown in the society of antiquity, and hence the greater importance which academical degrees assumed in the middle ages. A man who had passed through the trivium or quadrivium at Constantinople before barbarism had made

learning rare, or who had received the far higher instruction which was communicated at the museum of Alexandria, by no means differed from the society which surrounded him to the same extent as did a master or a doctor at Paris or Bologna. The minuter history of academical degrees in the middle ages is involved in much obscurity. The following are passages from the above-mentioned work of Mr. Kirkpatrick, who has gone over the authorities with much care. "Wood mentions (*Hist. and Antiq. of Oxford*, i. 50) that St. John of Beverley (680 A.D.) was commonly reported to have been the first who took the D. of master of arts at Oxford. The same writer informs us that this D. had become common in the reigns of John and Richard I. According to Bulæus (*Hist. Univ. Paris*, ii., pp. 256, 679, sqq.), academic degrees were first instituted at Bologna. The forms designative of the various orders of academic dignity in that university are stated to have been the Baccalaureatus, Licentiatus, and Doctoratus. Of these, the last two were probably equivalent to the degrees of the master incipient and the magister socius or regent of Paris. Certain stadia, or successive courses of legal study, are said to have been in existence from the time of Justinian. The five years devoted to the acquisition of juristic knowledge were divided into the Anni Justiniani, edictales, papinianistæ, lytæ, and prolytæ. The student who had passed through all successively was described as a licentiatus, from the circumstance that he was considered qualified to discharge the duties of an antecessor or public professor of this subject. The practice adopted in this respect by the schools of jurisprudence was afterwards transferred to theology at Paris by Peter Lombardus. The name bachelor is supposed by Malden (*History of Universities and Academic Degrees*, p. 23) to have been borrowed from the terminology of the military hierarchy of those ages." See BACHELOR. "Bachelors are often styled scholars (Wood, *Hist. and Antiq. of Oxford*, i. p. 59), and the individual invested with this D. was regarded as, at the utmost, an imperfect graduate. At the same time, in accordance with the system of mutual instruction so thoroughly adopted in the schools of the middle ages, the more advanced class of scholars were both encouraged and commanded to perfect their own acquirements, and extend the educational influences of the university into the minutest ramifications of the system by teaching and catechising the junior members of their own body (Crevier, *Histoire de l'Université de Paris*, ii. p. 160). Bachelors, though thus intrusted with certain tutorial functions, never possessed any of the legislative powers assigned to the masters" (pp. 206, 207). It was to the teaching masters—and all who took the master's D. were bound to perform the duties of tuition for a time—that the term regent was applied both on the continent and in Scotland. On retiring from the office of regent, the master—at Paris, at least—ceased to take an active share either in the legislation or the government of the university (Bulæus, par. iii. p. 420). The question as to whether the institution of teaching masters or regents ought to be revived, to the extent of permitting them to compete on equal terms with the endowed professors, is one of the most important now under discussion amongst the university reformers of Scotland. A very excellent pamphlet in favor of it was published by Dr. Kilgour of Aberdeen, in 1850. See BACHELOR, MASTER OF ARTS, DOCTOR, REGENT, UNIVERSITY.

DEGREE, in music, is the difference of position or elevation of the notes on the lines and spaces. When notes are on the same line or space, they are on the same degree, even though one of the notes should be raised by a sharp, or lowered by a flat. When two notes follow diatonically, so that one of them is on the line, and the other on the space adjoining, the interval is of one degree. Subtracting one from an interval, gives the degrees which separate the two notes; thus, a third is separated by two degrees; a fourth, by three, etc.

DEGREE. See CIRCLE.

DEGREE OF LATITUDE is a space along the meridian (q.v.) through which an observer must pass to alter his latitude by one degree—i.e., in order to see the same star one degree nearer to or further from the zenith. See LATITUDE. The space must be found by actual measurement; and owing to the earth being an oblate spheroid, and not a sphere, it varies with the place of observation—the degrees being generally longer towards the poles, where the earth is flatter, and shorter at the equator, where the earth is more curved. If the earth were a sphere, a degree would be exactly a 360th part of the meridian. As it is, the length of a degree of latitude depends on the latitude of the place. From a variety of observations conducted at various times and places, from as far back as the time of Eratosthenes (250 B.C.), tables have been constructed showing the length of degrees at different latitudes. The length of "the middle degree," as it is called, or that of places in latitude 45°, may be taken approximately at $69\frac{1}{10}$ English miles. The ascertained differences between degrees of latitude is one of the proofs of the earth's spheroidicity. See GEODESY.

DEGREE OF LONGITUDE is the space between two meridians that make an angle of 1° at the poles, measured by the arc of a circle parallel to the equator passing between them. It is clear that this space is greatest at the equator, and vanishes at the poles, and it can be shown that it varies with the cosine of the angle of latitude. The annexed table shows the lengths of a degree of longitude for places at every degree of latitude from 0° to 90°. It is computed on the supposition that the earth is a sphere.

DEGREES OF LAMBETH. By 25 Henry VIII. c. 21, sundry powers formerly belonging to the pope were conferred upon the archbishop of Canterbury, among which was the right of granting degrees. He can confer all the degrees taken in the universities of Oxford and Cambridge, but his degrees do not carry with them all the privileges which belong to degrees conferred by the universities.

DEGREES OF NOBILITY. See NOBILITY.

DEGREES OF RELATIONSHIP. See CONSANGUINITY, AFFINITY.

DE GREY, Earl. See RIPON, MARQUIS OF.

DE HAAS, MAURICE, F.H., a Dutch painter, b. Rotterdam, 1830, a pupil of Lewis Meyer. In 1859, he emigrated to New York, where he soon gained a high reputation. Marine views are his *forte*. His best known American picture is "Farragut Passing the Forts."

DEHRA DUN, a district in British India in the Meerut division of the lieutenant-governorship of the north-western provinces, between 29° 57′ and 30° 59′ n., and 77° 31′ and 78° 23′ east. The valley (dun) of the Dehra has an area of 673 sq.m., in the form of a parallelogram running 45 m. from n.w. tos.e., and 15 m. broad. The Ganges bounds the valley on the e. and the Jumna on the west. The agricultural products are tea, rice, oil seeds, millet, garden crops, etc.; pop. '72, 116,953, nearly all Hindus. (From *Encyclopædia Britannica.*)

DE'I GRA'TIÂ (Lat. "by the favor of God") is a formula taken from several apostolical expressions in the New Testament. It is believed to have been first formally used by the bishops at the council of Ephesus, 431 A.D. Afterwards, it came to be appended by archbishops, bishops. abbots, abbesses, deans, monks, and even chaplains, to their titles, in letters, and other documents, as a humble expression of dependence on the Most High. After the middle of the 13th c., when the sanction of the pope began to be considered necessary to ecclesiastical offices, the higher clergy wrote *Dei et Apostolicæ sedis gratiâ*, "by the favor of God and the apostolic see." At a later period, many of them preferred to write *miserationè divinâ, permissione divina*, and the like; but they still continued to be styled by others *Dei gratiâ*. In the British islands, this style was generally dropped about the time of the reformation, but it was occasionally given to the archbishops of Canterbury and York, even after the beginning of the 17th century. Beginning with the times of the Carlovingians, many temporal princes, earls, and barons made use of the formula D. G.; and before the 15th c., no idea of independence or of divine right seems to have attached to it. But in 1442, king Charles VII. of France forbade its use by the comte d'Armagnac, and in 1449, obliged the duke of Burgundy to declare that he used it without prejudice to the rights of the French crown. These instances show that it had now begun to be regarded as belonging exclusively to sovereigns who owed no allegiance to any other earthly potentate or power. In this way, what was originally a pious expression of humility, came to be looked upon as an assertion of the doctrine of the "divine right" of kings.

DEINOTHE'RIUM. See DINOTHERIUM.

DE'ISM, or THE'ISM, properly means belief in a God, as opposed to atheism. In common language, however, D. is opposed to belief in a revelation: and a deist is one who holds the existence and providence of God, but grounds his belief on reason and the evidence afforded by the constitution of things, and rejects the testimony of a revelation. The name is often used vaguely by way of reproach, similarly to "infidel."

The term deists, or freethinkers, is sometimes used to designate a school or series of writers who appeared in England in the 17th and 18th centuries, and who aimed at establishing what they called natural religion, upon the basis of reason and free inquiry, and then bringing all positive or revealed religion to the test of this. They are looked upon as the precursers of German rationalism in theology. The leading names in this school are lord Herbert of Cherbury (d. 1648); John Toland, whose *Christianity not*

Mysterious (Lond. 1696) gave exact expression to the tendency of the deists; lord Shaftesbury; Anthony Collins (d. 1729), the friend of Locke; Thomas Woolston; Matthew Tindal, the author of *Christianity as Old as the Creation, or the Gospel a Republication of the Religion of Nature* (Lond. 1730); viscount Bolingbroke.

DEISM, or THEISM (*ante*), is a term not so much used in religious distinction now as it was a century ago. Those who embrace the views of God which that term implies now generally take name of freethinkers, rationalists, or liberals. They differ very widely from each other in many particulars, agreeing only in their belief in the existence of God, and in their denial that the Bible is an infallible revelation of his will. They are often called "infidels" by way of reproach. Thomas Paine, who wrote in the latter part of the 18th c., was the most eminent champion of deism in the United States. See RATIONALISM, *ante*.

DEJANI'RA, or DEIANEIRA, in Greek mythology, daughter of a king of Ætolia, and wife of Hercules. She soaked her husband's tunic in the blood of Nessus, the centaur, and Hercules was thereby poisoned. He could not endure the agony, and threw himself on a funeral pile, and perished.

DE JURE. See DE FACTO.

DE KALB, a co. in n.e. Alabama, on the Georgia border, intersected by the Alabama and Chattanooga railroad; 720 sq.m.; pop. '80, 12,673—681 colored. The productions are wheat, corn, etc. There is good water-power, and much fine scenery. Co. seat, Lebanon.

DE KALB, a co. in n.w. Georgia, on the Chattahoochee, traversed by the Atlanta and Richmond, and the Georgia railroad; 291 sq.m.; pop. '80, 14,497—4,544 colored. Surface elevated and uneven, with very rich soil in the valley of the river. Productions, wheat, corn, cotton, etc. Iron and granite are abundant, and there are chalybeate springs. Stone mountain in the e. part of the co. is one of the curiosities of the state. Co. seat, Decatur.

DE KALB, a co. in n. Illinois, crossed by the Chicago and Northwestern, and other railroads; 648 sq.m.; pop. '80, 26,774. It has a rolling surface and fertile soil, mostly of prairie, producing wheat, corn, oats, barley, flax, wool, butter, cheese, etc. Co. seat, Sycamore.

DE KALB, a co. in n.e. Indiana, on the Ohio border, drained by the St. Joseph's and smaller rivers, and intersected by several railroads; 346 sq.m; pop. '70, 17,167; in '80, 20,225. The surface is undulating and the soil fertile. Agriculture is the main business. Co. seat, Auburn.

DE KALB, a co. in n.w. Missouri, drained by tributaries of the Platte, reached by the St. Louis and Denver railroad; 441 sq m.; pop. '80, 13,343—127 colored. The surface is level and the soil fertile; productions, agricultural. Co. seat, Maysville.

DE KALB, a co. in n. Tennessee; 300 sq.m.; pop. '80, 14,814—1153 colored. The surface is diversified and the soil fruitful; productions, agricultural. Co. seat, Smithville.

DE KALB, JOHN, Baron, 1732–80; a native of Alsace, and a gen. in the American army of the revolution. He was sent, in 1762, by France to the American colonies as her unavowed agent. He was in the French army when he engaged to serve in the cause of the Americans. The next year he accompanied Lafayette to America, was by congress made maj.gen., and was in the army under Washington. He served in New Jersey and Maryland; was second in command under Gates; led the Maryland and Delaware troops in the battle of Camden, where he received eleven wounds, and died three days afterwards. His memory is held in honor.

DEKKER, THOMAS, a dramatist of some note, was b. in the latter part of the 16th century. He appears to have applied himself industriously to his vocation, and is said to have written upwards of 20 plays, either wholly or in part. In company with Ben Jonson, he wrote for the Lord Admiral's theater; the two dramatists, however, afterwards quarreled. D.'s chief plays are *Fortunatus, or the Wishing-cap*, and *The Honest Whore*. Hazlitt, who regarded the latter as a highly successful comedy, has said that it unites "the simplicity of prose with the graces of poetry." D. died about the year 1638. His poetic diction is choice and elegant, but he often wanders into absurdity. His life, like that of many of his contemporaries, seems to have been one of alternate revelry, want, and despair. Recently, D. has become better known by the re-issue of a work of his (not a play), called the *Gull's Hornbook*, which is full of interesting details of the manners of his time.

DE KOVEN, JAMES, D.D., 1831–79; b. Conn.; an Episcopal clergyman and bishop; graduated at Columbia college, and at the general theological seminary of New York in 1854. He was rector in Wisconsin for five years. In 1875, he was elected bishop of Illinois, but in consequence of his extreme high-church views he was not consecrated. In 1878, he was chosen assistant-rector of Trinity church, New York, but declined to leave his work as dean of Racine (Wis.) college. He declined a call to Philadelphia also for the same reason. De Koven was especially conspicuous in the debates at the

national Episcopal convention in New York in 1874. His whole course showed great religious fervor and earnestness.

DEL, *Artocarpus pubescens*, a tree of the same genus with the bread-fruit (q.v.), indigenous to the forests of Ceylon, and valuable on account of its timber, which is used both for house-carpentry and for ship-building.

DE LA BECHE, Sir HENRY THOMAS, a well-known geologist, was b. near London in 1796. He was educated at the military school at Great Marlow, and entered the army in 1814. Three years after, he became a fellow of the geological society, of which he was afterwards made secretary, and eventually president in 1847. In 1820, while residing in Switzerland, he published a paper, *On the Temperature and Depth of the Lake of Geneva.* Shortly after, he returned to England; and in 1823, in conjunction with the Rev. Mr. Conybeare, he issued a paper, *On the Discovery of a New Fossil Animal, forming a Link between the Ichthyosaurus and the Crocodile.* This was the plesiosaurus. In 1824, De la B. visited Jamaica, where he possessed some property, and while there he devoted himself to the geology of the country, and in two years published a paper on that subject. On his return to England, he wrote a variety of scientific papers, among which are the following: *On the Excavation of Valleys, On the Geographical Distribution of Organic Remains,* and his *Geological Manual* (1831), which met with a very cordial reception. He now undertook to form a geological map of England, in which the various formations should be distinctly marked. Shortly after he had begun, the government, sympathizing with his design, instituted the geological survey, and placed him at its head. In 1848, De la B. received the honor of knighthood; in 1851, he published the *Geological Observer,* with upwards of 300 wood-cuts; and in 1853, was elected a corresponding member of the academy of sciences of Paris. He continued to discharge the duties of his position until within two days of his death, which took place on the 11th of April, 1855.

DELACROIX, FERDINAND VICTOR EUGENE, a modern French painter, chief of the "romantic school," was b. at Charenton-Saint-Maurice, near Paris, 26th April, 1799. At the age of 18, he entered the *atelier* of the artist Pierre Guérin. In 1822, he exhibited his first work, "Dante and Virgil." It attracted much attention. The love of color at the expense of accurate drawing, for which D. afterwards became conspicuous, is quite visible in it. It was highly praised, however, by M. Thiers among others. In 1824, D., who was now at the head of the new school of young painters, produced the "Massacre of Scio;" in 1826, the "Death of Marino Faliero," and "Greece on the Ruins of Missolonghi;" in 1827, "Christ in the Garden of Gethsemane," "Appearance of Mephistopheles to Faust," "The Blind Milton Dictating Paradise Lost," and the "Death of Sardanapalus;" and in 1828, "Cardinal Richelieu." The July revolution left its impress on D., and in 1831, appeared his "Liberty Directing the People on the Barricades." About this time, he made a voyage to Morocco, where he familiarized himself with novel effects of light and costumes. The Paris exhibition of 1852 contained the results of his artistic expedition. From this period, D. continued to send forth picture after picture, which proved at least the extraordinary fecundity of his mind. The principal are the "Prisoner of Chillon" (1835); "Cleopatra" (1838); "Hamlet Contemplating the Skull of Yorick" (1838); "Capture of Constantinople by the Crusaders" (1841); a "Shipwreck" (1841); "Death of Marcus Aurelius" (1845); "Farewell of Romeo and Juliet" (1846); and "Flowers and Fruits" (1849). D. has also decorated many public buildings and churches. In 1857, he was chosen by the institute to fill the place of Paul Delaroche (q.v.).—The most striking quality of D.'s genius is his wonderful versatility. He has painted almost all sorts of subjects, involving a vast variety of costumes. As a colorist, he ranks high, but he is almost equally noted, as has been said, for his incorrect drawing. What renders his pictures so attractive, is a certain dramatic energy of execution, with brilliant effects of light and shadow. He has been compared to Paolo Veronese and Rubens, but is vastly inferior to both. He has also been styled the *Victor Hugo* of painting, a criticism which more nearly expresses the truth. He died Aug. 13, 1863.

DELAFIELD, RICHARD, 1798–1873; b. N. Y., graduate of West Point. In 1864, he was chief of engineers, with the rank of brig.gen. He was employed on the northern boundary surveys, in building fortifications, and river and harbor improvements, and in making roads and canals. He was president of the military commission to the Crimea in 1854–56. When the rebellion began, he was on the staff of the governor of New York, and afterwards had charge of the engineering bureau of the war department; retiring, 1866, with the rank of brevet maj.gen. He was a regent of the Smithsonian institution.

DELAGO'A BAY, an inlet on the s.e. coast of Africa, lat. 25° 58′ s., and long. 33° east. It is about 55 m. in length, and about 20 in breadth. Into D. B. many rivers fall, among which are the Delagoa river, from the w., which gives its names to the bay; the Manice, from the n.; and the Machavanna, from the south. The shores of the bay being flat and marshy, are unhealthy in summer; the anchorage, however, is commodious and safe, and attracts many whalers. The Portuguese have a small fort here, whence they export ivory and gold-dust. In common with most of the Portu-

guese possessions on this continent, D. B. lies out of the thoroughfares of the world's traffic.

DELAMBRE, JEAN BAPTISTE JOSEPH, a French astronomer, was b. at Amiens, 19th Sept., 1749, and studied first under Delisle, and afterwards under Lalande, with both of whom he formed a close friendship. The discovery of the planet Uranus, in 1781, gave him the first opportunity of attracting the attention of the learned world in general. He formed tables of its motion, which obtained the annual prize of the academy of sciences. Soon after, he commenced the construction of new solar tables, and, at a still later period, tables of the motions of Jupiter and Saturn. Along with Méchain, he was appointed by the French government, in 1792, to measure the arc of the meridian between Dunkirk and Barcelona, which was completed in 1799. Afterwards, he was elected member of the academy. In 1802, he was appointed inspector-general of education, and in 1803, perpetual secretary of the mathematical section of the institute. The result of his measurements appeared in his great work, *Base du Système Métrique Décimal* (1806–10). In 1807, he obtained the chair at the college of France, rendered vacant by the death of Lalande, his master and friend. In 1814, he was appointed a member of the council of public instruction. He died at Paris, 19th Aug., 1822. D. received a multitude of honors during his lifetime. He was a member of most of the learned bodies in Europe, an officer of the legion of honor, and a chevalier of the order of St. Michael. His writings are very numerous. The principal are: *Traité d'Astronomie* (Paris, 1814); *Histoire de l'Astronomie du Moyen Age* (Paris, 1819); *Histoire de l'Astronomie Moderne* (1821); and *Histoire de l'Astronomie au Dix-huitième Siècle* (Paris, 1823–27), published under the care of Matthieu. Besides these, D. wrote several excellent *Mémoires.*

DE LANCEY, JAMES, 1703–60; b. N. Y.; son of a French Huguenot; graduated at Cambridge, England. He was for many years chief-justice of the supreme court of New York, and for several years lieutenant-governor of the colony. He was one of the founders of Columbia college.

DE LANCEY, WILLIAM HEATHCOTE, D.D., LL.D., D.C.L., 1797–1865; b. N. Y., graduate of Yale; student of theology under bishop Hobart. He was assistant to bishop White, of Philadelphia, and secretary to the house of bishops in the general convention of the Episcopal church in the United States. In 1828, he was provost of the university of Pennsylvania, and in 1833 assistant minister in a church in Philadelphia. In 1838, he was chosen bishop of the western diocese of New York. In 1852, he was a delegate from the Episcopal bishops of the United States to England, and was honored with the degree of D.C.L. from Oxford university.

DELANE, JOHN THADDEUS, late editor of the *Times* newspaper, was b. in London in 1815. He received the earlier part of his education in a private seminary, first in England, and afterwards in France. He then went to Oxford, where he entered himself of Magdalen hall. His father being manager of the *Times,* he was at a very early age introduced into the editor's room, and on the death of Mr. Barnes in 1841, succeeded to the direction. Under his editorship, the *Times* has attained a prodigious circulation, and an influence unparalleled in the history of journalism. The division of labor in newspapers being more complete than in the days of his predecessors, the duty of the modern editor is not so much to write in his own journal, as to suggest topics to others; to revise and bring into harmony conflicting contributions; to make arrangements for the prompt and punctual supply of the news of the day (in which he is assisted by the manager); and, before putting the journal to the press, to decide which of many competing articles and reports shall be inserted, and which laid aside or postponed. These are duties requiring for their due fulfillment great tact, quickness of decision, an extensive knowledge of men and things, literary taste and ability, and, in the case of a journal which claims to be the representative of the English nation, a ready discrimination of those straws on the surface which denote the ultimate direction of public feeling—qualifications which D. obviously possesses in very large measure. He resigned the editorship in 1877. He is a member of the hon. society of the Middle Temple, having been called to the bar in 1847.

DELANE, WILLIAM AUGUSTUS FREDERICK, 1793–1857; an English journalist for many years the financial editor and manager of the *London Times.* He was the father of John Thaddeus (q.v., *ante*), who became the editor of that journal.

DE LA RAME', LOUISA (Ouida, pseud.) b. 1840, in Bury St. Edmunds, England, of French descent on the father's side. When a child she was taken to London, and at a precocious age began to write for periodicals. While yet under age, she commenced her first novel in *Colburn's New Monthly Magazine.* The work is now known as *Held in Bondage.* Novel after novel followed in rapid succession, until she was known far and wide as one of the most prolific authors in the world. The signature "Ouida" is her own pronunciation when a child of her name, Louisa. She resides near Florence, Italy. Her writings, though widely popular, and showing much facility and some skill, are, as a whole, not held in high estimate by thoughtful critics.

DE LA RIVE, AUGUSTE, 1801–73; a Swiss physicist who devoted much attention to researches in electricity. At the age of 22, he was appointed to the chair of natural

philosophy in the Geneva academy. One of his specialties was an endeavor to determine the heat of the earth's crust, for which purpose he took advantage of an artesian well of 700 ft. deep, and his observations were adopted by Poisson as the basis of his calculations. The name of De La Rive is associated with original discoveries in connection with magnetism, electric dynamics, the connection of magnetism with electricity, the properties of the voltaic arc, and the passage of electricity through extremely rarefied media. He published a complete treatise on electricity, which is accepted as a standard work. In 1864, he received the highest honor open to the scientific men of Europe in his nomination as one of the eight foreign associates of the French academy.

DELAROCHE, PAUL, a historical painter, the head of the modern "eclectic" school of art in France, was b. in Paris in 1797, became a pupil of baron Gros, and between the years 1819 and 1823, acquired some note by painting subjects taken from Scripture, but first excited public admiration in 1824, by his "St. Vincent de Paul preaching in the Presence of Louis XIII.," and "Jeanne d'Arc interrogated in Prison by Cardinal Beaufort." These exhibit the earliest indications of that style for which he afterwards became famous —a style which endeavored to unite the picturesqueness of the romantic with the dignity of the classic school of art. In 1826, D. produced his "Death of President Durante;" and in 1827, his "Death of Queen Elizabeth." These pictures greatly increased his reputation, but the last is reckoned a failure by English critics. In 1831, appeared his "Children of Edward IV. in the Tower," a work of very high merit, but transcended, in this respect, by his "Cromwell contemplating the Corpse of Charles I." (1833), which is generally regarded as one of the first historical paintings of modern times. Both are well known in Britain through the medium of engravings. In 1834, appeared his "Execution of Lady Jane Grey;" and in 1837, his "Charles I. in the Guard-room Insulted by the Parliamentary Soldiers," and his "Lord Strafford on the Way to Execution receiving the Blessing of Archbishop Laud." From this period until 1841, he was engaged on what is probably his grandest work—the series of paintings executed on the wall of the semicircular saloon of the ecole des beaux arts. This composition contains 74 figures, comprising the greatest sculptors, painters, and architects in all history, according to D.'s judgment. The style is simple, lofty, and chaste. Among his later works may be mentioned, "Bonaparte at St. Bernard" (1850), "Marie Antoinette before the Revolutionary Tribunal" (1851), "Moses Exposed" (1852), "Calvary" (1853), "Jesus in the Garden of Gethsemane" (1854), "The Girondins in the Concierge" (1856). He died Nov. 4, 1856.—The characteristic excellences of D. are delicacy of treatment, picturesqueness of conception, harmony of color, and accuracy of drawing. He has been accused, however, of want of fire, imagination, and depth, and it must be admitted that he very rarely, if ever, exhibits the highest qualities of creative genius. D. was named a member of the institute in 1832, and professor of painting in the ecole des beaux arts in 1833.

DE LA RUE, WARREN, PH.D., b. island of Guernsey, 1815; educated in Paris; an inventor. Among his inventions are processes for utilizing earth-oils, machinery for printing surface-coloring paper, for pasting cards, and for folding envelopes. He has been very successful in applying photography to the recording of celestial phenomena, particularly in eclipses of the sun.

DELAUNAY, CHARLES EUGÈNE, 1816–72; a French astronomer, educated at the polytechnic school, the first one to whom the Laplace prize was awarded. He became a professor of mechanics, and in 1855, a member of the academy. He was chosen a member of the royal astronomical society of London in 1869. The next year he was the successor of Leverrier in the Paris observatory, and a year later received the professorship of astronomy and geology in the polytechnic school. He published a number of valuable treatises.

DELAVIGNE, JEAN FRANÇOIS CASIMIR, a French poet and dramatic writer, was b. at Havre, 4th April, 1793, and educated at the lycée Napoléon in Paris, where he first attracted notice by his poem on the birth of the "king of Rome" in 1811. A few years after the fall of Napoleon, he published his *Messéniennes*, a series of patriotic elegies, in which he bitterly deplored the misfortunes brought upon his country by the disaster of Waterloo. The July revolution inspired his song *La Parisienne*, which was set to music by Auber, and he wrote several other revolutionary lyrics, such as *La Varsovienne ou la Polonaise*, and *La Bruxelloise*. Many offers of employment in political affairs were made to him by Louis Philippe, but he chose to remain a *littérateur*, and worked assiduously at the composition of plays. His incessant labors at length undermined his health, and he returned to Lyons for change of air, where he died 10th Dec., 1843. D. is, next to Béranger and Scribe, the most popular of recent French poets. He represents that "golden mean" of the French Parnassus, the half-classic, half-romantic style of poetry. There is nothing extravagant, nothing profound about him. Easily comprehended, moderately liberal, with a slight tincture of skepticism and Voltairian wit, yet, on the whole, rather moral in his tendencies, D. was just the man to charm the more elegant and decorous circles of Parisian society. His language, too, is piquant, picturesque, and select, and skillfully conceals the lack of poetic substance. The titles of his principal dramatic pieces are *Les Vêpres Siciliennes* (1819), *Les Comédiens* (1820), *Marino Falieri* (1829), *Louis XI.* (1832), *Les Enfants d'Edouard* (1833), *Don Juan d'Autriche*

(1835), and *La Fille du Cid* (1839). Several editions of his works have been published, the first in 1845, containing a biography of D. by his brother Germain, and a panegyric by Sainte-Beuve.

DELAWARE, a term of various application in the United States, indicates a river, a bay, and a state, to say nothing of counties and less important localities.—1. The river D. rises in New York, on the w. slope of the Catskill mountains, commonly reckoned a portion of the Appalachians or Alleghanies; and, in a generally southerly direction, it divides New York state and New Jersey from Pennsylvania and the state of its own name, forcing its way through the great chain above designated between almost perpendicular crags of more than 1000 ft. in height, and gradually expanding into a broad estuary. With a course of fully 300 m., it is navigable for large ships to Philadelphia, and for steam-vessels to the head of tide-water at Trenton. The D. is connected by one canal with the Chesapeake, and by two others with the Hudson; and along the right side of the stream runs a similar work for 60 m. from Easton to Bristol.—2. D. bay—the estuary of the river—measures about 60 m. in length; the greatest width being 30 miles. It has New Jersey on the left, and D. on the right, its entrance being between cape May in the former state, and cape Henlopen in the latter. As numerous shoals make the navigation dangerous and the anchorage inconvenient, an artificial harbor of about 300 acres in extent, and of at least 4 fathoms in depth, has been formed at cape Henlopen.—3. The state of D., stretching in n. lat. from 38° 29′ to 39° 47′, and in w. long. from 75° to 75° 45′, is situated between Pennsylvania, Maryland, and its own bay and river. With the single exception of Rhode Island, it is the least considerable member of the union, being very little larger than the county of Norfolk in England. Its area is 2,120 sq.m., and its pop., according to the census of 1870, is 125,015, having been, in 1860, 112,222. Of this pop., the greater number (102,221) are white, and the remainder (22,794) colored. The senate of D. consists of 9 members, and its house of representatives of 21. The governor, who is elected for four years, is not eligible for re election. The legislature meets biennially. Amendments to the constitution must be proposed by two thirds of each house. The principal products are wheat, maize, oats, potatoes, flax, wool, fruit, and timber; and in addition to woolen and cotton factories, there are tanneries, paper-mills, iron-works, and ship-building establishments. Besides Dover, the political capital, and Wilmington, the most populous city, the other places of any note are Milford, Newcastle, Lewes, Smyrna, and Georgetown. Originally settled in 1627 by Swedes and Finlanders, D. was, in 1655, subjugated by the Dutch of New Amsterdam, afterwards New York. Again, in 1664, it fell, with the Dutch possessions in general, into the hands of the English, ultimately becoming a part of the grant to Penn in 1682; and though in 1702 it was detached from Pennsylvania for legislative purposes, yet it remained subject to the same governor down to the revolution. D. though a slave-state, did not secede in 1864.

DELAWARE (*ante*), the "diamond state," popularly so-called from its size and shape, was named after lord De La Warr, an early colonial governor of Virginia, who sailed up the bay in 1610, though Henry Hudson had preceded him by nearly a year. In 1630, the Dutch planted a small colony near cape Henlopen, but the Indians drove them out three years later. In 1637, there came a colony of Swedes and Finlanders, who bought land and built a fort on Christiana creek, named the country New Sweden, and a little later put up a fort on the island of Tinnicum, only a few miles below Philadelphia. This was considered by the Dutch of New Amsterdam an invasion of their territory, and they set up fort Casimir, near the site of the present New Castle, only 5 m. from the Swedish fort. The Swedes took fort Casimir in 1654, but the next year the Dutch seized the whole country, and sent to England all the colonists who refused allegiance to Holland. When New York came under the English government, in 1664, the Delaware settlements were claimed for the duke of York, and also by lord Baltimore for Maryland. But William Penn, soon after he settled Pennsylvania, purchased the duke's right, and effected a compromise with Baltimore, so as to add the Delaware settlements to Pennsylvania; and for 20 years they were governed as a part of that state, under the name of the "territories, or three lower counties on the Delaware," each county sending six representatives to the general assembly. In 1703, Delaware set up for herself so far as to establish a separate legislature, but the rule of the Pennsylvania governor was conceded on the ground of proprietary rights, until the period of the revolution, when the state became independent. While the other colonies suffered severely by Indian forays and wars, Delaware was almost exempt, being in a corner by the sea, out of the path of such trouble. Her men were found, however, on the side of England in the French war; and in the revolution, the soldiers of this little colony were foremost in good service, and the "Blue Hen's chickens," as the Delaware volunteers were called, were among the best and bravest of Washington's troops. The post-revolutionary history of Delaware has been uneventful.

Next to Rhode Island, Delaware is the smallest of the United States, having only 2,120 sq. miles. Texas alone would make 130 Delawares. The surroundings are Maryland on the s. and w.; Pennsylvania on the n., and New Jersey, Delaware bay, and the ocean on the east. There are no mountains in the state, and, except in the northern portion, the surface is uniformly level, and generally sandy. Of the numerous small

streams, only Christiana creek is available for large vessels, and that only to Wilmington, the most important harbor in the state. The only other harbors are Lewes and New Castle. There are some swampy districts, but in the main the soil is firm, warm, and fertile, and the climate equable and salubrious, though there is occasional malarial trouble around the wet regions. Wild animals are almost extinct; but the shores of the bay are the resort of wild geese, teal, and ducks. The peach and apple crop, and small berries, are the great staples of the state. There are more than 5,550,000 peach trees, occupying 55,000 acres of the richest soil. The shipment of peaches by the Delaware railroad was, in 1870, 2,707 car-loads, and in 1877, 4,248 car-loads, of 500 baskets to a car—or 2,124,000 baskets for the last year named; besides this, 20 per ct. of the crop is shipped by boats. The crop is exceedingly variable, some years falling off 60 to 80 per cent. Large quantities of strawberries, raspberries, and blackberries also are sent to market, amounting to more than 5,000,000 quarts in the brief season of six or seven weeks. There is some foreign commerce direct from Wilmington, but such trade is generally through Baltimore or some northern port. Wilmington has a coast line of steamers to New York. Dover is the capital of the state; Wilmington, at the junction of the Brandywine and Christiana creeks, where they empty into the Delaware, is the largest and most important city; and New Castle and Smyrna are the next largest places. The townships bear the name of "hundreds," as anciently in England. The state is divided into three counties, Kent, Newcastle, and Sussex, each having the same numerical representation in the legislature. This may have been equitable at first, but it is so no longer; since the county of Newcastle, at the northern end of the state, of which Wilmington is the capital, contains a larger population than both the other counties put together, and is at the same time more enterprising, intelligent, and prosperous than they. As the two smaller counties are not inclined to surrender their political advantages, controling, as they do, the legislature of the state by a minority of the popular vote, it is not easy to see how this wrong is to be righted. The population of the counties by the census of 1870 was—Kent, 29,804; Sussex, 31,696; Newcastle, 63,515; majority of the latter over the two former, 2,015, which is likely to be largely increased by the census of 1880. Of the total population of the state in 1870, 102,221 were whites, and 22,794 colored; 115,879 native, and 9,135 foreign born; 62,628 males, and 62,387 females. There were 22,900 families, and 22,577 dwellings. It also appears from the census of 1870, that of the population of the state 10 years old and over, 15,973 were engaged in agriculture, 11,389 in professional and personal occupations, 3,437 in trade and transportation, and 9,514 in manufactures and mining. The number of acres of improved land was 698,115; bushels of wheat raised, 895,477; of rye, 10,222. Other agricultural productions, such as oats, barley, buckwheat, sweet potatoes, flax, hay, butter, etc., were in fair proportion to the above staples. The farms of the state were valued at $46,712,870. The number of manufacturing establishments was 800, with 164 steam engines of 4,313 horse power, and 234 water wheels of 4,220 horse power; work people employed, 9,710, of whom 1200 were females; capital invested, $10,839,093; wages paid, nearly $4,000,000; value of raw materials, over $10,000,000; of products, nearly $17,000,000. Chesapeake and Delaware bays are connected by a canal large enough for coasting vessels. There are in the state 11 national banks, with capital exceeding $1,500,000; also several state banks, with considerably less capital, and a number of insurance companies. There are several iron mines in Newcastle county, bog iron ore is found in the swamps, and shell marl is abundant. The debt of the state in 1873 was $1,325,000, mainly incurred during the rebellion. Popular education has been much neglected. Of the total population in 1870 (125,015), 11,280 whites, and 11,830 blacks, 10 years old and upwards, could not write; while 19,680, whites and blacks, could not read. The state has a fund of $452,419 for the support of free schools. There is no state or county superintendence, the school districts acting severally, according to their pleasure in maintaining schools. The advantages of the schools are confined to the white children, the state making no provision for the instruction of colored children. There is, however, a charitable organization which supported 20 schools for colored children in 1871. According to the census of 1870, 19,965 children attended school during the year. There were 326 schools of all kinds, with 107 male, and 281 female teachers. In the city of Wilmington, at the northern end of the state, the interests of education are better cared for than elsewhere, and if Newcastle county were represented in the legislature in proportion to her population, the whole tone of legislation on this subject would be very speedily changed. The Delaware state normal university, in Wilmington, the charter of which was repealed in 1871 for political reasons, had, in 1871–'72, 11 instructors and 221 students. The Wesleyan female college in the same place is prosperous; and Delaware college in Newark, open to both sexes, in 1872 had 10 instructors and 105 students, with a library of 6,000 volumes. To this institution has been given the congressional grant of 90,000 acres of the public lands for an agricultural department; which has been duly organized. The number of libraries in the state in 1870 was 473, containing 183,423 volumes. Of these 221 with 91,148 volumes, were private. The number of church organizations was 267, of church edifices, 252; the Methodists (173 churches), Presbyterians (32 churches), and Episcopalians (29 churches), being the most numerous denominations. The number of newspapers and periodicals in 1870 was 17, with an aggregate circulation of about 21,000. The railroads of the state are: Delaware, from Delaware Junction to Maryland

line, 84 m.; Junction and Delaware Breakwater, from Harrington to Lewes, 40 m.; Smyrna and Delaware Bay, from Pierson's Grove to Murray's Junction, 20 m.; Delaware Western, from Wilmington to Lundonburg, Pa., 20 m.; Breakwater, and Frankford and Georgetown, Shelbyville to Georgetown, 19 miles.

The constitution gives the franchise to white male citizens (to colored also since the 15th amendment to the federal constitution) who have lived a year in the state and a month in the county, and paid certain taxes. Elections and legislative sessions are held biennially. There is a senate of nine members, three from each county, and a house of representatives of 21—seven from each county, chosen for two years. Senators must be 27 years of age or over, and be freeholders in their own counties; representatives must be 24 or over, and both must have been citizens of the state three years, and of the county one year to be eligible to seats in the legislature. Their pay is $3 per day and mileage. The governor must be 30 years old, six years a resident, and 12 years a citizen of the United States; he is not eligible for immediate re-election. There are five judges, one of whom is chancellor, and one the chief justice. Ministers of the gospel are not permitted to hold any civil office. The real property, stocks, plate, etc., owned by a woman at her marriage are not subject to the husband's control or liable for his debts; but a wife cannot make a conveyance without the husband's consent. Treason, murder in the first degree, arson of a dwelling, rape, and burglary at night with intent to commit high crimes, are punishable with death. The whipping-post is in use for petty offenders. Adultery by a wife, or impotence on either side, are causes for divorce; and divorce may be granted for cruelty, abandonment, etc. The state has the honor of being the first to ratify the federal constitution, Dec. 8, 1787. Though a slave-holding state, she did not join in the rebellion of 1860. Many of her people were in strong sympathy with the confederate cause, and some of them—how large a number is unknown—privately joined the rebel forces. On the other hand, the state furnished the union army seven regiments of infantry, a battalion of cavalry, and two or three batteries of artillery—in all, about 10,000 men. After the rebellion was subdued, the state, in conformity with the conditions of reconstruction, reluctantly acquiesced in the freedom of her slaves, and permitted negroes to vote on the same terms with white men. Until 1828, the presidential electors of Delaware were chosen by the legislature; since then, they have been elected by the popular vote. In 1812, 1816, and 1820, Delaware had 2 representatives in congress and therefore cast 4 electoral votes; but at all other times, having but one such representative, she has had but three electoral votes. The votes of the state for president and vice-president at the several elections have been as follows: 1789, Washington and Jay; 1792, Washington and John Adams; 1796, John Adams and Thomas Pinckney; 1800, John Adams and Charles C. Pinckney; 1804, Charles C. Pinckney and Rufus King; 1808, Charles C. Pinckney and Rufus King; 1812, DeWitt Clinton and Jared Ingersoll; 1816, Rufus King and Robert G. Harper (one vacancy); in 1820, Monroe and Daniel Rodney; 1824, for president, William H. Crawford 2, John Q. Adams 1; vice-president, Clay 2, Calhoun 1; in 1828, John Q. Adams and Richard Rush; 1832, Clay and John Sergeant; 1836, Harrison and Francis Granger; 1640, Harrison and Tyler; 1844, Clay and Frelinghuysen; 1848, Taylor and Fillmore; 1852, Pierce and William R. King; 1856, Buchanan and John C. Breckenridge; 1860, John C. Breckenridge and Joseph Lane; 1864, no vote; 1868, Horatio Seymour and Francis P. Blair; 1872, Grant and Wilson; 1876, Tilden and Hendricks. Delaware has furnished of federal officers, two secretaries of state, one of the treasury, and one attorney-general. (For latest statistics, see Appendix.)

DELAWARE, a co. in e. Indiana, on White river, crossed by four railroads; 400 sq.m.; pop. '80, 22,928. The surface is level, and the soil fertile. Much of the co. is still covered with forests. Productions, agricultural. Co. seat, Muncie.

DELAWARE, a co. in e. Iowa, crossed by two railroads; 576 sq.m.; pop. '80, 17,952. The surface is hilly and well supplied with water, although there is no large stream. Productions, wheat, corn, oats, barley, cheese, butter, etc. Co. seat, Delhi.

DELAWARE, a co. in s.e. New York, bounded n.w. by the Susquehanna, intersected by the Delaware river, and reached by the Erie and the Delaware and Susquehanna railroads; 1550 sq.m.; pop. '80, 42,719. The surface is hilly, but the lowlands are exceedingly fertile. Lumber, which is floated or boated down the river, is one of the leading industries. The other chief productions are butter, maple sugar, hops, corn, oats, buckwheat, etc. Co. seat, Delhi.

DELAWARE, a co. in central Ohio, on the Scioto and Olentangy rivers, crossed by two railroads; 478 sq.m.; pop. '80, 27,380. Surface even; soil fertile. Productions, wheat, corn, oats, butter, wool, maple-sugar, flax, etc. Co. seat, Delaware.

DELAWARE, a co. in s.e. Pennsylvania, on the Delaware river, below Philadelphia, crossed by several railroads; 108 sq.m.; pop. '80, 56,102. Its productions are mainly vegetables, fruits, milk, butter, etc., for the Philadelphia market. Water-power is abundant. In this section the original Swedish settlements were made. Co. seat, Media.

DELAWARE, a city in Delaware co., Ohio, on the Olentangy river; pop. '70, 5,641. It is pleasantly situated and neatly built; it is a place of considerable trade, and has a

number of manufactories. A medicinal spring is one of the attractions. It is the seat of the Ohio Wesleyan university, organized 1842, and of the Ohio Wesleyan female college, begun 1863. There is a theological department connected with the university.

DELAWARE INDIANS (INDIANS, *ante*), a tribe of American Indians once very important, dwelling in the region of the Delaware river, in Pennsylvania and New York. They were called Lenno Lenape, from "Lenappi," a term for men in general, applied by themselves to themselves. (Delaware is not an Indian word, as some think, but from the name of lord de la Warr, one of the early governors of the colony of Virginia.) The Delawares were among the earliest to become friendly and to trade with the Dutch settlers of New York, and were generally on good terms with the whites. After destroying one Swedish settlement, they became friendly with that people also, and the Lutherans made some efforts to Christianize them. In 1741, the Moravians established missions near Bethlehem and Nazareth, Pa. For a long period the Iroquois held the Delawares in great contempt, stigmatizing them as women; but they fought well enough on the side of the French at Braddock's defeat and elsewhere. Long afterwards, a number of the tribes, smarting under a sense of wrong in certain treaties with the whites, took part with Pontiac in the Indian war in the north-west, and were among those who besieged Detroit in 1763. They were defeated in the same year, and their chief was killed. Not long afterwards the whites destroyed the Delaware villages on the Susquehanna. Peace was made at fort Pitt in 1765, and the tribe began at once to emigrate to the west, so that in 1768 there were none of them east of the Alleghanies. The Moravian missionaries went with their flocks, and Christian Indians rapidly increased along the Ohio; but the hostile feeling prevailed until the battle of Pleasant Point in 1774, when they were utterly scattered. In the war of the revolution most of the Delawares took the English side, although a part of the nation made a treaty with congress. The Christian Indians had settled on the Muskingum in 1772, forming three towns, one of which was of Delawares only. They took no part in the war, but attended to their farming until the English captured them, 1781, and removed them to Sandusky. A part of those returned to save their crops, but were attacked by the Americans, who murdered 90 of them. The remainder fled to Canada. These, with others, subsequently formed the town of Fairfield on the Thames; only a few members of the tribe returning to the Muskingum country. There were still many hostile, and these had a strong band of warriors in the defeat of St. Clair in 1791. Peace was made after Wayne's victory four years later, and thenceforward from time to time the tribe disposed of their lands in Ohio, and nearly all remained in Canada. In the war of 1812, they refused to join Tecumseh, and remained friendly to the United States. Even after this the Americans destroyed their town in Canada. In 1818, the Delawares, numbering about 1800, ceded all their lands to the United States, and removed to Missouri territory. By treaty in 1829, the mass of the nation, only 1000, were settled on the Kansas and the Missouri. Here they suffered from the attacks of the Sioux and other wild tribes and the depredations of thieving white men. In the Kansas troubles they took no part. In the civil war they sent 170 men to the union army, out of a total of 200 able-bodied warriors. Being disturbed by the Pacific railroad, they sold their lands and moved to a location on the Verdigris and Cane rivers. In 1866, a special treaty permitted them to become citizens of the United States, and they elected so to do, since which time they have not been regarded as a tribe. Their language was among the best known of aboriginal tongues, and a number of educational and other works have been published in it.

DELAWARES. See INDIANS.

DELAWARE WATER-GAP, a pleasure resort on the Delaware river, reached by the Delaware and Lackawanna railroad, 92 m. w. of New York. The river here makes its way through the mountains in a narrow gorge, whose rocky sides rise almost 1200 ft. above the water; and the surrounding scenery is very fine.

DE LA WARR, or DELAWARE, THOMAS WEST, Lord, d. 1618. He succeeded his father as baron Delaware, 1602; became governor of Virginia, 1609; and landed at Jamestown the next year, after a voyage of fifteen weeks. He was an able and energetic officer, and infused new life into the colony, which had been badly managed. He founded a colony at the mouth of James river, and built two forts, which he named Henry and Charles, in honor of the king's sons. On a voyage to the West Indies for the benefit of his health, he was driven by a storm into the river which now bears his name; it was called by the natives Chickohocki. In 1611, he returned to England, but in 1618, in consequence of the tyranny of Argall, he was urgently besought to return. He complied, but died on the voyage. He published *A True Relation of the Counsell of Virginia.*

DEL CRE'DERÉ COMMISSION, an Italian phrase, borrowed by the law-merchant to express the additional premium charged by a factor or agent, in virtue of which he warrants the solvency of the purchaser, and renders himself personally liable for the payment of the price of the goods sold. It is, in short, what is called a guaranty or warranty in England, and warrandice in Scotland. If the percentage on the price for effecting the sales be two and a half, two and a half more is usually charged as del credere commission.

DELEB' PALM, a palm of great importance to the inhabitants of the regions around lake Tsad, and other parts of the interior and west of Africa, being in some districts the predominant tree, although very local in its distribution, which extends, however, through the vast tracts from Kordofan to the Atlantic. It is supposed to be nearly related to the palmyra palm (q.v.) of India (*borassus flabelliformis*). Its fruit, when full grown, is 6 to 8 in. long, and 4 in. thick, yellowish brown; the pulp a very close and coarse fibrous tissue. It has a mawkish taste; yet it is very much used by the natives of Africa, who also break the stone and plant it in the ground, when in a few days a blade shoots up, and a very tender root is produced, which is very pleasant, and much used as an article of food.—Barth's *Travels*.

DELECTUS PERSONÆ (Lat., choice of the person). In some legal relations, a choice of the person, for some qualification possessing value in the eyes of one of the parties to the contract, is assumed; and the individual so chosen cannot consequently transmit his rights and obligations to another without the consent of the person who is supposed to have chosen him. Thus, in Scotland, in an agricultural lease, of such duration as not to exceed the ordinary life of a man, the landlord is assumed to have chosen his tenant with a special view to his personal qualifications, and unless in virtue of a positive stipulation, the tenant cannot sublet the farm. The reverse is the case with urban tenements. For reasons still more obvious, the same rule holds in partnership; and unless in the case of great companies, where the sale of the stock is provided for, no new partner can be admitted if a single partner object to him. Even the executors and personal representatives of a partner do not succeed to his share. For the same reason, offices of trust are neither salable nor adjudgable for debt, though their emoluments may generally be attached for debt.

DELEGATE, the title given to members of the first continental congress, 1774. Representatives in the United States congress from the territories are still designated by this term. They have seats, and the right of discussion, but have no vote. The term is in common use to denote the members of partisan and religious conventions, and indeed of almost all associate bodies representing a constituency.

DELEGATES, COURT OF, formerly, the supreme court of appeal in ecclesiastical and maritime causes. Before the time of Henry VIII., the practice had gradually become established of taking ecclesiastical causes on appeal to the court of Rome. By 24 Hen. VIII. c. 12, this practice was abolished, and appeals were directed to be heard by the archbishops of the several provinces. By 25 Hen. VIII. c. 19, it was directed that appeals should finally be referred to the king in council, and his majesty was by the same statute empowered to issue a commission under the great seal to hear the appeals. The court thus established was called the court of delegates. It consisted, in ordinary causes, of a puisné judge from each of the common law courts, and three or more civilians. After sentence had been pronounced by the court of delegates, it was competent for the king to grant a commission of review; but this power was rarely exercised, except upon the ground of error in fact or in law. When application for review was made, it was usual to refer to the chancellor the memorial praying for review, and by him the expediency of granting the prayer of the petition was determined. By 2 and 3 Will. IV. c. 92, the court of delegates was abolished, and its jurisdiction was transferred to the king in council. And by 3 and 4 Will. IV. c. 41, and 6 and 7 Vict. c. 38, her majesty is empowered to refer all appeals from ecclesiastical or other courts to the judicial committee of the privy council.

DELEGATION (Ital. *delegazione*), the term formerly applied in Lombardy, Venice, and the states of the church, both to the governing court of a province and to the province itself. Until the recent political changes in Italy, there were nine delegations in Lombardy, and eight in Venice, each of which was presided over by a delegate, vice-delegate, and various subordinates. In the states of the Church, by a decree of 1816, 17 delegations were established, but the number was several times altered. The delegate was alwas a prelate, and directly appointed by the pope. If he was a cardinal, he was called a legate, and his province a legation.—*Delegados del fomento* is the name given in Spain to the superintendents of the entire police administration of a province.

DELEGATION, in civil law, an act by which a debtor, with the consent of a creditor, procures another debtor in his place, and is himself relieved from the charge. At common law, it is the transfer of property from one person to another. Any person may delegate to another authority to act for him in a matter which is lawful and otherwise capable of being delegated. But the one to whom a power is delegated cannot himself delegate that power to another, since the dependence of the party originally delegating was upon him only, and not upon a third person.

DELESCLUZE, LOUIS CHARLES, 1809–71; a French politician, journalist, and agitator, who took a prominent part in revolutionary conspiracies in the time of Louis Philippe, in those of the republic of 1848, and of the empire. He was imprisoned for one of his articles in the newspapers, and was once transported to Cayenne. In 1868, he started the *Réveil* newspaper, one of the most radical of prints. He was a conspicuously desperate and reckless leader of the commune during the siege of Paris. He was killed on a street barricade, whether by accident or design is not known.

DELF, a heraldic charge, representing a square sod or turf, the term being derived, it is supposed, from the verb to *delve* or dig. A delf tenné is the appropriate abatement for him who revokes his challenge, or otherwise goes from his word. See ABATEMENT.

DELFI'CO, MELCHIORRE, 1744–1835; an Italian writer on political economy. His first publication was a vindication of marriage against the loose views then prevalent. Another work, addressed to the king, had the effect of repealing vexatious restriction on the sale and exportation of agricultural produce. Other reforms of importance were due to his writings. During Joseph Bonaparte's brief reign he was councilor of state, and was employed in reconstructing the judiciary. When Ferdinand was restored he was made president of the commission of archives. He left a number of important critical works.

DELFT, one of the most ancient towns of s. Holland, is situated on the Schie, 8 m. n.w. of Rotterdam. It is intersected by numerous canals, the bridges over which are 69 in number. D. was once noted for its pottery (Delft-ware), but has now entirely lost its high reputation for this manufacture, and not more than 200 persons are engaged in the earthenware factories. D. is a dull town, but has several interesting buildings, one of which, the town-hall, is a picturesque and richly adorned edifice. The new church contains a monument more ornate than tasteful, to the memory of prince William I. of Orange, who was assassinated here 10th July, 1584. It also contains the tomb of Grotius, and the burial-vaults of the present royal family of Holland. The old church, a building of some note, contains the tomb of the naturalist Leeuwenhoek, and of the celebrated admiral Tromp. D. has also a state arsenal, a college where all matters connected with the management of the dikes are taught, a gymnasium, and infirmary. There are some manufactures of woolen cloths and tobacco-pipes. Pop. '74, 23,365.

DELFTSHA'VEN, an old t. in s. Holland, is situated on the Maas, 2 m. w. from Rotterdam. It is defended from floods by three strong dikes. The principal buildings are the Reformed church, which is a handsome cruciform building, the Roman Catholic church, and the town-house. There is some trade and shipping; but the chief sources of wealth are distilling spirits, beer-brewing, iron-founding, ship-building, sawing wood, refining sugar, etc. Pop. '75, 9,440.

DELGA'DA, or PONTA DELGADA, a city in St. Michael, one of the Azores, on the s. side of the island; 37° 45′ n., and 20° 40′ w.; pop. 15,885. It has a large trade in fruit, grain, etc.

DELHI, the name of an executive district and also of a division or commissionership in the Punjab, formerly in the North-west Provinces.—The *district* is situated in 28° 24′ to 28° 54′ n. lat., and 76° 49′ to 77° 29′ e. long., having an area of 1227 sq.m., of which 821 are under cultivation. Of the waste lands, 189 sq.m. are capable, and 263 incapable of cultivation. The pop. in 1868 was 608,850, classified as follows: Sikhs, 582; Hindus, 447,079; Mohammedans, 133,912; and other classes, 25,034. The Christians, in the same year, numbered 2,243, of whom 648 were Europeans, 233 East Indians and others, and 1362 natives. To the s. the district is rocky and barren. The soil generally is sandy or rocky, and the most fertile portions are those to the n. and n.w., watered by the Jumna.—The *division* of D. contains 2,971 villages, has an area of 5,595 sq.m., and had in 1868 a pop. of 1,916,423, of whom 1,029,757 were males. It comprises the three executive districts of Delhi, Goorgaon, and Kurnal.

DELHI (ancient name, *Indraprestha*, or *Inderput;* Mohammedan name, *Shahjehanabad*), a celebrated city of northern India, in 28° 39′ n. lat., and 77° 18′ e. long., capital of the province and district of the same name, is situated on an offset of the river Jumna, at about a mile from the right bank of that river, and at an estimated elevation of 800 ft. above the level of the sea. The modern city, which was founded by shah Jehan in 1631, has a circumference of about 7 miles. It is protected by ramparts, bastions, etc., and is entered by 11 gates. The greater number of the streets in D. are narrow, but the Chandni Chauk is an exception, being 90 ft. broad, and 1500 yards in length, and intersected by an aqueduct. The other principal street is 120 ft. wide, and 1 m. in length. D. has many monuments of its former magnificence. The mogul's palace was thought by bishop Heber to surpass the Kremlin. The Jumma Musjid, or principal mosque, was commenced by shah Jehan in the 4th year of his reign, and completed in the 10th, at a cost of £100,000. This magnificent building has been restored by the British government. The Delhi college was founded in 1792, and in 1829 the sum of 170,000 rupees was bequeathed to it by a minister of the king of Oude. The interest of this sum, together with grants from government, raises its annual revenue to 40,580 rupees. For each of the languages, English, Arabic, Persian, and Sanscrit, there is a separate department. According to the census of 1868, D. contained 154,417 inhabitants, of whom about one half are Hindus, and the other half Mohammedans. D. has railway communication, by the East Indian railway, with Calcutta, distant 1019 m.; with Bombay, distant 870 m.; and with intermediate places. The mean temperature of the day has been ascertained, by observations extending over three years, to be as follows: Jan., 56°; Feb., 61°; Mar., 72°; April, 83°; May, 91°; June, 92°; July, 86°; Aug., 83°; Sept., 83°; Oct., 77°; Nov., 65°; Dec., 58°. The vestiges of ancient D., on the e. bank of the Jumna, consisting of ruined tombs, gardens, serais, and palaces, cover

an area of about 30 m. in circumference, and present a remarkable scene of desolation. The modern city is noted for its needle-work, and here the shawls of Cashmere are embroidered in silk and gold. The D. goldsmiths are famous for the delicacy and beauty of their work. D. was the capital of the Afghan or Patan, and afterwards of the Mogul empire. It was taken by a British army under lord Lake, Sept. 8, 1803, and has ever since—if we except the brief period it was held by the mutineers in 1857—continued under British rule.

In our own time, D. has been rendered memorable by the events of 1857. The march on the city of the mutineers from Meerut, the terrible 11th of May, the explosion of the powder-magazine by Willoughby and his heroic band, the tragic scenes that followed, the siege, the assault (Sept. 14), when the city was won (Sept. 20) gate by gate and quarter by quarter—a success saddened by the death of the gallant Nicholson; the subsequent daring capture of the king of D. by Hodson of Hodson's horse, and the capture and shooting of his miscreant sons by the same officer, are historical facts still fresh in the recollection of the world. See *The History of the Indian Revolt*, published by the Messrs. Chambers in 1859; *The Punjab and Delhi in* 1857, by the Rev. J. Cave Browne, M.A. (Edin. and Lond., 1861); *Twelve Years of a Soldier's Life in India*, edited by the Rev. George H. Hodson, M.A. (Lond., 1859).

DELIA, a festival of Apollo held in Delos. It included athletic and musical contests, for which the prize was a branch of the sacred palm. The Athenians, who ascribed its establishment to Theseus, took especial pains to maintain the splendor of this festival.

DELICT. The law of Scotland, following that of Rome, divides delicts into delicts proper and *quasi* delicts—the former being offenses committed with a positively malicious purpose, the latter being injuries inflicted by culpable negligence of so gross a kind as to amount almost to crime. The latter class of delicts, though inferring an obligation to repair the injuries sustained by the private party, do not generally form grounds for criminal prosecution. See DAMAGES.

DEL'ILAH (Heb. the languishing) is the name of a Philistine woman whom Samson loved. By her flattering blandishments, she obtained from him the secret that his God given strength lay in his locks; and having cut these off while he lay asleep, she then treacherously betrayed the strengthless warrior into the hands of his enemies.

DELILLE, JACQUES, a French poet, was born at Aigues-Perse, in Auvergne, June 22, 1738, and received his education at the collége de Lisieux, Paris. He first occupied the position of instructor at the colleges of Beauvais and Amiens successively, and was afterwards appointed to a professorship in Paris, at the collége de la Marche. Here he published various poetical effusions, the most considerable of which was a translation of the *Georgics* of Virgil—a work which appeared in 1769, was distinguished by its grace and elegance of style, and met with a most enthusiastic reception. In 1774, he published *Les Jardins*, the success of which, however, was not equal to that of his *Georgics*. The comte d'Artois presented him with the abbey of St. Severin, or rather with its revenues, for he did not insist on D. becoming a priest. His poem *L'Imagination* was written during a visit which he made to Constantinople in 1784, in the suite of comte de Choiseul-Goubbier, the French ambassador to the Ottoman court. On his return, he was elected professor of *belles-lettres* at the university of Paris, and of Latin poetry at the college of France. At the revolution in 1789, however, he lost all his property. He afterwards removed to Switzerland, where, in 1800, he published *L'Homme des Champs*. In 1801, he visited London, published a translation of *Paradise Lost*, and in that same year, having been solicited to return to Paris, he re-entered the academy and the college there with which he had formerly been connected. He died 1st May, 1813.

DELIQUESCENCE is the term applied to the property which certain substances have of absorbing moisture from the air, and becoming damp, and even running into liquid. Caustic potash, and the chlorides of calcium and magnesium, are examples of substances which undergo this change.

DELIRIUM (from Lat. *deliro*, I am furious), a state of deranged mind, in which the intellect and the judgment are perverted or lost, while the imagination and the passions are often excited, or at least left without control. The result is an incoherent or totally disordered course of action and speech, frequently attended by delusions, or unreasoning belief in supposed facts, which the sound mind at once perceives to have no existence in nature. The nature, extent, and variety of the delusions, and the degree to which the control of the reason over them is lost, may be said to indicate the type of delirium to which the patient is subject; and in some instances, the cause of the disease is pretty decidedly shown forth by the prevailing impressions on the mind and senses. Referring to the article insanity for the description of maniacal delirium, or mania, and to the article fever for that of typhoid delirium, or typhomania, we may confine ourselves in the present article to a slight sketch of the delirium arising from habitual intoxication, the *delirium ebriosorum* or *potatorum* (of drunkards), or, as it is more commonly called, from the bodily tremors that accompany it, *delirium tremens*. This disease is not to be confounded with the mere paroxysm of intoxication, and still less, if possible, with the insane craving for drink, or dipsomania (q.v.). It is, on the

contrary, often found in persons who have not been recently intoxicated at all, though of persistently intemperate habits, and in whom the desire for drink, as well as for food, has been entirely suppressed by the access of the disease. It is a true though usually a temporary form of insanity or of mania, brought on by the habitual poisoning of the nervous system, over a long course of weeks or months, by alcoholic liquors; and it is not going too far to say that it is rarely, if ever, induced by a single debauch, at least in its aggravated form. Delirium tremens is characterized by a restless, irritable state of the nervous system, rather than by furious paroxysms of excitement (though these are not rare); by constant though ill-regulated and ineffectual attempts of the patient to occupy himself; by spectral illusions, or the vision and hearing of non-existent objects; by tremors of the hands and tongue; by prostration of appetite; and by great wakefulness, the want of sleep being often protracted over many days and nights, and forming, with the constant excitement of the senses, and the prostration of the vital powers from deficient nourishment, the true source of danger in this disease. The main elements in the cure are careful nursing, and the use of all means to secure sleep, and re-establish the digestion. Opium, hyoscyamus, and antimony, are used in some cases, and tonics with laxatives in others; chloroform has also been employed. In certain cases, stimulants are required for a time; but none of these remedies ought ever to be used except under the best medical advice, for there is little doubt that delirium tremens is one of the diseases where the rash employment of strong medicines is extremely dangerous to life, and where good nursing and food, without other remedies, will usually succeed. Where proper protection and vigilance cannot be otherwise secured, the patient should at once be transferred to the nearest hospital or lunatic asylum; and if the attacks have been repeated, he should be detained for some time after his recovery. See DELIRIUM TREMENS.

DELIRIUM EBRIOSUM, a term intended to denote a form of acute mania, having intoxication for its exciting cause. It is often mistaken for delirium tremens (q.v.), and doubtless has frequently been dealt with as such in criminal cases. It originates either from a single fit of intoxication, or a short course of intemperance—frequently of periodical occurrence—in those who are mentally excitable from hereditary peculiarity of constitution, or from some previous injury of the head, and who may have experienced some cause for depression of spirits. It is marked by an uncontrollable desire for drink, which, when gratified, only leads to further imperious demands, until the thing itself is loathed, and a fit of sickness brings about recovery. In the course of the paroxysm, however, more or less of indecorous conduct or wild and vicious passions are displayed; so that, unless the affected is restrained, and stimulants withdrawn, violence is apt to be offered to any one coming in the way. It is in this state that homicide and murder are so frequently perpetrated. On the delicate question of legal responsibility connected with this state, we do not here enter.

DELIRIUM NERVOSUM or **TRAUMATICUM**, a term given by baron Dupuytren, the celebrated French surgeon, to designate an attack of delirium with tremors, which frequently supervenes on severe bodily injuries, such as gunshot wounds, burns, and fractures—chiefly met with in large hospitals—in the case of persons of weakly constitution, and who are irritable and nervous, and have been intemperate in their habits. It has been considered by some as identical with delirium tremens (q.v.), but it only simulates that affection, being but a symptom of a sympathetic fever, having a typhoid character.

DELIRIUM TREMENS is the term given to a disease originating from the abuse of alcoholic stimulants by those of a nervous and irritable temperament, characterized by a combination of delirium with muscular tremors. The tremors are general, but chiefly of the hands, and of the tongue when protruded; and the delirium is of a muttering, sight-seeing, bustling, abrupt, anxious, apprehensive kind. The individual affected cannot follow out a train of thought, explain an illusion or perverted sensation, or perform any act correctly; and although at one moment partially conscious and rational, is the next incoherent and excited by the most ridiculous fancies of a spectral kind, such as visitors in the shape of devils, cats, rats, and snakes, or by alarming occurrences, such as robberies, fires, and pursuits for crimes. All this is ushered in and attended by complete sleeplessness; and during the attack, in an uncomplicated form, there is no violence or ferocity of demeanor (see article DELIRIUM EBRIOSUM), although mischief to himself or others may be done under false impressions; and he is easily pleased by gentleness and indulgence, and fretted by restraint and opposition. The face has generally a pale dirty color, and anxious expression; eyes startled but lusterless, sometimes considerably suffused, and the pupils not contracted, unless under treatment with opium, or when inflammation of the membranes of the brain has supervened; skin warm and moist, often perspiring copiously; tongue sometimes loaded, but generally pale, moist, and remarkably clean; appetite small, but the individual will often take whatever is presented to him; thirst by no means urgent, with seldom or never any craving for spirituous liquors; alvine evacuations bilious and offensive; urine scanty, high colored, and often albuminous; the pulse usually ranges from 90 to 120, and is generally soft, but of various degrees of fullness and smallness. The precursory symptoms are not peculiar to or pathognomonic of this disease, but common to many other febrile affec-

tions implicating the functions of the sensorium, of the circulation, of digestion; and the paroxysm—distinguished by the above phenomena—runs a remarkably uniform course, independently of age and constitution. In genuine uncomplicated cases—that is to say, when not precipitated by other illness, such as bronchitis, pneumonia, erysipelas, and fever; or some accident, such as contusions and fractures—when the illness is more of the nature of the delirium traumaticum (q.v.)—the paroxysm runs its course in from two to three days, and terminates in sleep, from which the individual generally awakens convalescent.

The above description has been taken from a paper by Dr. Peddie, of Edinburgh, referred to underneath, whose views shall here be further developed. Previous to its publication, the generally received opinions regarding the essential nature of D. T. were, that it is a disease of exhaustion or irritation of nervous power, and that it has the habitual abuse of intoxicating liquors for its predisposing, and the abstraction or diminution of the accustomed stimuli for its exciting, cause; and consequently, that the proper treatment consists in the continuation of stimulants—"a hair of the dog that bit"—together with large opiates to act on the same principle, and force on the salutary, or what has been called the critical sleep. Since then, however, a great revolution has taken place in the views of the medical profession regarding the pathology and treatment of D. T.; and in consequence of this, a fatal result in a genuine case of the disease now seldom or never occurs, where these views are understood and acted on.

It has been shown that the more the history and phenomena of the affection are examined, the greater will the difficulties surrounding the second part of the proposition above stated become. It has been shown that the affection is specific and peculiar, uniform in its symptoms and progress; and that it is essentially a form of nervous poisoning—a toxicological result from the accumulation of alcohol in the system through the continued abuse of stimulants. It has been observed that the alcohol—in whatever way it may be atomically changed or chemically combined—acts on the nervous pulp of the brain through the medium of the circulation, and sets up in it an alcoholism or alcoholic erethism, manifested by a certain amount and kind of exhaustion of the cerebral and muscular functions, together with decided over-action in the meningeal vessels; and that the alcoholic principle, although acting at first slowly, begins ere long to poison the gray matter of the brain, so that every additional drop thereafter brings it more and more into a poisoned condition, until at length, unless arrested by judicious treatment, the state of irritation tends to inflammatory action and serious encephalic mischief. While, therefore, the first part of the above proposition is true—though explainable in a very different way from formerly received opinions—the second part, viz., that the diminution or abstraction of the accustomed stimulus is the exciting cause of the disease, is altogether untenable. Analogy will not bear out the assertion. Mercurial fumes, or the oxides of mercury, when long inhaled or absorbed into the body, as in the case of quicksilver miners, gilders, and others, in the course of time produce an attack of shaking paralysis—the *tremblement mercuriel* of the French pathologists; but will the workmen thus long exposed be more likely to become affected with tremors when removed from this poisonous atmosphere and occupation, than if continuing at their work? The reverse is well known to be the fact, not only in the case of such artisans, but of those who are beginning to suffer in a somewhat similar way from lead-poisoning. In both affections, when the symptoms are precursory or recent, a cure can be effected only by removal from the injurious occupation; otherwise, the symptoms deepen with hourly increasing rapidity, until tremors are succeeded by sleeplessness, delirium, and ultimately coma. Then, too, for example, salivation from any of the preparations of mercury, and narcotism from any opiate, are not intensified by withdrawing these agents after a certain point is reached. On the contrary, a continuation beyond that stage, particularly in some kinds of constitution, more rapidly develops their peculiar physiological manifestations; and now, an infinitesimal dose will do what a large dose in an earlier stage could not. Thus is it with alcoholic stimulants in the production of delirium tremens. In those of a highly sanguine temperament, and of a nervous irritable disposition, the effect of a certain length of indulgence is to induce this condition (just as in subjects with the tendency to gout, a certain amount of high-living is apt to produce an attack of that affection), and beyond that stage, a small quantity of alcoholic stimulus will keep up and deepen the effect, which, previously, a large dose would not do, or, in another individual, could not produce, whatever quantity is imbibed. Thus is explainable the very common erroneous statement made in regard to an individual affected with D. T.; that although for a considerable time he had systematically indulged in considerable quantities of spirits, wine, or malt liquor, or in all of these, yet for a week or two he had drunk very sparingly, and, within the last few days, little or none; indeed, that he was now suffering from the withdrawal of his wonted stimulus, in meritorious efforts to free himself from a habit of which he had begun to be ashamed. All this seems plausible: but the statement should rather have been that, although consuming large quantities of drink at one time, he had felt latterly a smaller quantity affect him; that he then reduced still further the amount, but experienced an equal if not greater constitutional effect therefrom; and thus, from day to day, reduction was forced on him by his own sensations of gastric irritation, nervous excitement, and muscular debility—these feelings being, in fact,

neither more nor less than the premonitory symptoms of an attack of D. T., and just what might be looked for on the view that the alcoholic principle is in such instances a cumulative poison, and the exciting as well as the predisposing cause of the affection. That such is the true solution of the problem, cannot be doubted; and if a suspension or diminution of habitual supplies of stimulants be at any time followed by symptoms of D. T., this is not to be regarded as the result of the change in the practice of the individual, but as occurring in spite of it, and because the constitutional effect is already produced, and the premonitory stage of the disease begun. In a considerable number of instances, drink is taken freely up to the period when the disease is developed, there being no diminution of the quantity consumed, and no interval in the practice; and when there really is some diminution from the amount of previous supplies, it is on account of the system being already affected so much that a less quantity now produces a greater or equal effect. On the other hand, it may be safely averred, in contradiction to the popular error, that although stimulants are at once taken away from the habitual dram-drinker, a paroxysm of D. T. will not be produced if the peculiar diathesis is not yet established, and the precursory symptoms of the disease are not already begun. He may experience much mental disquietude and physical discomfort, and feel weak for a time, just as a gourmand would feel lowered and depressed by the abstraction of his accustomed good living; but this would soon pass off, without the occurrence of the usual signs of D. T., more especially without those spectral illusions or phantasms, which are common to poisonings with several other agents of the narcotico-acrid class.

It seems unnecessary to add more on this part of the subject, than that experience derived from some of our large prison-establishments shows that while fully three fourths of the criminals committed belong to the intemperate classes, and a large number, especially of the debtor class, are habitual drinkers up to the moment of admission, no bad effects are observed from the sudden withdrawal of the wonted stimuli, and the substitution of prison-fare.

In regard to the treatment of this remarkable disease, it is evident, from a common-sense consideration of its phenomena and pathology, that the non-stimulating and non-opiate plan must be the safest and best. If more spirits deepen the paroxysm, by producing greater cerebral determination, then why administer even one drop additional? And if opiates combined with spirits, or given alone, act in the same manner, and tend to occasion congestion in the blood-vessels of the brain, why run the risk of inflammation, convulsions, and coma, in an endeavor to force on the salutary sleep? It must not be overlooked that this sleep is the normal termination of the paroxysm, and is not to be viewed as a part of the affection, or in the same light as we are accustomed to regard a critical sweat or other discharge. It indicates diminished activity of the cerebral circulation and functions, and the commencement of convalescence. Hence, in a large proportion of instances, the sleep will take place spontaneously, and it will be safer to do nothing at all. The object, therefore, of treatment should rather be to remove all hindrances to sleep than to force it. In the more severe cases, this is best done by a moderate and well-regulated course of tartrate of antimony, the action of which, in this affection, appears to be remarkably sedative. It greatly diminishes excited action, induces weariness of muscle, general nervous exhaustion, and mental languor. It thus removes all obstacles to the occurrence of the salutary sleep, and favors it; and when the individual exhausted seeks his couch, he finds repose—not as a drugged sleep, but naturally and profoundly—awaking in general with restored reason and muscular control. Digitalis has been given with the same view, also ipecacuanha and aconite; but none of these answer the various ends so well as antimony. In the milder cases, however, no medicine is required, and it seems enough to do in such, what is essentially necessary in the severer attacks—to support the strength—the organic functions of life—by suitable nourishment, such as soups, *café au lait*, and white-of-egg, and to soothe in every possible manner the excited feelings of the patient. Nothing is more hurtful in delirium tremens than restraint, particularly that of the strait-waistcoat. It increases the cerebral excitement by the never-ceasing struggles for liberty which ensue, so that fatal convulsions have very frequently been the result. All the control required is the presence of one or two judicious attendants, who will humor the patient in his whims and fancies; who will speak and act regarding them so as to assure him of safety, and to relieve him of that apprehension which is the most characteristic feature of the delirium; and who will mildly but firmly interpose, if he attempts anything which may accidentally prove injurious to himself or others. The apartment, however, in which the patient is confined should be well secured, for he may rush out at the door, or leap from a window, in the fright and frenzy of imagined danger. The larger, too, the room is, the better, that he may have space to advance and retreat, according as he wishes to scrutinize or avoid a suspicious or distressing object of his fancy; to arrange and rearrange the furniture; or to carry on, after a fashion, the imaginary duties of some bustling occupation. Besides this, there should be abundance of light, so as to dissipate terrifying hallucinations. The expenditure of muscular effort without any restraint, aids greatly in producing a safe kind of mental and physical exhaustion; and the individual, languid and worn-out, lies down voluntarily, and falls into the desired and

restorative sleep.—*The Pathology of Delirium Tremens, and its Treatment without Stimulants or Opiates*, by A. Peddie, M.D., pp. 51, 8vo.

DELISLE. See LISLE, GUILLAUME DE.

DELITZSCH (named after the Slavonic *Delczczen*, once dominant there), a t. of Prussian Saxony, 15 m. n. from Leipsic, with which it is connected by railway, on the right bank of the Lobber, a small river. It is an old but well-built town, and has manufactures of tobacco, woolen cloth, and hosiery. It is the capital of a circle, for the most part flat, but producing much corn and fruit. Pop. '75, 10,312.

DE'LITZSCH, FRANZ, b. 1813; a German theologian, educated in Leipsic; in 1846, professor of theology at Rostock. In 1850, he became one of the strongest supporters of what is called the Erlangen school, or the strictest orthodox theology. He has written much on theology, and on oriental philology. In 1863, in company with Kiel, he began the preparation of a complete commentary on the Old Testament. To profound learning he adds critical acumen.

DE'LIUS, NIKOLAUS, b. Bremen, 1813; a graduate of Bonn, and since 1855 has held the professorship of Sanscrit, and of Provençal and English literature, in that university. He has published in German a critical edition of Shakespeare.

DELLA CRUSCAN SCHOOL. About the year 1785, a number of English residents at Florence endeavored to amuse their lagging hours by writing verses, which they published under the title of *The Florence Miscellany*. The insipidity, affectation, and fantastic silliness of these productions transcend all belief; yet such was the poetic destitution of the period, that they soon found a crowd of admirers and imitators. Taking the name of an academy at Florence (see ACADEMY), the Della Cruscans now began to print their precious lucubrations in England, chiefly in two daily newspapers called *The World* and *The Oracle*. "While the epidemic malady was spreading from fool to fool," as Gifford pungently says, one of the brotherhood, a Mr. Robert Merry, came over from Florence, and "immediately announced himself by a sonnet to Love." It was answered by a certain Anna Matilda, who (as was the custom) praised it immoderately in language even more absurd than Merry's own. According to Gifford, "the fever now turned to a frenzy: Laura, Maria, Carlos, Orlando, Adelaide, and a thousand other nameless names, caught the infection; and from one end of the kingdom to the other all was nonsense and Della Crusca." Retribution, however, came (for Nemesis watches the course of poetry as sharply as that of politics). In 1794, Gifford produced his *Baviad*, and, in 1796, his *Mæviad*. Rarely has literature witnessed such a scalping. It completely killed the school, and, indeed, it is only in these two poems that the memory of most of the unhappy Della Cruscan songsters has been preserved—an immortality which may be compared with that conferred by the *Newgate Calendar*.

DELLYS, a seaport t. of Algeria, 49 m. e. from Algiers. The French part of the town has wide streets, and a square planted with trees. The Arab part, which is greatly more populous, retains its old character: its streets are narrow and tortuous. The climate of D. is reckoned very salubrious. The vine and the olive succeed well in the neighborhood. *Bechena*, a kind of sorghum or durra, is grown. There is a trade in grain, oil, and salt. Pop. 10,484, of whom 862 are Europeans.

DEL NORTE, a co. in n.w. California, on the Oregon border and the Pacific ocean, intersected by the Klamath river; 1440 sq.m.; pop. '70, 2,022. The surface is mountainous, and mostly covered with timber. Gold and copper are plentiful. Agriculture is the chief business. Co. seat, Crescent city, on the Pacific.

DELOLME, JEAN LOUIS, b. at Geneva in 1740, was originally an advocate in his native town, but on account of certain political disturbances which took place there, and in which he had shared, he was forced to leave it. He went to England, where, in spite of his literary activity, he lived for several years in great poverty. He returned to his native country in 1775, and died at a village in Switzerland, July 16, 1806. D.'s principal work is *Constitution de l'Angleterre, ou Etat du Gouvernement Anglais comparé avec la Forme Républicaine et avec les autres Monarchies de l'Europe* (Amsterdam, 1771); English translation by the author himself (Lond. 1772). In 1772, he also published in English, *Parallel between the English Government and the Former Government of Sweden;* ten years later, his *History of the Flagellants, or Memorials of Human Superstition;* and, in 1796, an *Essay containing Strictures on the Union of Scotland with England*. His work on the British constitution, although not reckoned of great value by English critics, contains some acute observations regarding the advantages of a limited monarchy.

DELORME, MARION, a Frenchwoman, whose name figures too prominently in the history of the 17th century. She was born about 1612, at a village near Châlons-sur-Marne, and came at an early period of her life to Paris, where her great beauty would easily have secured for her a good match, had she not been inclined to a life of licentious intrigue. Almost all the distinguished men of the age were her "lovers." During the first disturbances of the *Frondeurs*, her house was the rallying-point of the chiefs

of that party, and in consequence, Mazarin was about to imprison her, when she suddenly died at the age of 39. A curious tradition sprang up in France during the next century, to the effect that Marion had *not* died, but escaped to London; that she had returned to Paris in 1682; that she, meanwhile, had been thrice married—first, to a lord, second, to a robber-chief, and third, to a procurator of finance; and, finally, that she died in 1706, or, as others say, in 1741, when in her 129th year. Victor Hugo has made her the subject of one of his historical dramas.

DE LOUTHERBOURG, PHILIP JAMES, 1740–1812; of a Polish family, but b. at Strasburg, where he was naturalized, educated in the university, and intended for the ministry. His inclinations, however, led him to painting, and he studied in Paris under Van Loo. He speedily made a name and won high rank. He was elected to the French academy while under the required age. He had some eccentricities, which constantly appeared in his work, especially in his titles, as, when he painted a group of asses he called them "Father and Mother," "Little Fanfan," "Aunt and Uncle from Brittany, Cousin Germain," and the "Perruquier of all the Family." He traveled in Switzerland, Germany, and Italy, and became celebrated more for mechanical construction than for painting. One of his mechanical contrivances was a model theater, where he cleverly represented the moon and stars by lights, and running water by sheets of metal and gauze with loose threads of silver. In London, he was employed by Garrick to superintend the mechanism and scene-painting of Drury Lane, which he did with remarkable success, making a new era in the adjuncts of the stage. The Christmas pantomime of 1781 introduced these novelties, to the surprise and delight not only of the public, but also of artists. The green grass actually became russet, the moon rose and lighted the edges of the passing clouds, and all England was captivated by effects which we now scarcely notice. A still greater triumph was in his mechanical representation of the rise, progress, and result of a storm at sea—the one which had just destroyed a great East Indiaman. The same show gave "The Fallen Angels raising the Palace in Pandemonium." At the same time his painting went on, and he produced "Lord Howe's Victory off Ushant," and other large pictures for the Greenwich hospital gallery. His restless spirit led him to dabble in magic, and he joined the famous Cagliostro for a time. He sought the philosopher's stone, and found a reason for his ill-success in the fact that a relative stole in upon him and broke his crucible at the critical moment.

DE'LOS (called also in ancient times Asteria, Ortygia, Cynthus, etc.), an island in the Grecian archipelago, the smallest of the Cyclades, is situated between the islands Rheneia and Mykonus, in lat. about 37° 23′ n., and long. 25° 17′ east. According to the mythological account, it was at first a floating island, but was fixed to the bottom by Zeus, in order that it might become a safe abode to Leto, who, about to bring forth Apollo and Diana, was seeking a refuge from the wrath of Hera. Its earliest historical inhabitants were Ionians, and it appears to have been the center of a great periodical festival held in honor of Apollo, both on the mainland and in the islands. In 426 B.C., D. was purified by the Athenians, all the tombs were removed from it, and it was declared pollution for any birth or death to take place on it. Four years after, the inhabitants of Athens expelled the Delians from the island. After 146 B.C., when Corinth fell, D. became the seat of extensive commerce. Its sacred associations, its great festival, its excellent harbor, and its situation in the direct route from southern Europe to the coasts of Asia, all combined to render it a port highly favored by merchants. So great was the traffic of D., that it is said 10,000 slaves changed hands here in one day. After flourishing for a considerable time, it was devastated in the Mithridatic war, and from this calamity it never recovered. Pliny describes D. as being merely a rock, and only 5 m. in circumference. It was noted for its palm-trees, and also for its brass and the brazen vessels which it manufactured. The town of D., which stood at the foot of Mt. Cynthus, a granite crag of from 400 to 500 ft. high, is now a mass of ruins. Still, however, the remains of the great temple of Apollo, and of the colossal statue raised in his honor, may be distinctly traced, although shiploads of the more perfect architectural fragments were conveyed, centuries ago, to Venice and Constantinople. A few shepherds and goatherds from Mykonus are now the only inhabitantss of Delos.

DEL'PHI (now CASTRI), an ancient t. of Phocis, Greece, celebrated chiefly for its famous oracle of Apollo, was situated about 8 m. n. of an indentation in the northern shore of the gulf of Lepanto (Corinthian gulf), at the southern base of Parnassus, in lat. 38° 27′ n., and long. 22° 37′ east. Its original name, and that by which Homer invariably speaks of it, was Pytho. It stood in the center of a district renowned for its classical associations. Occupying the vale of the Pleistus, it was seated in a semicircle like the area of a grand natural theater, backed towards the n. by two lateral spurs of Parnassus. These lateral ranges extend e. and w. around D., and give rise also, from the point at which they approximate, to the famous fountain of Castalia, the holy water of the Delphian temple. The earliest inhabitants of D. are said to have come from Cycoreia, a town upon one of the slopes of Parnassus, the inhabitants of which are supposed to have been Dorians. From the Delphian nobles were at first taken the chief magistrates and the priests of the temple, while the pythia or female who delivered the oracle, at first always a young maiden, but latterly always a woman not younger than 50, was usually selected from some family of poor country-people. In the center of the

temple was a small opening in the ground, whence arose an intoxicating vapor; and the pythia having breathed this, sat down upon the tripod or three-legged seat, which was placed over the chasm in the ground, and thence delivered the oracle, which, if not pronounced at first in hexameters, was handed over to a poet, employed for the purpose, who converted it into that form of verse. As the celebrity of the Delphic oracle increased, D. became a town of great wealth and importance. In the 8th c. before the Christian era, it had become famous not only in Hellas, but also among the neighboring nations. Here the Pythian games were at first celebrated in 586 B.C. The first stone temple at D., built by Trophonius and Agamedes, was destroyed by fire in 548 B.C., but was rebuilt at the cost of 300 talents, or £115,000, and was fronted with Parian marble. In 480 B.C., Xerxes sent a portion of his army to plunder the temple; but as they climbed the rugged path that led to the shrine, a peal of thunder broke overhead, and two huge crags tumbling from the heights crushed many of the Persians to death, while the others, struck with terror, turned and fled. It was plundered by the Phocians during the sacred war, and was attacked by the Gauls in 279 B.C., who, approaching by that route which the Persians had on a former occasion adopted, were repulsed by a similar supernatural agency. D. subsequently excited the rapacity of many potentates, and suffered severely by their attacks. Nero carried off from it 500 statues in bronze; Constantine also removed many of its works of art to his own capital. In the time of Pliny, the number of statues in D. was not less than 3,000, and within the temple for a long time stood a golden statue of Apollo.

The modern town of Castri now occupies the site of Delphi. Its situation is beautiful, and from it the traveler may command an excellent view of the ancient valley. Castri stands in the immediate neighborhood of the source of the still flowing Castalian spring.

DEL'PHIN CLASSICS, an edition of the Greek and Roman classics, prepared by 39 of the best scholars of the time, under the editorship of Bossuet and Huet, tutors to the dauphin (q.v.), son of Louis XIV. The title-pages bear the words, "*In usum Serenissimi Delphini*," and hence the name. They have never been reprinted *as a whole* in England, but octavo editions of particular authors, such as Virgil and Horace, have been published for the use of schools. The D. C. possess little value in the eye of a scholar of the present day.

DELPHINAP'TERA, a genus of *cetacea*, of the family *delphinidæ*, agreeing with *beluga* (q.v.) in the want of a dorsal fin, but differing in having the snout produced into a slender beak, which is flattened transversely, and separated from the head by a marked furrow. *D. peronii*, the RIGHT WHALE-PORPOISE of the South sea whalers, is an inhabitant chiefly of the seas of high southern latitudes, but sometimes found even on the coasts of New Guinea. It is about 5 or 6 ft. long, black, with brilliantly white belly and snout. Its mouth is furnished with a great number of slender sharp teeth. *D. commersonii*, also found in high southern latitudes, is about the size of a porpoise, silvery white; the snout, tail, and pectorals tipped with black, and is described as one of the most beautiful inhabitants of the ocean. *D. borealis* was discovered by the United States exploring expedition in the North Pacific ocean.

DELPHINIA, a festival of Apollo, held annually on the 7th of April, at Athens, where the god was styled Delphinios. All that is known is that a number of girls carrying branches went in procession to the temple seeking to propitiate Apollo, it is supposed because of his influence over the sea, as this was about the time of the yearly opening of navigation. (From *Encyclopædia Britannica.*)

DELPHINIDÆ AND DELPHI'NUS. See DOLPHIN.

DELPHINIUM. See LARKSPUR.

DELPHINORHYNCHUS, a genus of cetacea of the family *delphinidæ*, having one dorsal fin like the true dolphins, but the beak not distinguished from the forehead by a furrow. *D. bredanensis*, or *D. rostratus*, a species about 8 ft. long, black above and reddish below, has been thrown ashore on the French Atlantic coast. A much larger species, *D. coronatus*, attaining the length of 30 to 36 ft., is described as one of the whales of high northern latitudes, having been seen in numerous flocks among the ice-islands near Spitzbergen.

DELTA is the alluvial deposit formed at the mouth of a river from the deposition of the particles which it has held in suspension. The term was originally applied to the tract of land thus formed by the Nile, which, being inclosed by two main branches and the sea, has the form of the Greek letter Δ, delta. The formation of deltas depends more upon the presence or absence of currents met with at the mouth of the river, than upon the quantity of sediment held in suspension when it reaches the sea. Deltas are consequently of almost invariable occurrence in inland lakes, in the quiet estuaries of the nearly tideless Mediterranean, and in the sheltered bays and gulfs of other seas. When, on the other hand, there are strong ebb-tides, or powerful oceanic currents, the detritus is carried off into the sea.

DELTA, a term applied to the land lying between the two or more mouths of a river, generally of triangular form, like the Greek letter Δ (delta). They are usually constantly increasing alluvial deposits pushed out into the sea by the action of the rivers.

That of the Ganges is the largest, its base on the ocean being 200 m., and its sides about equal. The deltas of the Nile and the Mississippi are also very large.

DELTA, a co. in Michigan, on lake Michigan and Green bay, indented by two other bays, intersected by a branch of the Chicago and Northwestern railroad; 1500 sq.m.; pop. '80, 6,812. It is hilly, well wooded, and contains abundance of sandstone and limestone. Co. seat, Escanaba.

DELTA, a co. in n.e. Texas, formed since 1870, lying on the forks of Sulphur river, about 250 sq.m. The soil is good, producing cotton, corn, etc. Co. seat, Cooper. Pop. '80, 5,597.

DELUC, JEAN ANDRÉ, 1727–1817; a native of Geneva, Switzerland, geologist and meteorologist. He was a merchant until nearly 50 years of age; but within that time, assisted by his brother, he collected a fine museum of mineralogy and natural history. After some political reverses he removed to England in 1773; where he was made a fellow of the royal society, and appointed reader to queen Charlotte, a position held by him for 44 years, and affording him ample time for study. Later in life he traveled in the principal European countries, and made a geological tour of England. He lived at the time when modern science was first seriously questioning the literal meaning of the six days of 24 hours each in the Mosaic account of creation; and he clung to the old idea, but was obliged to fall back upon a theory of wonderful volcanic action to account for the existence of the present continents.

DELUGE (through the French, from Lat. *diluvium*, a washing away, a flood). There is scarcely any considerable race of men among whom there does not exist, in some form, the tradition of a great deluge, which destroyed all the human race except their own progenitors. That the Noachian deluge, recorded in Scripture, covered the whole earth, was the universal opinion until towards the close of the last century. The organic remains, on which the science of paleontology is now founded, were regarded as its wrecks, and were held to prove that it had covered every known country, and risen over the highest hills. In the progress of geology, it soon became evident that most of the stratified rocks demanded an earlier origin than a few thousand years, and the influence of the deluge was consequently restricted to the slightly altered superficial deposits; but many of these were, after a few years, found to belong to a period vastly anterior to any historical epoch, and to have been produced by long-continued and steady agencies, differing totally from a temporary deluge. The present tendency of opinion among writers like the late Hugh Miller, is to regard the flood of Noah as partial and local, although the universality seems to be implied in the biblical description.

DELUNATICO INQUIRENDO. See INSANITY (legal).

DELUNDUNG, *Prionodon gracilis*, a carnivorous animal inhabiting the forests of Java, referred to the family *viverridæ*, but regarded as a connecting link between that family and *felidæ*. It is of slender form, with a long cylindrical tail, and is prettily streaked and spotted.

DELVINO, a t. of European Turkey, in the province of Albania, beautifully situated on a hill-slope covered with olive and orange groves, about 47 m. n.w. from Janina. It is fortified, is the seat of a Greek bishop, and has a considerable trade in olive-oil. The women's dress is peculiar, being a long white wrapper, enveloping them from head to foot, and giving them the appearance of animated monumental figures. Pop. estimated at 7,500.

DEMA'DES, a Grecian orator and demagogue of the 4th c. B.C.; a man of genius, but entirely unscrupulous, and ready to sell his political influence to the best customer. He was a favorite with Alexander, and for a bribe saved Demosthenes and other Athenian orators from vengeance. He was deprived of civil rights by the citizens of Athens, but was restored on the approach of Antipater, and sent to him with Phocion, as ambassador. Antipater had no difficulty in bribing him; but on a later occasion he found out his duplicity, and put him with his son to death.

DEMAND AND SUPPLY. The nature and influence of the law or agency so designated by political economists have been the subject of considerable dispute. It has sometimes been maintained as a ruling principle, that the demand for anything creates the supply. This has been denied, however; and it has been held that, on the contrary, the supply precedes the demand, since the article must be in existence before a purchaser goes to ask for it. Steam-engines, for instance, and India rubber galoshes, must have been invented and made before any one thought of purchasing them. The most convenient way, perhaps, of viewing the term demand and supply, is to consider it as applicable to articles in the market; and here we shall find that the demand and the supply are continually vibrating with a tendency to balance. Sometimes there is more of an article than will sell at a remunerating price, sometimes less; but there is always a strong tendency to a balance. Thus, on any day in London, the supply of beef or of fish may be less than the demand—that is to say, the trade may be so brisk that had there been a few more bullocks at Smithfield, or a few more salmon and turbot at Billingsgate, they might have been sold at remunerating prices. At the same time, there may happen to be an excess of both commodities at Windsor. It never will happen,

however, that a supply suited for the London market will find its way to Windsor, or that no more will reach London than might feed Windsor—it would be as rational to expect the river Thames to reverse its course. This is the great law, then, by which the world is supplied with the necessaries of life. Every day the proper supply for the enormous consumption of London is on its way from the uttermost ends of the earth, as systematically as the sap is ascending to penetrate through all the branches of the tree. How impossible it would be to effect the same thing by artificial organization may be illustrated from the Russian campaign of Napoleon, where, despite of the most skillful and costly arrangements, one portion of the army were starving to death, while another were slaughtering their bullocks and leaving them to rot! It is necessary to keep in view the proper function of this law, which is in some measure defined under Competition (q.v.). The demand will not produce everything: no money will bring forth when wanted a Milton's *Paradise Lost*, or a Raphael's "Transfiguration." On the other hand, there are services beneficial to the world, or to a community, for which there is no demand in the commercial sense. There is a demand for almanacs, but none for the astronomical investigations on which they are founded. There is a demand for teachers of Latin and Greek, and for Latin and Greek school-books, but none for the profound scholarship necessary for keeping the knowledge of these languages alive; hence come scientific and scholastic endowments and establishments.

DEMARCATION, LINE OF, an imaginary line running due n. and s., 360 m. w. of the Azores, established by pope Alexander VI. in 1494. All new lands discovered e. of this line were to belong to Portugal; all on the w. to Spain.

DEMAVEND, MOUNT, an extinct volcano of Persia. It forms the loftiest peak of the Elburz chain, which separates the low shores of the Caspian sea from the high table-land of Persia. Although no longer subject to eruptions, D. bears traces of its having been an active volcano within the most recent geological epoch. Its summit is conical, covered with sulphur, and rent by heated fissures. The crater is still visible, and the surface of the mountain is in many places covered with scoriæ. At its base hot springs give evidence of the continued existence of volcanic fire at no great distance beneath the surface. A great deposit of sulphur covers the summit of D., and is brought down to the plains in bags to be disposed of as an article of commerce. Although the path that leads to the peak is, for this reason, familiar to the inhabitants of the adjoining districts, the mountain was not ascended by any European till 1837. In Sept. of that year, Mr. William T. Thomson of the English embassy at Teheran, with the view of taking important bearings from a point which commands an extensive view of the shores of the Caspian, determined to reach the summit. He set out from the base with four guides, three of whom deserted him when they experienced the effect of the rarified atmosphere on their breathing. The first night he slept below the snow limit; the second night in a sulphur cavern near the summit, so highly heated that it was impossible to place the hand near a crevice of the interior. On leaving this place of shelter, the traveler's wet clothes were instantly frozen with a bitter blast from the Caspian. The height, as recently determined by the Russian survey, is 21,000 feet.

D. towers high above the neighboring mountains, the adjacent summits not exceeding two thirds of its elevation. At all times it has been a conspicuous object from the great trade route between India and the west, along the edge of the Persian table-land. It is not then to be wondered at that it is connected with the earliest Persian as Etna is connected with the earliest Greek traditions. There seems indeed more than an accidental coincidence between the fables which relate to the two mountains. According to the Greeks, the giant Typhon was buried under the volcanic region of Sicily, and the earthquakes and eruptions were caused by his efforts to escape. Fire proceeded from his mouth, and he was figured with one hundred snakes growing from each shoulder. Zohak, a personification of the bad principle, was in the same way supposed by the Persians to be buried under Demavend. He was figured with one serpent growing out of each shoulder; and in other respects he had much in common with the Greek monster.

DEMBËA, or **TZANA,** LAKE OF, in Abyssinia, is in lat. 12° n., long. 37° 15′ e., and is 50 m. in length, with an average breadth of 25 miles. It occupies part of an extremely fertile plain, situated at an elevation of some 6,000 ft. above the sea, and contains several beautiful islands, one of which is inhabited. Its southern portion is traversed by the Blue Nile.

DEMBINSKI, HEINRICH, a Polish gen., best known in Britain through his connection with the Hungarian revolution, was b. in the palatinate of Cracow, 16th Jan., 1791, entered the Polish army in 1809, took part in the invasion of Russia by the French in 1812, and was made capt. by Napoleon himself on the battle-field of Smolensk. He subsequently distinguished himself at Leipsic. After the fall of the empire, he returned to his native country, and lived in comparative obscurity for some time. The Polish revolution of 1830 called him again to arms. He obtained the command of a brigade of cavalry, and exhibited heroic courage at the battle of Kuflew. Afterwards, he made the campaign of Lithuania, under Gielgud; and arriving in Warsaw—having traversed

the entire Russian lines—was made commander-in-chief of the national army. After the surrender of Warsaw to the Russians, D. went to France, where he published his *Mémoires sur la Campagne de Lithuanie* (Strasbourg, 1832). In 1833, he proceeded to Egypt, and entered the service of Mehemet Ali, but returned to Paris in 1835. On the outbreak of the Hungarian insurrection, he offered his services to that country, and Kossuth appointed him commander-in-chief of the Hungarian army. He drew up a plan of the campaign, but could not obtain the concurrence of Görgei, whose tardy arrival caused the loss of the battle of Kapolna (26th–28th Feb., 1849). Forced to retreat behind the Theiss, D. resigned his command, but subsequently consented to act under Messaros. He strongly urged the necessity of uniting the cause of Hungary with that of Poland, and proposed to lead an army into Galicia; but his advice was not taken. After the resignation of Kossuth, and the capitulation signed by Görgei at Vilagos (13th Aug., 1849), D. fled to Turkey. In 1850, he returned to France, and commenced to write his *Mémoires* on the Hungarian war. He continued to live in Paris till his death, which took place 13th June, 1864.

DEMEMBRÉ, or DISMEMBERED, a heraldic term to signify that the members of an animal are cut from its body.

DEMENTIA. See INSANITY.

DEMERA'RA, a district and river of British Guiana (q.v.). The river D. is upwards of 200 m. in length, is 1¼ m. broad at its mouth, and is navigable by ships of considerable burden for 100 miles. Its affluents are numerous though small, and at its embouchure into the Atlantic it affords a spacious harbor, obstructed, however, by a bar. It has many settlements on its banks.

DEMESNE (Lat. *terræ dominicales, Dominicum*), in the present day, may be said to be the right which the owner in possession of lands in fee simple has in his estate. But the original signification of demesne was that portion of the lands of a manor (q.v.) which the lord of the manor reserved for his immediate use and occupation. The lands so reserved were either cultivated by the lord of the manor or his villeins (see SERF), and were thus distinguished from lands granted or subfeued to vassals for services to be rendered. So long as the practice of sub-infeudation continued, the demesne lands were a distinct and separate right; but the statute *Quia Emptores*, 18 Ed. I., having abolished sub-infeudations, and declared that on every transfer of land the feofee should hold of the lord paramount, all lands became of necessity demesne, being in the actual possession of the owner or his tenants.

DEMESNE, ANCIENT, a species of copyhold tenure (q.v.). Lands held in ancient demesne are said to have belonged originally to vassals of the crown. The services rendered were determinate, not variable at the will of the lord, and more honorable than those of copyhold in general. The tenants also were entitled to certain privileges and exemptions from feudal services. But in process of time, the character of the services appears to have varied; so that in the present day tenants in ancient demesne in some instances differ little from ordinary copyhold tenants.

DEME'TER. See CERES

DEME'TRIUS, the assumed name of four different persons who figure prominently in Russian history between the years 1603–13. In 1584, Ivan the "terrible" died, leaving two sons, Feodor and Demetrius, the former of whom ascended the throne, but proved a weak ruler, and was completely under the control of his brother-in-law Boris Godunoff; the latter, D., was brought up at a distance from the Muscovite court, and when only 9 or 10 years old, either accidentally killed himself, or, which is more probable, was put to death. In 1598, Feodor died also, and Boris ascended the throne, but his tyrannical measures rendered him very unpopular. In 1603, a strange story reached Russia. It was affirmed that D. was not dead, but had appeared in Poland. The *fact* was, that a person calling himself D., but who, it was asserted, was in reality a monk, named Grishka Otrepiev, belonging to the convent of Tchudoff, had found means to persuade prince Wisniewski in Lithuania, and afterwards Mniszek, palatine of Sandomir, that he was the true son of Ivan. The latter introduced him to Sigismund III., king of Poland, who saw in him a useful instrument for introducing Polish influence into Russia, and so aided him in his designs against Boris. Towards the close of 1604, he invaded Russia, repeatedly defeated Boris (who died April, 1605), and entered Moscow in June, the people receiving him with every demonstration of enthusiasm. He ruled for some months with vigor; but his manifest predilection for the Poles soon excited the Russians against him, and the arrival of his bride, Marina Mniszek, the daughter of the palatine of Sandomir, on the 12th of May, 1606, brought the discontent to a head. Sixteen days later, an insurrection broke out in the capital, headed by prince Wasili Shuiski. D. was slain, and a multitude of the Poles massacred. Wasili Shuiski now ascended the throne; but in the following year, an individual appeared, alleging that he was D., and that another had been mistaken for him in the Moscow massacre. He found a considerable number of adherents, especially when Marina acknowledged him to be her husband. The Poles also helped him, and for some time it seemed likely that he would succeed; but at length he was put to death at Kaluga, in 1610. The third *false*

D. gave himself out to be the son of the first. After a brief career, he fell into the hands of the czar, and was strangled. The *fourth* made the same pretensions, but falling into the hands of the Cossacks, was carried to Moscow, where he was executed in 1613.

DEME'TRIUS I., POLIORCETES, King of Macedonia, son of Antigonous and Stratonice. At the age of 22, his father sent him against Ptolemy, who had invaded Syria. He was totally defeated near Gaza, but soon repaired the misfortune by a victory over Cilles. After other various successes, he led a fleet of 250 ships to Athens, and freed the people from the power of Cassander and Ptolemy, some time afterwards defeating Cassander at Thermopylæ. In the next campaign, he completely destroyed Ptolemy's naval power. In 301 B.C., he was defeated at Ipsus, and the fickle Athenians, who had worshiped him as a god, now deserted and reviled him. The loss of his possessions in Asia recalled him from Greece, and he established himself on the throne of Macedonia by the murder of Alexander, the son of Cassander, 294 B.C. Afterwards he had a stormy reign, and was finally forsaken in battle by his troops and made a prisoner, dying in confinement.

DEME'TRIUS II., grandson of Demetrius Poliorcetes; king of Macedonia for ten years. Little is known of his reign. He offered a slight opposition to the two patriotic leagues, and wrested Bœotia from the Ætolians. He died 232 B.C.

DEME'TRIUS I., SOTER, King of Syria; sent to Rome as a hostage during the reign of Antiochus Epiphanes. He escaped from confinement, and established himself on the throne. He fell in battle against the usurper Balas about 150 B.C.

DEME'TRIUS II., NICATOR, son of Demetrius Soter, lived many years in exile, but with the assistance of Ptolemy Philometer, whose daughter he married, he regained the throne of Syria. He was soon expelled for cruelty and vices; and Antiochus, infant son of Alexander Balas, was made king instead. After ten years of captivity, Demetrius once more regained the throne; but his wife Cleopatra, indignant at his subsequent marriage with a daughter of the king of Parthia, caused him to be assassinated, 126 B.C.

DEME'TRIUS III., EUCERUS, called also Eugertes, and Philometer; king of Syria. He recovered a part of his Syrian dominions, and held his court at Damascus. He assisted the Jews against Alexander Jannæus. In attempting to dethrone his brother Philip he was defeated by the Arabs and Parthians, and taken prisoner. Mithridates, king of Parthia, kept him in confinement until his death.

DEME'TRIUS, a sculptor of Attica, supposed to have flourished about 440 B.C. He was so close an imitator of nature that he was censured for reproducing her imperfections.

DEME'TRIUS OF BYZANTIUM, a peripatetic philosopher, supposed to have been the man who dissuaded Cato from suicide. Some portions of his writings are said to have been found at Herculanæum.

DEME'TRIUS OF SUNIUM, a cynic philosopher, disciple and afterwards antagonist of Apollonius of Tyana. Caligula, being desirous of counting a philosopher among his sycophants, sent a large bribe to Demetrius, who refused it, saying, "if Caligula wishes to bribe me let him send me his crown." Vespasian banished him because of his bitter speech. Seneca observes that nature made him to show mankind how an exalted genius may live uncorrupted by the vices of the world.

DEME'TRIUS, PHALE'REUS, so named from the Attic demos of Phalerus, a seaport of Athens, where he was born about 345 B.C., was distinguished as an orator and politician. Though descended from a family possessing neither rank nor property, yet by the resolute and persevering exercise of his abilities, he rose to the highest honors at Athens. Having been educated in the school of Theophrastus, he entered upon public life about 325 B.C., and soon made himself famous by the display of great oratorical talent. In 317 B.C., D. was placed by Cassander at the head of the administration of Athens, which office he discharged with such acceptance for nearly ten years, that the grateful Athenians, during that time, heaped all kinds of honors upon him, and erected to him no less than 360 statues. During the later period of his administration, he seems to have given himself up to dissipation; and when Demetrius Poliorcetes, king of Macedonia, approached Athens with a besieging army, in 307 B.C., D., having lost the sympathies and co-operation of the Athenians, was obliged to flee. All his statues were demolished except one. D. retired first to Thebes, but afterwards found refuge in the court of Ptolemy Lagi, at Alexandria, where he lived for many years, devoting himself to literary pursuits. On the death of his protector, D. was expelled from the court of Egypt, and retreating to Busiris in Upper Egypt, he is said to have died there from the bite of an asp, 283 B.C. D. was the last of the Attic orators worthy of the name. His style was graceful, insinuating, and elegant; bearing, however, in its luxuriousness and tendency to effeminacy, the marks of a declining oratory. The list of his works (50 in number) given by Diogenes Laërtius shows him to have been a man of most extensive acquirements.

DE'MI, or **DE'MY** (half). In heraldry, an animal is said to be demi when only the upper or fore half of it is represented. In inanimate objects, the dexter half per pale

is usually intended, when it is said to be demi, though a *demi-fleur-de-lis*, for example, may be a *fleur-de-lis* divided per fess.

DE'MI-BASTION, in fortification, is a kind of half-bastion which frequently terminates the branches of a crown-work or horn-work, and which is also occasionally used in other places. See BASTION, CROWN-WORK, HORN-WORK.

DEMIDOFF, a Russian family who in Russia occupy a position as capitalists similar to that held by the Rothschilds elsewhere, and who are not more celebrated for their wealth than they are for their beneficence.—NIKITA D., the founder of the family, was a serf in the time of Peter the great, but, leaving the place of his birth in order to escape being taken as a recruit, he afterwards became famous as a manufacturer of arms, and before his death, had amassed an immense fortune. In 1699, he established an iron-foundry, under the auspices of Peter the great, in whose favor he had attained a high position, near Neviansk, on the eastern base of the Ural mountains; this being the first iron-foundry ever established in Siberia. He subsequently erected numerous other forges among the solitudes of the Urals, and realized from them very great riches.—AKIMFI D., son of the preceding, employed German workmen to explore the rich mines of gold, silver, and copper, that are found in the valley of the Irtish, and the upper reaches of the Obi. In 1725, he built, at the foot of the Magnetic mountain, in Siberia, a foundry called Nischneitagilsk, which is still the most important in all Siberia. The Russian government, sensible of the great service done to the country by the labors of such a man, conferred upon the enterprising metallurgist the title of counselor of state.—His son, PROCOPE, founded in 1772 a school of commerce at Moscow, intended to furnish a complete education for the sons of Russian tradesmen. This establishment was transferred to St. Petersburg in 1800.—PAUL D., cousin of Procope, also a man of energy, traveled extensively when young, devoting himself to the cultivation of the natural sciences. He presented to the university of Moscow a valuable museum of natural history, and founded also, in 1803, the Demidoff museum, at Yaroslavl.—NICHOLAS, count D., nephew of the preceding, b. in 1774, distinguished himself while young as an aide-de-camp in the war against the Turks. Later, he married the countess Stroganoff, and became a privy councilor and imperial chamberlain. His taste for the fine arts and for the natural sciences led him to travel extensively; he also caused the workmen whom he employed in his mines to travel, in order to acquaint themselves with the processes of foreign miners. In 1812, he fought at the head of a regiment which he himself raised and led against the French. His death occurred in 1828. A collection of his works, entitled *Opuscules d'Economie Politique et Privée*, was published at Paris in 1830. Of his two children, Paul and Anatol, the former died young, leaving the great bulk of his fortune to the latter, who was b. in 1810 or 1812, and was educated in France. He was always remarkable for his enthusiasm in letters and in the sciences. His principal book, published at Paris in 1839, and of which an English translation appeared at London in 1853, is entitled *Travels in Southern Russia and the Crimea, through Hungary, Wallachia, and Moldavia*. D., in 1840, married the princess Mathilde de Montfort, daughter of prince Jerome Bonaparte. After five years, the marriage, by which there had been no children, was by mutual consent dissolved. D., on the 19th June, 1856, presented the town of Spa with a bust of Peter the great. Russia, as well as other countries, owes the foundation of many valuable charitable institutions to the philanthropy of Demidoff. D. died at Baden, 13th July, 1858.

DEMI-GORGE. See BASTION, GORGE.

DEMI-LUNE, in fortification, is a work constructed to cover or defend the curtain or wall of a place, and the shoulders of the adjoining bastions. It is composed of two faces, forming a salient angle towards the open country outside the place. It has two demi-gorges, formed near the counterscarp, and is surrounded by a ditch. See further under LUNETTE and RAVELIN.

DEMI-MONDE, the better class of courtesans in Paris and other cities, including a class whose reputation is a little above these, and yet not good enough to warrant their reception in strictly moral society. They are noticeable from the fact that the leaders among them have been for years the dictators of the fashions for women's dresses in Europe and America.

DEM'ING, HENRY C., 1815–72; b. Conn.; graduate of Yale, and of Harvard law-school; a lawyer and politician, who held a number of state offices. He served in the union army during the rebellion as a colonel of the 12th Connecticut volunteers, and mayor of New Orleans. In 1864, he was a member of congress from Connecticut.

DEMIR-HISSAR ("iron-castle"), a t. of European Turkey, in the province of Saloniki, in lat. 41° 12′ n., long. 23° 28′ east. It is situated on a tributary of the Karasu, at the foot of an old fort-crowned hill, is fortified, and contains several mosques and a Greek church. Pop. 8,000.

DEMISE. See LEASE (ENGLISH).

DEMISE OF THE CROWN. That "the king never dies," is a maxim of the public law of this country, in accordance with which, immediately on the death of the reigning

monarch, the sovereignty passes to his successor, by the act of the law itself. No installation, proclamation, coronation, or other ceremony is required to vest the new sovereign in the regal office, and thus there is no interval or interregnum, and the royal dignity remains perpetual. The word demise has, in English law, the more general signification of a lease or conveyance, by which a man grants lands or tenements to another for life, for years, or at will; such estate being short of the lessor's own interest therein. It is thus, as it were, by a sort of courteous and royal analogy that it is employed to signify the death of the sovereign. "So tender," says Blackstone, "is the law of supposing even a possibility of his death, that his natural dissolution is generally called his demise, an expression which signifies merely a transfer of property."

DEMI-SEMI-QUAVER, half a semi-quaver, or the 32d part of a semi-breve. See NOTATION.

DEMIURGE (from Gr. *demos*, people, and *ergon*, a work; hence a handicraftsman) was the name given in the cosmogony of the Gnostics to the creator or former of the world of sense. He was conceived as the archon or chief of the lowest order of the spirits or eons of the pleroma; minging with chaos, he formed in it a corporeal animated world. He created man, but could impart to him only his own weak principle, the *psyche* or sensuous soul; therefore the highest, the really good God, added the divine rational soul, or *pneuma*. But the power of evil in the material body, and the hostile influence of the merely sensuous demiurge, prevented the development of that higher element. The demiurge holding himself to be the highest God, could not bring his creatures to the knowledge of the true Godhead; as the Jehovah of the Jews, he gave them the imperfect law of Moses, which promised merely a sensuous happiness, and even that not attainable; and against the spirits of the *hyle*, or world of matter, he sent only a psychical, and therefore powerless Messiah, the man Jesus. See GNOSTICS.

DEMMIN, a t. of Prussia, on the river Peene, on the borders of Pomerania and Mecklenburg, in lat. 53° 50′ n., long. 13° 1′ east. Besides the town proper, D. comprises three suburbs. It has four public squares and a town-house, and manufactures of woolens, linens, hats, and leather. It has also distilleries and breweries, and some trade in tobacco, gloves, etc. Pop. '75, 9,856. D., which is a place of some antiquity, was a walled and fortified town during the 12th century. It suffered considerably during the thirty years' war, previous to which it was of much more importance than it has since been.

DEMMIT, a co. in s.w. Texas, on the Neuces; 1050 sq.m.; pop. '70, 109. Timber and water are plenty; stock-raising is the only business. Pop. '80, 665—16 colored.

DEMOCE'DES, b. 550 B.C.; a Greek physician. While on a visit to Sardis, he was seized by the Persians, and sent to the court of Darius, to whom he rendered such medical assistance that he was allowed to accompany a party of Persians on a secret mission to Greece. He managed to escape, or was rescued by his fellow-citizens. He married a daughter of the wrestler Nilo.

DEMOCRACY (Gr. the rule of the people). It is interesting to trace the progress of this idea, which now plays so important a part. In Greece, whence we derive the name, it was understood to mean a commonwealth so constituted that the power was exercised by the body of the citizens (the *demos*), and not by an individual, or by a dominant caste. Democracy, therefore, stood opposed both to monarchy and aristocracy. Most of the republics of Greece, more especially that of Athens, were democracies in this sense. The name by no means implied the notion of an absolutely equal right in all citizens, still less in all men, to the exercise of political power. Neither the total absence of rights of all kinds on the part of the larger half of the population, the slaves, nor the distinctions recognized by law among citizens proper (e.g., the exclusion of the poorer citizens from office under the Solonian constitution at Athens), were considered incompatible with the nature of a democracy; though in regard to inequalities among citizens, the continually growing force of the democratic principle tended to their gradual extinction, and the transference of power to the mass of citizens without distinction. Aristotle regarded this as an encroachment of *ochlocracy* (mobocracy), the degenerate form of democracy, or democracy proper. Or more frequently, he speaks of democracy as the degenerate form of the polity (Gr. *politeia*). The polity with him was the form where the many govern for the common benefit.—*Polit.* III. chap. 5, and IV. chap. 6.

In modern history, we meet at the very threshold a state of society which may be called democratic. Among the German nations, we find an almost perfect equality of all freemen (i.e., all that were not slaves), and real self-government exercised by these freemen in each separate tribe. For the personal distinction enjoyed by certain families gave them no privileges over the other freemen, and where royalty existed, it could hardly be said to rule, since the king could do nothing without the concurrence of the assembly of freemen, and reigned not by mere birthright, but required the confirmatory choice of the people.

This condition of general liberty and equality gave place gradually to one of a quite opposite kind. Through the growth of the feudal system (q.v.), the majority fell into a more or less abject dependence upon a privileged minority. The mass of former

freemen, now sunk into serfdom, were hardly distinguishable from those properly slaves, whose position, on the contrary, was become less dependent. The dominant class, the nobility, branded all that did not belong to themselves as "people," "commonalty," "canaille." Thus the term "people," which in the ancient republics implied the rights of citizenship, came to denote the masses that were without rights. The distinction between the dominant class and the mass of the people rested chiefly on two points—exclusive occupation in war, and the free possession of land, which was granted for warlike service alone.

But within this system of graduated dependence, from the monarch down through the aristocracy and their retainers in various degrees, there sprang up slowly an opposing element, which, as originating in the mass called the people, we may designate as democratic. It was not so much a new element, as the resuscitation of the old Roman municipal life, which had never altogether become extinct. It was of course in the cities that this fresh element first manifested itself. Here, instead of a lord with a group of dependents, there arose communities of men with equal rights and self-government. At the same time, a new material interest, that of movable property, the product of industry and commerce, began to claim recognition alongside of territorial possessions and nobility. In England, as early as the Anglo-Saxon times, a merchant who had made three voyages ranked with a thane; and soon after the Norman conquest, the cities were represented in parliament on an equal footing with the warlike aristocracy. This took place later on the continent, and never to the same extent, except in the cities of Lombardy and Flanders, where, at an early period, the citizen element entered the lists with the feudal and warlike. Even within the cities, the same contest was carried on between aristocracy and democracy. At first, it was only those carying on commerce on a large scale that asserted their right to take part in the municipal government of the towns; but the trades or guilds soon set up the same claims. These claims were pertinaciously prosecuted, and often led to bloody contests, but sooner or later were everywhere victorious. Thus was the basis of democracy widened; although the guilds also did not fail to manifest an aristocratic and exclusive spirit towards the body of the people not belonging to them, and with their restrictions and monopolies acted oppressively to the country population. It was not so easy for these last to break the bonds of feudal subjection in which they were held, or to acquire any political standing. Isolated attempts to throw off the yoke, by peasant insurrections and wars, failed, and only were followed by increased oppression. The abrupt division between the feudal possessor of the soil and the serfs under him continued long everywhere except in England. There the rigor of the relation began early to give way, and the transition was effected in such a peaceable and gradual way, that the English historian cannot say exactly how or when. For the greater part of the continent, it was not till the French revolution in 1789, and the impulse given by it to legislation in other countries, that the agricultural population acquired more or less complete freedom and equality with other classes.

Thus had one part after another of that "people," so oppressed and contemptuously thrown into the background by the dominant class in the middle ages, emerged from bondage, and successfully asserted a participation of rights that were at one time the privileges of a single class. The aristocratic principle of feudal society, the principle of exclusion, privilege, of the subjection of the majority to a minority, had given way to the democratic principle of the equal rights of all classes, of all callings and employments. But the development of this last principle was not yet complete. Those who had made good a position in the state alongside of the feudal aristocracy, formed in their turn an exclusive class, taking their stand on certain material grounds. Thus, the merchants, as representing large masses of capital; the guilds, with their privileged industry; the agriculturists, as possessors of land, however little: all these interests formed, as it were, another aristocracy within the democracy. They were democratic in their origin, and as compared with the class that was at one time exclusively privileged; but in another point of view they were aristocratic, since there still remained without a numerous body, which, instead of elevating to political power with them, they rather repelled, and treated much as the nobility had treated themselves. This residuary mass, which now came to be chiefly designated by the name "people," comprehended all those who possessed no capital, no privileged trade or calling, no land—nothing, in short, but their personal powers and capacities for work. This class forms at the present day by far the most numerous portion of the population in nearly all the civilized states of Europe. The designation "people," intended to be depreciative, is taken by them in the very opposite sense, and they ground upon it their claim to rule the state, as being properly the people, the numerically strongest class of the community. The preference given to the class of possessors, they look upon as groundless and absurd, just as these had judged of the nobility; they therefore claim perfect equality with them, especially in the exercise of the highest political rights. It is from this point of view that universal suffrage and the rule of mere numbers, without regard to possessions or other conditions, has been proclaimed as a self-evident consequence of the democratic principle.

With this there is connected in many quarters a still further extension of the idea. The same principles, it is said, that have dictated political reformations, call for a

remodeling of the social arrangements of mankind; that the possessors of property, the *bourgeoisie*, ought to be deprived, not only of the political privileges they have hitherto enjoyed, but also wholly or in part of the material basis of those privileges, their property, so as to produce a perfect equality, political, material, and social, of all classes. This gives rise to a division of the democrats of the present day into two parties: the purely democratic party, aiming only at securing the political consequences of the democratic principle—universal suffrage, and the absolute equality of social rights; and the "democratic and social," who look upon the attainment of political rights as only a means of ultimately securing the general social equality of men.

There seems, however, to be a fundamental error in thus treating the relation between the possessionless class and the possessors as analogous to that between the serfs and lords of feudalism. The contest of democracy against feudalism was not primarily so much for equal rights as for this, that among the same people mere birth should not make one man privileged, and a ruler; another destitute of all rights, and bound to obey. It was a contest for personal freedom, the right for every man to use his powers for his own behoof, and not for that of a master; the right to the free possession of land, etc. Participation in political rights was chiefly prized as a guarantee for securing this personal and social liberty. Now, there is no such absolute distinction between possessors of property and non-possessors, as between the nobleman and *roturier* of the middle ages; the two classes run imperceptibly into one another. Still less does the one class exercise any right of controlling the personal freedom of the other in respect of labor and acquisition, as was the case in villenage and feudal servitude. Possession has endless gradations, and in the present day, he who had nothing at the outset often becomes a capitalist, and the reverse. There may be other reasons for wishing that there were less abrupt differences of possession, and greater social equality between the lower and middle classes than society actually presents (see SOCIALISM); but this by no means follow, necessarily from the notion of democratic equality. All that this notion requires, seems to be the removal of all privileges that destroy the unity and homogeneity of a nation, the establishment of complete personal and social liberty, and of the equality of all in the eye of the laws; and, in regard to political rights, or direct participation in the government of the state, such a form of constitution as will exclude no fixed class of citizens as such. All this, however, seems quite compatible with making the exercise of the different political functions dependent, in the case of each individual, on certain guarantees, and not admitting the whole body of the people to share in the government of the commonwealth at once, but only in proportion as increasing culture renders a wider circle capable of such functions. If we may judge from the example of England and Belgium, this is the way in which the real and steady progress of the democratic principle is best secured.

In France, the feudal principle, instead of a timely compromise with the democratic, as in England, came to a struggle with it of life and death. The consequence was that victorious democracy, instead of seeking to satisfy the practical wants of society first, and leaving the theoretical to be attained gradually, undertook to reorganize at one stroke the whole political and social fabric. In Germany, things took lately a similar course. The case of America is peculiar. There the foundation of the state structure was to be laid on a clear site, and the first page of the history to be written. Those who came together to form the new community were personally perfectly free and equal, and the local circumstances were such as to favor the exercise of this liberty and equality, by rendering any very great disparity in material means impossible. In such circumstances, the construction of a perfectly democratic order of society could be carried out without struggle, and without any dangerous straining of the principle. There no one looks upon the restriction of the franchise to residents—which is the law in most states of the union—as an infringement of the democratic principle. Norway bears no little resemblance to America; in that country, the democratic element was never so completely crushed as in other parts of the continent, and that form of society is favored by the means and style of living, which are extremely simple, and are based on a nearly equal division of the soil.

In the development of democracy in modern times, circumstances have directed its attacks rather against the aristocratic, than against the monarchical principle. At one time, monarchy, in its struggle with the aristocracy, found its natural allies in the democracy. The princes, in striving to break the power of the great nobles, which limited their own, often called in the help of the democratic element, partly by conferring privileges on bodies of the people, such as city corporations, and partly by attaching individuals of the non-privileged classes to their personal service, and appointing them to influential positions in the state. The road to power and distinction was, it is true, already open to individuals of the democracy through the church, whose dignities and privileges were not confined to the noble by birth, but were accessible to personal capacity. At a later period, the universities, especially in the faculty of law, formed for the democracy stepping-stones to power, from which they sometimes overtopped the aristocracy of birth. And when the princes—at their head the Louis of France—aiming at absolute authority, sought to find a counterpoise to the feudal nobility, by creating a bureaucratic state machinery, and favoring intelligence in every form, the very widest path was opened to the democratic element for attaining influence and distinction. It is true that all this

was at the cost of its most essential principle; for the equality created by a leveling absolutism, raising the low and depressing the high, was nothing more than an equality of dependence upon the one absolute master of all.

The relation between democracy and monarchy was different where the ruler came to be limited as the chief officer of the nation. Such a limitation of the power of the monarch, by means of a representative system not confined to the privileged classes, but embracing at least the citizens of towns, was in itself a victory of the democratic principle. As the circle of this popular representation widens, and its influence in the state increases, such a monarchy becomes more and more democratic in all its institutions.

In a purely democratical state, the people may exercise their power in either of two ways—directly, or through delegates: in the one case, the democracy is said to be absolute; in the other, representative. The absolute or direct form prevailed in the republics of antiquity; political representation, in fact, seems to be a modern idea. The same is the case with the original Swiss cantons, where almost all public business is discussed in a full assembly of the people. In Switzerland generally, the representative form is now preferred. It is also carried out in the states of North America, and was adopted in the French republic of 1848. The absolute form, in fact, is only adapted for small communities with a population concentrated as to space, and differing little in mode of life or culture. According to some, the representative system is inconsistent with the principle of democracy, as the will of the people is liable to be falsified and crossed by the very organs that are to carry it into execution. It is rather an advantage, however, that the first impulse of the public will, sometimes passionate and short-sighted, should be tempered and enlightened, by passing through a series of media on its way to action; and the hold which the constituency have upon their representatives, by means of frequent re-election, and in other ways, is sufficient guard against any defeat of a steady, earnest, public conviction.

M. de Tocqueville and Mr. J. S. Mill applied themselves to setting forth the evils and dangers of democracy, which they—the latter especially—both regarded not only as a system that must inevitably extend itself, but as the ideally perfect form of government. Mr. Mill was at great pains to show that self-government by a representative democracy is what develops, in the greatest degree, the good mental qualities, both intellectual and moral, of the governed, and that it is desirable gradually to extend this participation in the acts of government till it include the entire adult population, male and female. On the other hand, there are two sources of evil to which we are liable, more or less, as democracy approaches to the term of universal suffrage, and which are to be provided against by proper constitutional arrangements. The first of these is the insufficient mental qualifications of the governing body for the highly complicated work of government. Public administration is a profession, like engineering, medicine, or the law, and demands, no less than these, a special training and devotion of mind. In monarchies and aristocracies, the management of affairs is in the hands of a few, who make it the business of their life, and acquire the requisite skill for doing the work well. In a democracy, this advantage is lost, except in so far as the details of administration are left to skilled officials; the public assembly merely retaining the power of checking and controlling those officials, and of determining general rules of policy.

The other danger is the predominance of the laboring class, by virtue of their numbers, over the class made up of employers of labor, and the rich and educated generally. When there are two or more classes in the community with conflicting interests, the desirable arrangement is, that their power should be equally balanced, so that no party could carry a point by political position alone, or without appealing to the reason, and sense of justice, of some members of the other parties. But if the suffrage were universal, the laboring-class interest would be the predominant one; and so serious would be the danger of class legislation as a result, that Mr. Mill thought it necessary to provide a remedy in the shape of granting a plurality of votes to certain persons, especially those distinguished by education, so as to restore the balance.—*Considerations on Representative Government*, chap. viii.

'DEMOCRACY (*ante*). The definition of this term most widely accepted in the United States is embodied in the striking words of Abraham Lincoln: "A government of the people, by the people, for the people." This definition is fluctuating on account of the uncertain meaning of the word "people," which is generally used in a more or less restricted sense. Strictly speaking, it might be held to include every person in the jurisdiction, without distinction of age, sex, or class; but as a political term it is usually taken to mean only the great body of adult male citizens. In the days of slavery, by a mental reservation, negroes were generally excepted. Women and children, as well as idiots and criminals, are also excluded; but it is now insisted by a strong and growing party that the exclusion of women cannot be reconciled with the rational and consistent interpretation of the word democracy. The rights of this class are already so far recognized in some of the states that they are allowed to participate in the election of school officers, and to serve on school committees and boards of charity. The tendency of the times is undoubtedly towards a broader interpretation of the democratic idea, though the movement in this direction meets with a stubborn resistance. The government of the United States is called democratic, as also are the governments of the states com-

posing the union; but they are only comparatively, not purely such. See SUFFRAGE, *ante*.

DEMOCRITUS, an illustrious Greek philosopher, was b. at Abdera, in Thrace, about 470 or 460 B.C. Of his life, little is known. The statement that he was first inspired with a desire for philosophic knowledge by certain Magi and Chaldeans whom Xerxes had left at Abdera, on his Grecian expedition, is as untrustworthy as that which represents him as continually laughing at the follies of mankind. His extensive travels, however, through a great portion of the east, prove the reality of this desire, as does also his ceaseless industry in collecting the works of other philosophers. D. was by far the most learned thinker of his age. He had also a high reputation for moral worth. He appears to have left a strong impression of his disinterestedness, modesty, and simplicity on the mind of the community, for even Timon the scoffer, who spared no one else, praised him. The period of his death is uncertain. He lived, however, to a great age. Only a few fragments of his numerons physical, mathematical, ethical, and musical works are extant. These have been collected by Mullach (Berlin, 1843). Cicero praises his style, and Pyrrhon imitated it.

D.'s system of philosophy is known as the *atomic system*. Its essence consists in the attempt to explain the different phenomena of nature—not like the earlier Ionic philosophers, by maintaining that the original characteristics of matter were *qualitative*, but that they were *quantitative*. He assumes, therefore, as the ultimate elementary ground of nature, an infinite multitude of indivisible corporeal particles, *atoms* (see ATOM), and attributes to these a primary motion derived from no higher principle. This motion brings the atoms into contact with each other, and from the multitudinous combinations that they form, springs that vast and varying aggregate called *nature*, which is presented to our eyes. D. did not acknowledge the presence of *design* in nature, but he admitted that of *law*. "The word *chance*," he says, "is only an expression of human ignorance." He believed strictly in secondary or physical causes, but not in a primary immaterial cause. Life, consciousness, thought, were, according to him, derived from the finest atoms; those images of the sensuous phenomena surrounding us, which we call mental representations, were, according to him, only material impressions, caused by the more delicate atoms streaming through the pores of our organs. D. boldly applied his theory to the gods themselves, whom he affirmed to be aggregates of atoms, only mightier and more powerful than men. Strange to say, the ethical system of D.—in spite of the grossness of his metaphysics—is both pure and noble. Such fragments of his writings as we possess contain beautiful, vigorous, and true thoughts concerning veracity, justice, law, order, the duties of rulers, etc.; while, in a spirit not alien to the teaching of Christianity, he looks upon an inward peace of heart and conscience as the highest good, the end and the aim of all virtuous endeavor.

DEMOD'OCUS, a famous singer, who is represented by Homer as celebrating at the banquet of Alcinous the Greek heroes of the Trojan war. He also sang the loves of Venus and Mars. Some writers have represented him as a blind poet and musician of Corcyra.

DEMOGORGON, a mysterious and terrible being, referred to by the classical and mediæval writers, and in later poetry. He is to be the conqueror of Jupiter, and the ancients avoided even the mention of his name.

DEMOISELLE, *Anthropoides*, a genus of birds of the family *gruidæ* (cranes), differing from the true cranes in having the head and neck quite feathered, and the *tertials* of the wings elongated and hanging over the tail, so as in some species to reach the ground. The D., or NUMIDIAN D. (*A. virgo*), is about 3 ft. in length from the point of the bill to the tip of the tail, and the top of its head is about 3½ ft. from the ground. It is remarkable, as are all its congeners, for elegance and symmetry of form, and grace of deportment. The general color of its plumage is gray, but the sides of the head are adorned with two elegant white tufts, formed by elongation of the ear-coverts, and a tuft of blackish feathers hangs down from the breast. The D. is an African bird, but visits Greece and other parts of the s. of Europe. To the same genus belongs the beautiful Stanley crane (*A. paradisæus*) of the East Indies, a larger and taller bird, with very long tertials. Notwithstanding its large size, it seems to feed chiefly on the insects of marshes, which it takes when on wing.

DEMOIVRE, ABRAHAM, a distinguished mathematician, was b. at Vitri, in Champagne, 1667, and died at London in 1754. Of French extraction, he spent most of his life in England, whether he fled, with many others, for shelter in 1685, on the revocation of the edict of Nantes. He long supported himself by private tuition and public lecturing, and, towards the end of his life, by answering questions in chances, play, and annuities, most of his responses, it is said, being given at a coffee-house in St. Martin's lane, where he passed much of his time. The appearance of Newton's *Principia* incited him to increased devotion to mathematical studies, to which he had always been disposed, and at last he ranked among the leading mathematicians of his time. He was a member of the royal societies of London, Berlin, and Paris. The *Philosophical Transactions* of London are enriched by many contributions from his pen; and he was so esteemed by the royal society, that they judged him a fit person to decide the famous

contest between Newton and Leibnitz for the merit of the invention of fluxions. Among his published works are *Miscellanea Analytica de Seriebus et Quadratis*, etc. (1730, 4to); a work on *The Doctrine of Chances* (1718 and 1738), dedicated to sir Isaac Newton; and another on *Life Annuities* (3d edit., 1750). D.'s name is well known from its association with a useful trigonometrical formula—viz., that whatever be the index n, $\cos n\theta + \sqrt{-1}\sin n\theta$ is a value of $(\cos\theta + \sqrt{-1}\sin\theta)^n$.

DEMOLITION, in military operations, is one of the destructive parts of the duty intrusted to the engineers. When works and buildings belonging to the enemy are to be destroyed, to facilitate operations on the one side, or to obstruct on the other, rules are laid down by which the demolition may be most easily and quickly effected. The quantity of gunpowder to be blasted for bringing down masonry of a particular thickness, the determination of the line of least resistance—these and similar matters are required to be studied by officers of the engineer corps.

DEMO'NAX, a cynic philosopher of Athens, of the 2d c. A.D. He was a native of Cyprus, highly honored while living, and at death publicly buried with great magnificence.

DEMO'NIACS (*dæmoniaci, obsessi*, or, with reference to the supposed influence of the moon, *lunatici*), the name given by the Jews to persons afflicted with epilepsy, hypochondria, or insanity, diseases of frequent occurrence in the east. The name originated in the belief, that persons so afflicted had been taken possession of by evil spirits or demons (q.v.). It was a prevalent opinion among the Persians, Greeks, Romans, and the ancients generally, that the extraordinary conditions and actions of men, which could not be referred to the known and apparent operations and powers of the mind, must be ascribed to the influence of one or more higher spirits. This belief is found in Homer, Herodotus, Euripides, and later writers, and also rooted itself very deeply in the Christian mind during the middle ages. As the *good*, when beyond the limits of the ordinary powers or faculties of great men, was attributed to the inspiration of the Muses, or to the direct co-operation, or even incarnation in their persons of some beneficent deity, so also that deep internal unhappiness of "a mind diseased," which no strength of will, and no physician's art in olden times could remove, was as unhesitatingly attributed to evil spirits, or *demons*, as the later Jews, probably with an oblique reference to paganism, called them. Spells and exorcisms, in consequence, took the place of the healing art in reference to such as were supposed to be demonized, and the Jewish exorcists (demon-banishers) alleged, according to Josephus, that they possessed the necessary magic formulas, wonder-working roots, etc., which had been handed down from antiquity. The good spirits thus appeared—in harmony with the idea that healing was a thing natural and divine in itself, the normal action, so to speak, of nature—to fulfill their function in banishing and destroying the demons. Thus, Christ appears in the synoptic gospels as healing many who were possessed of unclean spirits, casting out devils, etc. But apart from the fact, that a belief in demoniacal possession was more vital and universal among the later Jews than among the other nations, on account of their being more deeply penetrated by the consciousness of sin, and by a conviction of the mysterious connection between evil and Satan, it was also expected of the Messiah, the anointed of God, that he would possess "power" over demons. This fundamental national belief would unconsciously prepare the contemporaries of Christ for regarding his divine exercise of the physician's art from a *religious* rather than a *scientific* point of view. When they beheld the miraculous effects of his "power" on the bodies and spirits of the so-called demoniacs, it was natural that they should speak of it in language intelligible to their age, and in harmony with its general notions. To have used other words from the stand-point of a higher scientific knowledge, would have been as confusing to the Jews and earliest Christians as it would have been to assure them that it was the *earth*, and not the *sun*, which stood still during the battle at Gibeon. Besides, when it is remembered that before even the synoptic gospels were written, the miraculous incidents in Christ's life must have fixed themselves in the memory of the populace, under the conditions of the popular belief, it is difficult to see that there was any other course open to the evangelical historians, even if they did not share the common belief of their countrymen, than to adopt the current representations. They had no interest in the mere scientific accuracy or inaccuracy of such representations. Their object was different and higher: it was to show the power, wisdom, and goodness of the Saviour, qualities which are equally manifest whichever theory may be adopted. This view of the question, which is held to be in conformity with sound science and sound criticism, presents itself almost irresistibly to the candid and impartial student of the Bible, when he bears in mind that there is nothing in the recorded examples of demoniacal possession different from the ordinary symptoms of epilepsy, hypochondria, and insanity, which are not *now* beyond the physician's skill.

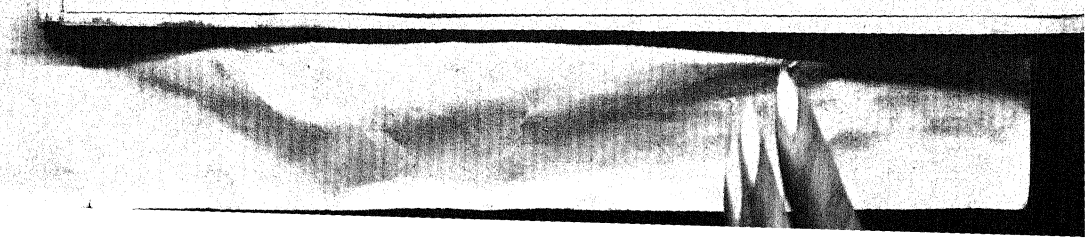
DE'MONS (Gr. *daimŏnes*, Lat. *genii*) are, according to superstitious belief, spirits which exercise an influence on the fortunes of men. Their dignity and character have both changed greatly in the course of time. Homer calls the *gods* demons, and *daimoniakos* is with him equivalent to *divine*. Hesiod affirms that there are in the air 30,000 D. or ministering spirits, who were the souls of men in the golden age; but a proper classification of these is first found in the Pythagorean and Neo-Platonic systems. Aristotle

separates the immortals into gods and D.; mortals, into heroes and men. Plato, from whom Aristotle probably received the hint of his division, says in his *Symposium* that "the demon is a middle intelligence between God and man, and the uniting link which completes the chain of being." In other places, he informs us that they inhabit the air, wander through the sky, hover over the stars, and tarry on the earth. They also see the hidden issues of the future, and can alter them at their pleasure. Every mortal receives at his birth a particular demon, who accompanies him to the end of his life, and bears his soul to the place of purification and punishment. In general, it may be said that the Greeks included the divinity or Deity among the D., in so far as he arranged and disposed the dissimilar fortunes of men. In reference to the actions ascribed to them, the D. were divided into *good* and *bad*—*agathodaimones* and *kakodaimones*. These evil D. were not, however, originally supposed to be hostile to the divinity or supreme demon. They came from him, and carried out his purpose as truly as the good demons. This was precisely the belief of the earlier Jews also, as we find, for example, from the history of Saul, into whom God repeatedly sent an "evil spirit," i.e., a demon, in the classical and not in the mediæval sense of the term. The demonism of the Romans consisted chiefly in the worship of departed spirits. See LARES, MANES, and PENATES. The origin of the doctrine of D. is to be sought for in the east. In the teaching of the Hindus, who, besides the highest Deity, Brahma, recognize a countless number of divine agents or messengers, the D. are called *deitjas*. In Parseeism, or the religion of Zoroaster, however, this doctrine is found in its most systematic and elaborate development. Indeed, the Persians and Jews *alone* among the nations of the old world had the conception of evil spirits headed by a chief demon, a Satan, who was over them as a god. To the genii or D. in the kingdom of Ormuzd (light), who are called *Ieeds*, stand opposed the genii in the kingdom of Ahriman (darkness), who are called Dews. According to the belief of the Egyptians, the circuit of the world (the sea, the earth, the air) was filled with D., who ruled the elements, exercised mysterious influence over stones, metals, and plants, and had the souls of men in their power. Although demonism came to Greece from various countries, and by various channels, yet the principal source of it was Egypt. The Jews derived theirs—at least to a great extent—directly from the Persians, during the time of the Babylonish captivity; and although acquainted with "angels" from an early period, angelology, beyond all question, first received elaborate treatment after the return from exile. The dualism which characterizes the system of Zoroaster now made itself conspicuous here. According to the Jewish demonology, there were seven good D. who formed the council of Jehovah, and ever stood before his throne, while the evil D. have at their head Satan or Asmodi. After the Jews had, under the Seleucidæ and Ptolemies, entered into extensive commercial relations with the Egyptians and Greeks, especially in Alexandria, Græco-Egyptian conceptions were associated with those derived from Persia. When Christ made his appearance in the world, the Jewish conception of a demon as an "evil spirit," *not* from God, had become definitely fixed and popular. This narrowing of the application of the word may have partly originated in the wish to glorify Judaism at the expense of paganism. It would gratify the national pride, which was strongest when it had least to boast of, to include the *D.*, i.e., the spirits both good and bad, of all the surrounding Greek-speaking nations, in one black category, and so make them stand as the representatives of evil. The early Christian writers carried out this tendency to perfection; for instead of denying the existence of the heathen gods, they turned them into D., who, acting under the inspiration of their wicked master, had cheated the souls of men, and so made them also worship Satan unawares. See DEVIL. The doctrine of the early church concerning the fall of the D., based on Genesis vi. 2, and concerning their activity, is a mixture of Jewish and Platonic notions, Christianized, however, by the belief that all their action is controlled and directed by God. Among the Germanic races, during the middle ages, the idea of a person's being taken possession of by D., led to the other idea of a covenant with the devil, of which the legend of Faust is a well-known example. See Ukert, *Ueber Dämonen Heroen und Genien* (Leip. 1850); and Conway's *Demonology and Devil Lore* (1878).

DEMONSTRATION (Lat. *demonstrare*, to point out, to cause to see), in mathematics, is a proof of any proposition which excludes doubt; such are the demonstrations of the propositions in Euclid's *Elements*. The method of demonstration in mathematics is the same with that of drawing conclusions from principles in logic, and is usually syllogistic, the premises being omitted to be stated at each turn. The principle of *reductio ad absurdum* is also employed. See REASONING, SYLLOGISM.

DEMONSTRATION, in military operations, is an apparent movement or maneuver, the chief object of which is to deceive the enemy, and induce him to divide his force, as if to meet dangers from various quarters. When thus divided and weakened, he may be attacked with greater chance of success.

DEMONTÉ, a t. in the s.w. of Piedmont, northern Italy, situated on the Stura, 15 m. s.w. of Coni. Pop. 6,078.



DE MORGAN, AUGUSTUS, was b. in 1806, in the small Indian island of Madura, on the n.e. coast of Java. His father was an officer in the British army. He was educated

at Trinity college, Cambridge, and took his degree of B.A. in 1827, when he was fourth wrangler. He was appointed first professor of mathematics in the University college, London, after its foundation in 1828. In 1831, he resigned this office, but was reappointed in 1836, and continued in that capacity till his death. His writings are very numerous. Besides being a mathematician of the first order, he was extensively and minutely versed in the history of the mathematical and physical sciences. He also devoted himself to the development of the Aristotelian or "formal" logic, to which he has given so symbolical a shape as to make it seem like a branch of algebra. He has written likewise on the calculation of insurances and on the decimal coinage. The following are the titles of a few of his works: *Elements of Arithmetic* (1830); *Elements of Algebra, preliminary to the Differential Calculus* (1835); *Elements of Trigonometry and Trigonometrical Analysis, preliminary to the Differential Calculus* (1837); *Essay on Probabilities, and on their Application to Life Contingencies and Insurance Offices* (1838); *Formal Logic, or the Calculus of Inference necessary and probable* (1847); *Arithmetical Books, from the Invention of Printing to the Present Time, being brief notices of a large number of works drawn up from actual inspection* (1847). De M. is also the author of the treatises on the differential and integral calculus, published by the society for the diffusion of useful knowledge; and contributed largely to the *Penny Cyclopædia*. He died Mar., 1871.

DE'MOS, a name applied first to the 100, and afterwards to the 174 districts into which Attica was divided. They had each their own officers, assemblies, and religious usages.

DEMOSTHENES, the greatest orator of Greece, and indeed of the ancient world, was a native of Athens. The date of his birth is doubtful. Fynes Clinton assigns it to the year 382 B.C.; Thirlwall and other good authorities, to the year 385 B.C. His father, a wealthy manufacturerer, died early, leaving his fortune and children to the care of three guardians, who cruelly abused their trust. As soon as D. came of age, he resolved to prosecute at law these unfaithful stewards. He gained his case, but much of the property had been already squandered, and he only recovered enough to save him from poverty. His success in this and some other civil causes fixed his resolution to devote himself to public life; and he set himself to master the law and politics of his country with a labor and perseverance almost without a parallel. His first care was to conquer the physical disadvantages under which he labored. His health was naturally feeble, his voice harsh and tuneless, and his action ungraceful. To strengthen his lungs, he used to climb steep hills, reciting as he went, or declaim on the shores of the sea in stormy weather. To improve his delivery, he took instructions from Satyrus the actor, and did not even disdain to study effects before a mirror. His feebleness of health he never fairly overcame, but he obviated the defects of his early training by the severest study pursued for months at a time without an interruption.

D. first began to take part in public affairs in the 106th Olympiad, when he was between 27 and 30 years of age, and from that time till his death, his history is the history of Athens. The states of Greece were at this time miserably weak and divided, and had recklessly shut their eyes to the dangerous encroachments which Philip of Macedon was even now making on their common liberties. The first period of D.'s public life (extending over ten years from 356 B.C.) was spent in warning his countrymen to abate their mutual jealousies, and unite their forces against the common enemy, whose crafty and grasping policy he exposed so nobly in 352 B.C. in the oration known as the First Philippic. Three years later, Philip became master of Olynthus, the last outpost of Athenian power in the north, which, in a series of splendid harangues—the three Olynthiacs—D. had implored his countrymen to defend. Peace was now necessary for Athens; and D. was among the ambassadors sent to negotiate with the conqueror; but Macedonian gold had done its work, and D., as incorruptible as he was eloquent, saw with despair that Philip was allowed to seize Thermopylæ, the key of Greece, and become a member of the Amphictyonic league. The peace lasted for six years, during which Philip's incessant intrigues were exposed and denounced by D. in orations hardly less remarkable for their political wisdom than for their matchless eloquence. The most important of these were the second, third, and fourth Philippics; and the speeches on the "Misconducted Embassy," and "The Affairs of the Chersonese. When war broke out in 340 B.C., D. introduced several important reforms into the army and navy, and showed such powers of vigorous administration, that Philip was baffled for a time. The struggle was closed in 338 B.C. by the battle of Chæroneia, which laid Greece prostrate at the feet of the Macedonians. Only once after that event did D. appear on the scene of his previous triumphs. But on that occasion he delivered, in defense of his friend Ctesiphon, his oration "For the Crown," which the almost unanimous verdict of critics has pronounced to be the most perfect masterpiece of oratory that ancient or modern times have seen. Æschines, his life-long enemy, against whom this speech was delivered, was so overwhelmed by it, that he quitted Athens, and spent the remainder of his life in exile. In 324 B.C., D. was accused of taking part in a revolt against the Macedonian domination, and thrown into prison, whence he escaped, and fled into exile. The death of Alexander the great in the following year brought a gleam of hope and sunshine to the Athenians; and D., recalled from exile, was again at the head of affairs. Once more the power of Macedon prevailed. D. was demanded up by the conquerors.

Finding escape impossible, the hunted orator sought an asylum in the temple of Neptune, in the island of Calaurea. Before his pursuers overtook him, he had died, as was generally believed, of poison administered by his own hand. His death took place in 322 B.C.

The personal character of D. is one which it is scarcely possible either to praise or to admire too much. His dauntless bravery, the stainless purity of his public and private life, his splendid and disinterested patriotism, and his services as a statesman and administrator, entitle him to a place among the highest and noblest men of antiquity. On his merits as an orator, it is hardly necessary to dwell. Suffice it to say, that the intelligent of all ages subsequent to his own have, with scarcely a dissentent voice, assigned to him the highest place. Homer is not more clearly the prince of ancient poets, than is D. the prince of ancient orators.—The best of the earlier editions of D. are those of Taylor and Reiske, both now superseded by the more recent edition of Bekker. His principal orations are translated into English by Leland, and the whole by Kennedy, in 5 vols., for Bohn's Classical Library.

DEMOS'THENES, a conspicuous Athenian gen. in the Peloponnesian war. He was one of the commanders sent, 413 B.C., to reinforce Niceas at Syracuse; but he was captured and put to death.

DEMO'TIC ALPHABET. See HIEROGLYPHICS.

DEMO'TICA, a t. of European Turkey, in the province of Roumelia, 22 m. s. of Adrianople. It is situated on the Maritza, here navigable for small vessels, and is defended by a citadal. Its contains an old palace, is the seat of a Greek bishop, and has manufactures of silks, woolens, and pottery, Pop. 8,000. Charles XII. of Sweden, who, after the battle of Pultowa, first found a refuge at Bender, afterwards removed to D., where he remained for some time.

DEMPSTER, JOHN, D.D., 1794–1863; a Methodist clergyman, a native of New York. When young he was a peddler. At the age of 18 he was converted, and in 1816 he was admitted to the general conference, preaching in various places in New York and Canada. In 1835, he was a missionary to Buenos Ayres. In 1842, he had charge of a church in New York. In 1847, he founded the biblical institute which now constitutes the school of theology of Boston university. In 1856, he established a similar institution near Chicago. His *Lectures and Addresses* have been published.

DEMPSTER, THOMAS, a professor famous for his learning, and a miscellaneous and voluminous writer, was born at Muiresk, in Aberdeenshire, about the year 1579. What the rank or condition of his family was, is unknown; we know, however, that he studied at Cambridge, and that when he went to France, which he did while yet young, in order to perfect his education, he represented himself as a man of family, and as the possessor of an estate. At Paris, he obtained a professorship in the college of Beauvais, where he manifested a very quarrelsome temper, engaging, it is said, almost daily in some brawl. One of these unseemly disturbances resulted in D.'s having to retreat to England. To France, however, he again returned, bringing with him a wife, whom he had married while in England, and who was very beautiful. Crossing the Alps, he obtained a second professorship at Pisa, drawing a handsome salary for his labors. Here, however, the infidelities of his wife marred his peace; and he removed to Bologna, where he became professor of *belles-lettres*, and where his wife completed her shame by eloping with "one or more" of his students. Poor D. seems to have been fond of this wanton, for he took the trouble of attempting the capture of the fugitives. He failed; and died at Butri, near Bologna, 6th Sept., 1625.

D. is the author of numerous treatises, among which may be mentioned the *Historia Ecclesiastica Gentis Scotorum*—a work in which his desire to magnify the merits of his country often induced him to forge the names of persons and books that never existed, and to unscrupulously claim as Scotchmen, writers whose birthplace was doubtful, or who were known to be natives of England, Wales, Ireland, and even France and Germany; but nevertheless, in spite of its defects, it is justly reckoned a valuable and erudite peformance. It was reprinted for the Bannatyne club in 1829.

DEMULCENTS (Lat. *demulceo*, I soften), bland and lubricating liquid substances, taken by the mouth, for the purpose of soothing irritation of the mucous membranes, and promoting the dilution of the blood, and the increase of the secretions. D. are chiefly composed of starch (q.v.), or gum (q.v.), or of substances containing these, dissolved in water; sometimes also of oily matters, or the white of eggs, and other albuminous or gelatinous substances largely diluted. The decoction of althæa, or marsh-mallow, is a favorite form of demulcent.

DEMURRAGE, in the law-merchant, is an allowance made to the master or owners of a ship, by the freighter, when she is detained in port by the latter beyond the specified time of sailing, for his own convenience. A certain number of days, called running or working days, are allowed for receiving and discharging cargo, and it is usually stipulated in charter-parties that the freighter may detain the vessel, either for a specified time, or as long as he pleases, on paying so much *per diem* for over-time. All the ordinary causes of detention, such as port-regulations, the crowded state of the harbor, and the like, are at the risk of the freighter, and D. must be paid, though it be

proved that the delay was inevitable by him (*Commentaries*, V. i. 431, Shaw's ed.). "In short," says Mr. Bell, "the rule is, that during the loading or unloading of the ship, the merchant runs all the risk of interruptions from necessary or accidental causes; while the ship-owners have the risk of all interruptions from the moment the loading or unloading is completed." But D. is not due where the delay arose from detention of the ship by a public enemy, or from hostile occupation of the port; and it cannot, of course, be claimed where the fault lay with the owners themselves, or the master, or crew of the vessel. The D. ceases as soon as the vessel is cleared for sailing, though she should be prevented from actually doing so by adverse winds. When the days of D. are limited by special contract, and the ship is detained beyond them, the sum due as D. under the contract will be taken as the measure of the loss for the further time which may be claimed in the form of damages. It will be open, however, to both parties to show, that the rate thus fixed *per diem* is either too high or too low. Where there is no stipulation beyond the ordinary agreement that the usual time shall be allowed for loading and unloading, the master will be entitled, when this period expires, either to sail or to claim damage for detention.

DEMURRER, in English law, is an exception by one party in a suit or action to the sufficiency in point of law of the case of the opposite party. *At common law*, each party might demur to the sufficiency of the pleading of the opposite party. The party whose pleading was demurred to might either amend or put in a joinder in demurrer. *A demurrer in equity*, like a D. in law, admitted the facts of the case, but stated objections to the form of the bill in equity (q.v.), or the sufficiency of the plaintiff's case to sustain the remedy craved. Since the judicature act of 1875, a D. is argued before a divisional court if in the queen's bench, common pleas, or exchequer division of the high court; before a single judge, if in the chancery division, or in the probate, divorce, and admiralty division.

Demurrer to evidence is also a form of procedure which existed in both common law and equity practice. In the former it had long been almost obsolete; and in its place was substituted a motion for a new trial (q.v.). It may arise on a trial at bar or at Nisi Prius (q.v.). It admits the facts proved, but objects that they are not sufficient to sustain the issue. In equity, a D. to evidence is where a witness refuses to answer a question put to him by direction of the court. The objection is then taken down in writing, and is argued before the judge by whom the interrogatories were settled.

Demurrer to a criminal indictment is also almost obsolete. After the passage of 7 Geo. IV. c. 64, this form of D., which was formerly of little moment, became of consequence to a prisoner, inasmuch as by neglecting to state in the form of a D. his objection to an indictment, he was precluded from afterwards insisting in them. But by 14 and 15 Vict. c. 100, it is enacted that no indictment shall for any of these defects be held insufficient; and further, that every objection for any formal defect in an indictment shall be taken before the jury is sworn, and may be amended by the judge. This last provision places demurrers in criminal cases on a similar footing to that of objections to the indictment in Scotland. There is, however, this material difference, that in Scotland the defect cannot be immediately remedied, but the prisoner, if the objection be sustained, undergoes a further detention in jail on a new indictment.

DEMY', a particular size of paper. In that of printing-paper, each sheet measures 22 inches by 17½; drawing-paper, 22 by 17; and writing-paper, 22 by 15½.

DENAIN, a t. of France, in the department of Nord, on the left bank of the Scheldt, about 5 m. w. of Valenciennes. Its situation, in the center of an extensive coal-field, and in the immediate vicinity of iron mines, gives it unusual facilities for smelting iron, and its works of this kind are of considerable importance. D. is a regular and well-built town, and has a good market. It has some manufactures of beet-root sugar. Pop. '76, 11,849. Here the allies under lord Albemarle were defeated by the French under maréchal de Villars, 24th July, 1712.

DENA'RIUS (*deni*, ten each), the principal silver coin among the Romans, was equal to ten *ases*, but upon the reduction of the *as*, the D. equaled sixteen of it. It was first coined 269 B.C. Its weight at the end of the Roman commonwealth is estimated at 60 grains, while under the empire the weight was 52.5 grains of silver. The value of the commonwealth D. was thus rather more than 8½*d.*, and of the later period about 7½*d.*

DEN'ARY SCALE. See NOTATION.

DENBIGH, a parliamentary and municipal borough, the county town of Denbighshire, in the n. of the county, 30 m. w. of Chester, and 213 m. n.w. of London. It stands in the hundred of Isaled, near the middle of the vale of the Clwyd, on the sides and at the bottom of a rugged steep limestone hill, crowned by the imposing ruins of a castle built in 1284, by Henry Lacy, earl of Lincoln, where there had stood fortifications erected by William the conqueror, and where there are traces of still earlier castellated remains. The newer part of D. was built at the bottom of the hill, after the destruction and desertion of a great part of the town on the top of the hill, about 1550. D. has manufactures of shoes and leather for the English markets and export trade; but it is

more a place of genteel retirement than commerce. Pop. in 1871, 6,323. It sends one member to parliament; Ruthin, Holt, and Wrexham being contributory boroughs. In 1645, Charles I. took refuge in the castle after the battle of Rowton Heath. The garrison surrendered to the parliamentary forces, after a siege of two months. It was shortly afterwards dismantled. The fortifications have an area of a sq.m. in extent. A lunatic asylum for the five counties of North Wales was erected near the town in 1848. A noble institution for the maintenance of 50 female inmates, of whom 25 are orphans, was built in the town, and opened in 1860, with funds in the hands of the Drapers' company of London, from money left to them in 1540, by one Thomas Howell, a Welshman. It has an endowment of about £1500 a year. The charter of Henry de Lacy is preserved among the corporate archives.

DENBIGHSHIRE, a co. of North Wales, on the Irish sea, and between the Dee and the Conway. It is 41 m. long, with an average breadth of 17; contains 603 sq.m., has 8 m. of coast, and is the sixth in size of the Welsh counties. The surface is partly rugged and mountainous, with some beautiful and fertile vales, as the vale of the Clwyd, 20 m. by 7. In the n., is a horse-shoe range of hills, 65 m. long, and convex to the coast. The highest hill is Cader Fromwen, 2,563 ft.; and many others rise above 1500 feet. The rocks are chiefly Silurian clay and graywacke slates, with some granite and trap, and bands of Devonian, carboniferous, and permian strata. There occur coal, iron, slates, flags, millstones, limestone, lead, and copper. The chief rivers are the Dee, Conway, Elwy, and Clwyd. The Rhaiadr waterfall is 200 ft. high in two parts. Llangollen vale is famed for romantic beauty and verdure, amid hills of savage grandeur. The climate is mild in the lower parts, but cold and bleak among the hills, where small hardy sheep and ponies are reared. About two thirds of D. are under cultivation; its corn, cheese, butter, and live-stock are greatly esteemed. It is also well timbered. Salmon are caught in the rivers. D. is divided into 6 hundreds, 3 poor-law unions, and 64 parishes, in the diocese of Bangor and St. Asaph. The chief towns are Denbigh, Wrexham, Ruthin, Holt, Llangollen, Llanrwst, Abergele, and Ruabon. Pop. '71, 105,102, showing an increase of 74 per cent since the first census in 1801. D. returns three members to parliament—two for the county and one for Denbigh. D. was anciently occupied by the Ordovices, a powerful tribe, not entirely subdued by the Romans till the time of Agricola. Of British or pre-Roman remains there still exist tumuli, two cistvaens or stone cells, barrows, and forts. To the times of the Welsh and Saxon struggles are referable the Pillar of Eliseg, near Llangollen, and the dikes of Offa and Watt. Offa's, the king of Mercia's dike, to keep out the Welsh, was a ditch, with small forts on mounds at intervals, and ran from Herefordshire to the estuary of the Dee; Watt's dike ran on the e. side of Offa's dike and parallel to it. Wrexham church is one of the seven wonders of Wales. Chirk castle is a fine Norman stronghold, lately restored.

DENDERAH (Gr. *Tentyra*, Coptic *Tentore*, probably from *Tĕi-n-Athor*, the abode of Athor), a ruined t. of Upper Egypt, situated near the left bank of the Nile, in lat. 26° 13′ n., long. 32° 40′ east. It is celebrated on account of its temple, dating from the period of Cleopatra and the earlier Romam emperors, and one of the finest and best preserved structures of the kind in Egypt. The principal temple measures 220 ft. in length by about 50 in breadth, and has a noble portico supported on 24 columns. The walls, columns, etc., are covered with figures and hieroglyphics. Prominent among the former is that of Athor or Aphrodite, to whom the temple was dedicated. On the ceiling of the portico are numerous mythological figures arranged in zodiacal fashion, and which were long regarded as a representation of the zodiac; but the absence of the crab has led some recent archæological travelers to doubt whether the figures were intended to have any reference to astronomy. There are many other sacred buildings at D., including a temple of Isis. The whole, with the exception of one propylon, are surrounded by a sun-dried brick-wall, 1000 ft. long on one side, and in some parts 35 ft. high.

DENDERMONDE (Belg. *Termonde*), a t. of Belgium, in the province of East Flanders, situated at the confluence of the Dender and the Scheldt, 18 m. e. of Ghent. D., which is said to have originated in the 8th c., is fortified, and has a citadel dating from 1584, and possessing the means of laying the surrounding country under water in case of attack: Louis XIV. besieged it in vain in 1667, but Marlborough, aided by a long drought, succeeded in taking it in 1706. [In connection with Marlborough's siege, D. is mentioned frequently in Sterne's *Tristram Shandy.*] The principal buildings of D. are the town-house and several churches, the most noteworthy of which is the church of Notre Dame, a very old edifice, containing two admired pictures by Vandyk. The manufactures are woolens, lace, cotton-yarn, etc., and there is a large weekly market for the disposal of the agricultural produce of the neighborhood. Pop. '70 about 8,300.

DENDRERPETON, a small lizard-like batrachian, found by Lyell and Dawson in the interior of the hollow trunk of an upright *sigillaria* in Nova Scotia. The tree was about two ft. in diameter, and consisted of an external cylinder of coal, and an internal axis of mud and sand, cemented together with fragments of wool into a solid rocky mass. In this were discovered the shell of a *pupa*, the first air-breathing mollusk met with in the coal, and the bones of a small reptile probably 2¼ ft. long. It was described and figured by Owen as *D. Acadianum.* He showed it to be nearly related to *arch-*

egosaurus, from the plicated structure of the teeth, the sculpturing of the broad cranial plates, and the structure and proportion of certain limb-bones. It received its name, "tree-lizard," from its having been found in a tree; and this was supposed to show that it had arboreal habits: it is, however, probable that the remains had been washed in with the mud and sand which form the matrix in which they are preserved.

DENDRITE, the name given to a peculiar branching mineral crystallization on the surfaces of the fissures and joints, or in the substance of rocks, having the appearance of moss, and often mistaken for fossil plants. The hydrous oxide of manganese is the mineral that generally assumes this form, occurring frequently in great abundance in limestone, steatite, trachyte, and other substances.

DENDRO'BIUM, a genus of parasitical plants, almost entirely confined to tropical Asia. The flowers are grotesque in form, but very beautiful, some of which are purple, some a deep yellow, and some green; and all are very fragrant. When artificially raised they require a high temperature.

DEN'DROLITES, petrified stems of trees or shrubs, which occur in all parts of the world in the formations called secondary, especially in the coal formation. They may be regarded as the remains of a former creation. They are of very various magnitude. In some places, gigantic stems are found, and these are often observed to have branches, fruit, and even leaves—these, however, only as impressions—whilst in other places only fragments occur, which, however, belong to trees having nothing in common with those now growing in the same regions—as, for example, beautiful stems of palms at Chemnitz in Saxony, etc. Such woods are generally changed into agate, or into pitchstone, when they occur in ancient strata altered by volcanic fire. Concerning the question of their origin, opinions are still divided. Many of them are so hard and beautifully colored, that they are cut and employed for all artistic purposes. When cut into very thin plates, they exhibit under the microscope the structure of the wood so perfectly, that it is not only possible for botanists to determine the natural order or family of plants to which it belongs, but even the genus and species. They mostly belong to the *filices*, *cycadeæ*, and *coniferæ*. Brongniart was amongst the first investigators of this department of science. He has had many followers, amongst whom, in our own day, Unger and Göppert have especially distinguished themselves. See Göppert *Monographie der fossilen Koniferen* (Leyden, 1850).

DEN'DROPHIS (Gr. tree-snake), a genus of serpents of the family *colubridæ*, remarkable for their extremely slender form, their beautiful colors, and the liveliness of their movements. Their eyes are very large and prominent. They are widely distributed over the warm parts of the world; none are found in Europe. They live chiefly among the branches of trees, and insects are their principal food.

DENGUE, or BREAK-BONE FEVER, also called DANDY and BUCKET FEVER, is a disease known in the southern states of North America and in the West Indies, where it was first described as having appeared in the years 1827 and 1828. It was very violent in its access, but not often fatal, and consisted chiefly of a severe attack of inflammatory fever, with great heat and redness of the surface, and well-marked rheumatic pains of the limbs both in the joints and muscles. It usually terminated by a copious perspiration after a few days.

DENHAM, DIXON, 1786–1828; an English soldier and traveler. After the Napoleonic wars he traveled in Europe, and in 1821, joined the English government expedition to Africa under Clapperton. Denham himself explored the region around lake Tchad, in 1823. In a fight with the Arabs he was wounded and separated from his company, but found his way back after great suffering, reaching England in 1825. He published *Narrative of Travels and Discoveries in Northern and Central Africa in the years* 1822, 1823, *and* 1824.

DENHAM, Sir JOHN, an English poet of the reign of Charles I., was the son of the chief baron of exchequer in Ireland, and was b. at Dublin in 1615. In 1631, he entered Trinity college, Cambridge, where, after studying three years, he took his degree. Turning his attention to literature, he wrote a tragedy, entitled *Sophy*, which in 1641 was acted with great applause at Blackfriars. Two years after, he produced the poem *Cooper's Hill*, which has done more to perpetuate his name than any other of his works. In 1647, he was engaged in the performance of secret services for Charles I.; but these being discovered, he was obliged to escape to France in 1648, returning thence to England in 1652. After the restoration, he was appointed surveyor-general of his majesty's buildings, and created knight of the bath. Towards the close of his life, the latter part of which was darkened by an unfortunate marriage, he was visited by insanity; but recovering for a short time, he commemorated the death of Cowley in one of his happiest poetical performances. His own death occurred in 1668. His verse is characterized by considerable smoothness and ingenuity of rhythm, with here and there a passage of some force.

DENI'NA, CARLO GIOVANNI MARIA, an Italian author, was b. 28th Feb., 1731, at Revello, in Piedmont; studied at Turin, and in 1754, was appointed humanity professor at Pignerolo, but was deprived of his office on account of his having written a comedy in which there was much that excited the professional animosity of the ecclesiastical

order. D. went to Milan, but was soon after recalled to Piedmont, and appointed professor of rhetoric in the university of Turin. In 1777, he published anonymously at Florence his *Discorso sull' Impiego delle Persone*, in which he sought to show how monks might be transformed into useful members of society. This, of course, again cost him his chair, and he was even banished from the metropolis. In 1782, he went to Berlin, on the invitation of Frederick the great. Here he lived for many years, and wrote a considerable number of works. In 1804, he was introduced to Napoleon at Mentz, to whom he dedicated his *Clef des Langues* (Ber. 1804), and was in consequence appointed imperial librarian at Paris, where died 5th Dec., 1813.—D.'s principal productions are: *Discorso sopra le Vicende della Letteratura* (2 vols., Turin, 1761), *Delle Rivoluzioni d'Italia* (3 vols., Turin, 1769–70), an excellent work, which was copiously abused by the apologists of ecclesiastical privileges; and *Storia Politica e Letteraria della Grecia Libera* (4 vols., Turin, 1781–82). D.'s other works were, for the most part, written in Prussia. Among them may be mentioned—*Essai sur la Vie et le Regne de Frédéric II.* (Berlin, 1788), *La Prusse Littéraire sous le Regne de Frédéric II.* (3 vols., Berlin, 1790–91), *Tableau Historique Statisque et Moral des la Haute Italie et des Alpes qui l'entourent* (Turin, 1805), and *Storia dell' Italia Occidentale* (6 vols., Turin, 1809–10).

DENIS, SAINT, according to tradition, the apostle of France and first bishop of Paris, suffered martyrdom in the 3d century. He was sent (as is said) from Rome about 250 A.D. to preach the gospel to the Gauls. After various detentions at Arles and other places, he arrived in Paris, where he made numerous proselytes. Pescennius or Sicinnius Lescennius, who was then the Roman governor of this part of Gaul, ordered D. to be brought before him, along with other two Christians, Rusticus, a priest, and Eleutheros, a deacon. As they continued firm in their faith, in spite of threats, Pescennius caused them to be cruelly tortured, and afterwards beheaded, 272 A.D., or, as others say, 290 A.D. Gregory of Tours, Fortunatus, and the Latin martyrologists, state that the bodies of the three martyrs were thrown into the Seine, but taken up by a pious woman named Catulla, and interred near where they lost their lives. At a later period, a chapel was built over their tomb. In 636, king Dagobert founded on the spot an abbey, called St. Denis, which soon grew to be one of the richest and most important in the whole kingdom, and was long the sepulcher of the French kings. What measure of truth there may be in the above biography, it is impossible to say. The Acts of St. D., written about the end of the 7th or beginning of the 8th c., is founded merely upon vulgar traditions, and is full of absurdities. The Greek church makes St. Denis to be the same person as Dionysius, the Areopagite, first bishop of Athens. The Roman Catholic church celebrates his memory on the 9th of October. For a long time his name was the war-cry of the French soldiers, who charged or rallied to the words *Montjoye St. Denis.*

DENIS, ST., a t. of France in the department of Seine, 6 m. n. of Paris. It is traversed by two small streams, the Croud and Rouillon, and is well built, with clean spacious streets. It is situated within the line of forts forming the outworks of the fortifications of Paris, and was itself formerly fortified, but its ramparts have been converted into promenades. St. D. has manufactures of printed calicoes and other cotton goods; also several flour-mills, dye-works, bleacheries, and chemical works. Its yearly market, at which there is an annual sale of about 180,000 sheep, is one of the oldest in France, and lasts for a fortnight. Pop, '76, 29,500. The town is supposed by some to date from the foundation of a chapel raised above the tomb of St. Denis (q.v.). This chapel was replaced, some time after his death, by a church and abbey, built by Dagobert I., who was buried in the abbey church, which thereafter became the mausoleum of the kings of France. By a decree of the national convention in 1793, the abbey was ordered to be destroyed, and in 3 days 51 tombs were sacrilegiously rifled and demolished, and the bodies cast indiscriminately into ditches prepared for them. The building, stripped of its lead to furnish bullets for the revolutionists, remained roofless, and was used as a cattle-market, until the time of the empire, when Napoleon commenced its restoration, a work which was completed by succeeding governmnts, in a style surpassing even its former splendor. The crypt of the abbey church contains statues of the French kings and princes from Clovis to Louis XVI.

DENISON, JOHN EVELYN, for many years speaker of the house of commons and privy councillor, was b. in 1800; eldest son of John Denison, Esq., of Ossington, Nottinghamshire. Educated at Christ Church, Oxford; married, 1827, Lady Charlotte, third daughter of the fourth duke of Portland; represented Newcastle-under-Lyne from July, 1823 to 1826, and Hastings from 1826 to 1830; was a lord of the admiralty from 1827 to 1828; sat for Notts from 1831—when he was also returned for Liverpool—till Dec., 1832. On the division of the county under the reform bill, he was returned for South Notts until 1837. He was then without a seat until 1841, when he was returned for Malton, but exchanged this borough for North Notts in 1857. In May, 1857, on the elevation of Mr. Shaw Lefevre to the peerage, D. was elected speaker of the house of commons without opposition, and unanimously re-elected in 1859, 1866, and 1868. In 1872, he retired from the speaker's chair, in which he was succeeded by Mr. Brand, and shortly after he was created viscount Ossington. He was a D.C.L. of Oxford. He died in 1873.

DENIZLI', a t. of Anatolia, Asiatic Turkey, situated on a low hill rising out of a spacious plain, in lat. 37° 48′ n., long. 29° 3′ east. D. is chiefly occupied with bazaars and market-places, the inhabitants for the most part residing in the environs. The manufacture of leather and a kind of morocco forms the staple industry of the place. The pop. may now amount to 8,000 or 10,000; it was formerly much more numerous, but by an earthquake in 1715, no less than 12,000 people perished.

DENMAN, THOMAS, Baron, 1779–1854; chief-justice of England; the son of a physician, educated at Cambridge. His success at the bar was rapid, and he speedily rose to rank next to Brougham and Scarlett. His greatest point in advocacy was as counsel for queen Caroline. In this trial he made the king his enemy, and thereby retarded his own promotion. In 1818, he was elected to parliament, and took a seat with the whig opposition. He remained in the commons until his elevation to the bench in 1832. In 1830, he was attorney-general under the Gray administration. Two years later he was made lord chief-justice of the king's bench, and in 1834, was raised to the peerage. He resigned the office of chief-justice in 1850, and retired to private life.

DENMARK (Dan. *Danmark*), capital, Copenhagen, the smallest of the three Scandinavian kingdoms, is situated between 54° and 57° 44′ 50″ n. lat., and 8° 5′ and 12° 45′ e. long., excepting the small island of Bornholm in the Baltic, about 90 m. e. of Seeland, which lies in 15° e. longitude. D. is bounded on the n. by the Skagerak, a gulf of the North sea; on the e. by the Cattegat, the Sound, and the Baltic; on the s. by the states of the German empire; and on the w. by the North sea, which the Danes call the "Western ocean."

The following table gives the main divisions of the kingdom of D. and its principal colonies:

	Area in Eng. sq. miles.	Pop. in 1870.
Denmark proper, comprising the islands of Seeland, Fünen, Laaland, Falster, etc., and the peninsula of Jutland	14,553	1,784,741
The Faröe islands	495	9,992
Iceland	38,860	69,763
Greenland	25,000	9,825
Danish W. I. islands—viz., Santa Cruz, St. John, and St. Thomas.	105	37,821
	79,013	1,912,142

The population of D. proper was in 1878 estimated at 1,940,000, and that of Copenhagen (Dan. *Kjœbenhavn*), the capital, at 250,000. In 1870, there were 5 towns in D., besides the capital, in which the population exceeded 10,000.

	Population.
Odense, chief town of Fünen	16,970
Aarhus, in Jutland	15,025
Aalborg, "	11,721
Randers, "	11,354
Horsens, "	10,501

The continental portion of D., which since the treaty of Vienna, of Oct. 30, 1864, has been almost wholly limited to Jutland, is, in point of fact, the north-western extremity of the German continent. The entire coast-line of D., along the North sea, Skagerak, Cattegat, Sound, Baltic, and Little Belt, exceeds 800 m.; but many parts of this range are entirely unavailable for purposes of maritime intercourse, in consequence of the shallowness of the water, or of the numberless sand-banks, bars, and small islands which skirt the coasts. Seeland, or *Sælland*, the largest of the islands, and the seat of the metropolis, Copenhagen, has an area of about 2,000 sq. miles. Its surface is in general very flat, and only a few feet above the level of the sea, and the highest of its few isolated elevations is not 500 ft. above the sea. The island is generally fertile and well-wooded, more especially in the s., but in the n. the soil is in many parts arid. Fünen (Dan. *Fyn*), the island next in extent, with an area of about 900 sq.m., is divided from Seeland by the Great Belt, and from Jutland by the Little Belt. It is less wooded than Seeland, and is intersected by a range of hills of inconsiderable height. The smaller islands of Laaland, Langeland, Falster, and Moen, with an area of 2,000 sq.m., are grouped to the s. of Fünen and Seeland, and exhibit the same physical and geological characters. They evidently, at some earlier epoch of the world's history, formed, together with those two larger islands, one connected whole, with Jutland on the w., and Sweden on the east. The n.e. shores of Seeland are separated from the latter country by a channel 70 m. in length, and only 1½ m. in breadth at its narrowest point, known as the Sound, or the *Öre Sund*, Ear sound, so denominated from its resemblance to the human ear. This channel varies from 10 to 19 fathoms in depth. The western coasts of Seeland are divided from Fünen by the Great Belt, a channel 9 m. wide at its narrowest point, and from 5 to 25 fathoms in depth—while the western shores of Fünen are separated from the peninsula of Slesvig and Jutland by the Little Belt, which is about four-fifths of a mile wide. The peninsula of Jutland, whose area is about 9,600 sq.m., was anciently, and even comparatively recently, covered with forests; but since their

wasteful destruction, extensive tracts have become converted into sandy heaths, and in some parts it has been found necessary to sow bent-grass and plant trees, in order to prevent the mischief accruing to the cultivated lands by the clouds of dust raised by the wind. One third of Jutland has been rendered unfruitful by these causes, but where the few forests still remain, the neighboring districts are productive and well cultivated. Efforts have been made within the last few years to plant the heaths and drain the marshes of Jutland, and the results have on the whole been successful, more especially in regard to the latter, which are of considerable importance, since they supply large quantities of turf for fuel.

The coasts of D., both on the continent and in the islands, are indented with numerous bays or *fjords*, the largest of which is Limfjord, which intersects Jutland, and since 1825 has insulated its northern extremity by breaking through the narrow isthmus which had separated it from the North sea. It covers an area of 250 sq. miles. D. abounds in small lakes, the most considerable of which are Arre, Esrom, Fure, and Bavelse, all in the n. and w. parts of Seeland. But as no inland point is more than 30 or 40 m. from the sea, and the ranges of hills are low and interrupted, the country has no rivers properly so called. Intercommunication is, moreover, facilitated in the islands and in Jutland by various canals.

Roads, Railways, etc.—The high-roads and lesser country roads, together measuring upwards of 1000 m. in length, are in general in excellent condition. At the present time there are about 850 m. of railroad in the islands and Jutland. In 1875, the telegraphic lines extended to a length of 1734 m.; while the number of telegrams transmitted was 886,917.

Climate, Soil, Productions, etc.—The climate of D. is modified by vicinity to the sea, and is considerably milder, and the air more humid, than in the more southern and continental Germany. The cold is seldom very intense before Christmas, or after the middle of March. The summers are occasionally very hot; the weather generally may be characterized as very variable; rain and fogs are frequent. The main temperature in Copenhagen, whose climate may be regarded as representing an average of that of all D., is, in winter, 32.9°; spring, 43.5°; summer, 63.5°; autumn, 49.3° Fahrenheit. The alternations from winter to summer are rapid, and scarcely broken by the intervention of spring or the succession of autumn. Westerly winds prevail in the proportion of 48 per cent to all others. The total absence of mountains and large rivers, and the alluvial character of the soil, by precluding all mining operations, of necessity lead the peasantry to follow agriculture, in the pursuit of which more than half the population are engaged. The drought of the spring and the short and sudden heat of the summer are often detrimental to the grass; but there is seldom an absolute failure in the supplies, and the cereal crops are generally good. During the last half century, the cultivation of wheat has increased nearly 200 per cent, while that of rye and barley has decreased rather than augmented.

Rye is more extensively used for bread than any other of the cereals, the average returns for the last ten years showing that about 3 millions of tons were raised in the kingdom annually, valued at nearly 19 millions of rix-dollars; while, in spite of the relatively increased cultivation of wheat, the quantity and value of the latter scarcely reached the half of the above figures. Barley and oats, for which the Danish climate seems to be specially well adapted, yield the largest annual average returns—viz., for the former, 6½ millions of tons, valued at 29 millions of rix-dollars, and for the latter 7½ millions of tons at 21 millions of rix-dollars. Since the potato crops were attacked by disease in 1847, the cultivation of this tuber has declined, but the average yield may be reckoned at about 400,000 tons. According to the census of 1870, there were in D. 316,570 horses, 1,238,898 horned cattle, 1,842,481 sheep, and 442,421 swine. Of these there were exported in the same year 12,500 horses, 50,200 horned cattle, 21,000 sheep, three fourths of which belonged to Jutland, while the 60,600 swine exported had been nearly all raised in the islands.

The Danish fisheries are not so important a branch of industry as might be expected, when we consider the extended coast-line of the country. But it was recently calculated that the Danish fisheries had an annual value of £150,000, and employed 6,500 men. The principal fish in D. are porpoises, herrings, whitings, cod, flounders, mackerel, salmon, and eels. Oyster beds, which are included under the royalties of the Danish crown, are met with at Frederikshavn, Skagen, and in the Limfjord. No part of the Danish territories is rich in minerals; some coal is found in the island of Bornholm, gypsum at Segeberg, and salt at Oldesloe. Amber is collected on the western shores of Jutland. Peat is got wherever there are swamps; and from the absence of productive coal-mines, and the increasing scarcity of wood, it is of great value for fuel, and every village in the vicinity of such land has a certain portion assigned for its supply. Beech and birch are the prevalent trees, but oak, pine, and larch are also indigenous, and grow to perfection. Agriculture has been steadily improving in D. of late years, but the land is too much subdivided to admit of the expenditure of great capital; and, moreover, is seldom cultivated by the owners. The condition of the laboring classes is happy; they are more roomily and warmly lodged, and better clad, than in Great Britain, and their dwellings are always clean. The peasants still continue to manufacture much of what they require within their own homes, the women weaving linen and woolen stuffs for the

use of the household, and the men making their own furniture and simplest farm-implements, and the wooden shoes which are worn by men, women, and children. Almost two thirds of the entire area of the country is arable land. The Danes have not hitherto availed themselves of the great natural advantages which the country possesses for manufactures and trade; and notwithstanding the rich porcelain clays in Bornholm, which afford valuable materials for the manufacture of earthenware, and the abundant water-power in every part of the kingdom, the industrial operations are very inconsiderable. There are, however, a few good porcelain and glass works, and iron-foundries, chiefly in Seeland and near Copenhagen; and of late years the manufacture of cards and ornamental paper has been brought to great excellence in Copenhagen, and at Silkeborg, in Jutland. Linen is the principal article of domestic manufacture in Seeland, but the supply does not suffice for the home-demand. Many of the restrictions which formerly cramped foreign commerce have of late years been removed, but the commercial legislation is still too protective to give free scope to individual enterprise.

Exports and Imports.—The principal articles of export are grain, butter, cheese, smoked and salted meats, brandy, liqueurs, horned cattle, horses, skins, hides, tallow, bristles, etc. Among the imports are sugar and molasses, wines and spirits, salt, drugs, spices, textile fabrics, timber, coal, coffee, tea, tobacco, rice, flax, hemp, etc.

The Danish official returns of the commerce of the country afford no clew to the money-value of the imports and exports, as they merely give the weight or bulk of the articles as rated by the customs. About two thirds of the export trade is carried on in native vessels. In 1875, the imports amounted to 1,220,425 tons, valued at £12,650,000; and the exports, 501,565 tons, at £9,483,000. In 1876, the Danish mercantile fleet consisted of 3,200 vessels, including 169 steam-ships, having 11,509 horse-power; total tonnage, 250,643.

Revenue, etc.—The estimated revenue for the financial year 1878–79 was 47,761,350 kroner, or more than 2¾ million pounds sterling, and the expenditure was 71,457,681 kroner. Since the war of 1866, the Danish government has maintained a large reserve fund for the purpose of having means to provide against war or other emergency. The amount reserved in 1876 was 34,339,143 kroner. The interest of the fund thus accumulated constitutes a very considerable item in the annual revenues of the state; and the national debt, which, since 1866, has been undergoing a gradual reduction, and which in 1872 amounted to 123,032,612 kroner, was, in 1876, only 100,805,939 kroner. Till lately, the current coinage consisted of gold Fredericks d'or (16s. 4d.), silver specie-dollars (4s. 3d.), a rix-dollar (2s. 2d.), divided into 6 marks of 16 skillings each. But under a law which came into force 1st Jan., 1875, a decimal system of currency has been introduced into D., the unit being the *krone*, divided into 100 öre. The krone is worth about 1s. 1⅛d., and is therefore about half the rigsdaler, which it has supplanted as unit. Since 1839, the Danish pound-weight has been made equal to half the French kilogramme, and its fractions reduced to corresponding equivalents. With a similar view of facilitating international commercial relations, the old Danish ship-measure of a læst (=150 cubic feet) was done away with in 1867, and the English tonnage system officially adopted. The present unit is the ship last, equal to 2 tons.

Army, Navy, etc.—According to law, all able-bodied adult Danes are liable to serve for eight years in the regular army, and for a similar period in the army of reserve. Exemption from this duty can, however, be obtained under definite conditions, and by payment of the appointed penalties. The kingdom is divided into five territorial brigades, subdivided into four battalions, each brigade furnishing its contingent of infantry and one regiment of cavalry. Exclusive of the reserve, the army on the peace-footing numbers 37,850 men and officers; and on the war-footing, 49,253. The budget for 1876 was charged 4,295,440 rix-dollars for the ministry of war. The Danish navy is recruited from certain maritime districts exempt from the liability of supplying men for the army. The old Danish fleet, of which D. was deprived by England in 1807, is now represented by a small but well-appointed force of 33 steamers (of which 6 are iron-clads), with a horse-power of 23,190. The navy numbered, in 1875, about 900 men and officers. The budget of 1876 was charged with the sum of 2,201,814 rix-dollars, for the year's expense of the ministry of marine.

Education.—The educational institutions of D. have reached a very high degree of perfection, and few countries, if any, can compete with her in regard to the excellence of the system, and its extensive application relatively to the amount of the population. Education is compulsory for children between the ages of 7 and 14 years, and poor parents pay only a nominal sum towards the government of parochial schools, of which there are about 3,000 in Denmark. There are six training-colleges for the teachers of these public schools. Classical and other higher-class education is afforded by a large number of colleges in the capital and more important provincial towns, with the university of Copenhagen for its center, whose professional and tutorial staff of about 50 university teachers is remarkable for the high order of instruction imparted. There are three public libraries in Copenhagen, of which the royal library, with 500,000 volumes, is especially rich in oriental and Icelandic MSS.

Religion.—The established religion of D. is Lutheran, to which the king must belong; but complete toleration is enjoyed in every part of the kingdom. The reformation was introduced in 1536, when Christian III. caused all the Romish bishops to be seized in

one day, formally proclaimed their deposition from their sees, and incorporated the property of the church with that of the crown. D. is divided into 7 dioceses, or *stifter* (besides those in the West Indian colonies)—viz., Seeland, Laaland, Fünen, Ribe, Aarhus, Viborg, Aalborg, besides Skalholt in Iceland; 1907 parishes, with numerous affiliated churches, 62 rectors, and 1677 parish ministers. The nomination of the bishops is vested in the king; they have no political character; but in other respects exercise nearly the same privileges within their dioceses as their English brethren of the same rank.

Law.—The supreme court of justice, presided over by four assistant judges, chosen by the landsthing, in addition to the four ordinary high judges, holds its sittings at Copenhagen, and there are lower courts in the town. All civil cases are first carried before a court of conciliation, composed of persons from the vicinity, selected on account of their position and character. Their decisions are registered, and have legal force where both parties have engaged to abide by the judgment; otherwise, the case is carried to the higher courts. Appeals are allowed from all the lower courts to the supreme court.

Constitution and Government.—The succession to the crown was not necessarily hereditary till 1660, when the people and the clergy, impelled by hatred towards the nobles, in whose hands the supreme power of the state rested *de facto*, constituted themselves into a national assembly, which invested the sovereign (Frederick III.) for himself and his heirs with absolute power, and declared the succession to the throne hereditary. From that time, the crown exercised the *dominium absolutum*, unchecked by any constitutional restraint, till 1831, when Frederick VI., yielding to the pressure of the times, granted a constitution to his people, and established an assembly of notables for the islands and Jutland; the duchies being governed by their own constitutional forms. The nation was at first perfectly satisfied with the amount of power conceded by the king, but after a time the anomalous character of the authority vested in the assembly created great political agitation and discontent. This feeling continued to increase under the reign of Frederick's successor, Christian VIII.; and on the death of the latter, his son and successor, Frederick VII., saw himself obliged to depart from the conservative policy of his father, and to grant, in 1849, the constitutional form of government which D. now enjoys, and which is based upon the most liberal principles. The national assembly or rigsdag consists of the folkething and landsthing, and is invested with very extensive powers: it meets annually for two months, and its members receive a fixed allowance during their sittings. The landsthing is composed of 66 members, of whom 12 are chosen for life by the king, while the remainder are elected for a term of eight years by certain municipal and rural electoral bodies, who represent the large tax-payers of the kingdom. A fixed age, good reputation, and a certain moderate independent income are the only qualifications required for election to this branch of the rigsdag. The members of the Folkething, whose number (which is now 102) varies with the population, are elected for three years by universal suffrage, and, except that no fixed income is required in their case, they must have the same qualifications as candidates for the upper chamber. The rigsdag must meet every year, and must, in the course of their session, consider and dispose of the annual accounts that the finance minister is bound to submit to their scrutiny.

The king's person is inviolable; the ministry is responsible, and with the king as president, constitutes the executive royal privy council. The seven members of this body, who preside over seven distinct ministerial departments, are individually and collectively responsible to the rigsdag for their acts, and cannot under any circumstances be condemned or pardoned by the sovereign without the concurrence of that body. D. is divided for administrative purposes into 20 *amter*, or jurisdictions—viz., 10 for the islands, and 10 for Jutland, each presided over by a chief, or "amtmand," who in Copenhagen alone bears the title of "over-president." Primogeniture is still in force, but all other limitations to succession, and all remains of the ancient forms of land-tenure by soccage or fixed terms of labor, are being entirely abrogated. The titles of nobility in D. are limited to counts ("grever") and barons.

History.—The Kymri were the earliest known inhabitants of Scandinavia, and made themselves formidable to the Romans 100 years B.C. To them succeeded the Goths, who, under their mythical leader, Odin, established their rule over the Scandinavian lands. Odin's son, Skjold, is reputed to have been the first ruler of D.; but the little that is known of Danish history in those remote ages, seems to indicate that the country was split up into many small territories, whose inhabitants lived by piracy. The people were divided into "Bonder," freemen, and "Trælle," bondsmen. The former busied themselves with war, and "Vikingetog," or piracy, and the government of the land; while to the latter were left the peaceful pursuits of hunting, fishing, and tilling the soil. The mission of Ansgarius, the apostle of the north, to Southern Jutland in 826, where he baptized Harald Klak, one of the Smaa Kongar, or little kings of D., was the means of first opening the Danish territories to the knowledge of the more civilized nations. The country was soon torn by civil dissensions between the adherents of the ancient and modern faith. Gorm the Old, the first authentic king of D., the bitter enemy of Christianity, died in 935, after having subjugated the several territories to his sway; and although his death gave fresh vigor to the diffusion of the new faith, paganism kept

its ground for 200 years longer, and numbered among its adherents many of those half-mythical heroes whose deeds are celebrated in the Eddas and the Kæmpeviser of the middle ages. The success that attended the piratical incursions of the Northmen, drew them from their own homes; and while Gorm's descendants, Svend and Knud, were reigning in England, D. was left a prey to anarchy. On the extinction of Knud's dynasty in 1042, his sister's son, Svend Estridsen, ascended the throne. Internal dissensions and external wars weakened the country, and the introduction of a feudal system raised up a powerful nobility, and ground down the once free people to a condition of oppressed serfage. Valdemar I., by the help of his great minister, Axel Hvide, known in history as bishop Absalon, subjugated the Wends of Rügen and Pomerania, and forced them, in 1168, to renounce the faith of their god, Svantevit, and accept Christianity. During the time of Knud VI., and in the early part of the reign of Valdemar II.—sons of Valdemar I.—the conquests of D. extended so far into German and Wendic lands, that the Baltic was little more than an inland Danish sea. The jealousy of the German princes and the treachery of his vassals combined to rob Valdemar II. of these brilliant family conquests. His death in 1241 was followed by a century of anarchy, and inglorious decadence of the authority of the crown, during which the kingdom was brought to the brink of annihilation under the vicious rule of his sons and grandsons. Under his great-grandson, Valdemar III., the last of the Estridsen line, D. made a quick but transient recovery of the conquests of the older Valdemars, and the national laws were collected into a well-digested comprehensive code. From his death in 1375 till 1412, his daughter, the great Margaret, first as regent for her only and early lost son, Olaf, and later as sole monarch, ruled, not only D., but in course of time also Sweden and Norway, with such consummate tact, and with so light yet firm a hand, that for once in the course of their history, the three rival Scandinavian kingdoms were content to act in harmony. Margaret's successor, Erik, the son of her niece, for whose sake she had striven to give permanence, by the act known as the union of Calmar, to the amalgamation of the three sovereignties into one, undid her glorious work with fatal rapidity, and, after an inglorious war of 25 years with his vassals, the counts-dukes of Slesvig-Holstein, he lost the allegiance and the crowns of his triple kingdom, and ended his disastrous existence in misery and obscurity. After the short reign of his nephew, Christopher of Bavaria, the Danes, on the death of the latter in 1448, again exerted their long-used ancient right of election to the throne, and chose for their king Christian of Oldenburg, a descendant of the old royal family through his maternal ancestress, Rikissa, the great-granddaughter of Valdemar II. Christian I., the father of the Oldenburg line, which continued unbroken till the death of the last king of D., Frederick VII., in 1863, laid the foundation of the Slesvig-Holstein troubles, which, after maturing for centuries, have ended in our own day in dismembering the Danish monarchy. Christian bought the empty title of count-duke of Slesvig and Holstein in 1460, by promising for his successors that they should forever leave the two provinces united, a pledge he had no right to impose, and they no power to keep; and by his failure to pay his daughter's dowry to her husband, James III. of Scotland, he lost for Norway her ancient provinces of the Shetlands and Orkneys, which had been given in pawn to the Scottish king. His unprofitable reign was followed by half a century of international struggles in Scandinavia. The insane tyranny of the otherwise able and enlightened Christian II., by exasperating the Danish nobles, and lashing the national anger of the Swedes to fury, cost him his throne, and gave him a lifelong cruel imprisonment among his subjects in D., who chose his uncle Frederick I. to be their king, while Sweden was forever separated from D., and raised under the Vasas (see GUSTAVUS I.) to be a powerful state. Christian III., in whose reign the reformation was established, united the Slesvig-Holstein duchies in perpetuity to the crown in 1533. His partition of the greater part of these provinces among his brothers became a source of much mischief to D., which did not end till 1773, when the alienated territory was recovered by the cession of Oldenburg and Delmenhorst to the grand-duke of Russia, the representative of the Holstein-Gottorp family. Frederick II., who increased the embarrassments connected with the crown-appanages, by making additional partitions in favor of his brother (the founder of the Holstein-Sonderburg family), was succeeded by Christian IV., 1588, who was the ablest of all the Danish rulers. His liberal and wise policy was, however, cramped in every direction by the arrogant nobles, to whose treasonable supineness D. owes the reverses by which she lost all the possessions she had hitherto retained in Sweden. The national disgraces and abasement which followed, led, in 1660, under Christian's son, Frederick III., to the rising of the people against the nobles, and their surrender into the hands of the king of the supreme power. For the next hundred years, the peasantry were kept in serfage, and the middle classes depressed; while the power of the crown rested in the hands of a Germanized nobility, who despised the language and usages of their country, and exerted the most baneful influence on the true national life. Many improvements were, however, effected in the mode of administering the laws, and the Danish kings, although autocrats, exercised a mild rule. The abolition of serfage was begun by Christian VII. in 1767, but not finally completed till twenty years later; it was extended to the duchies in 1804. The miseries of the reign of Christian's son, Frederick VI., due to the relations maintained by D. with Napoleon, brought the country to the verge of ruin. At war with Sweden, England, Russia, and Prussia, and with the finances in a depressed

condition, the kingdom was threatened with bankruptcy; and although it had speedily rallied from the injuries and losses inflicted by the battle of Copenhagen, under Nelson, in 1801, the fresh rupture with the allies, which ended in the compulsory surrender to the English of the entire fleet, after the destructive bombardment of Copenhagen, Sept. 1807, completely paralyzed the nation. By the congress of Vienna, D. was compelled to cede Norway to Sweden. The discontent that had long been brooding in the duchies, degenerated after the stirring year of 1830 into mutual animosity between the Danish and German population, which was not allayed by the schemes devised by the court to meet the difficulties of the case. The anticipated failure of heirs to the throne complicated the questions at issue; and the Holstein party, being encouraged by the diet at Frankfort, and perhaps still more by Prussia, came to an open rupture with D. in 1848, hastened, no doubt, by the reaction produced all over the continent by the French revolution, and thus, on the accession of Frederick VII., half his subjects were in open rebellion against him. After alternate hostilities and armistices, the Slesvig-Holstein war was virtually concluded in 1849, by the victory of the Danes over Slesvig-Holsteiners at Idsted, followed by the conclusion of peace between D. and Prussia. The liberal constitution granted by the king fully satisfied his subjects in D. proper, but disaffection still smoldered in the duchies.

On the death, in 1863, of Frederick VII., the present king, prince Christian of Slesvig-Holstein-Glücksborg, ascended the throne under the title of Christian IX., in conformity with the act known as the treaty of London of 1852, by which the succession to the Danish crown had been settled on him, and his descendants by his wife, princess Louise of Hesse-Cassel, niece of king Christian VIII. of D. With Frederick VII., the direct Oldenburg line had expired, and, at his death, the question of the succession to the duchies acquired an importance which it had never before possessed. A pretender, backed by German influence and help, at once started up in the person of the eldest son of the duke of Augustenborg, whose defeat in 1848, and solemn renunciation of all claims on the titles or possessions of the Danish royal house, in consideration of his receiving a free pardon, and accepting a large sum of money from the crown, had been regarded in D. as the final settlement of his pretensions.

The cause of the Augustenborg prince, who assumed the title of duke Frederick VIII. of Slesvig-Holstein, was speedily merged and lost sight of by Prussia and Austria in their direct aim of incorporating the duchies with the German confederation. D., unaided by the neighbors and allies on whose support she had relied, was forced to go single-handed into the unequal contest. After a brave but utterly futile attempt at resistance, the Danes found themselves forced to submit to the terms conceded to them by their powerful foes, and resign not only Lauenborg and Holstein, but the ancient crown-appanage of Slesvig into the hands of the German confederate powers. By the peace of Vienna, 1864, the Danish king bound himself to abide by the decision which Prussia and Austria should adopt in regard to the destiny of the severed Danish provinces. The dissensions between these two great powers, which led to the Austro-Prussian war of 1866, and resulted in the triumph of Prussia, have left the fate of the Slesvigers entirely in the hands of the latter state, which has hitherto refused to relinquish its hold upon the province. Since the war, D., although reduced to the narrow limits of the islands and Jutland, has recovered from its fall, and the degree of political and social freedom enjoyed by the nation now perhaps as high as is to be found in any country in Europe.

DENNER, Balthasar, 1685–1747; a German portrait-painter employed by Frederick the great; went to England by invitation of George I., where he was not appreciated. His chief peculiarity consisted in the fineness of his mechanical finish, which extended to depicting even the almost invisible furze or hair growing on the smooth skin. Charles VI. paid 4,700 florins for a "Head of an Old Woman" by this artist.

DENNERY, or **D'ENNERY**, Adolphe Philippe, a French dramatic writer of Jewish extraction, was b. at Paris on June 17, 1811. His first employment was that of clerk to a notary; he gave that up to become a painter; and afterwards, while still very young, he became a contributor to the newspapers. The first dramatic work in which he had a hand was brought out in 1831; this was *Emile, ou le Fils d'un Pair de France*, and it was produced by him in concert with M. Charles Desnoyer, a well-known *littérateur* and theatrical critic. It had some success, and D. followed it up with two or three others, which had so much popularity that his services as a play-writer came into considerable demand. He was a ready writer, and always able to come up to a fair standard of merit; and, encouraged by the theatrical managers of France, he has been one of the most prolific of dramatic authors. He has produced, by himself or in concert with others, about 200 pieces in one style or another; and a few years ago, five of his pieces were to be seen upon the Parisian stage at one time. Latterly, D. has been a man of business as well as an author. He was appointed director of the Théâtre Historique in 1850, but resigned this appointment almost immediately. An attempt which he made in 1855 to establish a new theater, which he first proposed to call the Théâtre du Peuple, and afterwards the Théâtre du Prince Impérial, did not succeed; but since that, he has had a large share in establishing and in managing a public company, in which many persons connected with the press and with the theaters were concerned—

the Société Thermale de Cabourg-Dives. Of this company, whose speculation consisted in developing the attractions of a new watering-place (in the dep. of Calvados), he has been successively secretary and managing director. D. was decorated with the legion of honor on the 10th Dec., 1849, and was promoted to the rank of officer on the 16th of Aug., 1859.

DENNEWITZ, a small village in the province of Brandenburg, Prussia, 42 m. s.s.w. of Berlin. Here was fought, on the 6th of Sept., 1813, a battle between 70,000 French, Saxons, and Poles, commanded by marshal Ney, and 45,000 Prussians, under gen. Tauentzien. The fighting was obstinate to the last degree. Both armies more than once drove each other from their positions, but the patriotic enthusiasm of the Prussians finally prevailed, and Ney gave the order to retreat. At this moment Bernadotte, crown-prince of Sweden, appeared at the head of 70 battalions of Russians and Swedes, supported by 10,000 horse, and preceded by 150 pieces of cannon. These fresh troops turned the retreat into a complete rout, until the whole of the French army presented nothing but a vast mass of fugitives. The French lost 15,000 killed, wounded, and prisoners (the Germans say 20,000), and 43 pieces of cannon. The allies lost 6,000 killed and wounded, of whom 5,000 were Prussians. The most important feature of this victory to the Prussians was that most of their troops were *landwehr* (militia), for whom Napoleon had expressed the utmost contempt, designating them a "rabble."

DENNIE, JOSEPH, 1768–1812; b. Mass.; graduated at Harvard in 1790. In 1795, he became connected with the *Tablet*, a Boston weekly journal; and the same year established *The Farmer's Weekly Museum* at Walpole, N. H., in which he published, over the signature of "The Lay Preacher," a series of papers which attracted universal attention. In 1801, he began the *Portfolio* at Philadelphia, and adopted the *nom de plume* of "Oliver Oldschool." This publication was the channel through which the letters of many great men appeared.

DENNIS, a t. in Barnstable co., Mass., 65 m. s.e. of Boston; pop. '80, 3,290. The township extends quite across the peninsula, and is intersected by the Cape Cod railroad. Most of the people are engaged in ship-building, navigation, and fishing.

DENNIS, JOHN, the son of a London saddler, was b. in London in 1657. He was put to school at Harrow; and afterwards, in 1675, he went to Caius college, Cambridge. Four years afterwards, he removed to Trinity hall in the same university, and in 1683, took there his degree of M.A. After leaving Cambridge, he traveled on the continent, passing through France and Italy. Returning home, and in the possession of a small fortune, he joined the whigs, and brought a sufficiently rancorous pen to the assistance of his party. He formed the acquaintance of Dryden and Wycherley, and other distinguished wits of the time, and instigated by companionship, as well as by native bent, he made various attempts as a theatrical writer. D. was expensive in his habits; and having dissipated his fortune, he had to depend for subsistence during the remainder of his life on private patronage and his pen. For several years, he enjoyed a small annuity procured for him by lord Halifax, but that he outlived. He became blind before he died; and in his distress, some of those he had flattered, and some of those he had abused, got up a play for his benefit. He died in 1734. D. had an ungovernable temper, and made many enemies; and his name, which his own writings could not preserve, will live for ever in their contempt and hate. He is one of the best abused men in English literature. Swift lampooned him, Pope assailed him in the *Essay on Criticism*, and finally "damned him to everlasting fame" in the *Dunciad*.

DENON, DOMINIQUE VIVANT, Baron, was b. at Châlons-sur-Saône, Jan. 4, 1747. At an early period, he went to Paris, to study law, but quickly betook himself to the fine arts, and acquired a high reputation as an amateur and art critic. During a residence in Southern Italy, he spent much of his time in studying etching and mezzotint engraving, and along with the abbé St. Non, wrote a *Voyage Pittoresque de Naples et de Sicile* (Par. 1788). Afterwards, he lived at Venice, and other Italian cities, but returned to France during the revolution. Having, at the house of Mme. Beauharnais, formed the acquaintance of Bonaparte, he was chosen by him to accompany the expedition to Egypt in the capacity of a *savant*. He was indefatigable in drawing the relics of ancient Egyptian art. In 1802, he published his *Voyage dans la Basse et la Haute Egypte*, the engravings attached to which admirable work are very correct, and prove D. to have been a skillful artist. As a member of the Egyptian institute, he had also the most important part in the *Description de l'Egypte* drawn up by that learned body. Bonaparte now made him inspector-general of museums, in which capacity he exhibited great ability. He accompanied Bonaparte in various subsequent expeditions, and suggested to him what art-treasures of the conquered cities would be most suitable for the Louvre. After 1815, he was dismissed from his office. The remaining years of his life were occupied in preparing for publication a history of art, to be illustrated by the best artists, but he did not live to finish it, having died 27th April, 1825. D.'s work was completed by Amaury Duval, and published in 1829, under the title *Monuments des Arts du Dessin chez les Peuples tant Anciens que Modernes*. D. himself executed as many as 300 etchings, chiefly imitations of the style of Rembrandt.

DÉNOUEMENT (Fr. from *dénouer*, to untie, which again is from *nœud*, a knot). In fiction this term is generally applied to the termination or catastrophe of a play or romance; but, more strictly speaking, it designates the train of circumstances solving the plot, and hastening the catastrophe. A good dénouement in a novel or play should be natural, as a result of the preceding plot, and yet should not be so obvious as to be easily anticipated. Forced and arbitrary solutions of plot, offending against nature and common-sense, are frequently perpetrated for theatrical effect (*coups de théâtre*).

DENS, PETER, a well-known Roman Catholic theologian, was b. in 1690, at Boom, a small Belgian town, situated on the river Rupel, about 10 m. s. of Antwerp. Apparently, nothing is known—at least by Protestant writers—regarding the incidents of his life, as his name appears in no encyclopædia or biographical work that we are acquainted with. The scanty information we possess is derived from the epitaph inscribed on his tomb in the chapel of the archiepiscopal college of Malines by the present (1857) rector. From this epitaph it appears that he was reader in theology at Malines (something equivalent to our professor of divinity) for twelve years, *plebanus* or parish priest of St. Rumold's or Rumbold's church in the same city, and president of the college of Malines for 40 years. He also held various honorary church offices. He was canon and penitentiary, synodical examiner and scholastic archpriest of St. Rumold's—the metropolitan church of Belgium. He died 15th Feb., 1775, in the 85th year of his age. The work which has rendered D.'s name familiar, even to the Protestant public, is his *Theologia Moralis et Dogmatica*. It is a systematic exposition and defense—in the form of a catechism—of every point of ethics and doctrine maintained by Roman Catholics, and is extensively, if not generally, adopted as the text-book of theology in their colleges. It appears to owe its popularity more to its being a handy and usable compilation than to any great talent exhibited by its author. The casuistical parts of the work have been severely criticised by Protestant moralists. The edition we have consulted is the Dublin one of 1832.

DENSITY. When of two bodies of equal bulk or volume, the one contains more matter than the other, it is said to have greater density than that other. The quantity of matter is measured by the weight, and thus density and specific gravity come to be proportional to one another. Platina, which is about 21 times the weight of water, long passed for the densest body; but Breithaup of Freiburg, in 1833, made out *iridium* to be twice as dense. Rare is opposed to dense, and the rarest body known is *hydrogen*, which is about 14½ times rarer than atmospheric air. The density of bodies is diminished by heat, and increased by cold. See HEAT, MATTER.

DENT, a co. in s.e. Missouri, reached by a branch of the Atlantic and Pacific railroad; 750 sq.m.; pop. '80, 10,647—61 colored. The soil is fertile; productions agricultural. Co. seat, Salem.

DEN'TA, or GYENTA, a market t. of Hungary, situated on the Berzava, about 30 m. s. of Temesvar. It has several large annual fairs. Pop. '69, 2,919.

DENTAL SYSTEM. See TEETH.

DENTALIUM (Lat. *dens*, a tooth), a genus of marine gasteropodous mollusks, of the order *tubulibranchiata*, having two symmetrical *branchiæ* (gills), which are inclosed, along with all the other soft parts of the body, in an elongated shelly tube. The tube is conical, somewhat curved, and has a considerable resemblance to an elephant's tusk in miniature. Until recently, from a mistake originating in the similarity of its branchiæ to those of some of the *annelides*, the D. was ranked in that order. Fossil species abound in the tertiary formations.

DENTA'RIA, a genus of plants of the natural order *cruciferæ*, having a lanceolate compressed silique. One species only, *D. bulbifera*, is found in Britain, and is a rare plant, with a simple stem, the lower leaves pinnate, the upper leaves simple, and rose-colored flowers, the axils of the leaves producing bulbs, and the creeping rhizome having tooth-like knobs, whence the name D., and the English name coral-root. The root, when dried, is said to have greater pungency than pellitory of Spain, and was formerly used in the same way for toothache. *D. diphylla*, a North American species, is called pepper-root from the same property.

DENTATUS, MANIUS (or MARCUS) CURIUS, a Roman consul in the first half of the 3d c. B.C. He was made consul in 290, and conquered the Samnites; he defeated Pyrrhus in two important engagements in 275, and the next year reconquered the Samnites, and also defeated Lucanians and Bruttians. At the close of his third term as consul he retired from public life and cultivated his farm. He was elected censor in 272, and while in office built an aqueduct to bring water into the city, and a canal for draining marshy land. His name "Dentatus" was given because it was said that he was born with teeth.

DENTEX, a genus of acanthopterous fishes of the family of *sparidæ* (Sea-breams, etc.), having a deep compressed body, and generally perch-like form; a single dorsal fin, the anterior rays of which are spinous; scaly cheeks; and many small conical teeth, among which are in each jaw at least four large canine teeth, elongated, and curved inwards. One species (*D. vulgaris*), the *Dentex* of the ancient Romans, abounds in the Mediterra-

nean, and has occasionally been taken on the southern shores of Britain. It is sometimes called the four-toothed sparus. It attains a large size, sometimes 3 ft. in length, and 20 to 30 pounds weight. It is an excessively voracious fish, as its large canine teeth might be held to indicate, devouring other fishes; but is itself in much request as an article of human food, and great numbers are taken in the mouths of rivers in Dalmatia and the Levant. It is there also a considerable article of commerce, being cut in pieces, and packed in barrels with vinegar and spices, in which state it will keep good for twelve months. It was preserved in the very same way by the ancients.

DENTIFRICES are substances, generally powders, which are employed as aids in cleaning the teeth. Charcoal and cuttle-fish bone-powder are useful as detergents; chalk, as a soft powder; and pumice, as a hard gritty substance for occasional use, when the teeth are more than ordinarily colored. Catechu, cinchona, and rhatany are employed to give astringency to the tooth-powder; myrrh, to impart odor; and bole armeniac, to communicate a red color. Common salt, cream of tartar, phosphate of soda, and sulphate of potash, are occasionally used; and where the breath has an unpleasant odor, the addition of 4 parts of bleaching-powder (chloride of lime) to the 100 of the tooth-powder, removes the fœtic character of the breath, and also tends to whiten the teeth.

DENTILS (Lat. *dens*, a tooth), in the Ionic, Corinthian, and Composite orders of architecture, are ornaments resembling teeth. See ENTABLATURE.

DENTINE is the thin layer of cement or enamel which more or less coats the teeth of the mammalia, and from the compactness of its structure and fine texture, it is generally called the ivory of the tooth. It is very hard and durable, and consists mainly of phosphate of lime accompanied by gelatine.

DENTIROSTRES, a tribe or sub-order of birds, of the order *insessores*, characterized by a bill with a marginal notch towards the extremity of the upper mandible. It is composed chiefly of insectivorous birds, although the shrikes (*laniadæ*), which belong to it, prey also on small birds, quadrupeds, and reptiles. Among the other families of D. are *merulidæ* (thrushes, etc.), *sylviadæ* (warblers, etc.), *ampelidæ* (chatterers), and *muscicapidæ* (flycatchers, etc.).

DENTISTRY, the art of the dentist, or that of treating disease in the teeth (*dental surgery*), and of replacing these organs when lost (*mechanical dentistry*).

1. *Dental Surgery.*—The disorders to which the teeth are liable are those arising from defective development, such as imperfections in form or structure, irregularity of position, etc.; these, again, constituting diseases more properly so called, such as caries or dental decay, necrosis or death of a tooth, inflammation or neuralgia of the soft tissues connected with them, such as the gum, the central pulp or *nerve*, etc.; lastly, those arising from accident of various kinds, such as blows, falls, and the like.

The treatment of all these different affections is generally of a *local* kind; or, in other words, confined to the spot in which the disease manifests itself. But dental diseases themselves are not always of a purely local nature; and it may be generally stated that wherever a tooth becomes diseased without any well-marked or ostensible cause, such a tooth has been originally defective or weak. It has been, in fact, imperfectly developed, and this imperfection is due to *constitutional* causes, or such as affect the general health of the individual. In this way, a very slight cause is sufficient to excite disease in, and lead to the destruction of, such a tooth. Disease impairs what of such little vitality it already possesses; it become less and less able to resist the action even influences as it is naturally exposed to in the mouth—chemical decomposition is set up, and the substance of the tooth is broken down, and decays—literally, rots away. This, in most cases, constitutes the pathology of dental caries; but there seems no doubt that in other instances caries, like any other morbid action in the bodily tissues, may commence in teeth previously quite healthy.

The object of the dentist, in these circumstances, is two-fold: he either attempts to arrest the decay, and repair its ravages; or he removes the diseased tooth altogether. These operations, along with supplying artificial teeth when the natural ones are lost, constitute, with those for the treatment of various minor affections, the main offices of dentistry.

Premising that all operations in dentistry require to be modified according to different cases, we shall shortly describe the various manipulations required in their performance.

Scaling.—This is a little operation, by which the accumulation of a substance termed "tartar" is removed from the teeth. Tartar is a deposit from the saliva, and lodges in greatest quantity most commonly behind the lower front teeth. Where it accumulates it is generally accompanied by absorption of the gums, whereby the necks of the teeth are exposed, and they become loosened, and fall out. Its removal is effected by little hoe-shaped steel instruments, bent in a manner to reach more easily those situations in which the tartar is found. Their mode of use is by inserting the point of any one of them under the free edge of the mass of tartar, at the gum, and lifting it away from the backs of the teeth to which it is adherent. The teeth are then freed from any par-

ticles still sticking about them, and their surface smoothed by being rubbed with pumice-powder or chalk.

Regulating.—The teeth of the second, or permanent or adult set, are very liable to be crowded and misplaced, one overlapping the other, or those of the upper jaw falling behind those of the lower when the mouth is closed, thus producing the prominent condition of the under-jaw denominated "under-hung." To remedy these defects, a variety of means have been adopted by dentists; the principle upon which all of them act, however, being that of pressing the displaced tooth or teeth into the natural position. This, of course, requires that room or space should exist for them to be thus adjusted; and where this is not the case, the usual procedure is to remove one or more of the back-teeth, or any others which it is less desirable to preserve. Some considerable time is necessary to complete the regulation of misplaced teeth; and even after they have assumed their proper position, they require to be carefully maintained there, otherwise a tendency to resume their former irregularity soon manifests itself.

Stopping or Filling.—This is one of the most important and delicate operations the dentist has to perform. The first step to be taken in filling or "stuffing" a tooth, as it is sometimes called, is to clear away all decayed and decaying substance. For this purpose, a number of slender digging and excavating steel instruments, termed "excavators," are required. With these the hollow in the tooth is scooped out and thoroughly cleaned. If pain be occasioned by this process, the operation of "destroying the nerve," as it is called, had better at once be resorted to. This is performed in several ways. Where the tooth is single-fanged, as in front-teeth, the nerve, or more correctly the pulp, may be bored out by passing a slender broach, or square and pointed steel wire, up into the central cavity of the tooth, with a slight rotary motion. When this cannot be done, however, the best plan is to destroy the nerve by some caustic application, such as arsenious acid, chloride of zinc, carbolic acid, etc., carefully applied. The method of doing this is to clean the tooth thoroughly out, and then to apply a little of the caustic on a pellet of cotton wool about the size of a barley-pickle or a grain of rice—pressing it well into the decayed hollow, and then filling it over with soft bees-wax. This should be allowed to remain there for six, eight, or twelve hours; it may at the end of that time be taken out, and the stopping proceeded with.

The cavity being properly shaped and cleaned out until its walls are of sound and hard tooth-bone, it is to be well dried, and the plug of stopping-material inserted. Various substances are employed for this purpose, and the mode of using each is somewhat different. For temporary stoppings, pure gutta-percha is a serviceable material. A quantity sufficient to fill the cavity, and somewhat more, is to be gently warmed over a spirit-lamp—not in hot water—and when quite plastic, is to be firmly pressed with a blunt-pointed stopping-instrument or "plugger," into all the interstices of the hollow in the tooth—more and more being pressed in, until the surface of the plug so formed is on a level with the surface of the tooth, when all the superfluous portion should be removed, and the solid plug smoothly finished.

A set of stoppings known as osteo-plastic fillings have recently been introduced, and are inserted into the tooth in a soft condition, where they harden in the course of a few minutes.

Another variety of stopping-material consists of amalgams of different kinds. Many absurd statements have been made regarding the evil effects of amalgam stoppings, but the only real disadvantage attending their use is shrinkage, and that many of them get black in the mouth, and discolor the tooth, while some that do not get black are friable, and crumble away in a short space of time. They are to be readily obtained, made up, and under various names. None of them seem very much superior to what is known as the platinum and gold alloy amalgam. The amalgam, then, whatever one it may be, is to be rubbed up with mercury to a firm, plastic consistence, and carefully introduced into the dried cavity in the same way as described regarding the gutta-percha, and is to be finished off in precisely a similar manner.

Gold-stopping is an operation of a much more complicated and difficult description. The materials used here are either gold-foil—that is, thick gold-leaf—or the peculiar substance, or rather the peculiar form in which gold exists, known as sponge-gold, or "pellets" of gold made up in a soft spongy condition of various sizes ready for use. In stopping a tooth with gold, even more care is necessary in preparing the cavity than what has been already inculcated. Its *shape* must now be particularly taken into account, and the nearer it approaches to a cylindrical form the better. The gold-foil, when it is employed, should be cut into strips, their breadth varying according to circumstances. Various modes of packing the gold are adopted, the chief object being that the foil shall lie in the cavity in such a way that its edges, and not its flat surfaces, shall be presented at the surface of the plug; otherwise the plug will be liable to injury by layers of it peeling off. In stopping with sponge, or other forms of gold, the preparatory steps are the same as for foil-stopping; it is, however, necessary to be more careful that no moisture be allowed to interfere with the operation.

The surface of a gold plug, formed in either of these ways, should be well consolidated by hard pressure with a blunt plugger, or lightly hammered with a suitable mallet, and the superfluous portion being removed, it ought to be burnished until it assume a brilliant metallic lustre.

Extraction.—This is the principal surgical operation falling to the dentist. It is most commonly demanded in consequence of what is termed toothache—a disorder which, however, is not always one and the same in its nature. This want of uniformity in the nature of those diseased states to which teeth are subject, and which are comprehensively denominated toothache, leads to the conflicting results obtained from those applications recommended for its cure. These remedies are numerous, and of various characters. To explain their mode of action, and the particular symptoms indicating the selection of each one in preference to another, would here be out of place. Their intention, in general, is either to destroy the nervous fibers existing in a tooth, or to narcotize and render them insensible. Among those acting in the former manner are such as creosote, arsenious acid, carbolic acid, pepsine, chloride of zinc, nitrate of silver, alum, tannin, etc.; among those acting in the latter mode are chloroform, laudanum, ether, spirit of camphor, etc. There is no necessity for describing the method of their application, further than to remark, that in all cases the decayed cavity should previously be well cleaned out, otherwise the remedy employed may be altogether prevented from reaching the spot where it is intended to act.

Where extraction comes to be demanded, it is performed by means of instruments adapted to the special peculiarities of the tooth requiring removal, or to the circumstances in which it exists. The great matter is, that each tooth should be extracted in accordance with its anatomical configuration; and to accomplish this, of course, requires an intimate knowledge of the natural form proper to each of these organs individually; without this, it is impossible to extract any tooth upon a correct principle. The tooth is grasped, as far as the instrument can be made to do so, by that portion of the root or fang which just emerges from, or perhaps which is just within, the socket; it is then loosened, not exactly by pulling, but rather by moving it in a lateral or in a rotatory manner, in strict accordance with the respective character of fang possessed; and finally, on its being thus detached from its connection with the jaw, it is, with very little force, easily lifted from its socket.

Anæsthetics are employed in the extraction of teeth in the same manner as for other surgical operations, where it is desirable to abolish pain. Ether and chloroform are the only agents of this nature which have as yet been found generally fit for practical application in any operation of a prolonged character. Chloroform tends to depress the circulation when far pushed, and in this way should be watched with care during its administration. Ether, again, has little of this tendency, but requires larger time to induce insensibility, is more exciting and persistent in its effect, while the odor of this preparation remains about the patient for hours. Both of these agents are liable to occasion sickness, and as a variety of accidental and collateral difficulties may arise during their exhibition, they ought not to be given by inexperienced hands.

An anæsthetic proposed at the end of the last century—namely, nitrous oxide or laughing-gas, has been revived, and its application in dental surgery has been of much service, answering all the purposes of chloroform or ether in short operations. Like these, it requires careful employment, and in some cases it would better be avoided if possible—such as in elderly patients of a full habit, or those who may have suffered from any lesion of the nerve centers, from hæmoptysis, etc. Other modes of inducing insensibility, local or general, have been proposed from time to time, but one after another has been abandoned as unserviceable. All over the world quack nostrums are found for rendering this operation painless; these, however, do not demand consideration here, as had any one of them afforded the least chance of success, it would long ago have been gladly welcomed and generally adopted by dentists.

2. *Mechanical Dentistry.*—The manufacture of artificial teeth, and other matters comprehended in mechanical dentistry, involve many subjects of which no adequate or satisfactory idea can be conveyed by mere description. Nothing beyond a mere outline of the materials employed and the leading processes involved in this branch of art, can be given without practical illustration. The various conditions of the mouth requiring the adaptation of artificial teeth, range from cases where only one tooth may be wanting, to those where not a single tooth remains in the jaw, above or below. Accordingly, artificial teeth are spoken of as partial or complete sets—a partial set being one for either upper or lower jaw, where some of the natural teeth still remain; a complete set being one for either jaw, where none are left, or for both jaws, when both are in such circumstances.

The simplest form of partial sets is what is termed a pivoted tooth. This is an artificial tooth fixed in the mouth upon the fang or root of one whose crown has been lost by decay or otherwise. The mode of procedure is as follows: An artificial tooth, as near as possible to the color and form of that to be replaced is selected. This artificial tooth may be either the crown of a natural human tooth corresponding to that lost, or one made in imitation of this, in a species of pottery-ware, and by a process much too long for detail in this place. Such *mineral teeth*, as these last are termed, are manufactured on an extensive scale, and sold ready for use to dentists. A tooth of either kind, then, being selected, is accurately fitted to the root remaining in the mouth, and, by means of a gold pin, adjusted to, and inserted into the open central canal existing in the root—the other extremity of this gold pin being attached

to the substitute tooth—the whole is fixed in its natural position, in a manner that renders detection almost impossible.

When more than one tooth is required, and occasionally even where only one is necessary, a somewhat different contrivance is had recourse to. What is called a "plate" requires to be fitted to the gum and remaining teeth in so precise and perfect a manner as to lie quite firmly and steadily in its place, and to which the artificial teeth required are subsequently fixed.

This "plate" is frequently made of gold, silver, or platinum plate, of the thickness of card-board, in which case, the name of "plate" is used in its literal signification. But such plates may be made of other substances besides those of gold, silver, etc., such as the ivory of the walrus, or the hippopotamus's tusk, formerly used, but now almost entirely superseded by vulcanized caoutchouc (q.v.) or vulcanite. The first step in any of these processes is to obtain an exact model of the gum and other parts upon which the plate is to rest. This is obtained by introducing bees-wax, or gutta-percha, or other modeling compound, softened by previous heating, into the patient's mouth, and pressing it forcibly upon those parts of which an impression is desired. On removing the wax or other substance from the mouth, Paris plaster is poured into the mold thus procured, and on its hardening, or "setting," this plaster-cast presents an exact counterpart of the gum. It is upon this plaster-model that all the subsequent operations are performed in fitting the artificial set. The following is a very brief sketch of the principal steps in working each of the most ordinary methods employed for these purposes:

Metallic-plate Sets.—Where the framework lying upon the gum is to be of gold or silver plate, or the like, it is necessary to procure, besides the plaster-model, a metal one. This metal-model is generally cast in zinc, gun-metal, or some such material; and a counter-model of a softer metal, generally lead, is taken from this again, so that a complete pair of dies is in this way procured. The gold or other plate, cut of a convenient size, is then stamped between the two metallic dies, and so made to assume the precise form desired. It is then trimmed, and any more delicate adjustments made upon it, such as soldering bands or clasps round those parts where it is to embrace any teeth remaining in the mouth, and finally completed by having the individual artifical teeth added to it, and adapted to the comfort and convenience of the wearer. The mode of fastening the teeth to the plate is in one of two ways. One kind of teeth have a tube extending along their whole length, and these are fastened by means of a pin fixed to the plate, upon which the tooth is secured by this pin passing up the tube alluded to. The other kind are provided with short platinum pins, fixed in the material of the tooth during its manufacture, to which pins a piece of gold or other plate is soldered, or a mass of gold fused upon them, and this, again, soldered to the framework of the set itself, wherever they are required.

Vulcanite Sets.—The first step in the manufacture of a vulcanite set of teeth is to make a pattern set in wax, with the mineral teeth constructed for the purpose, and which are to be used in the piece when it is finished, fixed in the wax; the whole constituting, in short, an exact fac-simile of what the completed set is intended to be. This pattern set is, of course, made upon and fitted to the plaster model, and is adjusted to the wearer's mouth precisely as if it were the set to be worn there. When everything is thus prepared, a duplicate of the wax-set is made in vulcanite—the vulcanite replacing the wax, and the mineral teeth being retained as they were. The process by which the vulcanite is made to take the place of the wax consists in imbedding the pattern set in Paris plaster, so that the mold of it, thus secured, may be separable into at least two parts. On these being taken asunder, the wax of the pattern set is melted out with boiling water, leaving the teeth *in situ*. The wax is then replaced by raw vulcanite, which, on the mold being reclosed, is subjected to the usual process of vulcanizing.

The foregoing description comprehends most of the operations connected with surgical and mechanical dentistry. For a more detailed account of them, as well as the discussion of many minor points connected with the subject, we must refer to the numerous and beautifully illustrated works specially devoted to such matters, lately published both in this country and America; of these, Mr. Tomes of London's *Dental Surgery;* Dr. Smith of Edinburgh's *Handbook of Dental Surgery*, published by Churchhill, London; Taft's *Operative Dentistry*, and Richardson's *Mechanical Dentistry*, both published in America; Oakely Cole's *Dentistry;* etc., deserve to be specially mentioned as among the latest and best works on the subject.

DENTITION, Period of (Lat. *dentitio*, the process of teething, from *dens*, a tooth). In man and most mammals, there are two distinct sets of teeth; one set which appears shortly after birth, and which are termed the *milk* or *deciduous* teeth; and a second set, which, after a few years, replaces these, and which are termed *permanent* teeth.

In the human subject, the milk-teeth are twenty in number, each jaw containing (from before backwards) four incisors, two canines, and four molars; while the permanent teeth are thirty-two in number, each jaw containing four incisors, two canines, four premolars or bicuspids, and six molars. Anatomists are in the habit of briefly expressing the number of the different kinds of teeth in any mammal by what they

term a *dental formula*. The permanent teeth in man are represented by the formula, $i\frac{2-2}{2-2}, c\frac{1-1}{1-1}, p\frac{2-2}{2-2}, m\frac{3-3}{3-3} = 32$, where the letters *i*, *c*, *p*, *m*, stand for incisors, canines, premolars, and molars, and where the two terms in each numerator and in each denominator represent the number of each particular kind of tooth in each half of the upper and lower jaw respectively. As these formulæ are of common use in most works on zoology and comparative anatomy, we add another example—that of the permanent teeth of the hog, whose formula is $i\frac{3-3}{3-3}, c\frac{1-1}{1-1}, p\frac{4-4}{4-4}, m\frac{3-3}{3-3} = 44$: which signifies that there are on each side of both upper and lower jaws three incisors, one canine, four premolars, and three molars, making in all 44 teeth.

For a general description of the form and uses of these different kinds of teeth, we refer the reader to the article DIGESTION, ORGANS AND PROCESS OF, where their special uses are noticed in reference to the digestive function; while the history of their structure, etc., is given in the article TEETH.

The following is the usual order and period of appearance of the milk-teeth: The four central incisors usually appear through the gums about the seventh month after birth, those of the lower jaw showing themselves first. The lateral incisors next appear between the 7th and 10th months; the anterior molars show themselves about the 13th month, and are soon followed by the canines, which usually appear between the 14th and 21st months. The posterior molars are the last and most uncertain in their time of protusion, which may range from the 18th month to the end of the 3d year. Except in the case of the incisors, there is no definite law as to whether the upper or lower teeth first apper.

About the middle or end of the 7th year, the jaw-bones have become sufficiently elongated to permit the appearance of the first true molar; and about the same time, the central incisors are replaced by the corresponding permanent teeth. The advance of the permanent teeth towards the surface of the gum causes the absorption of the roots of the temporary teeth, and thus facilitates their shedding; the crown falling off, and leaving room for the permanent tooth behind it to come forward and supply its place.

In the replacement of the first by the second set of teeth, the following order is observed: The middle incisors are first shed and renewed (usually when the child is about eight years of age), and then the lateral incisors (perhaps a year later). The anterior molars of the first set are then replaced by the anterior premolars (this usually happens about the 11th year); and about a year afterwards the posterior deciduous molars are replaced by the second premolars. The persistent canines take the place of the deciduous ones in the 12th year; these being the last of the milk-teeth to be exchanged. The second molars appear between the ages of twelve and a half and fourteen years; and the third molars, or *dentes sapientiæ* (wisdom teeth), seldom appear till three or four years subsequently, and often much later.

The factory laws in England render it very important that we should be able to determine the ages of *nine* and *thirteen* in children, because before a child is nine years old, it is illegal to employ it in factory-work; and until it is thirteen, it may only be employed for a limited number of hours a day. Mr. Saunders, a well-known dentist, has shown in his pamphlet, *The Teeth a Test of Age, considered with Reference to Factory Children*, that the teeth afford a far better test of age at this period of life, than the standard of height which has been adopted by the legislature for this purpose.

Dangers attending Teething.—The teeth are formed in closed sacs, and in rising to the surface in the progress of their growth they slowly penetrate the gum from below; a process familiarly called "cutting the teeth." The minuter physiology of this process will be described in a separate article (see TEETH); in the present it will be sufficient to indicate shortly the dangers to which children are exposed, particularly during the period of the first dentition, or from five months old to two years or more. Infants are occasionally said to die of "teething;" but this, like many other vague terms, may be said to be only a cloak for ignorance; for the mere cutting of the teeth is never, by itself, mortal, or even a serious source of suffering. It only becomes a cause of disease by its reflected influence on the delicate nervous system of the child. The period of dentition, in fact, is one during which the whole organization of the infant is undergoing a revolution; in passing from an exclusively milk-diet to one of a more complex character, the entire digestive system undergoes a corresponding development. The diseases of this period of life correspond in importance with the great physiological changes taking place in it, and with the dangers of derangement in the just order or symmetry of their development. If these diseases often appear to be due directly to the cutting of a tooth, it is because complex causes of disorder have prepared the way for a morbid change, which is ready to be developed into activity by a comparatively slight irritation. The principal diseases of dentition are diarrhea (q.v.), convulsions (q.v.), vomiting, and hydrocephalus, or tubercular inflammation of the membranes of the brain, which are all apt to originate at this period of infantile life, and to coincide more or less closely with the development of the first set of teeth. It is very doubtful how far the operation of cutting the gum with a lancet, so commonly supposed a specific for the diseases of dentition, ought to be encouraged. Sometimes there is evident irritation,

or even inflammation of the gum, and then the operation will probably at least do no harm; but the indiscriminating use of the gum-lancet, at the request of anxious but foolish mothers and nurses, is characteristic of a weak and erroneous routine practice, and must be denounced as an unwarrantable interference with the truly beautiful process by which the tooth is gradually evolved from its socket, in most cases without any suffering. The special treatment of the diseases of dentition is discussed under the separate articles devoted to some of these diseases.

DENTON, a co. in n.e. Texas, on the upper waters of Trinity river; 900 sq.m.; pop. '70, 7,251—500 colored. It is a prairie and forest region. Agriculture is the chief business. Co. seat, Denton.

D'ENTRECASTEAUX, a term of various application in Australasia, affords one of the few traces of French discovery in that part of the world. It indicates an archipelago, a cape, and a channel.—1. The archipelago lies between New Guinea and New Ireland, about lat. 10° s., and long. 151° e.—2. The cape, a headland in West Australia, forms nearly the s.w. point of the continent, being in lat. 34° 52′ s., and long. 116° e.—3. The channel, an arm of the Pacific, separates Bruné island from the s.e. coast of Tasmania or Van Dieman's land. It is about lat. 43° 25′ s., and long. 147° 15′ e., is 35 m. long, and varies in width from 3 to 9 miles. On the side of the mainland, it is connected with the interior by means of the Derwent and the Huon, communicating through the former with Hobart-town, the capital.

DENUDATION is the removal of solid matter by water in motion, whether of rivers or of the waves and currents of the sea, and the consequent laying bare of some inferior rock. The rate of abrasion depends upon the velocity of the current, and the nature of the solid materials through which it flows; these two causes equally affect the deposition of the abraded matter, for the carrying power of the water varies with its velocity and with the weight of the particles. The heavier débris—large stones and gravel—are carried short distances, and deposited generally in masses; the finer particles are conveyed even by a slow current to great distances, and scattered in thin layers over extensive districts. All deposition, except in the case of showers of volcanic ashes, is the sign of a superficial waste going on contemporaneously, and to an equal extent, elsewhere, the gain at one point being equal to the loss at another. No new material has been used in the formation of the sedimentary rocks. The degradation and abrasion of igneous rocks provided the materials of the earliest strata; these in their turn were frequently abraded and re-deposited, under new conditions, and with the remains of a newer fauna and flora. Thus the crust of the globe has not actually increased in thickness, for whenever it acquires density in one place, it becomes thinner in another. The changes that have been effected by D., and the amount of matter thus transported, are difficult to imagine. In districts where faults occur, the surface has been smoothed, and the uptilted ends have been washed away. These faults sometimes extend over several hundred sq.m., and the dislocations, had they remained unaltered, would have produced mountains with precipitous escarpments of different heights, reaching occasionally to a thousand feet. But D. not only leveled the surface of the earth; in regions with horizontal stratification it has produced inequalities, hollowing out valleys of D., and often carrying away the whole of the superficial strata, leaving mountains here and there which show, by the direction and succession of their beds, that the strata of which they are composed were at one time continuous.

DENVER, the capital of Colorado, in Arapahoe co., on the South Platte river, about 15 m. from the eastern base of the Rocky mountains, at the junction of the Kansas Pacific, Denver Pacific, Colorado Central, and Denver and Rio Grande railroads, 620 m. w. of Omaha; pop. '70, 4,759; '80, about 35,718. The city, 5,375 ft. above the sea, occupying a series of levels rising gradually towards the mountains, commands a magnificent view of the nearer plains and of peaks covered with perpetual snow. Its climate is delightful. It is the commercial as well as the political capital of the state, and has had wonderful growth. There are many manufactories, smelting and refining works, a United States mint, and various public buildings. In 1858, there was not a human habitation in the vicinity.

DEOBSTRUENTS (Lat. *de*, from, and *obstruo*, I obstruct), medicines which have the property of removing obstructions, especially in the lymphatic system (q.v.). The glands of the thorax and abdomen (e.g., the liver, spleen, kidneys, etc), as well as the lymphatic and lacteal glands, are subject to enlargements, which were formerly, under a mechanical theory of disease, universally ascribed to obstructions of their outlets, or of the vessels in connection with them; against all of these states, D. were employed with varying success. The favorite deobstruent remedies are mercury, iodine, and bromine; blisters and friction, with stimulating liniments, may be said also to have a like action in some cases.

DEOBUND, a t. of India, in the British district of Saharunpore, North-west Provinces, 20 m. s.e. from Saharunpore, on the railway route from Saharunpore to Mozuffurnuggur. It is situated between the rivers Hindun and Kali Nuddee, the one a branch of the Jumna, the other of the Ganges, in an open cultivated country. Pop. '72, 19,168.

DE'ODAND. A personal chattel which was the immediate and accidental occasion of the death of a reasonable creature, was, by the law of England, forfeited to the crown, in order that it might be applied to pious uses, or given to God, as the term implies. The rule did not apply where the instrument had been intentionally used for the purpose of causing death, as in cases of murder and homicide. Blackstone traces the origin of the custom to the popish prayers for the souls of the dead, and asserts that deodands were "designed in the blind days of popery, as an expiation for the souls of such as were snatched away by sudden death; in the same manner as the apparel of a stranger, who was found dead, was applied to purchase masses for the good of his soul." The more probable view is, that it originated in the natural horror which is felt for whatever has been the instrument of so dreadful an occurrence; just like the Jewish law, that if "an ox gore a man that he die, the ox shall be stoned, and his flesh shall not be eaten;" or the old English law, that a well in which a person was drowned should be filled up under the inspection of the coroner. Similar regulations are to be found in the legal systems of most nations. The law of deodand was abolished by statute 9 and 10 Vict. c. 62.

DEODAR. See CEDAR.

DEODAR, remarkable as being one of the pettiest states in the world, is a district in the n.w. of Guzerat. Containing only 80 sq.m., and 2,000 inhabitants, it is yet subdivided into as many independent communities as there are villages—the whole being, for external purposes, under the gratuitous protection of the British government. The principal village, bearing the name of D., is in lat. 24° 9′ n., and long. 71° 49′ east. The district was forced on the East India company in 1819, as having become a refuge of marauders.

DEO'DORIZERS are chemical substances employed for the purpose of absorbing or destroying the odoriferous principles evolved especially from decomposing animal and vegetable matter. They strictly belong to the classes of substances known as antiseptics) q.v.) and disinfectants (q.v.).

D'ÉON, CHEVALIER. See EON, DE BEAUMONT, *ante.*

DEORI', sometimes distinguished as BURA DEORI or GREAT DEORI, a t. of Hindustan, stands in lat. 23° 22′ n., and long. 79° 4′ e., and is 1705 ft. above the level of the sea. Though it has been but little noticed by travelers or writers, yet it appears to be not unworthy of its second name, as mentioned above, for, on its being burned down by a freebooter before English authority was established here, 30,000 people are said to have perished in the flames. Pop. '72, 5,500. It is situated in the Nagpore division of the central provinces, on the table-land, whence flow the Sone to the Ganges, and the Nerbudda to the Arabian sea; so that the territory of Saugor and Nerbudda, within which it is contained, is common to the two principal basins of northern India. The place is about half-way between the better known cities of Saugor and Gurrah, being 44 m. to the s.e. of the former, and 41 to the n.w. of the latter.

DEOXIDA'TION is the term applied to the process of withdrawing the oxygen from a compound, as in the reduction of the native peroxide of iron in the smelting furnaces to the condition of metallic iron. On the small scale, in experimental inquiries, the process of deoxidation may be carried on before the blow-pipe (q.v.), where the inner or reducing flame is essentially a deoxidizing one.

DEPARTMENT (Fr. *departement*), a term used to denote a territorial division in France. Previous to the revolution, France was divided into provinces; but in 1790 Mirabeau rose in the constituent assembly, and declared that, after having abolished aristocracy, it was neither convenient nor safe to preserve these provincial divisions. He alleged that they were too large, that they tended to concentrate the administrative power in the hands of a few, and that such power soon becomes aristocratic of necessity. He suggested, therefore, a minuter territorial division, as a carrying out of the principles of the revolution. This expression of opinion was followed by a decree of the assembly, dated Feb. 16, 1790, ordering the abolition of the old provincial divisions (34 in number), and the redistribution of the land into 83 departments. During the year 8 of the revolution, these were increased to 98; in 1808 the empire consisted of 127; at the fall of Napoleon, of 130; and at present it consists of 87, including the sadly diminished department of Haut Rhin (from 1871 till 1879 "the territory of Belfort"). Originally, it was intended that the departments should be governed by persons elected by the citizens; but this plan did not suit the views of the first consul, who placed over each department a prefect, and a *conseil de préfecture.* The departments were again subdivided into arrondissements, over each of which was placed a sub-prefect (*sous-préfet*). The right of naming these functionaries was reserved to the chief of the state. This system of departmental administration is still in force in France.

DEPARTMENT is a word used to designate a subdivision of executive government, under the control of a subordinate officer. In the United States, e.g., there are the departments of state, justice, interior, war, navy, treasury, post-office, and agriculture. In some of these departments the work, according to its character, is distributed between different bureaus. The government itself is conducted in three separate departments, each independent in its sphere, viz., the legislative, the judicial, and the executive. The

country is also subdivided into military departments, each under an officer appointed by authority of the president.

DEPARTURE, a term in navigation, explained under SAILINGS. See also DEAD RECKONING.

DEPENDING ACTION. An action is said in Scotland to be in dependence, from the moment of citation, until it be finally decided by the house of lords, should it be appealed to that ultimate tribunal. As a security for the implement of the decree by the defender, in the event of his being found liable, the pursuer is entitled to use either inhibition (q v.) or arrestment q.v.) on the dependence, or depending issue.

DE PERE, a t. in Brown co., Wis., on Fox river, and the Wisconsin Central, and Chicago and Northwestern railroads; pop. '70, 3,834. There are two villages on opposite sides of the river connected by a bridge of 1500 feet. The Milwaukee and Northern railroad passes along the river. In the villages are many manufactories.

DE PEYSTER, ARENT SCHUYLER, 1736–1832; an English soldier, native of New York, holding command at Michilimacinac; through whose exertions the Indians very generally sided with the British during the revolutionary war. Late in life he resided in Dumfries, Scotland, and was on terms of friendship with Robert Burns, who was a private in De P.'s regiment of volunteers, and with whom he carried on a poetical controversy in a newspaper. Burns dedicated to him his *Poem on Life.* He was a commissioned officer in the British army for 77 years.

DE PEYSTER, JOHANNES, d. 1685; one of the early settlers of New York, and founder of a noted family. He was a French Huguenot. In New York he filled many offices, including that of mayor.

DE PEYSTER, JOHN WATTS, b. New York, 1821; descendant of Johannes: a writer on military and historical subjects; author of *Life of General Torstensen; The Dutch at the North Pole; The Dutch in Maine; Early Settlement of Acadia by the Dutch; The Dutch in the Battle of the Baltic; History of Carusius; The Ancient, Mediæval, and Modern Netherlanders; Winter Campaigns the Test of Generalship; Practical Strategy; Secession in Switzerland and the United States Compared; Decisive Conflicts of the late Civil War;* etc. De P. was active in introducing a paid fire department in New York. His three sons, J. Watts, jr., Frederick, jr., and Johnston L., were gallant officers of the union army in the war of the rebellion.

DEPHAL, *Artocarpus lakoocha*, a tree of the same genus with the bread-fruit (q.v.) and jack (q.v.), a native of the s. of India, and frequently cultivated in the northern parts of that country. The fruit is eaten, but is inferior to the jack. The juice, like that of the bread-fruit, is tenacious, and is used for bird-lime. The root is used for dyeing yellow. The D. is a large tree, and its timber is valued for a variety of purposes.

DEPHLOGISTICATED AIR. See PHLOGISTON.

DEPILATORIES, or EPILATORIES (Lat. *depilo*, to pull out the hair), are chemical agents employed for removing superfluous hair from the skin. They were extensively used by the ancients, but are now restricted in their employment to the face, and to the removal of the hair from the scalp in the treatment of certain diseases. The caustic alkalies and alkaline earths are generally used, and a good recipe is to mix 5 parts of caustic or slaked lime, 10 parts of carbonate of soda, and 40 parts of lard. The tersulphuret of arsenic (commonly known as orpiment) is occasionally used, but its employment is dangerous, as any abrasion of the skin will enable the arsenical compound to begin to act. A mixture of caustic lime and orpiment constitutes some of the depilatories to be purchased; and it is believed that the Turkish *rusma* is composed of these ingredients. A very active and comparatively safe compound is a strong solution of sulphuret of barium made into a paste with starch, which is immediately applied to the part from which the hair is to be removed, and is allowed to remain for five or ten minutes.

DEPLOY, as a military movement, is a spreading out of a body of troops in such way that it shall display a wider front and a smaller depth than it did before the deploying.

DEPONENT, a term in Latin grammar applied to verbs having a passive form but an active signification. They are so called because they, as it were, lay down (Lat. *depono*) or dispense with the signification proper to their form. Such verbs had all originally a reflective meaning, like the middle voice in Greek verbs; thus, *aversor*, "I detest," means radically, "I turn myself away from."

DEPORTATION, the forcible removal of a people from their country; in former times employed as a means of securing the fruits of conquest. In the Scriptures it is recorded that not only the Jews, but other peoples were carried away captives. Banishment is still a method of punishing political offenders in France and some other countries.

DEPOSIT was a real contract of the civil or Roman law. It was the simplest of all contracts, and consisted merely in the delivery of an article by one person to another,

to be kept without remuneration, and to be restored *in specie* as soon as the depositor should require.—*Inst.* iii. 15, s. 3. Return when required was the sole condition of the contract; and no obligation was incurred by the depositary but to exercise ordinary care in preservation of the article. The civil law recognized a distinction, as to the value which might be recovered by the depositor in case of loss, between the case of articles voluntarily deposited, and those which came into the hands of the depositary by the misfortune of the owner, as by fire or shipwreck. In the latter case, double the value of the article might be recovered. There was also a special provision by the edict *Nautæ, caupones, stabularii*, whereby shipmasters, innkeepers, and stablemen were compelled to exercise more than ordinary vigilance over the goods of their customers and passengers.

The principles of the civil law as to D. have been universally adopted by modern nations. In Scotland, the name of the contract is preserved. Lord Stair, i. 13. 2, lays down that the depositary is "not liable for light faults, or for the perishing or deterioration of the thing deposited by casualty or accident." The article must be restored when demanded, and failure to do this will involve the depositary in liability for the consequences. See also Erksine, iii. 1, 26.

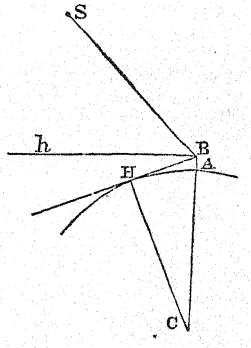
Deposit, in English law, is a branch of bailments, which includes also loans, pledges, and letting and hiring. From each of these, D. is distinct. It is defined by judge Story to be "a bailment of goods, to be kept by the bailee without reward, and delivered according to the object and purpose of the trust."—*Story on Bailments*, c. ii.

The chief questions which have arisen in modern times relate to the amount of care which the depositary is bound to exercise. Judge Story lays down the principle to be, not the care which a man takes of his own affairs, but that which a reasonable being would use, and cites in support of his view the case Doorman *v.* Jenkins, ii. Ad., and Ellis 256, where a person intrusted with money placed it in his own cash-box, and the box having been stolen, the depositary was yet held liable for negligence. So also with jewels or other valuables—the nature of the article implies extra care. Where, however, a sealed packet or locked box is deposited, the question arises as to the liability of the depositary. Erskine lays it down broadly, that where such a deposit is made without showing the contents, the depositary incurs no extra liability. But Story takes a distinction, and states that if the depositary had reasonable ground to believe the contents were valuable, he incurs liability accordingly. The immense value of the timber-trade of America raises in that country questions as to the liability of a landowner for timber left by the river on his ground. On this point, Story indicates that the smallest amount of liability is incurred. Whether or not the depositary may make use of goods left in his charge, is said by the same author to depend on the particular circumstances. If the article would benefit by use, then such use is allowable; but if injury were likely to accrue, it is not. If use is a matter indifferent, then the depositary is not entitled to the use. The admirable work of Story on Bailments is the best authority on this subject.

DEPOSIT, a term much used in geology, to characterize those rocks which have been formed from matter that has settled from suspension in water. The materials constituting such rocks have been obtained by denudation, and their extent in one place equals the denudation in some other. Deposits are characterized according to the conditions under which they were formed, as marine, lacustrine, fluviatile, and so forth.

DEPOSI'TION, the testimony of a witness set down in writing. Depositions are taken either by a judge or by a commissioner specially appointed by him for that purpose. The questions to which the depositions are answers are usually put by the legal representatives of the parties to the suit, under the control of the court or commissioner, and the answers are taken down by the clerk of court, or by a clerk specially appointed for the purpose. If the competency of the questions or the admissibility of the witnesses be objected to, the objection must be stated to the court or commissioner. The latter may either dispose of the objection at the time, or reserve it for the opinion of the court by which he was appointed. It is a rule in the laws of evidence of all countries that the deposition cannot be read where the witness might be himself produced, because his oral testimony is the best evidence, and secondary evidence is never admissible. Where he is dead, however, or insane, or beyond the jurisdiction of the court, his deposition then becomes the best evidence, and may be read in court.

DEPOSITION OF A CLERGYMAN. In Scotland, the minister of a parish who has been guilty either of immoral and scandalous conduct, or of preaching or otherwise publishing doctrines contrary to the standards of the church to which he has declared his adherence, or of contumaciously setting aside the authority of the Presbyterian church-courts, may be deposed from his holy office by the church-courts. By this means he is deprived not only of his ecclesiastical dignity, but of the temporalities of his benefice (stat. 1592, c. 115), and the benefice becomes vacant, just as if he were dead. He may, however, be restored to the exercise of the ministry, and to his position as a minister of the church by the general assembly, but he cannot, of course, be restored to his benefice; and it is considered irregular that he should be so even by a new presentation by the patron, because the stigma attached to his character by his deposition is likely to affect his usefulness. Where sentence of deposition is pronounced by an inferior church-court, the judgment of which is reversed on appeal to the general assembly, it is



held that it has never been pronounced; but if the sentence be affirmed, it takes effect from the date when it was pronounced by the inferior court, and from that date the minister's right to the profits of his benefice ceases. Sentence of deposition cannot be pronounced by a presbytery in the absence of the minister, except by the authority of the general assembly. See DEPRIVATION OF A CLERGYMAN.

DEPOT, in military matters, is a name sometimes given to a place where army stores are deposited during war. In the regimental system, however, a depot used to be the town or barrack where certain stores belonging to the regiment were kept, as well as the regimental books and some of the men, when the regiment was ordered on foreign service. It was rarely that a whole regiment was engaged in active service at once; either one or two companies were generally kept at home, under the command of one of the officers, and were called *depot companies*. They formed a nucleus where recruits were received and drilled, and where the corporate existence of the regiment might be kept up. By the military forces localization act of 1872, under which the United Kingdom is divided into 70 sub-districts, every battalion, whether at home or abroad, has a depot of two companies. The depots of two battalions constitute the depot-center, or sub-district brigade, to which the volunteers and militia of the sub-district are affiliated. In time of war, the depot would expand into a third battalion.

DEPPING, GEORGES BERNARD, 1784–1853; a native of Westphalia, resident of Paris; a writer on a wide range of subjects. Two of his juvenile works attained wonderful popularity: *Winter Evenings*, including the instructions of a father to his children on moral and scientific themes; and *Beauties and Marvels of Nature in France*. He assisted Malte-Brun in his geographical works, and wrote a number of important histories, books of travel, biographies, etc.

DEPRÈS, or DESPREZ, JOSQUIN, 1440–1521; a French musical composer, of whose life little is known. He was considered by his contemporaries to be the greatest master of his age. Luther was among his admirers. His works consist chiefly of sacred music.

DEPRES'SION or DIP OF THE HORIZON is the angle through which the sea-horizon appears depressed in consequence of the elevation of the spectator.

Let A be a point on the surface of the earth, B a point situated in a vertical line from A. Let BH be a tangent to the earth's surface drawn from B, B*h* a line in the same vertical plane perpendicular to AB. The angle *h*BH is the *true* dip of the horizon to a spectator at B.

The true dip measured in minutes is equal to the distance in nautical miles of the visible horizon. Let C. be the center of curvature of the surface; then, since CHB is a right angle, the angle *h*BH = HCA; and the minutes in this angle are the nautical miles in the arc AH. To find this angle in minutes or nautical miles, the rule is: Multiply the square root of the height in feet by 1.063.

The true dip of the horizon, however, is not exactly the same as its apparent depression. The apparent sea-horizon is raised above its true place by *refraction* through an angle, which varies according to the state of the atmosphere and the relative temperatures of the air and water, the variation ranging from one third to one twenty-third of the amount of the true dip. The rule commonly employed is to diminish the true dip by about one fourteenth of its amount, to find the apparent dip.

If S be a star or the sun in the same vertical plane with ABH, and an observation of the altitude above the sea-horizon be made by means of a sextant from the point B (as from the deck of a vessel), the apparent dip of the horizon must be subtracted from the observed angle, in order to find the altitude of the sun. Owing to the uncertainty of the amount of refraction, the nearest minute to the dip given in the tables is usually taken. The following table gives a sample of the amount of the apparent dip under ordinary state of the atmosphere and equal temperature of air and water. See Raper's *Practice of Navigation*.

Height. Feet.	Dip. m. s.	Height. Feet.	Dip. m. s.
0	0 0	8	2 50
1	1 0	9	3 0
2	1 20	10	3 10
3	1 40	20	4 20
4	2 0	30	5 20
5	2 10	40	6 10
6	2 20	50	7 0
7	2 40	100	9 50

DEPRIVA'TION OF A CLER'GYMAN. In England, this may be either (1.) by a sentence declaratory in the proper court, on the ground of attainder or conviction of treason,

felony, or any other infamous crime, or of conviction for heresy, infidelity, or gross immorality, or for farming or trading contrary to law, 1 and 2 Vict. c. 106, s. 31; or (2.) in pursuance of divers penal statutes, which declare the benefice void for some nonfeasance or neglect, or else some malfeasance or crime, as simony; for maintaining any doctrine in derogation of the king's supremacy, or of the thirty-nine articles, or the book of common prayer; for neglecting to read the liturgy and articles in the church, and to declare assent to the same, within two months after induction; for using any other form of prayer than the liturgy of the church of England; for continued neglect, after order from the bishop, followed by sequestration, to reside on the benefice. In these latter cases, the benefice is void, without any formal sentence of deprivation (Stephen's *Com.*, iii. 37). A bishop may be deprived of his bishopric, but cannot be deposed, as may be done in the case of a Presbyterian clergyman, the character of a bishop, like that of a priest, being indelible. The tribunal by which the bishop of Clogher was deprived in 1822 consisted of the archbishop and the other bishops of the province; and this precedent having been established, would probably be adhered to on any future occasion, notwithstanding that the archbishop alone might have full authority to deprive.—*Cripps's Laws of the Church*, p. 100.

DE PROFUNDIS ("Out of the depths"), the first words of the 130th psalm, which forms a portion of the liturgy of the Roman Catholic church, and is sung when the bodies of the dead are committed to the grave. A tender melancholy pervades the psalm, which, however, brightens up at the close under the conviction that with God there is "plenteous redemption."

DEPTFORD, a t. on the s. bank of the Thames, about 4 m. below London bridge, divided from Greenwich by the river Ravensbourne, a creek of deep water (*depe ford*), formerly fordable at the spot where D. bridge now stands. It contains two parishes, St. Nicholas' and St. Paul's, the latter formed by act of parliament in 1727. St. Nicholas' Deptford lies wholly in Kent, but St. Paul's extends into Surrey—the Surrey portion being known as the Manor of Hatcham. Pop. in 1871, 60,215, engaged to a large extent in the royal Deptford victualing-yard, and in extensive private ship-building and engineering establishments. The market-gardens of Deptford are famous. The upper portion of the town is well built, and is a favorite place of residence for persons engaged in business in London. D. forms, with Greenwich, Woolwich, Charlton, and a portion of Plumstead, the parliamentary borough of Greenwich, which returns two members. The ancient incorporation of the master and brethren of the Trinity house of "Deptford Strond," founded by Henry VIII., has its hall at D., and also two sets of almshouses. Queen Elizabeth, in 1581, visited Drake at D., in the ship in which he "compassed the world." In 1698, Peter the great acquired the art of ship-building in the dock-yard here, residing at the manor-house of Sayes court, which John Evelyn had previously occupied.

DEPTFORD DOCK-YARD, as one of the royal naval establishments, was not so remarkable for ship-building as for other operations connected with the fitting-out of fleets. Being ill adapted for the large war-ships of the present day, the dock-yard proper was abandoned in 1835, and the naval establishment limited to the victualing-yard, an important place, employing several hundred persons as officers, clerks, workmen, and hoymen. This is the chief depot for victualing the home and foreign stations, and the marines; also for slops and many of the necessaries for seamen. It is convenient for these purposes in being near the metropolitan markets. The officers receive, examine, store, pack, reissue, and register the various stores, and transmit all their accounts to the admiralty. For simplicity it used to be called collectively a royal dock-yard; but the ship-building, the store-keeping, and that very miscellaneous process called the provisioning, were the work of different establishments.

DEPUCH ISLAND, a member of the Dampier archipelago, lies off the n.w. coast of Australia, in lat. 20° 38' s., and long. 117° 44' east. Though only 8 m. in circuit, yet it is, on more than one ground, worthy of notice. On it have been found some curious specimens of native sculpture; and, rising with its greenstone rocks to a height of 514 ft. above the sea, it presents a remarkable contrast to the low-lying shore of the adjacent mainland.

DEPUTY, one who exercises power which properly belongs to another who has placed him in his stead. The appointment of a deputy does not free the principal from responsibility, for the deputy is not an assignee. It is a general rule, that no judge can appoint a deputy unless he be authorized to do so in the commission by which he himself is appointed. In the rare cases in which a deputy is empowered to appoint a deputy, the latter is usually called a substitute. See SHERIFF.

DE QUINCEY, THOMAS, a distinguished English writer, was b. in Manchester, Aug. 15, 1786. His father was a wealthy Manchester merchant, who, dying while his children were yet young, left his widow a fortune of £1600 a year. De Q. received his first education at home, and was afterwards sent to the grammar school of Bath. He proceeded to the university of Oxford in 1803, and remained there till 1808. At the university, he made the acquaintance of opium, which was ever afterwards his dread familiar. On leaving college, he went to reside at the lakes, and formed one of the

cluster of literary lights which made that region at the time so illustrious, and afterwards so memorable. He left Cumberland in 1819; and in 1843, he came to reside in Scotland, settling with his family at the village of Lasswade, near Edinburgh. He died at Edinburgh on the 8th Dec., 1859.

With the exception of a strange episode of his youth, described in the *Confessions of an Opium-eater*, the heroine of which was, singularly enough, one of the "waifs of womanhood," De Q.'s career was almost entirely eventless. He led a lonely and a speculative life, and his writings are at once history and autobiography. He was perhaps, with the exception of his friend prof. Wilson, the most brilliant magazine-writer in this century of magazines. Everything he wrote, putting aside the *Confessions*, *The Logic of Political Economy*, and a novel, which no one seems to have read, or, if read, to have remembered, is in the form of articles. Even the *Confessions* themselves were originally published as a series of articles in the *London Magazine*. De Q. has written on a great variety of subjects, and in a great variety of styles. He has written articles pervaded by humor of the most curious and novel kind, philosophical and critical articles distinguished by originality and daring of speculation, and articles of the nature of prose-poems, which are unquestionably of their kind the most wonderful things in English literature. In point of imaginative grandeur, and music and sweep of sentence, the *Suspiria de Profundis*, and the opium visions that close the *Confessions*, are miracles of impassioned prose. De Q.'s works were first collected and republished in America. The edition of De Q.'s works, in 16 vols., published by A. & C. Black, Edin., includes nearly all his writings. See Page's *Life and Writings of De Q.* (1877).

DERAH, the Egyptian unit measure of length. The one most in use is 22.37 English in., or 57 centimeters. The derah is divided into the *kadam*, one half; the *abdat*, one sixth; and the *kerat*, one twenty-fourth. The derah by which dry-goods are sold is 25½ in., and the derah of Constantinople is 66.34 inches.

DERAJAT', the fluvial portion of Daman (q.v.), itself a comparatively narrow strip in the Punjab, between the Suliman mountains and the Indus, and which, when duly irrigated, is singularly fertile. D. is so called from *dera*, a camp, a common element in the names of its towns—Dera Deen Punah, Dera Futti Khan, Dera Ghazee Khan, and Dera Ismail Khan. It is divided into three districts, and has an area of 12,565 sq.m., and a pop. of 991,251. Dera Deen Punah, apparently the least considerable of the above towns, has suffered much from physical causes, having, in 1819, been nearly destroyed by an earthquake and by a simultaneous flood from the Suliman mountains. —Dera Futti Khan is the center of a district which produces cotton, grain of various kinds, indigo, sugar, and opium. Pop. 5,000.—Dera Ghazee Khan occupies, for commercial purposes, a very favorable position—the intersection of the two great routes of the country between n. and s., and between e. and west. Hence it has been recommended as the best site for an annual fair, so as to suit at once Sinde, the Punjab, Afghanistan, Beloochistan, and Khorassan. It manufactures cotton, silk, and steel, and has an extensive bazaar. Pop. 17,164.—Dera Ismail Khan is of recent origin, another town of the same name having been swept away by an inundation of the Indus. It stands on the thoroughfare already mentioned between n. and s., commanding also two ferries across the river. To this position it is indebted for a thriving trade, and in spring particularly it is crowded by the Lohani Afghans, an enterprising tribe of pastoral peddlers. Pop. 24,906.—Besides the towns already described, D. has Isa Khel, a town with (1872) 17,746 inhabitants; and the important commercial town of Leia (q.v.).

DERA'YEH, or **DEREY'EEYAH**, a t. of Arabia, formerly the capital of the Wahabees. It is situated near the center of Nedjed, 430 m. n.e. from Mecca. It was a town of some consequence before the time of the Wahabees, but attained its highest importance under their dominion. See WAHABIS. It was taken by Ibrahim Pasha in 1819, after a siege of seven months, and nearly destroyed. It stands in a valley about half a mile in breadth, filling the whole breadth of the valley, and may probably have at one time contained 40,000 inhabitants, whereas now its pop. is not estimated at more than 15,000.

DERBEND', or **DERBENT'**, a t. of Russia, capital of the government of Daghestan, is situated on the western shore of the Caspian sea, on the declivity of a branch of the Caucasus, which here approaches very close to the water's edge, and forms a defile anciently known as the *Albaniæ Pylæ*, now called the Pass of Derbend. Lat. 42° n., long. 48° 15′ east. D. is built in the form of a parallelogram, being about 3 m. in length, and from a quarter to half a mile in breadth. It is surrounded by strong walls of very ancient date, which are further strengthened at intervals by towers. From two massive iron gates, through which the road to the interior passes, the town derives its name, which signifies "the shut-up gates." The harbor of D. is quite inaccessible to all but small boats. The manufactures of the place consist chiefly of coarse silk and woolen stuffs, and saffron is cultivated. Pop. '67, 15,739. D. is a very ancient place, having, as it is said, been fortified by Darius I. to prevent the incursions of the Scythians; and it was long considered the key of Persia on the n.w. side. It came finally into the possession of Russia in 1795.

DERBY, a t. in New Haven co., Conn., on the Housatonic river at the mouth of the Naugatuck; pop. '70, 8,020. The place is reached by the New Haven and Derby and

the Naugatuck railroads, and is approached by vessels drawing 10 ft. of water. It contains the villages of Birmingham and Ansonia.

DER'BY, a parliamentary and municipal borough and manufacturing town, the capital of Derbyshire, in the s. part of the co., in the wide and fertile valley of the Derwent—thence navigable to the Trent—at the junction of the main branches of the Midland railway, 132 m. n.n.w. of London, and 35 m. n.n.e. of Birmingham. The houses are mostly of brick, and the public buildings of stone. The free grammar-school is one of the oldest English foundations, reaching to 1162. Here Blackwell, author of the *Sacred Classics*, was a master, and Flamsteed a pupil. Dr. Darwin, in 1783, founded the philosophical society of D., and wrote most of his works here. D. is well situated for manufacture and trade, being at the s. end of a coal-field, and being connected by canals and railways with a great part of England. It has manufactures of silk, cotton, lace, hosiery, lead, iron, paints, porcelain, jewelry, black marble vases, columns, chimney-pieces, and ornaments of fluor-spar, petrifactions, marble, etc. The staple manufacture is throwing silk, introduced by Mr. Crochet from Italy early in the 18th c.; the silk-mill, with machinery still in use, erected in 1718 by John Lombe, being the first and largest of the kind in England. Pop. (1871), municipal borough, 49,449; parliamentary borough, 61,381. D. returns two members to parliament. In 1867, a new cattle-market, on a very complete scale, was opened, and also a new corn-exchange. The grammar-school was removed in 1862 from St. Peter's church-yard to St. Helen's house, the site of the original foundation; and a large handsome market-hall was completed in 1866. In 1867, Mr. M. T. Bass, for nearly forty years one of the members of parliament for D., presented the town with six acres of recreation ground; and a new wing was added to the general infirmary. D. was the Roman station *Derventio*, which stood on the e. bank of the river, opposite the town. Roman brass, silver, and gold coins have been found, a Roman pavement, and the foundations of a Roman bridge. D.—called *Northworthige* by the Saxons, and *Deoraby* by the Danes—was given by the conqueror to William Peverill.

DER'BY, the titular name of a distinguished family of the British aristocracy, descended from a common family with the barons Audley or Audleigh, co. Stafford. William de Audleigh, on exchanging with his cousin, sir Adam de Audleigh, the manor of Talk, co. Stafford, for that of Stanleigh (Stony Lea), co. Derby, adopted the latter name, and continued it to all his descendants. This event occurred in the 12th century. The first who assumed the arms now used by the family—viz., "three stags' heads on a bend"—was sir William de Stanley, son of William de Stanley, who flourished in the reign of Henry III. The first Lord Stanley was created in 1456; his eldest son Thomas was created first earl of D. in 1485.

DERBY, Edward Geoffrey Smith-Stanley, 14th Earl of, was b. 1799, at Knowsley park, Lancashire. He was educated at Eton and Christ-church, where, in 1819, he gained the Latin verse prize (subject, *Syracuse*). He was elected member of parliament for Stockbridge in 1820; in 1825, he married the second daughter of the first lord Skelmersdale; and in 1826, he represented Preston, but lost his seat in 1830, on becoming chief secretary for Ireland under the administration of earl Grey. A seat was then found for him at Windsor. He took a distinguished part in the debates in favor of the reform bill, and signalized his Irish administration by two bold measures—one for national education in Ireland, and another relative to the Irish church temporalities, which resulted in ten Irish bishoprics being abolished. The grievance of church-rates and first-fruits was also removed, and a graduated tax upon benefices and bishoprics substituted. In 1833, he became secretary of state for the colonies, and in the same year carried the bill for emancipating slaves in the West Indies, and providing a compensation of twenty millions to the planters. In 1834, being alarmed by the success of Mr. Ward's motion for appropriating the surplus of the Irish church temporalities to secular purposes, lord Stanley seceded from the Grey ministry, carrying with him sir James Graham, the duke of Richmond, and the earl of Ripon. He ever afterwards adhered to the conservative party, although, in 1834, upon the dismissal of the Melbourne ministry by William IV., he declined to join the administration of sir Robert Peel. After acting in concert with the opposition for seven years, he accepted the colonial seals in the Peel administration of 1841, and held them for four years. In Sept., 1844, he resigned his seat for north Lancashire, for which he had sat since 1832, and was called to the upper house in his father's barony of Stanley of Bickerstaffe. In Dec., 1845, when sir Robert Peel determined to repeal the corn laws, he retired from the cabinet. In 1846, he put himself at the head of the protectionist opposition, which, headed in the commons by lord George Bentinck and Mr. Disraeli, waged a stout but ineffectual opposition to the free-trade measures of sir Robert Peel. He was now regarded as the leader of the great conservative party. In 1851, on the death of his father, he succeeded to the earldom. In Feb., 1852, on the resignation of lord John Russell, he was sent for by the queen, and intrusted with the formation of an administration, which was, however, displaced in Dec. following by a hostile vote of the house of commons condemnatory of the budget of his chancellor of the exchequer, Mr. Disraeli. On the death of the duke of Wellington in 1852, he was elected to the post of chancellor of the university of Oxford. In Feb., 1858, when the Palmerston gov-

ernment resigned on the rejection of the conspiracy bill, he again became first lord of the treasury. At the meeting of parliament in the following year, his government brought forward a measure of parliamentary reform. A hostile amendment having been moved by lord John Russell, and carried, he dissolved parliament, and appealed to the country. When the new house of commons reassembled in June, 1859, a vote of want of confidence was carried against his government, and he resigned. He returned to power in 1866, and, in conjunction with Mr. Disraeli, passed the reform measure of 1867. See REFORM. In 1868, he resigned the premiership in favor of Mr. Disraeli. His last speech in parliament was made (1869) in opposition to the disestablishment of the Irish church. He died Oct. 23, 1869, and was succeeded in the earldom by his son, Edward Henry Smith-Stanley (see STANLEY). As a debater, the late earl stood in the very first rank. His power of invective was almost unequaled, and his vehement contentions with O'Connell on the repeal of the union and the Irish church did much to diminish the influence of the Irish agitator. He was tall, of commanding gesture, and his voice, in elevated passages of declamation, rang with power and effect. D. devoted the leisure of his latter years to translating Homer's *Iliad*, which was published in two volumes in 1864, in blank verse.

DERBY DAY is the second day, the Wednesday, of the grand spring meeting, which takes place at Epsom in Surrey, in May, in the week succeeding Trinity Sunday. Upon this day, the most important on the list, and that on which the best horses run, the famous Derby stakes, instituted by the earl of Derby in 1780, and which consist of 50 sovereigns each, are contended for. When the first Derby was run for, there were only 36 subscribers at 50 guineas each (with £25 forfeit in case of non-starters); but the number of subscribers is now so large, that the value of the stakes sometimes amounts to more than £6,000. The Derby Day is the great English holiday. To be present at Epsom on that occasion, London empties itself, and proceeds to the Downs by modes of locomotion the most heterogeneous. For hours, a continuous stream of carriages, gigs, dog-carts, vans, and vehicles of every description, moves tumultuously along the road to Epsom. Shopkeepers on that day shut up their shops, the benches of parliament are deserted, one half of the aristocracy appear on the ground, people of every condition arrive in countless numbers from all districts; and huge trains arrive every few minutes at the station, bringing their thousands, until the entire Downs are covered with a vast moving mass. So great is the demand for conveyances on this day, that scarcely a horse can be had either in London or within 40 m. of it. At the Derby in 1861, the course, which is a mile and a half in length, was gone over in 2 minutes 43 seconds—the swiftest running, by 2 seconds, ever yet known on that course.

DER'BYITES. See PLYMOUTH BRETHREN.

DERBYSHIRE, an inland co. of England, lying between Yorkshire on the n. and Leicestershire on the south. Its shape is triangular; the greatest length from n. to s. being 56 m.; greatest breadth, 34; area, 1030 sq. miles. The north-west is occupied by the s. end of the Pennine chain, called the High peak or Derbyshire highlands. This tract forms the water-shed between the Trent and Mersey, and is not surpassed for rugged and romantic scenery by anything in England; abounding in precipices, faults, rocking-stones, caverns—one of which is 2,700 ft. long—and streams that often lose themselves for a time among the fissures of the limestone hills. The peak, the loftiest hill in D., is 2,000 ft. high. From the peak tract, a range runs s.; another runs 60 m. s.s.e. Other ranges intersect parts of the co. To the s., D. sinks into a flat or gently undulating tract of new red sandstone, with some spots of magnesian limestone and coal, and beds of red marl and gypsum. The chief rivers are the Trent—dividing D. from Staffordshire for 10 m., and then crossing the s. of the co. and passing into Nottingham—and its tributaries, the Derwent and the Dove, both of which rise in the region of the peak, and flow in a south-easterly direction. Warm mineral springs exist at Buxton and Matlock, and intermitting springs at Barmoor and Tideswell. D. is celebrated for metals and minerals—iron, lead, zinc, manganese, copper, coal, fuller's-earth, mineral caoutchouc and mineral oil, gypsum, pipe-clay and chert for potteries, marble, fluor-spar, and alabaster for ornaments, etc. D. has six canals, and is intersected by many branches of the Midland railway. In the n., the climate is cool and moist, with fogs, and often frosts in summer. D. is more a manufacturing and mining than an agricultural county. The best soils in the s. are red, marly, fertile loams. There are many woods and coppices. The chief crops are wheat, barley, and oats. The total acreage under crops of all kinds, bare fallow, and grass was 502,791 in 1876. D. has much permanent pasture, large dairies, and sheep-pasturage in the peak district. There are manufactures of cotton, silk, worsted, metallic goods, porcelain, and marble and spar ornaments. D. is divided into six hundreds, nine poor-law unions, and 140 parishes in the diocese of Lichfield. The chief towns are Derby, Ashbourne, Bakewell, Buxton, Chapel-le-Frith, Chesterfield, Belper, and Wirksworth. In 1871, the pop. was 379,394. D. returns eight members to parliament—six for the co., and two for Derby. There are in the co. remains of so-called Druid circles, barrows, cromlechs, British and Roman roads, Roman baths, and a Roman altar at Haddon hall. There are also ecclesiastical and monastic remains. Repton church crypt is older than 874. Hardwick hall contains some furniture of Elizabeth's time, and some embroidery said to have been done by

Mary queen of Scots. Near Bakewell is Chatsworth, the magnificent seat of the duke of Devonshire. Arkwright built his first mill at Cromford, in 1771. Brindley was born at Turnstead; and Strutt, the inventor of ribbed stockings, at Normanton.

DERBYSHIRE SPAR is a name given to the fluoride of calcium, or fluor-spar (q.v.)

DERECSKÉ, a t. of Hungary, 12 m. s. of Drebreczin. It is situated in the vicinity of several small lakes, from which, in the summer time, a considerable quantity of soda is obtained by evaporation. In one of the lakes, small but very beautiful pearls are found. Pop. '69, 7,334.

DEREHAM, EAST, a t. in the middle of the co. of Norfolk, 16 m. w.n.w. of Norwich. Its streets are wide, well lighted, and well paved. The church, which is cruciform, with a tower, contains the remains and monument of Cowper the poet. D. has manufactures of agricultural machines, and in the highly cultivated country around, there are many gardens and orchards. Pop. '71, 3,689. Here Withburga, daughter of king Anna, founded a nunnery in the 7th c., which was burned by the Danes, and afterwards refounded. Withburga was buried in her nunnery in 654, but her remains were stolen thence by the monks of Ely in 974.

DERELICT, a term in English law, signifying anything forsaken or left, or willfully cast away. Derelict lands, if suddenly left by the sea, belong to the crown; but if the sea has receded gradually and imperceptibly, the gain will go to the owner of the adjacent lands.

In order to constitute a ship which has been wrecked derelict, it is necessary that the master and crew shall have abandoned her, without hope of recovery. The mere quitting of a ship for the purpose of procuring assistance from the shore, or other temporary cause, with the intention of returning to her again, is not an abandonment. See Lord Stowell's judgment in the case of the *Aquila* (1 Rob. 37), and *Abbot on Shipping*, p 489. When such abandonment or dereliction has occurred, the first-comers are entitled to take temporary possession of the ship, and to claim salvage, either from the owners, the lord of the manor, or other person having right to wrecks unclaimed by the owners, or in the event of no claim from the crown. The general superintendence of all matters relating to wreck is placed in the board of trade by the 439th section of 17 and 18 Vict. c. 104, commonly called "the Merchant Shipping act;" and the board may, with the consent of the commissioners of her majesty's treasury, appoint any officer of customs, or of the coast-guard, or other person, to be a receiver of wreck in any district, and to perform the duties imposed on him by the act. These duties consist in taking the command of the persons present, and availing himself of their services to the best of his ability to save the ship and her crew and cargo. If any one refuses to obey him, he shall incur a penalty of £50; and if any master of a ship or boat shall refuse him his aid, or any proprietor of a wagon, cart, or horses shall refuse him the use of them, he shall incur a penalty of £100. All articles washed on shore or lost are to be delivered to the receiver, and he has power to suppress plunder and disorder by force. Within 48 hours after taking possession of any wreck, the receiver shall cause to be posted up in the nearest custom-house a description of the same, and of any marks by which it is distinguished; and if the value of such wreck exceeds £20, he shall transmit a similar description to the secretary of the committee of Lloyd's (s. 452). See LLOYD'S. Goods deemed perishable he may sell immediately (s. 453). The owner of all wreck is entitled, within one year, to claim it from the receiver, who will deliver it up to him on receiving payment of such expenses, fees, and salvage as may have been incurred in terms of the act (s. 470). In the event of no owner establishing his claim before the expiration of a year from the date at which the wreck has come into the possession of the receiver, it shall be delivered up to the lord of the manor or other person having title to it. If a dispute arise as to the property of wreck, or the amount of salvage or other charge due, it may be decided by two justices, whose proceedings may be reviewed by any court of law or equity, if carried there by appeal within three months. If no claim shall be established to wreck either by an owner or lord of the manor, or admiral, mayor, or other person having title to wrecks cast on shore at particular parts of the coast, the wreck becomes the property of the crown, and shall be sold by the receiver, and the proceeds, after deducting fees and expenses, paid into her Majesty's exchequer (s. 475).

The principle upon which Salvage (q. v.) is given on wrecks and derelict is, that a person who by his labor preserves goods which the owner or those intrusted with the care of them have either abandoned in distress at sea, or are unable to protect and secure, is entitled to retain the possession of the goods until proper compensation is made to him for his trouble. Where the parties cannot agree on this sum, and are unwilling to adopt the decision of the justices, as above stated, the amount is generally ascertained by a jury. Till the question is decided, the goods remain in the custody of the salvor, or of the receiver for his behoof. No claim for salvage is due where the owner, or those in his employment, are at hand on the coast, and in a condition to save and protect his property. If any one set of persons have taken possession of a derelict, and are endeavoring to bring it into port and save it another set have no right to interfere with them and become participators in the salvage; unless it appears that the first in possession would not have been able to effect the rescue of the property without the aid of the others (Abbot, p. 490). This rule applies to king's officers, even where the property

saved is government stores. The original salvors cannot be dispossessed without reasonable cause. As to the proportion which the salvage allowed bears to the value of the property saved in various circumstances see SALVAGE.

DERG, LOUGH (signifying the *red lake*), the name of two Irish lakes. One, the largest lake expansion of the river Shannon, between Tipperary on the s.e., and Galway and Clare on the n.w., is 24 m. long from n.e. to s.w., 2 to 6 broad, 10 to 20 ft. deep at the upper, and 50 to 80 at the lower end. Its surface is about 100 ft. above the sea. It contains several islands.—The other Lough Derg is in the s. of Donegal county, on the borders of Tyrone. It is 3 m. by 2½, has many small isles and rocks, and wild dreary shores, and is surrounded by mica-slate hills 700 to 1200 ft. high. Saint's Isle contains the remains of a priory, founded about 600, and is the original seat of St. Patrick's purgatory. But the place of penance has for some centuries been on Station Isle—under an acre in extent, and with two chapels—which is now the most celebrated place of pilgrimage in Ireland, 10,000 to 15,000 persons flocking to it annually, from 1st June to 15th August, for prayer, fasting, and vigils.

DERIVA'TION. See ETYMOLOGY

DERIVATION, in Medicine, a method of curing disease, by which it was formerly supposed that the *materies morbi*, or matter of the disease, was drained away through some channel established for it by artificial means, as when a blister is applied over an inflamed lung, or a discharge from the bowels established in a case of dropsy. Without too closely scrutinizing the theory, it may be admitted that many of the practices founded on it have also a pretty firm basis of experience, and are well established in modern medicine.

DERMATOLOGY (Gr. *dermatos*, of the skin, *logos*, a discourse), the science of the management of the skin and of its diseases. See SKIN.

DERMATOPHYTES (Gr. *derma*, the skin, and *phyton*, a growth or plant), vegetable growths, chiefly of the lowest of Cryptogamia (q. v.), inhabiting the cuticle or epidermis, and giving rise to some forms of skin-disease, as Favus (q. v.), Pityriasis (q. v.), Ringworm (q. v.), etc.

DERMESTES, a genus of coleopterous insects of the section *pentamera*, and of the family *clavicornes* (q.v.); having antennæ shorter than the thorax, their three terminal joints forming an ovate compressed club. Their larvæ feed mostly on dry and decaying animal matter, and are very voracious, committing great ravages among furs, collections of natural history, etc. *D. lardarius* is the well-known BACON BEETLE, the larva of which is so often destructive to bacon and other dried meats, and often also to cheese. The perfect insect is about a quarter of an inch in length, and of a dull black color, the base of each wing-cover ash-colored with three black spots. The larva is of a long shape, tapering towards the tail, dark-brown above, white beneath, with long hairs, and furnished with two horny hooks on the last segment. The larva of *D. murinus* is common in the dried carcasses of vermin nailed up on doors by gamekeepers; that of *D. vulpinus* abounds among cargoes of hides brought from warm climates; that of *D. paniceus* in long-kept stores of ship-biscuits.

Use is sometimes made of the larvæ of species of D. for procuring well-cleaned skeletons of birds and other small animals: the animal is first soaked in water, to get all the blood out; then dried, to suit it to the taste of the larvæ, which are placed with it in a covered box; and in a short time their work is very neatly and completely done, much better than by ants.

DERMIS. See SKIN.

DERMOPTEROUS (Gr. skin-finned) **FISHES,** an order of fishes in Owen's classification, so named from the cutaneous vertical fins, in which the rays are extremely soft and delicate, or altogether imperceptible, and further characterized by the want of pectoral and ventral fins. Lampreys, the lancelet, etc., are dermopterous fishes.

DERMO-SKEL'ETON, a term applied to the coriaceous, crustaceous, or osseous integument that covers most invertebrate and some vertebrate animals. It serves as a protection for the soft parts of the body.

DERNA, or DERNAH, a t. of Tripoli, northern Africa, situated at the mouth of a ravine a mile from the Mediterranean, in about lat. 33° 30′ n., long. 22° 30′ east. Built on both sides of the ravine, it has regular streets, which are far from cleanly, although a copious stream of pure water flows through several of them. The houses are low, and have a mean appearance, but they are surrounded by fine gardens and orange-groves. The harbor of D. is insecure, and its prosperity, which was formerly considerable, has now greatly declined. Pop. 6,000.

DERREY'EH, EL, or DERAY'EH, a t. of Nedjed, central Arabia, in lat. 25° 15′ n., long. 46° 30′ east. It is fortified, and has a population usually stated at about 15,000. It was formerly the capital of the country of the Wahabees, but was captured and almost destroyed by Ibrahim pasha in 1819.

DERRICK, a mechanical contrivance used for the same purposes as the crane, but recently so improved in size, strength, and mechanism, as to be able not only to raise a body of 1000 tons in weight, but to transport it from one place to another. The fol-

lowing description of the *Great Floating Derrick*, built in 1859, will convey an idea of the powers of this machine, and of the principles upon which it works. This derrick was built by the Thames iron ship-building company, at Blackwall. It consists of a flat-bottomed vessel, 270 ft. long, and 90 ft. across the beam, and is divided throughout into a number of water-tight compartments, which can be filled, so as to counterbalance any weight on an opposite side. From the deck of this floating steam-crane rises an iron tripod 80 ft. high, on the top of which revolves a gigantic boom, 120 ft. long, and above the boom the "king-post," a continuation of the tripod, rises to the height of 50 feet. One arm of the boom is furnished with ten fourfold blocks; the chains attached to these blocks are passed across the king-post, brought over the other arm of the boom, and so descend to the other side of the vessel, where they are connected with two powerful steam-engines, by means of which the weights are raised. This derrick is capable of being propelled by means of a series of bucket-paddle floats at the rate of 4 miles an hour. It is the invention of Mr. Bishop, an American. Derricks have been long in use in America, and have proved much more expeditious and economical than any other species of lifting-power. They are chiefly used for lifting machinery or other great weights, and for raising wrecks.

DERRY. See LONDONDERRY, *ante.*

DERVISH is a Persian word signifying *poor*, corresponding to the Arabic *Fakir* (q.v.). It designates, in Mohammedan countries, a class of persons resembling in many respects the monks of Christendom. The dervishes are divided into many different brotherhoods and orders. They live mostly in well-endowed convents, called Tekkije or Changah, and are under a chief with the title of a Sheik, i.e., "elder." Some of the monks are married, and allowed to live out of the monastery, but must sleep there some nights weekly, Their devotional exercises consist in meetings for worship, prayers, religious dances, and mortifications. As the convent does not provide them with clothing, they are obliged to work more or less.

It is difficult to say when these religious orders took their rise. From the earliest times, pious persons in the east have held it to be meritorious to renounce earthly joys, to free themselves from the trammels of domestic and social life, and to devote their thoughts in poverty and retirement to the contemplation of God. In this sense, poverty is recommended by Mohammed in the Koran. Tradition refers the origin of these orders to the earliest times of Islam, making the caliphs Abubekr and Ali found such brotherhoods; but it is more probable that they arose later. Many Mohammedan princes and Turkish sultans have held dervishes in high respect, and bestowed rich endowments on their establishments; and they are still in high veneration with the people. The orders are generally named after their founders, and the best known are the *Bestamis*, established 874 A.D.; *Kadris*, 1165; *Rufaji*, 1182; *Mevelevis*, 1273; *Nakshibendis*, 1319; *Bektashis*, 1357; *Rushenis*, 1533; *Shemsiss*, 1601; and *Jemalis*, 1750.

DERWENT, one of the principal rivers of Tasmania, issues from lake St. Clare, in the center of the island; flows tortuously towards the s.e.; waters Hobart-Town, the capital; and enters Storm bay, in D'Entrecasteaux channel, by an estuary of 4 m. in width. Up to Hobart-Town, the D. is navigable for ships of any burden. The lat. and long. of the mouth are about 42° 53′ s., and 147° 25′ east.

DERWENTWATER, or KESWICK LAKE, an oval sheet of water in the s. of Cumberland, and one of the most beautiful of the lakes of that county. It stretches s. from Keswick, is 3 m. long by 1½ broad, 72 ft. deep, and 222 ft. above the sea. Its banks are rocky and abrupt, and behind them rise rocky mountains, one of which, the Cat Bells, is 1448 ft. high, and another, Lowdore, has a fall of 100 feet. This lake is an enlargement of the Derwent river, which runs through the lake in its course towards the Irish sea, into which it flows at Workington. It has several wooded isles, besides a remarkable floating isle—a mass of earthy matter 6 ft. thick, and varying in size in different years from an acre to a few perches, covered with vegetation, and full of air-bubbles, which buoy it on the surface of the water. D. abounds in trout, pike, perch, and eels.

DERWENTWATER, JAMES, Earl of, one of the leaders in the rebellion of 1715, and the last earl of D., was the descendant of an ancient Northumberland family named Radcliffe. He was b. in 1688, educated in France, and on the death of his father in 1705, D., then in his 17th year, returned to the seat of his ancestors at Dilston, in Northumberland, and assumed the paternal titles and estates. On the eve of the insurrection, at the close of 1714, warrants were issued on suspicion against several gentlemen in the n. of England, and one, among others, against the earl of D.; but having been previously warned, he fled from Dilston, and found refuge in the cottage of one of his dependents. He soon afterwards collected a few retainers, and placed himself at their head, under the impression that the entire body of the Jacobites either had risen or were about to rise. From this period the history of the earl of D. becomes the history of the rebellion of 1715, which ended in the disastrous encounter at Preston, on which occasion D. conducted himself with the utmost heroism, but, with the most of the rebel leaders, was taken prisoner, and conveyed to the tower of London. Having been impeached of high treason at the opening of parliament, he was carried before the house of lords, Feb. 9, 1716, and, requesting time to prepare an answer to his accusation, was

remitted till the 19th, when, being taken for trial to Westminster hall, he pleaded guilty, and threw himself upon the mercy of the king. His appeal was unavailing, and he was condemned to suffer. Every possible effort was made by the relations and friends of D. to obtain a pardon, but their exertions were fruitless, and he was beheaded on Tower hill, 24th Feb., 1716. His youth, his invariable amiability of temper, his rank, and his bravery, combined to excite great sympathy for the unhappy sufferer.

DERZA'WIN, GABRIEL ROMANOWICZ, a celebrated Russian lyric poet, was b. at Kasan, 3d July, 1743, studied at the gymnasium of his native city, and in 1762 entered the army as a private soldier. His talents and superior education soon procured him promotion. The empress Catharine highly esteemed him; and in 1791, appointed him secretary of state; in 1800, imperial treasurer; and in 1802, minister of justice. This last office, however, he held for only one year, when he retired on a pension, and devoted the remainder of his life wholly to the muses. He died 6th July, 1816. D. is a thoroughly original poet. He excels in loftiness of idea, purity of sentiment, and rich vigor of language; in fact, the latter quality at times manifests itself in an oriental extravagance of imagery which the colder fancy of the west fails to appreciate. D.'s noblest as well as his most popular ode is his *Address to the Deity.* It has been translated into English, German, and other European languages. His collected works were first published at St. Petersburg in 5 vols. (1810–1815), and have been often reprinted since.

DESAGUADE'RO, the name of various waters in Spanish America, of which the chief are a lake and two rivers.—1. The lake, situated in Araucania (q.v.), measures 35 m. in length, with an average breadth of 5, and sends forth the Osorno to the Pacific.—2. A river of the Argentine confederation, separates the departments of San Luis and Mendoza. It is, however, merely a winter torrent, being quite dried up in summer.—3. A river of Bolivia—the only stream of any magnitude that is wholly within its borders—issues from lake Titicaca, and, after a s. course of 190 m., loses itself in the landlocked lake of Aullagas, near the town of Oruro. It is, without exception, the loftiest stream of any length on either continent, for the elevation of its source, not greatly exceeding that of its mouth, is 12,846 ft., or nearly 2½ miles.

DESAGUADE'RO, a great plain between the e. and w. branches of the Bolivian Andes, two thirds of it in Bolivia and one third in Peru, about 400 m. long by 30 to 80 m. wide. This plain is 13,500 ft. above the sea. The region is rich in silver, copper, and tin, and there are probably other minerals. Thermal springs are a feature also. There are but two seasons, dry and wet, answering to summer and winter. Not a tree is to be seen. The lower valleys are covered with luxuriant grass, and afford excellent pasturage. Grain is not cultivated. Potatoes grow wild. The Indians make huts, boats, mats, and other articles of convenience, from native rushes. Cattle, horses, asses, and mules are plentiful. The most important animals are the guanaco, and the allied genera of alpacas, llamas, and vicunas, all yielding valuable wool. Oruru is the most important town.

DESAIX DE VEYGOUX, LOUIS CHARLES ANTOINE, a general of the first French republic, was born at St. Hilaire-d'Ayat, in Auvergne, Aug. 17, 1768. After studying at the military school of Effiat, he was appointed in 1792 aid-de-camp to prince Victor de Broglie, then at the head of the army of the Rhine. Here D. distinguished himself by his bravery, which was at the same time cool and fearless. In 1796, Moreau, having obtained the command of the army of the Rhine, made D. his lieutenant, and employed him in the most difficult and dangerous missions. In Moreau's (q.v.) famous retreat through the Black Forest during this year, D., who commanded the left wing of the army of the Rhine, increased his already great reputation. The French by this retreat had now retired within the Rhine, retaining on the right bank only the fort of Kehl, which D. was commissioned to defend. The fort was in ruins, and could not be well repaired before the approach of the Austrians; nevertheless, behind this imperfect defense D. resisted the Austrian army for more than two months, only capitulating in Jan., 1797, when his ammunition was spent. His greatest achievement, however, was the conquest of Upper Egypt, which he accomplished in 1799, after an eight months' campaign. He was incredibly fertile in resources, and possessed the power of winning and restraining the people whom he had conquered to a wonderful degree; his own soldiers used to compare him to Bayard, while the inhabitants named him *The Just Sultan.* D. returned from Egypt just in time to take part in the battle of Marengo, on the 14th June, 1800, in which he was killed by a musket-bullet. His body was placed—after being embalmed—in the convent of Mt. St. Bernard. A statue has been raised in his honor in the Place Dauphine, in Paris.

DE SANCTIS, LUIGI, 1808–69; an instigator of the Protestant movement in Italy, for several years a Roman Catholic professor of theology. In 1847, he established a Protestant journal, the *Eco del Verité;* in 1868, he accepted the professorship of theology in the Waldensian seminary at Florence.

DÉSAUGIERS, MARC ANTOINE MADELEINE, 1772–1827; a French dramatist and composer of songs; author of many dramas, including comedies, operas, and vaudevilles, produced in rapid succession. His singing of his own songs made his company

greatly sought after. Late in life he undertook theatrical management, but with no great success.

DESAULT, PIERRE JOSEPH, 1774–95; a French anatomist and surgeon, who, when but 20 years of age, opened a school in Paris, where his success excited the wonder and jealousy of the established professors. In 1776, he was admitted a member of the incorporation of surgeons, and successively held other positions of honor. In 1782, he was appointed surgeon-major to the *De la Charité* hospital, and came to be regarded as one of the first surgeons of the age. He next went to the hôtel Dieu, and after Moreau's death the surgical department of the hospital was intrusted to him. There he instituted a clinical school for surgery, and attracted pupils from all countries, often having audiences of 600; and most of the surgeons of the period derived their knowledge in great part from his lectures. He introduced many improvements in the practice and in surgical instruments. During the revolution he suffered undeserved persecution, but was afterwards restored to favor.

DES BARRES, JOSEPH FREDERICK WALLET, 1722–1824; an English scientist; descendant of a Huguenot family which fled from France to England. He graduated from the royal military academy at Woolwich, and was sent to America as a lieut., where he was engaged in the French and Indian war. He was in the expedition against Louisburg, and in the siege of Quebec was aid to Wolfe, who fell into his arms when he received his death-wound. For some years afterwards Des Barres was charged with important engineering surveys in Nova Scotia, Newfoundland, and other British colonies, with a view of establishing a chain of military posts. He was also engaged in correcting old and making new charts of the North American coast, which were published in 1777, under the title of the *Atlantic Neptune*. In 1784, he became governor of the island of Cape Breton, and soon afterwards began to build the town of Sydney, where he opened the coal trade. In 1804, at the age of 82, he was made lieutenant-governor and commander-in-chief of Prince Edward's Island. He lived to be 102 years old.

DESCANT, or DISCANT (Sp. *discante*), a term which, in ancient times, was given to a musical composition; also to the counterpoint or melody which the singer (taking the upper part) sung extempore to the tenor or bass. In modern music, the term is applied to the part written for the voices of females or boys, and is the same as treble or soprano.

DESCARTES, RENÉ (Latinized into RENATUS CARTESIUS), the name of one of the reformers of philosophy, was b. Mar. 31, 1596, at La Haye, in Touraine. He was sent at the age of 8 years to the Jesuit college at La Flèche, where he soon became distinguished for his keenness of intellect, and made great and rapid progress in languages, mathematics, and astronomy. It was not long, however, before he became dissatisfied with the doctrines and method of scholasticism, and felt it impossible to acquiesce in what had hithero been regarded as *knowledge*. The first thing that he did after leaving college, as we are informed in his treatise on method, was to abandon books, and endeavor to efface from his mind all that he had hitherto been taught, that it might be free to receive the impressions of truth, whencesoever they should come. In pursuance of his plan, he resolved to travel, and soon entered the army as a volunteer, serving successively in Holland and Bavaria. As, however, the life of a soldier contributed little to his main object, he quitted the army in 1621; and after making journeys in different directions, he at last retired to Holland, where he prepared most of his works, attracted many disciples, and at the same time became involved in several learned controversies, especially with the theologians. Although he loved independence, yet, in 1649, he accepted an invitation to go to Sweden, addressed to him by queen Christina, who desired his learned intercourse and instruction. His willingness to leave Holland was partly occasioned by his anxiety to escape from the hostility of his enemies. Only a few months after his arrival at the court of queen Christina, he died on Feb. 11, 1650. Sixteen years later, his body was brought to Paris, and buried in the church of St. Genevieve-du-Mont.

The grand object towards which D. directed his endeavors, was the attainment of a firm philosophical conviction. The way whereby he sought to attain this end, is explained in the discourse on method (*Discours de la Méthode*, published in 1637), to which we have already referred. This small, but extremely interesting and important treatise, contains a history of the inner life of the author, tracing the progress of his mental development from its commencement in early years, to the point where it resulted in his resolution to hold nothing for true until he had ascertained the grounds of certitude. The author also, in the same treatise, explains the practical rules whereby he resolved to be guided while in this state of *suspended belief*, and by the observance of which he hoped to arrive at *absolute certainty*, if, indeed, it were at all attainable. The results of his inquiries, so conducted, he exhibited more particularly in his *Meditationes de Primâ Philosophiâ* (Amst. 1641), and the *Principia Philosophiæ* (Amst. 1644). In the former of these treatises, the independence of his thinking is strikingly brought out by his commencing his Meditations with the expression of doubt with regard to all that had hitherto borne the name of knowledge. After examining thoroughly, as he thought, the grounds of certitude in the various departments of knowledge, he found one, and only one, proposition that seemed to him to stand the test, and of which the truth could not possibly be doubted: that proposition was, that he existed, which he inferred from the fact of his possessing consciousness. He could not doubt that he felt and thought,

and therefore he could not doubt that *he*, the feeler, the thinker, existed. This relation between consciousness and existence he expressed by the memorable words: *Cogito, ergo sum.* Instead, however, of making the above proposition the foundation of his philosophy, by which he would have been led into a direction similar to that of Kant or Fichte, he employed it only so far as to ascertain from it the criterion of certitude—viz., that whatever is *clearly and distinctly thought, must be true.* Amongst these clear and distinct thoughts, he soon recognized the idea of God as the absolutely perfect being. This idea, he reasoned, could not be formed in our minds by ourselves, for the imperfect can never originate the perfect; it must be *connate*, i.e., part of the original structure of our understanding, and implanted there by the perfect being himself. Hence, from the existence of the idea of perfection, D. inferred the existence of God as the originator of it; he inferred it also from the mere *nature of the idea*, because the idea of perfection involves existence. But if God exist, then we have a guarantee of the previously determined ground of certitude, for God the perfect being cannot deceive, and therefore whatever our consciousness clearly testifies, may be implicitly believed.

The most general fundamental principle of the philosophical system of D., is the essential difference of spirit and matter—the thinking and the extended substances—a difference so great, according to D., that they can exert no influence upon each other. Hence, in order to account for the correspondence betwixt the material and spiritual phenomena, he was obliged to have recourse to a constant co operation (*concursus*) on the part of God; a doctrine which gave rise subsequently to the system called Occasianalism (q.v.), the principle of which was, that body and mind do not really affect each other, God being always the true cause of the apparent or occasional influence of one on the other. This doctrine received its complete development in the pre-established harmony of Leibnitz. See LEIBNITZ.

D. did not confine his attention to mental philosophy, but devoted himself systematically to the explanation of the properties of the bodies composing the material universe. In this department, his reforms amounted to a revolution, though many of his explanations of physical phenomena are purely *a priori*, and certainly sufficiently absurd. His corpuscular philosophy—in which he endeavored to explain all the appearances of the material world simply by the motion of the ultimate particles of bodies—was a great advance on the system held up to that time, according to which, special qualities and powers were assumed to account for every phenomenon. It was in mathematics, however, that D. achieved the greatest and most lasting results; and, indeed, his mathematical discoveries procured among his contemporaries, for his, in many cases, wild philosophical views, a greater importance than they in themselves are entitled to. It was D. who first recognized the true meaning of the negative roots of equations; and we owe to him the theorem, which is called by his name, that an equation may have as many positive roots as there are changes of sign in passing from term to term, and as many negative roots as there are continuations of sign, and not more of either kind. He gave a new and ingenious solution of equations of the fourth degree; and first introduced *exponents*, and thereby laid the foundation for calculating with *powers*. He showed, moreover, how to draw *tangents* and *normals* at every point of a geometrical curve, with the exception of mechanical or transcendental curves; and, what perhaps was his highest merit, he showed how to express the nature and the properties of every curve, by an equation between two variable co-ordinates; thus, in fact, originating *analytical geometry*, which has led to the brightest discoveries. D. was less happy in his cosmological exercitations, in which he attempted to explain the movements of the heavenly bodies by *vortices* (*tourbillons*), consisting in the currents of the ether which he supposed to fill the universe; a theory which not only then, but even after the discoveries of Newton, made a great noise, and found many adherents, but which has long ago been consigned to oblivion. The philosophical and mathematical works of D., which are composed in Latin, were published at Amsterdam (9 vols. 4to, 1692–1701, also in 1713), and at Paris (1724–1726, in 13 vols. 12mo). More recently, an edition of his whole works has been published by M. Cousin (11 vols., Paris, 1824–26).

DESCENDANTS. See HEIR, CONSANGUINITY, etc.; SUCCESSION.

DESCENT, LINE OF SWIFTEST, is that by which a body falling under the action of gravity, passes most quickly from one point to another. It is proved that, when the one point is not directly over the other, the line of swiftest descent is an arc of a cycloid (q.v.).

DESCHAMPS, EUSTACHE (MOREL), a poet of France of the 14th century. His life was a long series of tournaments, feasts, and battles, and he was one of the most popular men of his time. He saw the English invasion of 1358; was at the siege of Rheims, and witnessed the march on Chartres. In 1360, he became the vassal of the young princess Isabella, to whom he paid all possible poetic homage. He was a great traveler, but in France he lived the true life of a trouvere, wandering from castle to castle with his poems. He was master of arms to Charles V., who appointed him governor of Fismis. One of his ballads is addressed to Chaucer, the English poet. None of his works were published until 1832.

DESERET. See UTAH.

DESERT (*desertus*, solitary), a term used to denote any portion of the earth's surface which, from its barrenness, as in the case of the arid places of northern Africa and Arabia, or from its rank exuberance, as in the case of the *silvas* of South America, is unfitted to be the site of great commercial and industrial communities. Many names, each differing in meaning to some extent, are employed to designate the desert-plains of different countries. The *desert* proper may be said to signify the vast sandy plains of Africa and Arabia; while the flats extending from the Black sea on the n., and from Persia on the s., onward across Thibet and Tartary to the north-eastern coasts of Asia, are called *steppes;* those in the northern division of South America, *silvas* or desert-forests; those in the other portions of South America, *llanos* and *pampas;* and those in North America, *prairies* or *savannahs*. All these, though widely differing in individual characteristics, have in common the important physical features of wide extent and uniform general level. The *oases*, which are occasional spots in the desert where springs arise, and where the waste is enlivened by the presence of vegetation, are usually lower than the general level of the surrounding plain. The great and famous desert-ground, however, is to be found in the old world. A huge tract of comparatively rainless country stretches almost continuously from the north Atlantic to the shores of the north Pacific, thus forming a great belt of sand from e. to w., along the whole extent of the eastern hemisphere. Beginning from cape Nun on the n.w. coast of Africa, the *Great Sahara*, the grand type of all desert-grounds, stretches away eastward from the shores of the Atlantic to the banks of the Nile, its eastern division being frequently called the desert of *Libya*. Crossing the Nile, by the irrigation and inundations of which alone Egypt is preserved from subsiding into the waste condition of the surrounding country, the desert is again found, interposing a strip of hot sand between the right bank of the Nile and the western border of the Red sea, upon whose shores no rain ever falls. On the right shore of the Red sea, desert-grounds unvisited by any rains prevail over the greater portion of Arabia, and stretch onward, with occasional interruption, over Persia, Thibet, and the Tartaries. The most extensive desert in the eastern portion of these arid districts is called the desert of Gobi, which extends from the western extremity of Thibet n.e. to the shores of lake Baikal. The cause of this extraordinary zone of parched land and of similar smaller tracts in other parts of the world, will be best explained under the head of RAIN.

DESERTAS, the general name of three rocky islands in the Atlantic ocean, situated to the s.e. of Madeira, in lat. 32° 31′ n., long. 16° 30′ west. The southern and largest island is called Bugio; the center one, Deserta Grande; and the northern, Chão. Deserta Grande has a length of 6 m., with a breadth of from ½ a m. to 1 m.; Chão and Bugio are only about 1 m. in length—the latter about the same in breadth, but the former not more than a quarter. The D. are not inhabited, but they yield considerable pasturage, and are visited at certain seasons of the year by fishermen and herdsmen.

DESERTER, a soldier or seaman who forsakes his flag. In time of war such an act is punishable with death or otherwise as a court-martial may decide. In time of peace, the punishment is comparatively light.

DESERTION from the public service of the country is the crime of a man absconding, during the period for which he is enlisted, from the service of the army or navy. This crime was, by certain old statutes, made punishable with death; but now the punishment for desertion is prescribed by the annual mutiny acts. By these annual acts, any court-martial may inflict a sentence of corporal punishment, not exceeding fifty lashes, for desertion, and may in addition award imprisonment for the period prescribed by the articles of war. By 20 Vict. c. 13, s. 35, and 22 Vict. c. 4, s. 35, it is provided that deserters may be marked on the breast in gunpowder or ink with the letter D. This provision is omitted in the mutiny act, 1860. Recruits deserting before they have joined their regiments, are to be taken to the regiment nearest to the place where they were found, but to suffer no punishment except loss of bounty. Inducing to desert was formerly punishable by death; the punishment has, by modern statutes, been commuted to penal servitude. If simply "absent without leave," a British soldier, besides undergoing some kind of punishment, forfeits his regular pay for the days of absence; but if his non-appearance involves actual desertion, he loses all claim to additional pay, good-conduct money, and pension. The number of deserters from the British army is very great. In one particular period of 8 months, it was found that no less than 8,822 men deserted from the regular army, and 6,614 men from the militia; in 1874, 7,939 men deserted from the army, and in 1875, 5,629. Many experienced officers attribute the evil to the temptations of bounty, rather than to any other cause (see BOUNTY); and advise that the same amount of money should be applied to the soldier's benefit in some other form.

Desertion is equally a crime when committed by a seaman of the royal navy as by a soldier. A sailor absent from three successive musters is a "runaway;" and when discovered and brought back, his punishment consists in a deduction of his wages. If his absence is continued, it amounts to desertion. All harboring of deserters by other persons is punishable. The year 1860 was marked by great and scandalous desertions from the royal navy; the cause is very obscurely known, but is generally referred to

some points of superiority in the merchant-service, which tempt the seamen away from their duty.

DESERTION OF SPOUSE. Before the passing of the divorce and matrimonial court acts, there existed in England no means whereby a wife, willfully deserted by her husband, could obtain redress. By 20 and 21 Vict. c. 85, and 21 and 22 Vict. c. 108, desertion by either spouse is made a ground of judicial separation, and desertion coupled with adultery is a ground for dissolution of marriage. The same acts make provision for the protection of property acquired by a wife who has been deserted. In such cases she can go before justices of the peace, who can make a protecting order. Since 1873, the divorce court is part of the high court of justice.

In Scotland, where the wife deserts the husband, she forfeits her claim to aliment; but in the event of her contracting debt for necessaries, the husband will be liable in payment unless he show that the tradesman was aware of the separation. It is said that she may claim her legal provision of terce on the husband's death, though she have deserted him. A husband deserting his wife continues liable to aliment her; and she can now obtain a similar protection order to that allowed in England, which has the effect of securing her earnings against the husband should he return. This order, however, can only be obtained in Scotland from the lord ordinary, and with greater difficulty and expense than in England, 24 and 25 Vict. c. 86, Fraser *On Domestic Relations*, 458, 680. See DIVORCE; JUDICIAL SEPARATION.

DESERTION OF THE DIET. See DIET, DESERTION OF.

DESFONTAINES, RENÉ LOUICHE, 1751–1833; a French botanist. He began the study of medicine in Paris, took his degree in 1783, and was elected to the academy. He went the same year to n. Africa, and spent some time in scientific explorations in Barbary, returning with a large collection of plants and objects in natural history. He was then appointed professor in the famous Jardin des Plantes, and made that place thenceforth his world. He escaped the perils of the revolution, although on two occasions he ventured from his retirement to rescue the naturalists Ramond and Lheritier from prison and probably death. At the establishment of the legion of honor, Desfontaines was admitted one of the members. At the age of 63 he married a young wife, but she soon died. In 1831, he became blind and could thereafter recognize his favorite plants by touch alone. He was the author of an important work on the flora of the Atlantic coast, and of many valuable essays on his favorite subjects.

DESFUL. See DIZFUL, *ante*.

DESHA, a co. in s.e. Arkansas on the Mississippi, and intersected by White and Arkansas rivers; 600 sq.m.; pop. '80, 8,973—6,523 colored. It is low and subject to inundation; productions agricultural. Co. seat, Napoleon.

DESHOULIÈRES, ANTOINETTE DU LIGIER DE LA GARDE, 1634–94; a French poetess, daughter of the chevalier de la Garde, mistress of the palace to the queens Mary de Medici and Anne of Austria. She won the friendship and admiration of the most eminent literary men of the age, some of whom gave her the title of "the Tenth Muse." Her writings embrace almost every form of verse, and included a number of dramatic pieces. Voltaire pronounced her the most successful of the female poets of France.

DESIC'CANTS, in medicine, are substances with astringent properties, which are serviceable in checking secretion and exhalation.

DESICCA'TION is the process of drying by the employment of heat, dry air, or chemical agents which have an affinity for water. Examples of the class of *desiccants* or drying substances are fused chloride of calcium, quicklime, fused carbonate of potash, and oil of vitriol. The latter is employed by being placed in a separate vessel near the substance to be dried, and under a bell jar.

DESIGN, a preliminary work, either in outline or color, in which the conception of the artist is indicated, and more or less fully expressed. The design ought to exhibit the whole composition and drawing of the work, though the last only in a general way. The design ought thus to be a correct, though not a complete representation of the future work. When colors are employed in a design, it is rather tentatively, and for the purpose of ascertaining what their effect will be, than with a view to actually producing the effect required. A sketch differs from a design, inasmuch as the former is generally applied to a first drawing from an object placed before the artist; the latter, to a first drawing of an object which he has imagined, either wholly, or in the attitude and combinations in which he represents it. In architecture, the term is applied to a drawing mathematically correct, but in which the effects to the eye which will ultimately be produced by distance and by light and shade, are altogether ignored. An architectural design is consequently scarcely intelligible on first sight.

Designing on wood for wood-cuts or engravings is now a distinct profession, followed by a class of artists. A design of this kind consists of a drawing in pencil on the wood, the effects being as closely as possible what the printed engraving is intended to represent. See WOOD-ENGRAVING.

DESIGN, GOVERNMENT SCHOOLS OF, the original designation of what are now officially termed "schools of art." The establishment of schools of design had for its object the training of designers and artisans in the principles and practice of the fine arts, with a view to the improvement of the artistic quality of our manufactures, by imparting, where requisite, more symmetry of form, harmonious arrangement of coloring, and general appropriateness of decoration. To Scotland is due the credit of having taken the lead in this matter, schools having been established at Edinburgh in 1760, "for teaching and promoting the art of drawing for the use of manufacturers, especially the drawing of patterns for the linen and woolen manufactures." In 1837, a central school of design was established at Somerset house in London, followed shortly afterwards by about twenty branch schools in important seats of manufacturing industry. These schools were at first placed under the control of the board of trade, and the education in art afforded by them was in a great measure restricted to students of the artisan class. This attempt, however, to circumscribe the action of the schools, gradually gave way to the admission of a more mixed element into their rôle of students; but no radical change took place in the management of these schools until 1852. The great exhibition of 1851, which brought to light the marked deficiency in the artistic element of British as compared with foreign manufactures, was no doubt the main cause of the subject of national art education being taken up with renewed vigor. About this time Mr. Henry Cole was made general superintendent, and to him may in great measure be ascribed the complete reorganization of the government scheme for national art education that soon followed. It was grounded on the conviction that in order to improve the artistic taste of our manufactures, the first step was to elevate the art education of the people at large. For this end it was to be brought into closer alliance with the system of general education. A national art training-school for educating art-teachers was instituted at Marlborough house. The nucleus of an industrial museum was also formed there, the government granting a fund of £5,000 for the purchase of specimens of industrial art from the great exhibition collection. Such was the comparatively humble origin of its wealthy and magnificent successor, now established at South Kensington. From this date a rapid increase took place in the establishment of schools of art, which now number more than 120, situated all over the country; besides this, a comprehensive system of art-teaching is carried on in other educational institutions. The following is a summary of the official arrangements for promoting this work, abridged from the *Science and Art Directory*, 1875, of the committee of council on education, South Kensington:

"*Establishment of a National Art Training-school.*—A central school, for the benefit of the United Kingdom, is established at South Kensington for the training of art masters and mistresses, and for the training of students in drawing, designing, and modeling, to be applied to the requirements of trade and manufactures. A limited number of students are received into training as art-teachers, receiving a maintenance allowance, which is proportionate to their attainments and the certificates of qualifications obtained by them; in return for which they may be required to perform certain duties as teachers, and must engage to accept the situations to which they are recommended.

"*National Art Scholarships.*—A limited number of duly qualified students from the local schools of art, who may have given evidence of special aptitude for design, are eligible for appointments to national scholarships in the national art training-school, with weekly allowance for maintenance: these appointments are for one year only, but in cases of marked proficiency they may be renewed for a second year.

"*Aid to Schools of Art, etc.*—The department will aid the instruction given in schools of art, when under the direction of a local committee of not less than five well-known responsible persons, and instructed by teachers holding one or more art certificates of the third grade, provided that day classes be held, and that artisan night classes are taught at least three times in each week for two hours. A system of payment on results of teaching is made, on account of persons of the industrial classes, teachers, or their children above twelve years of age, who pay fees for their instruction. In a similar way the department gives aid to the teaching of drawing in art night classes to artisans, in elementary day schools, and training colleges for teachers.

"*Annual Examinations.*—At the close of April or beginning of May in each year, a competitive local examination in drawing is held in all the schools of art on two consecutive evenings, conducted by means of examination papers supplied by the department, the subjects given being free-hand and model drawing, practical geometry and linear perspective, certificates and prizes being awarded to the successful competitors. The works of the students from all the schools of art are annually transmitted to the department in April for inspection, prizes being awarded to the most meritorious.

"*National Competition.*—The best of the more advanced of the above works are selected to compete with each other in this competition, which is annually held at Kensington in the month of May. The prize list for awards in this competition includes 10 gold, 30 silver, and 60 bronze medals. Additional prizes of works of art, books, etc., are also awarded.

"*Prizes to Art Masters.*—Monetary prizes are awarded annually, to the head-masters of schools of art, for the most satisfactory results in teaching.

"*Circulation of Books and Examples.*—The art library and collections of decorative

art, etc., at S. Kensington are as far as possible made available for the purposes of instruction of schools of art.

"*Grants for New Buildings, and Purchase of Examples.*—In aid of new buildings to be adapted for schools of art, a grant not exceeding 2*s.* 6*d.* per superficial foot of internal area is made, up to a maximum of 4,000 feet. Grants of 75 per cent are made towards the cost of art examples selected from lists approved by the department, on behalf of art schools, mechanics' and other educational institutions."

DESIGNS, COPYRIGHT IN.—Designs for articles, whether of ornament or utility, are protected by various statutes. Of these, the most important are the act to consolidate and amend the laws relating to the copyright of designs for ornamenting articles of manufacture, of 1842 (5 and 6 Vict. c. 100), etc., to 24 and 25 Vict. c. 73. By the 21 and 22 Vict. c. 70, the protection which the former had granted for nine months, is extended to three years, to be computed from the time when the design was registered. By section 5, it is provided that the registration of any pattern or portion of an article of manufacture to which a design is applied, instead of, or in lieu of, a copy, drawing, print, specification, or description in writing, shall be sufficient. The copyright is only acquired where there was no previous publication except such as takes place at an exhibition (33 and 34 Vict. c. 27). The other statutes are 6 and 7 Vict. c. 65, 13 and 14 Vict. c. 104, 38 and 39 Vict. c. 93, and 24 and 25 Vict. c. 73. By the last-mentioned statute, the application of the design to articles of manufacture need not be done within the United Kingdom, as was the case under the first act, but the protection of the act applies generally, and whether the inventor or proprietor of the design be a British subject or not.

DESIGN, SCHOOLS OF (*ante*), institutions where the arts of ornamental and mechanical drawing are taught. They are numerous in the United States. One of the oldest is the "National Academy of Design," founded 1828, in New York, whose annual exhibitions of paintings (April to July) are well known. Another, entirely free to all students, is in the Cooper institute in the same city. In the public school system of Massachusetts free instruction in drawing is provided.

DE'SIO, a t. of n. Italy, province of Milan. It is a well-built town, surrounded with gardens and vineyards, and has a fine hospital. Pop. 5,500.

DESIRA'DE, or DESIDERA'DE, or DESËA'DA, the first of Columbus's discoveries during his second voyage, lies about 4 m. to the e. of Guadeloupe, of which, under France, it is a political dependency. It measures 6 m. by 2, and contains (1871) 1637 inhabitants, chiefly emancipated slaves. The surface is elevated in proportion to the area, and the soil, though not generally fertile, is yet said to yield excellent cotton.

DESMAN. See MUSK RAT.

DESMIDIEÆ, according to the prevalent opinion of naturalists, a tribe or group of *algæ*, and as such ranked by some botanists among *diatomaceæ* (q.v.); whilst other naturalists regard them as belonging to the animal rather than to the vegetable kingdom, some also esteeming them to be vegetable who maintain the animal character of the true *diatomaceæ*. They are amongst those lowest organisms which seem to connect the animal and vegetable kingdoms at their common starting-point. The D. are readily distinguished from the true *diatomaceæ* by their rounded, not angular form, and by their want of silicious covering; also by their color, which is a herbaceous green, whilst the *diatomaceæ* are generally brownish. Unlike the *diatomaceæ*, they shrivel up, and lose their form in drying. They are, like them, microscopic, but are usually found in stagnant or very slowly running water, sometimes in brackish, but never in salt water. They may often be procured in great numbers, by pouring the water in which they exist upon a cloth; and if the cloth is kept moist, they will live for a long time, and their progress may be observed. They all exhibit a transverse constriction, sometimes not very distinct, but often almost dividing the single cell which forms the organism into two parts. It is at this constriction that new cells are formed; but this process ceases after a while, and a true reproduction takes place by spores, either through conjugation (q.v.) or swarming (q.v.). It is very much on account of these modes of reproduction, and of the presence of starch in the D., that they are confidently referred by naturalists to the vegetable kingdom. Our knowledge of the D. has been much extended by the work of Mr. Ralfs on the *British Desmidieæ*.

DES MOINES, a co. in s.e. Iowa, on the Mississippi, drained by Flint river, and intersected by three railroads; 408 sq.m.; pop. '80, 33,099. It has a prairie and forest surface, with fertile and well cultivated soil. Agriculture is the chief occupation. Co. seat, Burlington.

DES MOINES, a city, the capital of Iowa, in Polk co., at the head of steam navigation on the Des Moines river, and the Chicago, Rock Island, and Pacific, and Des Moines Valley railroads; pop. '75, 16,130. The city is regularly laid out, on both sides of the river, on a plateau 15 or 20 ft. above the water. In the rear is much higher ground, on which are many fine residences. There are public buildings of importance, including the new state-house (estimated cost $3,000,000); more than 20 churches, 3

national banks, 3 daily and 7 weekly papers, and extensive manufactories. It was chartered and became the capital of the state in 1855. Pop. '80, 22,408.

DES MOINES RIVER, the most important stream in Iowa, rising from a chain of lakes in Minnesota. It runs through about the center of the state and joins the Mississippi a little below the city of Keokuk. In its course of 300 m. it drains more than 10,000 sq.m. of fertile territory.

DESMON'CUS, a genus of palms, with slender stems, climbing over shrubs and trees, like the rattans (*calamus*) of the East Indies. They are the only American palms of this character. They have alternate pinnate leaves, with long hooked spines, instead of several of the uppermost leaflets, which make them very formidable to those who attempt to penetrate the forests where they grow. The species are pretty numerous, and all American.

DESMOULINS, CAMILLE, one of the prominent personages of the French revolution, was b. in 1762 at Guise, in Picardy; studied law at the Collége Louis-le-Grand, Paris; but on account of a stutter in his speech, did not prosecute the profession. His mind was filled with lofty but confused notions of classical republicanism, which found vent on the eve of the revolution in his *La Philosophie au Peuple Français* (Par. 1788), and *La France Libre* (Par. 1789). To his exaggerated denunciation was owing that outburst of popular fury which resulted in the destruction of the Bastile on the night of the 14th July, 1789. In the events of the Champ de Mars, Aug. 10, 1792, D., like his friend Danton, took a leading part, but was less implicated in the Sept. massacres. Elected to the national convention by the people of Paris, he voted for the death of Louis XVI. His relation to Danton, which had always in it something of dependence, induced him to take up the pen against the Girondists, and in his *Histoire des Brissotins*, he covered these moderate republicans with ridicule. In this, however, D. was not quite sincere, for many of the Girondists he highly esteemed, and he was himself by nature much more like Vergniaud and Brissot than like Robespierre and St. Just. When the guillotine was erected, D. saw his error, and bitterly repented his facile folly. Towards the end of 1793, he began to publish *Le Vieux Cordelier*, a journal which recommended, among other things, that the forms of justice should be restored, and attacked the members of the *Comité de Salut Public*. Twice accused before the Jacobin club, he was at length, on the night of the 30th Mar., 1794, along with Danton, arrested, and brought before the revolutionary tribunal. When asked his age, D. replied: "J'ai l'âge du sans-culotte, Jésus, c'est-à-dire trente-trois ans, âge fatal aux révolutionnaires." He was condemned without a hearing, and mounted the scaffold along with Danton, April 5, 1794. His wife, the beautiful Lucile Duplessis, vainly endeavored to excite an insurrection in his favor, and a fortnight after, she also was executed.—D. was essentially an enthusiast and hero-worshiper, always leaning for support on some stronger spirit than his own. His first idol was Mirabeau, after whose death he devoted himself to Danton. His aspirations were noble, his sympathies magnanimous, but he had neither sufficient moral resolution to oppose the political excesses of the popular party, nor even, until the close of his career, sufficient insight to assure him of their injustice and folly. Gifted abundantly by nature, as the light-hearted Camille was, with wit, fancy, and feeling, one cannot help regretting that he did not live in less troublous times, when he might have given to the world, in the form of poesy or fiction, the treasures of his rich and sparkling genius.

DESNA, a river of Russia, rises in the government of Smolensk, 50 m. s.e. of the t. of that name. It flows s.e. through the governments of Smolensk and Orel, until it reaches Briansk, where it enters the government of Tchernigov, through which it flows s., then s.w. to the town of Tchernigov, and finally joins the Dnieper nearly opposite Kiew. The D. is 500 m. in length, and is navigable throughout almost the whole of its course. Its chief affluents are the Seim, from the left, and from the right, the Snov.

DE SOTO, a parish in n.w. Louisiana, on the Texas border, drained by Red and Sabine rivers; 910 sq.m.; pop. '80, 15,605—10,490 colored. Corn and cotton are the chief productions. Co. seat, Mansfield.

DE SOTO, a co. in n.w. Mississippi on the Tennessee border and the Mississippi, and crossed by the Mississippi and Tennessee railroads; 960 sq.m.; pop. '80, 22,934—15,344 colored. The surface is level and much of it swampy. Productions, wheat, corn, cotton, and butter. Co. seat, Hernando.

DE SOTO, FERDINANDO, 1496–1542; one of the early Spanish explorers of North America. He distinguished himself when young in literary studies and athletic exercises. In 1519, he accompanied Pedrasias Davila, his patron, to the isthmus of Darien, and was a most daring and independent opponent of the tyrannical rule of that officer, who was afterwards governor of Darien. Leaving Davila's service, in 1528, he explored the coast of Guatemala and Yucatan, seeking for a supposed water communication between the Atlantic and Pacific. In 1532, he was in Pizarro's expedition for the conquest of Peru, and used all his influence with the Spanish butcher to prevent the murder of the Peruvian king. Having amassed a fortune, De Soto returned to Spain and married Davila's daughter. In 1536, moved by the reports of the mystical El Dorado, he undertook the conquest of Florida, and sailed in April, 1538, with 20 officers, 24 priests, and 600 men.

May 25, 1539, he landed at Tampa bay, and followed the track of Narvaez, a former Spanish invader. In July, 1539 his ships were sent back to Havana. In 1540, he slowly worked westward, having many conflicts with the Indians. His second winter was spent in the Chickasaw country. These Indians, in the spring, burnt his camp and their own villages, because he attempted to force them to carry his baggage, and 40 of his men were burnt to death. After several days of marching mainly through swamps he reached the Mississippi, June, 1541, being the first European to look upon that mighty river. He constructed rude barges and crossed over, marching towards the highlands of White river, the w. limit of his exploration. Turning s. and passing the hot springs of Arkansas, he passed his third winter on the Washita river. In the spring he moved down the Washita to the Mississippi; and was marching along the latter river when he was taken with fever and died either in May or June, 1542. To keep the knowledge of his death from the natives, his body was sunk at night in the middle of the river His wife died at Havana on the third day after hearing of his fate.

DESPOT AND **DESPOTISM.** A despotism is a form of government which has for its object the interests either of an individual or of a class, to the exclusion of those of the whole community. In the former case, it is usually called a tyranny, which is the degenerate form of monarchy; in the latter, it may be either an oligarchy, which is the degenerate form of aristocracy, or an ochlocracy, which is the degenerate form of democracy. A despot is the individual or class in whose favor and for whose benefit such a government is carried on. A despot may thus include any number of persons, from unity upwards—from a monarch to a mob. Much of the confusion which attends political speculation, and many of the disasters which befall political life in modern times, would be obviated, if these terms were used in the strictly scientific sense which was assigned to them by the Greek politicians more than 2,000 years ago. See MONARCH, TYRANT, DICTATOR.

DESSAIX, JOSEPH MARIE, Count, 1764–1834; a gen. in the French service, who studied and began to practice medicine in Paris, but went to Savoy in 1791, where he formed a democratic association, and became a capt. of volunteers. He was actively engaged at the siege of Toulon, and served under Napoleon in Italy. He was one of the council of 500 of 1798, and opposed the *coup d'état* of the 18th Brumaire. He was made a brig.gen.; and, in the campaign against Austria, gen. of division. Napoleon gave him the title of "the intrepid," and the dignity of a count of the empire. He was appointed commander of the national guards at Lyons, after the revolution of 1830.

DESSALINES, JAQUES, some time emperor of the island of Hayti (St. Domingo), was imported into that island from the gold coast of Africa as a slave. On the liberation of the slaves, 4th Feb., 1794, he became one of the most prominent among the negroes who rose in insurrection against the white colonists. After the organization of the insurrection, D. occupied the position of 1st lieut. to the leader Toussaint l'Ouverture; and in the wars against the French troops, was always distinguished by his agility and swiftness of movement, as well as by his fearlessness and ferocity. D. submitted, however, and took advantage of the amnesty granted on the capture of Toussaint in 1802; but shortly after, he headed another insurrection, attacked the French forces, defeated them in the battle of St: Mark, and compelled them to evacuate the island in Oct., 1803. He was created governor in Jan., 1804, when the people of the island declared themselves independent, and had himself crowned as emperor of Hayti, 8th Oct. of the same year, under the name of Jaques I.; but his despotism and cruelty soon alienated from him the sympathy and support even of those who were formerly his firmest adherents. On the 17th of Oct., 1806, D. was attacked and killed by Christophe, a negro chief, who succeeded him as emperor Henri I. of Hayti.

DESSAU, a t. of northern Germany, and capital of the duchy of Anhalt, is situated on the left bank of the Mulde, not far from its junction with the Elbe, about 80 m. by railway s.w. of Berlin. The country round the town is pleasant and is very industriously cultiva ed. D. consists of three parts, the old and new town, and the Sand, and it has besides three suburbs. It is, in general, well built, and one or two of the streets are particularly handsome. Among the principal buildings are the ducal palace, a noble structure, built in 1748, with a picture-gallery, and a library containing many MSS. of Luther; a town-hall, an elegant theater, and several churches and benevolent institutions. Its educational establishments are numerous and excellent. It has a fine cemetery, and the environs are surrounded by beautiful gardens. The manufactures are woolen cloth, hosiery, tobacco, and spirits. Pop. '75, 19,621.

DE STAËL. See STAËL-HOLSTEIN, *ante.*

DESTER'RO, NOSSA SENHORA DO DESTERRO, or SANTA CATHARINA, a port of Brazil, the most important town in the province of Santa Catharina, on the w. coast of the island bearing the same name; 27° 30′ s., and 48° 30′ w.; pop. 8,000. It is strongly fortified; its harbor is excellent, and it has some foreign commerce. It is well laid out, but poorly built.

DESTUTT DE TRACY, ANTOINE LOUIS CLAUDE, Count de Tracy, 1754–1836; a French statesman, member of the provincial assembly of the Bourbonnais, and appointed delegate of the nobility to the states-general in 1789. He was a leader of reform meas-

ures. In 1792, he joined the army under Lafayette and followed him over the frontier. Returning secretly to France, he was arrested and imprisoned. After the revolution, he was made a senator. He voted for the overthrow of the empire in 1814, but opposed reactionary measures. He adopted the views of Condillac, and became an earnest materialist. He wrote, among other works, a *Commentary on the Spirit of the Laws*, which was translated by president Jackson for a text-book.

DESUETUDE, a technical term in the law of Scotland, signifying that repeal or revocation of a legal enactment which is effected, not by a subsequent enactment in a contrary sense, but by the establishment of a contrary use, sanctioned by the lapse of time and the consent of the community. The corresponding term in English law is *nonuser;* but neither the word nor the idea attached to it is familiar to that system. The rule in England is, that a statute once formally enacted by the legislature, remains in force, however unsuited it may be to the altered conditions of society, till it be repealed by another statute. The repeal may be by implication, but here the law watches with a jealous eye. Such repeal "is to be understood," says Blackstone, "only when the matter of the later statute is so clearly repugnant that it necessarily implies a negative. As, if a former act says that a juror upon such a trial shall have an estate of 20 pounds a year; and a new statute afterwards that he shall have 20 marks—here the latter statute virtually repeals the former." So far was this principle carried, that it was formerly the rule, that if a statute repealing another was itself repealed afterwards, the first statute was revived without any formal words for that purpose. But this rule has been changed by 13 and 14 Vict. c. 21, s. 5 and 6, which enact that where any act repealing, in whole or in part, any former act, is itself repealed, such last repeal shall not revive the act or provisions before repealed, unless words be added for that purpose: and that where any act shall be made, repealing in whole or in part any former act, and substituting provisions instead of those repealed, such repealed provisions shall remain in force till those substituted shall come into operation by force of the last made act. In Scotland, an opposite principle prevailed, and it is still held that acts of parliament made before the union may lose their force by disuse, without any express repeal, or "go into desuetude," as it is commonly said. But by D. is meant something more than mere non-use for a period of time, however great. There must be contrary use of a positive kind, inconsistent with the statute, and of such a kind as to prove the altered sense of the community; there must, in short, be consuetudinary law in a negative sense; and the so-called D. thus amounts to a repeal of statute law by consuetudinary law. Both rules are liable to objections. The result of that followed in England has been, that statutes have remained on the statute-book without formal repeal, after their enforcement had become morally impossible. Of this it may be mentioned, as one single example, that the judicial combat was formally demanded in virtue of an unrepealed statute, and had in point of form to be conceded in the present century. See DUEL. But, since 1869, the English statutes have been weeded of all obsolete and inconsistent enactments, and a new edition has been published by authority, containing only such parts as are in force. The rule in Scotland is entirely the same as the English as to all statutes made since the union; but as regards the older Scotch statutes, the difficulty still exists in dealing with enactments more or less forgotten or violated, and in determining what constitutes such contrary use as to support the plea of desuetude. The best arrangement is now adopted, whilst retaining the Scottish rule as correct in principle, to endeavor, by purging the statute-book of all obsolete enactments, to render its practical application as limited as possible.

DETACHMENT, in military matters, is a small but indefinite number of troops, sent for some special duties away from the regiment, brigade, division, or army, as the case may be. In a fleet, also, a D. of one or more ships may be told off in a similar way.

DETERMINANTS, the name given to a new method of great use, *inter alia*, in the solution of equations embracing several unknown quantities, whereby the student can almost on inspection write down the values, in terms of the known quantities, of each of the unknown.

DETERMINATE PROBLEM, in geometry, a problem of a limited number of solutions; as: "Given the base, perimeter, and area, to construct a triangle." For this there are four general solutions. But if either of the three propositions be omitted, it becomes indeterminate.

DETINUE, in English law, an action for the recovery of goods wrongfully detained, or their value, with damages and costs. The action is for the recovery of a specific article; the goods detained must, therefore, be of such a character that they can be distinguished from others, as a horse, money in a bag, etc. In this respect, the action of D. differs from an ordinary action at law, and judgment in D. is accompanied by its special remedy for enforcing execution—called writ of *distringas*. There must actually be a title of property in the plaintiff at the time he brings his action; but property without possession is sufficient, and an heir can thus bring his action for an heirloom which has never been in his possession. This action was formerly subject to *wager of law* (q.v.), now abolished, whereby the defendant was allowed to clear himself by his own oath, supported by that of eleven neighbors. This proceeding rendered the action of D. so

inconvenient, that, by a fiction of law, remedy for wrongful detention was most frequently sought by the action of *trover* (q.v.).

DETMOLD, a t. of north-western Germany, on the Werre, capital of the principality of Lippe-Detmold, 47 m. s.w. of Hanover, consists of an old and new town, the latter of which is well built, and adorned with public walks and gardens. The chief buildings are the palace, a fine old castellated edifice, the gymnasium, and the theater. D. has also a training-school, a public library, and a hospital. The manufactures are leather, woolens, and linens. There are also several breweries. On the Grotenburg, about 2 m. from D., is a colossal copper statue of Hermann (q.v.). Pop. '75, 6,982.

DETONA'TION is the phenomenon of combustion with explosive rapidity, accompanied by sound and light. Thus the firing of gunpowder, gun-cotton, and fulminating powders, as in a percussion-cap, is detonation.

DETRI'TUS, applied in geology to accumulations formed by the disintegration of rocks, which consist of gravel, sand, or clay, or of an admixture of them.

DE TROBRIAND, PHILIP REGIS, b. France, 1816; a man of letters, long resident of the United States. In the war of the rebellion he was an officer on the union side, and became brevet-brig.gen. in the United States army. He has written a number of works in French, including *Four Years in the Army of the Potomac*. From 1854 to 1861, he was editor of the *Courrier des Etats Unis*, the leading journal in the French language in the United States.

DETROIT (French for strait) is that part of the St. Lawrence which discharges lake St. Clair into lake Erie. With a s.s.w. course, it forms the lowest section of that mighty body of waters before it assumes its n.e. direction towards the gulf of its own name. It is about 28 m. long, with a minimum breadth of fully half a mile. Though the middle of its length is barely above the 42d parallel—about 550 m. to the s. of any point in England—yet it is frost-bound for about four months in the year. It is navigable for vessels of any burden, the deeper channel being on the Canadian shore.

DETROIT, the chief city of Michigan, the oldest city by far in the w. of the United States, and older than either Baltimore or Philadelphia on the seaboard, was founded by the French of Canada in 1670, as an outpost for the prosecution of the fur trade, on the right bank of the river of its own name. For more than a century and a half, however, the advantages of its position were rather prospective than actual. The settlement of the adjacent wildernesses was so slowly carried into effect, that Michigan, of which D. was the capital, continued to be a subordinate territory, as distinguished from a sovereign state, from 1805 to 1837. Accordingly, as late as 1830, the place contained only 2,222 inhabitants. But in 1840, the pop. had risen to 9,102; in 1850, it was 21,019; and in 1870, 79,577. According to the official returns of the United States, the value of the imports in the year ending June 30, 1874, was $1,450,072 (£290,014), and of the exports $3,293,440 (£658,688). In 1875, the assessed value of real estate amounted to $90,000,000, or £18,000,000. D. has 34 newspapers and periodicals, of which 8 are issued daily. Besides a net-work of navigable communications, which, with the aid of art, has added the open ocean and the gulf of Mexico to the St. Lawrence, D. is a center from which 8 railways radiate. Eight lines of street-railway, with 40 m. of track, intersect the city. Among the chief buildings are the city hall, 200 ft. long, and 180 ft. high to the top of the tower, completed in 1871, at a cost of $600,000; the opera-house; and the custom-house. D. has a well-organized system of public schools, and possesses 64 churches, of which the largest is the Roman Catholic cathedral. It is supplied from the river with water, which is forced into a reservoir 50 ft. high. The manufactures are extensive and important, consisting of steam-engines, machinery, stoves, cabinet-ware, bricks, tobacco, etc. Brewing and tanning are also largely carried on.

DETROIT (*ante*), the most populous city of Michigan, and the capital of Wayne co., on the w. bank of the Detroit river, about 18 m. from lake Erie and 7 m. from lake St. Clair. The site is sufficiently elevated above the river to afford excellent facilities for drainage, which have been thoroughly improved. The river, which is the dividing line at this point between the United States and Canada, is half a mile wide and over 30 ft. deep, forming the best harbor on the lakes. The city extends 6 or 7 m. along the bank of the river and from 2 to 3 m. back from it. The river front is lined with warehouses, mills, foundries, grain elevators, railway stations, shipyards, dry docks, etc., the signs of an enterprising and thriving community. Fort Wayne, a mile below, commands the channel. The site of the city was visited by the French early in the 17th c., but no permanent settlement was made by them until 1701. Sixty-two years later, in 1763, at the close of the war between England and France, it fell into the possession of the English. Immediately after this, Pontiac, the great Ottawa chief, made a desperate but unsuccessful effort to expel the whites from all that region. In 1778, Detroit contained only 300 inhabitants, living for the most part in log huts. A Roman Catholic church had survived from the days of the French possession. The British, in 1778, erected a fort, which, after the Americans gained possession, became Fort Shelby. At the peace of 1783, Detroit became a part of the United States, but the Americans did not take possession until 13 years later. The place was wholly destroyed by fire in 1805, and two years afterwards the present city was laid out. In the war of 1812 it was surrendered

by gen. Hull to the British, but recovered by the Americans after the battle of lake Erie in 1813. It was incorporated as a village in 1815, as a city in 1824. It was the seat of government of the territory of Michigan from 1805 to 1837, and of the state of Michigan from the latter date till 1847. The plan of the city is not altogether harmonious, but the streets are broad and well paved and lighted, many of them lined with beautiful shade trees. The avenues are from 100 to 120 ft. wide. Many of the business structures are large, solid, and imposing, and there are many elegant and costly private residences. The city has had a very rapid growth, the population increasing from 770 in 1810 to 79,750 at the last census, when there were 15,639 families and 14,688 dwellings. Of the 79,570 inhabitants, 35,381 were of foreign birth, and 2,225 colored. The larger portion of the foreigners were Germans. The principal park of Detroit is the "Grand Circus," and it is the center from which the principal avenues radiate. The plan of the city leaves a number of small triangular parks, where the streets intersect each other at oblique angles. The "Grand Circus" is semicircular and divided by Woodward avenue into two parts, each adorned with a fountain. The "Campus Martius" is a plot of ground 600 ft. long and 250 wide, crossed by two avenues. Facing it on one side is the city hall, a fine structure of sandstone, 200 ft. in length by 90 ft. in width, which cost $600,000. In front of the city hall is a monument to the soldiers of Michigan who fell in the war of the rebellion; and facing the Campus Martius on the n. is an opera house, a large and fine building. The United States custom-house and post-office, a large building of stone, is on Griswold street. The largest church edifice is the Roman Catholic cathedral, but there are several of other denominations which are fine specimens of architecture. The Roman Catholic convent of the Sacred Heart is a large and handsome structure. The Michigan Central freight depot is 1250 ft. long and 102 ft. wide—a single room, covered by a self-supporting roof of iron; and near it stands a grain elevator with cupola, commanding a fine prospect. The house of correction is also a very handsome building, erected at a cost of $300,000, with a capacity for 450 inmates. There are two beautiful cemeteries, one on the w., the other on the e. side of the city; and besides these several smaller ones belonging to different religious sects. Nearly a dozen lines of street railroad intersect the different parts of the city, and ferry-boats ply constantly between it and Windsor on the Canada side of the river. There are numerous lines of steamers with elegant and commodious boats running to different points on the lakes. Eight great lines of railroad center here, connecting Detroit with all parts of the United States and Canada. The foreign commerce of the city is almost exclusively with the adjoining British possessions. For the year ending June, 1873, the exports amounted to almost $3,000,000, the imports to about $2,000,000. In the second year there were entered and cleared 1949 American and 1522 foreign vessels, with a capacity of about 8,000 tons. The coasting trade in the same year, by steam and sailing vessels, amounted to over 773,000 tons. The number of sailing vessels belonging to the port was 188, of steamers 120. The exports for the most part consist of corn, oats, wheat, lumber, cotton, hogs, bacon, and lard. Large quantities of domestic produce, from Michigan and states farther west, pass eastward through D., the chief articles being flour, wheat, corn, oats, barley, apples, butter, hides, hops, dressed hogs, pork, beef, wool, and sheep. The trade in lumber is very large, the receipts in 1872 being 76,947,000 ft., of which less than 5,009,000 ft. was from Canada. About 60,000 cattle, valued at about $2,500,000 were sold in D. in the same year. The manufactures have developed rapidly and are very extensive. There are numerous foundries and blast-furnaces, copper-smelting works, locomotive and car works, safe factories, furniture establishments, iron-bridge works, brick-yards, flour-mills, tanneries, breweries, distilleries, and tobacco and cigar factories. The capital invested in banks of discount was $2,250,000 and there were 4 savings banks with deposits of about $400,000. There are also fire, marine, and life insurance companies doing an extensive business. The cash value of property in 1872 was estimated at $78,718,913. The police and fire departments are well organized. The city is abundantly supplied with water from the Detroit river by works valued at $1,221,752. Hospitals and asylums abound. The public schools are well organized and efficiently managed. The Roman Catholics and some of the Protestant sects have schools of their own. The Detroit medical college was organized in 1868, the homœopathic college, 1871. The public library contains 25,000 volumes; that of the young men's society 12,000; that of the mechanics' society 4,000. There are in the city 8 daily papers (3 of them German), 3 tri-weekly, 14 weekly, 7 monthly. There are 64 churches, of which 9 are Roman Catholic, the others being divided among the various denominations, of which the Baptists, Methodists, Presbyterians, and Lutherans are most prominent.

DETTINGEN, a village of Bavaria, circle of lower Franconia, on the right bank of the Maine; noted as the scene of a battle during the Austrian wars of succession. This conflict, in which George II. of England headed the army of the allies, while the duke de Noailles acted as commander of the French forces, took place on the 27th June, 1743, and was the last occasion in which a king of England appeared in person on the field. The army of the allies was composed of English, Hanoverians, Hessians, and some troops from the Low Countries, amounting in all to an active force of 37,000 men; while the French leader Noailles had an army of about 60,000. The former occupied

valley extending from Aschaffenburg to Dettingen. Before the fight, Noailles threw 12,000 men into Aschaffenburg, and so made it impossible for his opponents to retreat with safety. The defile of D. in front of the allies was also held by De Grammont with 25,000 men, while Noailles himself, shifting his position on the Maine, so as to command with his batteries the flank and rear of the allies, rendered their position so critical that George resolved to force his way through the enemy. It was his only chance; and fortunately for him, De Grammont rashly and foolishly left his position, rushed over the morass and rivulet in his front, and engaged. At this moment, George, dismounting, placed himself at the head of the British and Hanoverian infantry, flourished his sword, and shouted: "Now, my boys, for the honor of England! fire; behave well; and the French will soon run!" Shock after shock from the impetuous French horse broke on the steady lines of infantry in vain, and at length George, forming his infantry into one solid column, advanced. Onward went the column, dense, steady, and overwhelming, breaking the squadrons of De Grammont, and driving horse and foot before them, until the enemy broke into promiscuous and bewildered retreat. Noailles's reserves were too late to be of any use: the allies had won the day. Many of the French were driven into the Maine, and so drowned; some were killed in the pursuit, which, however, was not prosecuted to any great extent. The loss of the French, in killed, wounded, and prisoners, was estimated at 6,000, and that of the allies at 2,000 men.

DETVA, a t. in the n.w. of Hungary, is situated in a deep valley, 20 m. e. of Altsohl. Pop. 31st Dec., 1869, 10,035.

DEUCA'LION, according to the Greek myth, was a son of Prometheus, grandson of Iapetus, and husband of Pyrrha. When Zeus had resolved to destroy the race of men by a flood, D. built and provisioned, by the advice of his father, an ark or ship, which he entered along with his wife. The flood came, and all Hellas was submerged. D. floated about for nine days, and on the subsidence of the waters, the ark rested on Mt. Parnassus. Other versions of the myth, however, make it rest on Mt. Othrys in Thessaly, on Mt. Athos, or on Mt. Etna in Sicily. D. and Pyrrha, according to one account, now offered up sacrifice to Zeus *Phyxius*, i.e., Zeus, the protector of fugitives, and prayed that he would repeople the world, which he did; but the more common tradition was, that they went to the sanctuary of Themis for this purpose, and were told by the goddess that they must throw behind them the bones of their mother as they departed from the temple. Understanding by the "bones of their mother," the stones of the earth, they obeyed the injunction, and from those thrown by D. sprang up men, and from those by Pyrrha, women. D. built his first dwelling-place at Opus or Cynus. He is also said to have founded the sanctuary of Olympian Jove at Athens, and in later ages his tomb in the vicinity was long pointed out. D. had by Pyrrha several children, Hellen, Amphictyon, Protogeneia, and others. It was at one time extensively believed, even by intelligent scholars, that the myth of D. was a corrupted tradition of the Noachian deluge, but this untenable opinion is now all but universally abandoned. The myth is a comparatively late one, being mentioned neither by Homer nor Hesiod.

DEU'EL, a co. in e. Dakota, on the Minnesota border, as yet unsettled. It is watered by a number of lakes, and by affluents of the Big Sioux and Minnesota rivers. Pop. '80, 2,302.

DEUS EX MA'CHINA, an expression borrowed from the classical theater. In conformity with the popular mythological beliefs of their age, the tragic poets of Greece, instead of bringing about the dénouement of their plots by natural means, had often recourse to a more expeditious mode—viz., the intervention of a god, who descended in a machine, and abruptly solved whatever difficulty barred the proper termination of the piece. As examples of the *Deus ex Machina*, take the appearance of Hercules in the *Philoctetes*, and of Diana in the *Iphigenia in Tauris*. In modern tragedy, when a person or incident is introduced arbitrarily, *forced*, as it were, into the conduct of a plot, merely to remedy some inartistic negligence in its construction, or to save the author the labor of further ingenuity, such a contrivance is metaphorically called a *Deus ex Machina*. In modern comedy, the rich old uncle who suddenly comes home from the West Indies, and rescues the young couple (hero and heroine) from their dreadful pecuniary embarrassment, serves exactly the same purpose. When a savant or philosopher cannot explain some fact of nature by any known law, and has recourse to the supposition of the direct and immediate action of God, his assumption is also termed by analogy a *Deus ex Machina*.

DEUTERON'OMY (Gr. *Deuteronomion*, i.e., the second law) is the name given by the Septuagint translators to the 5th book of the Pentateuch, because it contains a repetition of the laws which had been already promulgated. It is commonly presumed to have been written by Moses himself, with the exception of the last four chapters, which narrate the closing events in the life of the great law-giver. Many critics, however, affirm that the entire book itself in its present form is post-Mosaic. The repeated allusions to the kingdom, the prophethood, the temple at Jerusalem, places in Palestine which Moses never saw, and could not have known, as well as various other particulars far too numerous to specify, are held to render it probable that D. is a late rescension and enlargement of some Mosaic abridgment of the previous portion of the Pentateuch.

Even in regard to the legislation, it differs materially from the Sinaitic code contained in the previous books. There are not only *deviations* from the latter, but also *additions* and *discrepancies*, suggesting another hand. The language, too, has late peculiarities. Ewald, Riehm, Bleek, Davidson, etc., fix the date of its composition about the middle of the 7th c. B.C.—See Davidson's *Introduction to the Old Testament*, vol. i., pp. 341–408.

DEUTERONOMY (*ante*) is the English title of the fifth book of Moses, derived from the Greek translation, and signifying "repetition of the law." It well expresses the general scope of the book, which is a review of the 40 years in the wilderness, including the laws which had been given, and the events which had occurred. Whatever may have been the time occupied in writing it, the uttering of it to the people began two months before the end of the 40th year. To the arguments advanced by some writers that it was not written by Moses, the following answers (among others) have been given: 1. These writers are not agreed among themselves. The older of them affirm that D. was written long after the other books of the Pentateuch; the newer school pronounce it the quarry from which the materials of the others were taken. This conflict of opinions at least precludes the assertion that its style betrays its late origin. 2. The alleged anachronisms, discrepancies, and difficulties admit, for the most part, of easy and complete explanation on the supposition that Moses was the author. 3. The unanimous and unwavering testimony of the ancient Jewish church and nation is that Moses was the author of the book. This is testimony against themselves, as it involves the admission that their sufferings as a nation were divine judgments on their sins. Consequently, their possession of the book and acknowledgment of it as a writing of Moses can be rationally accounted for only on the supposition that the generation in the wilderness received it from his hand. At no subsequent period could it have been imposed on them as a law which had been given them in the wilderness, under acknowledged obligation to which they had always lived, and for the transgression of which they had been punished in the past, and would be in the future. And as no generation, after the settlement in Canaan, could have been persuaded to receive it for the first time, so to every subsequent generation the temptation became stronger, if it were possible, to deny and reject its authority. 4. It had, in a remarkable manner, the attestation of the apostles and of Christ. Peter and Stephen quoted from it to large assemblies of Jews, as truly the words of Moses; Paul cites it in writing to Jews at Rome; and Christ drew from it, as the word of God, his answers to all the temptations of Satan.

It contains: I. A review of the history from Horeb to Kadesh; from Kadesh to the land of the Amorites; of Moses' own transgression, his exclusion from Canaan, and the appointment of Joshua in his stead; of the reception of the law at Horeb, spoken by the voice of God, and written by him on tablets of stone. The review of these events is made the ground of an earnest exhortation to reverence, obedience, and gratitude to God. II. A review of the laws: 1. Of the moral law, and of the effect produced on the people by the proclamation of it; of the first and second commandments especially, with exhortations to obedience, and warnings against transgression; and, again, of the whole law, with a renewed appeal for obedience in view of past experience; of future blessings promised, and wrath threatened. 2. Of laws for the regulation of religious ceremonial and of personal life; for the abolition of idolatry and the observance of divine worship; against false prophets, idolatrous cities, and personal disfiguration as a sign of mourning; concerning clean and unclean animals, the year of release, the annual feasts, judges and justice; and against groves and images. 3. Of the strictly judicial law in numerous details. III. Provision for the confirmation of the law by writing it on large stone tablets to be set up on Mt. Ebal, with the uttering of curses on transgressors, and of blessings on the faithful. This is followed by an earnest call for consecration of heart and life to God. Pardon is promised to the penitent, and the choice of life or death is set before all. IV. The close of the official and personal history of Moses. He appointed Joshua to succeed him, charging him to be faithful and courageous; delivered a copy of the law to the priests and Levites to be placed by the ark of the covenant, and read publicly to the congregation every seven years; and as he had commenced the journey through the wilderness with a triumphant song, so now he closed it with songs of review, warning, and prophetical blessing on the tribes. The account of his seeing the promised land, the record of his death and burial, and the testimony to his greatness as a prophet and servant of the Lord, were added, probably, by Joshua, as the appointed finisher of his work.

DEUTSCH, EMANUEL OSCAR, was b. of Jewish parents, at Neisse in Silesia, in 1829. His education was begun by an uncle, to whom he owed his mastery of the whole range of Hebrew and Chaldee literature, and was finished at the university of Berlin. In 1855, he came to England to fill an appointment in the national library; and from this time he was known for his labors in the British museum, and his efforts to promote the study of the Semitic languages. He is best known to the outside world by his brilliant article on the *Talmud* in the *Quarterly Review*, to which he also furnished an article on *Islam*. He wrote excellent articles on the *Targum* and the *Samaritan Pentateuch* for Dr. Smith's *Dictionary of the Bible*, and was a valued contributor to the present work, for which he wrote nearly 200 articles. The best monument of his official work in the national

library is to be found in the *Phœnician Inscriptions*, edited by Mr. Vaux, to whom D. rendered most valuable assistance. D. died in 1873 at Alexandria, whither he had gone in the pursuit of health. His engrossing public duties and comparatively short life prevented D. from fulfilling the dream of his life, an elaborate work on the *Talmud*. A volume of his literary remains, with a sketch of his life, was published in 1874.

DEUTZ. See COLOGNE.

DEUT'ZIA, a genus of shrubs of the natural order *Philadelphaceæ*, natives of the n. of India, China, and Japan, some of which are now reckoned among the favorite greenhouse plants of Britain, in some situations even enduring the open air. They produce abundance of beautiful white flowers. The leaves of *D. scabra* are so rough with siliceous hairs, that they are used by joiners in Japan for polishing wood.

DEUX-PONTS (Ger. *Zweibrücken*), a t. of Rhenish Bavaria, picturesquely situated among wooded heights on the Erbach, near its junction with the Serre, 34 m. w.n.w. of Landau. Deux-Ponts, which owes its name to the two bridges which there cross the Erbach, is well built, and has among its principal buildings a Lutheran cathedral, also the remains of an ancient ducal palace, now used as a Catholic chapel. Its manufactures are woolen and cotton cloth, hardware, leather, and tobacco. Pop. '75, 9,349.

Deux-Ponts, or, in Latin, Bepontium (whence the name Bepontine given to the edition of Greek and Latin classics here printed by a society of scholars in 1779), is not mentioned in history till 1197, and was then in the possession of counts of Deux-Ponts. After various changes of masters, it finally came into the possession of Bavaria.

DEV, or DEW (Persian), and DEVA (Sanscrit); kindred names; in Persian applied, according to Zoroaster, to a race of demons created by Ahriman, and subject to his commands. The Sanscrit word in Hindu mythology signifies "gods."

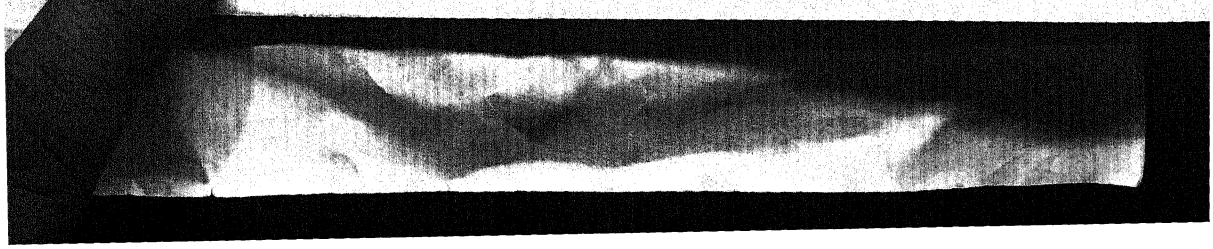
DE'VAPRAYA'GA, a t. in India, remarkable chiefly for its situation, stands in the fork of the Aluknunda and the Bhageerettee, whose united waters immediately assume the name of Ganges. It is in lat. 30° 8′ n., and long. 78° 39′ e., belonging to the protected state of Gurwhal; and its elevation above the point of confluence is 313, and above the sea, 2,266 feet. Marking, as it were, the source of the sacred river, D. is a favorite place of pilgrimage for the Hindus; and, in fact, its only permanent pop. consists of about 1000 Brahmans from the Deccan. In connection with the holy character of the locality, are two ancient temples, a flight of steps in the rock down to the very brink of the mingled streams, and three basins excavated in the solid stone a little below the level of the surface of the current. The town was much shattered by an earthquake in 1803, but was subsequently repaired at the expense of Scindia, the Mahratta chief of Gwalior.

DEVELOP, in algebra, to write out in full the operations set down in symbols. In geometry, to develop a curved surface is to produce on a plane an equivalent surface, as by rolling the curved surface so that all parts shall successively touch the plane.

DEVELOPMENT OF DOCTRINE signifies the modifying process through which Christian or philosophical opinion passes in its transmission from age to age. At first comparatively simple in its expression, doctrine has a tendency to become more complicated and technical in structure as argument is exercised upon it, and the spirit of controversy excited. The difference between the doctrinal statements in the Pauline epistles and the earlier creeds, such as that of Nicæa, the elaborate expositions of the mediæval theologians, and again of the Protestant theologians of the 16th and 17th centuries, is a difference at once appreciable by the theologian, as it is full of interest to him. There is, beyond doubt, at these several points in the history of the church, a certain growth or extension of Christian opinion called forth by, and corresponding to, the exigencies of the times. This is what is meant by the development of Christian doctrine, and the name denotes with sufficient propriety an unquestioned series of phenomena.

It is true that the idea of development in doctrine is one of modern origin, unknown to the earlier dogmatic ages of the church. But this merely proves that it is only in recent times that the history of the church has been reviewed in a critical and philosophical spirit. The idea of development is modern in its application to science altogether, and especially to the science of history. The ground upon which it is vindicated, in its application to Christian doctrine, is, that this doctrine is not a mere repetition of Christian truth in the language of inspiration, but really the rational or argumentative exposition of this truth. It represents this truth as it appears to the Christian reason in different ages. It is the expression of what has been called the *Christian consciousness* working in contact with the text of Scripture. The Nicene doctrine of the Trinity, for example, is the definite explanation which the Christian reason of the 4th c. gave to the undefined and general expressions of the gospels and epistles as to the relation of the Father and the Son. The doctrine of the atonement, as a *satisfaction* to God for the sins of the world, is first clearly and explicitly unfolded by St. Anselm in the 11th century. It is not meant that the elements of either of these doctrines are not to be found in Scripture, or that they are the product of human ingenuity; it is only affirmed that the scriptural elements in the one case and the other, were first clearly and argumentatively unfolded by the ingenuity of the Christian reason at these different times. The very idea of *doctrine* implies the employment of reason, and the exercise of inquiry and

argument upon the divine truth of Scripture. It is this truth analyzed and reflectively given forth—not the mere equivalent of Scripture, but something derived from it by Christian investigation and culture. Such a process of investigation and culture is necessarily variable and progressive. The divine fact remaining the same, the human explanation or doctrine of it may and does greatly vary. The course of this variation—the rising and falling of the human apprehension of the meaning of Scripture—is the development of doctrine.



This view is to be distinguished from that which characterizes the extreme subjective school of German theology. According to this school, Christian doctrine is nothing else than the expression of the Christian consciousness at any time. Scripture maintains no permanent or authoritative relation to it. It is all progress—a continued flux, without any normal standard or expression. Scripture may be its primary expression, but it may leave its fountain-head, and in the course of time issue in developments not necessarily bound to Scripture. But according to the view above set forth, Scripture remains the absolute and complete revelation of Christian doctrine, which is continually unfolded, but never exhausted by inquiry—beyond which right reason and truth never travel. The Christian revelation not only admits of, but demands constant criticism, as the means of unfolding more comprehensively and perfectly its contents, but it remains in itself the consummate expression of all spiritual truth; and it is this very peculiarity of the Christian revelation that makes its contents capable of continual and ever fresh development. It is just because its substance is divine, that its doctrinal expressions never cease to interest and to answer to the necessities of successive times. Other religions, while capable of development, reach a point where they cease to have any further living meaning, and pass on the one hand into mere popular mythology, or into an esoteric priestly tradition. They become transmuted into poetry or some ordinary product of philosophical speculation. Civilization overtakes and supplants them. But it is of the distinguishing divine character of Christianity that its doctrines possess a vital ever-renewing power, capable of adaptation to the highest forms of human civilization, and full of enlightenment and guidance to the most advanced intelligence. The development of Christian doctrine, therefore, is not merely a subject of curious and important study in the past, but of great and significant influence for the present and the future.

DEVELOPMENT OF THE EM'BRŸO. Harvey laid down the principle, in opposition to the views of those who believed in the doctrine of spontaneous generation, that all animals are produced from eggs (*omne vivum ex ovo*); and more recent researches have fully confirmed this view, if we are allowed to accept the modes of reproduction known as *gemmiparous* and *fissiparous*, or multiplication by buds and propagation by division, and the series of cases in which the offspring never resemble their parents, but the original form reappears in the second generation, and which are consequently said to present the phenomena of *alternate generation*. These exceptional cases occur only in very low forms of animal life, and, as a general rule, in retracing the phases of animal life, we arrive at an epoch in which the incipient animal is inclosed within an egg. It is then termed an *embryo;* and the modifications which this embryo undergoes before the young animal has an independent existence, are included in the general term which stands at the head of this article. Before embryology was properly studied, all animals were arranged under two great heads—the *oviparous*, which lay eggs; and the *viviparous*, which bring forth their young alive. We now know that viviparous as well as oviparous animals are produced from eggs—the only difference in this respect being, that their eggs, instead of being laid before the development of the embryo, begin to undergo their early changes in the body of the mother.

The egg has generally a more or less spherical form; the eggs of birds have, however, the form of an elongated spheroid, narrow at one end, and hence the origin of the word *oval*. Some eggs, as, for instance, those of certain insects (e.g., the podurella), are furnished with projecting filaments; others have a sculptured surface; and others, again, have peculiar forms, being cylindrical or prismatic. A simple sphere is, however, the normal form.

The egg originates within organs termed *ovaries*, peculiar to and characteristic of the female, except in those cases in which both male and female reproductive organs are associated in the same individual. These ovaries are glandular bodies, and are usually situated in the abdominal cavity. So long as the eggs remain in the ovary, they are very minute, and in this condition they are called *ovarian* or *primitive eggs*. They are identical in all animals, being, in fact merely little cells, containing yolk substance, in which is inclosed the germinative vesicle and the germinative dot. The yolk itself, with its membrane, is formed while the egg remains in the ovary; it is afterwards inclosed in another envelope, the shell-membrane, which may either remain soft, like parchment, or may be surrounded by calcareous deposit, as we observe in birds' eggs. The number of eggs seems to increase in proportion as we descend the animal scale, the eggs laid by a bird being far fewer than those laid by a fish, while these again are less than those laid by some insects.

The egg, when it has attained a certain degree of maturity, leaves the ovary. This step in the process is termed *ovulation*, and must not be confounded with the laying or

deposition of the eggs, which is their subsequent expulsion from the abdominal cavity, through (in most cases) a special canal termed the *oviduct*. Ovulation takes place at a definite period of the year in most of the lower animals, and seldom until the animal has attained its full growth. In general, ovulation is repeated for a number of years consecutively, usually in the spring; sometimes, however, it occurs but once during life, as in most insects, which die soon after the process is accomplished.

After leaving the ovary, the eggs are either discharged from the animal, and undergo their further changes in the external world, or they continue their development within the body of the mother, as is the case in some fishes and reptiles (as sharks and vipers), which have consequently been named *ovoviviparous* animals; or, in the case of the mammalia, they are not only developed within the body of the mother, but, except in the case of the marsupiata and monotremata (q.v.), become intimately united to her by the intervention of certain temporary structures—namely, the placenta and umbilical cord. This mode of development is termed *gestation*.

The development of the embryo does not always take place immediately after the egg is laid, and a considerable time may elapse before it commences. Thus, the first eggs laid by the bird do not begin to undergo development until the whole number which is to constitute the entire brood is deposited; and the eggs of most insects are laid in the autumn, and remain unchanged till the following spring. During this time, the vital principle is dormant. See DORMANT VITALITY. In the case of birds and reptiles, a considerable degree of warmth is requisite for the process of development. In birds, the act of *incubation*, or "sitting," supplies the necessary amount of heat; and in reptiles, the eggs are hatched by exposure on sands to the sun's rays, by their being deposited in warm dunghills, etc.

In the composition and structure of a newly-laid hen's egg—and of course the description equally applies to the egg of any other bird—we have exteriorly the shell, whose hardness is due mainly to carbonate of lime, and which is lined by a double membrane, the shell-membrane; then there is an albuminous substance, the *white*, in which several layers may be distinguished; within this, we find the *yolk*, inclosed in its membrane; and in the midst of the yolk there was, before it was laid, a minute vesicle, the *germinative vesicle*, containing a still smaller one, the *germinative dot*. The most conspicuous of these parts—namely, the shell and the white—are not physiologically essential, and are wanting in the eggs of most animals lower than birds; while the yolk, the germinative vesicle, and the germinative dot, are found in the eggs of all animals; and it is from these parts, and these only, that the germ is formed. The *yolk* or *vitellus* is the most essential part of the egg. It is a viscid fluid, sometimes opaque and colored, as in the eggs of birds, and sometimes transparent and colorless, as in the eggs of many fishes and mollusks. The microscope shows that it is composed of an accumulation of granules and oil-vesicles. The yolk is surrounded by a very thin skin, termed the *vitelline membrane*. In some insects, this membrane forms the outer coat of the egg.

The *germinative vesicle* is a cell, situated in the young egg near the middle of the yolk; it contains one or more minute spots or nuclei, termed the germinative dots, which themselves contain smaller nucleoli. The *albumen* or *white* of the egg is a viscid and colorless fluid, which coagulates and becomes opaque on the application of a temperature of 146° F. Although it forms a large part of the egg of the bird, it is of very trifling importance in reference to the development of the embryo. It is not formed in the ovary like the yolk, but is secreted by the oviduct, and deposited round the yolk during the passage of the egg through that canal; hence, when there is no oviduct, the albumen is generally absent. In birds, it consists of several layers, one of which, forming the *chalazæ*, presents a coiled, rope-like appearance. The albumen in this part is thicker than that which lies more externally. The albumen is bounded externally by the *membrana putaminis*, or *shell membrane*, which splits into two layers, leaving a space at the broad end, filled with air; in birds, and in some reptiles, this membrane is covered by the calcareous shell; in most cases, however, it continues membranous, as in the eggs of the mollusks, most crustaceans, and fishes, frogs, &c.; and sometimes it is horny, as in the sharks and skates.

In order to understand the successive steps of embryonic development, we must remember that the whole animal body is formed of tissues, the elements of which are cells. See CELLS. While in the full-grown animal these cells have undergone such modifications as often hardly to present any indication of their primary form; in early embryonic life, the cells, which originate within the yolk, present a definite form and consistence. These cells we shall presently see become transformed into the blood, bone, muscle, etc., of the young animal. At the commencement of the process of development, the yolk, which previously was a mass of uniform appearance, gradually presents certain alterations. Some portions become more opaque, and others more transparent; and the germinative vesicle, which was in the center, rises to the upper part of the yolk, where the germ is to be formed. The yolk at the same time undergoes a peculiar process of segmentation. It is first divided into halves, forming distinct spheres, which are again continuously and regularly subdivided into two, till the whole or a part of the yolk assumes the appearance of a mulberry, and in known as the "mulberry mass." In fishes, the class of animals whose development we shall specially follow in this article, the segmentation is only partial, the divisions of the yolk not extending into its whole

mass. This process leads to the formation of a *germ*, which usually rises above the yolk in the form of a discoid protuberance, which has received the various names of germinative disk, proligerous disk, germinal membrane, etc., and which is composed of minute cells. This disk enlarges till it embraces the whole, or very nearly the whole, of the yolk. At this early period, the germ consists of a single layer of very minute cells of uniform appearance; it soon, however, increases in thickness, and in vertebrate animals separates into various layers, which gradually become more and more distinct. The upper layer is termed the *serous* or *nervous layer*, and from it are subsequently developed the principal organs of animal life—such as the bones, muscles, brain and nerves, etc. The lower layer gives origin to the organs of vegetative life, and especially to the intestines and chylopoietic viscera, and is called the *mucous* or *vegetative* layer; the cells of which it is composed are larger than those of the serous layer. Between these layers there is, in the vertebrata, an intermediate layer, giving rise to the organs of circulation and to the first-formed blood, and hence termed the *vascular layer*.

At a very early period the germ undergoes modifications of form, varying with the department of the animal kingdom to which it belongs. Thus, in the articulata (insects, crustaceans, etc.), the germ is divided into segments, indicating the transverse divisions which occur in the adult animal; while the germ of vertebrate animals displays a longitudinal furrow, marking the position which the vertebral column and spiral cord are to occupy. The development of this furrow is highly important. At first, the furrow is very shallow, and a minute transparent band appears under it, called the *primitive stripe*. The walls of the furrow consist of two raised edges formed by a swelling of the germ on both sides of the primitive stripe. As these walls increase in height, their summits approach each other; and after a time they unite and convert the furrow into a closed canal, which is soon filled with a fluid from which the brain and spinal cord are subsequently formed.

The primitive stripe is gradually developed into a cartilaginous structure, termed the *chorda dorsalis*, which is the representative of the back-bone. In the meantime, the margin of the germ continues to extend over the surface of the yolk, until at length the latter is entirely closed in a cavity thus formed by the germ. In this lower cavity, the intestines and other organs of vegetative life are subsequently developed.

In all classes of the animal kingdom, the embryo rests upon the yolk, and covers it like a cap; but the direction by which its edges approach each other and unite to form the lower cavity, is very different in different kinds of animals, and is highly distinctive in reference to zoological classification. In all the vertebrata, the embryo lies with its face or ventral surface towards the yolk, and thus the suture or line at which the edges of the germ unite to enclose the yolk, and which in mammals forms the navel, lies in front. Another suture is found along the back, arising from the folding together of the upper surfaces of the germ, to form the dorsal canal. In the affection known as *spina bifida*, this suture is incomplete. In the articulata, the embryo lies with its back upon the yolk; in the cephalopoda, the yolk communicates, as in the vertebrata, with the ventral surface of the body, but no dorsal canal is formed in them; and in the other departments of animal life, we find special and characteristic relations between the embryo and the yolk.

The development of the embryo of vertebrated animals is best observed in the eggs of fishes, as from their transparency they do not require to be cut open; and with due care the whole series of embryonic changes may be observed upon the same individual, and the succession of appearances of the different organs may be ascertained. Prof. Agassiz has carefully examined and depicted the principal phases of development in the white-fish, which belongs to the salmon family, and we shall endeavor to give his chief results. The egg when laid is spherical, about the size of a small pea, and nearly transparent. It contains no albumen, and the shell-membrane and the membrane of the yelk seem fused into one. In a few hours after it has been laid, provided it has come in contact with the fecundating fluid of the male, a separation between these two membranes takes place, in consequence of the absorption of water, by which the size of the egg is increased. Between the shell-membrane and the yelk there is now a considerable transparent space, corresponding in position to the albumen of birds' eggs. Oil globules are scattered through the yelk, but soon arrange themselves in a stratum or disk towards the upper part, where a swelling, in the shape of a transparent vesicle, begins to show itself. It is composed of very delicate and minute cells, and is the germ in its earliest stage. As the germ increases, and has a larger surface in contact with the yelk, we notice a depression on its upper part, and soon after a second furrow appears at right angles to the former, so that the germ now presents four elevations. A continuous subdivision of this nature goes on during the second and third days, until the germ is divided into numerous minute spheres, which form what is termed the mulberry mass. This appearance, however, does not long continue; at the end of the third day, the fissures disappear, and the germ continues to extend as an envelope around the yelk, which it at last entirely incloses.

On the tenth day, the first outlines of the embryo begin to appear, and we soon distinguish in it a depression between two little ridges, whose edges approach till they form a canal. At about the same time, an enlargement at one end of the furrow is

observed, which is the rudimentary head, in which may soon be distinguished traces of the division of the brain corresponding to the organs of sight, hearing, and smell.

Towards the thirteenth day, we see a transparent cartilaginous cord (the *chorda dorsalis*) in the position afterwards occupied by the backbone, composed of large cells, in which transverse divisions are forming. In some fishes, as the sturgeon, this cartilaginous or embryonic state is persistent through life, and no true osseous vertebral column is ever formed. The rudiments of the eye soon appear in the form of a fold in the external membrane of the germ, in which the crystalline lens is afterwards formed. At the same time we see at the posterior part of the head an elliptical vesicle, which is the rudimentary ear. At this period, the distinction between the upper (serous) and lower (mucous) layers of the germ is best traced; all the changes which have been mentioned occurring in the upper layer.

At or soon after the seventeenth day, the lower (or mucous) layer separates into two laminæ, the inferior of which becomes the intestine. The heart at about the same time appears in the form of a simple cavity, in the midst of a mass of cells belonging to the middle or vascular layer. As soon as the cavity of the heart is closed in, regular motions of contraction and expansion are observed, and the movement of blood-corpuscles within it is seen.

It is not till the thirtieth day that any traces of a circulation of the blood are manifested; we then notice two currents, one running towards the head, and the other towards the trunk, with corresponding returning currents. The traces of the liver are now seen. The embryo begins to liberate itself at both extremities from the yelk, the tail first becoming free, and moving in violent jerks.

The embryo, although still inclosed in the egg-membranes, now unites all the essential conditions for the exercise of the functions of animal life: it has a brain, an intestine, a pulsating heart, and circulating blood, and a limited amount of spontaneous motion; but the forms of the organs are still incomplete, nor have they acquired the precise shape characterizing the class to which it belongs. The embryo is as yet only a vertebrate animal in general, and might be taken for that of a frog as well as for that of a fish.

Towards the close of the embryonic period, after the fortieth day, the embryo acquires a more definite shape: the jaws protrude; the nostrils approach the end of the snout; divisions are observed in the fin-like structure which surrounds the body; the anterior extremities, which were mere knobs, become rudimentary pectoral fins; and, finally, the gill-openings appear, so that the fish-type is now obvious. In this state, the young white fish escapes from the egg about the sixtieth day after it is laid; but its development is still incomplete. We cannot yet tell to what genus the fish belongs. The gill-covers are not yet formed, there are no teeth, the mouth is below instead of at the most projecting part of the head, and the fins have no rays. The remainder of the yelk is suspended from the belly in the form of a bladder, but it daily diminishes in size, till it is at length completely absorbed by the animal. The duration of these changes varies extremely in different fishes; some accomplish them in a few days, while in others, months are required.

In frogs and all the naked reptiles, the development is very similar to that of fishes; in the scaly reptiles (snakes, lizards, turtles), and in birds, there are peculiar membranes surrounding and protecting the embryo during its growth, termed the allantois and the amnios; and in mammals there are additional complications of structure, which it would be impossible to describe clearly without occupying more space than could be allotted to a subject of this nature. For further information on this subject, we may refer to the various writings of Agassiz, especially his *Lectures on Comparative Embryology*, and his *Comparative Physiology*, from which this article is mainly drawn, and to Carpenter's *Comparative Physiology*.

DEVELOPMENT IN PHOTOG'RAPHY, the process which immediately follows exposure, and which renders the picture visible in all its details. It consists in the precipitation or deposition of *new material* on that portion of the sensitive surface which has been acted on by light; the same principle therefore prevails in all processes. This may be made clearer by reference to a few examples. In the daguerreotype process (q.v), an iodized silver plate, after exposure in the camera, is exposed to the vapor of mercury; the vapor adheres to those portions of the plate which have undergone a peculiar molecular change from the action of light, but not to those parts unacted on. The lights of the picture are therefore "developed," or "brought out," by the acquisition of *new material*, i.e., mercury. A collodion negative is similarly "brought out" by the precipitation, by means of a deoxidizing agent, such as pyrogallic acid, or protosulphate of iron, on the *actinized* portion of the plate, of *new material*, composed of metallic silver and organic matter. A similar change takes place in the chrysotype process (q.v.), where the metallic salt with which the paper is impregnated is reduced to a state of proto-salt, which reacts through the decomposition of water, and causes the precipitation of *new material*, in the form of finely divided metallic gold, on the parts where light has acted. Other processes might be cited, but these are deemed sufficient to illustrate the principle stated above.

DEVELOPMENT THE'ORY. See SPECIES.

DEV'ENS, CHARLES, JR., b. Mass., 1820; graduated at Harvard, and admitted to the bar in 1841. He has been a member of the state senate; U. S. marshal for the district of Mass.; in the union army during the rebellion, being several times wounded; was associate justice of the Mass. Supreme Court; is now U. S. attorney-general.

DEV'ENTER, a thriving t. of Holland, in the province of Overyssel, situated on the Yssel, about 55 m. e.s.e. of Amsterdam. Tower-flanked walls surround D., which is further defended by a broad, deep ditch. The streets are narrow, but the market-places spacious. The principal buildings are the cathedral—a structure in the early Gothic style—the town-house, the court-house, and prison. From the ramparts, which are used as a promenade, there is a commanding prospect. The industry of D. consists in iron-founding, the manufacture of carpets, stockings, etc. Its gingerbread (called *Deventer koek*) is celebrated throughout Holland, and many thousand pounds are exported annually. There is a large trade in grain, butter, beer, firewood, etc. Pop. '76, 18,575.

DE VERE, MAXIMILIAN SCHELE, LL.D.; b. Sweden, 1820. He was in the Prussian diplomatic service, but came to the United States and was appointed to the chair of modern languages in the university of Virginia, 1844. Among his work are *Outlines of Comparative Philology; Stray Leaves from the Book of Nature; Studies of our English; The Great Empire; Wonders of the Deep; Americanisms; The English in the New World;* etc.

DEVEREAUX. See ESSEX, EARL OF, *ante*.

DEVIATION OF THE PLUMB-LINE, an effect observed near cliffs or mountains, which seems to show that the attraction of masses of earth deflect a perpendicular line. Similar effects have been observed on plains, whence it is argued that there must be hollows underneath, or masses of earth of different degrees of density.

DEVICE—from the middle-age Lat. *divisa*, a drawing or design—is a motto expressed by means of a pictorial emblem. The motto proper originated in the emblem, a written inscription coming to be added to the pictorial design, with the view of rendering the meaning more explicit. Devices thus consist of two parts—a pictorial figure called the "body," and a motto in words called the "soul" of the device. As early as the times of Æschylus, the "seven heroes before Thebes" all appear with devices on their shields; and the same is related by Xenophon of the Lacedæmonians and Sicyonians. In the middle ages, devices on coat-armor came into regular and formal use, and chivalry employed them in its courtly expressions of devotion to the fair sex. They were used both as charges on the shield and as crests. The only respect in which the device differs from other heraldic emblems is, that it has always some specific reference to the history, or circumstances, or position of the bearer. As an example: Louis XIII. of France had a falcon as a device, with these words: "*Aquila generosior ales*" ("A more generous bird than the eagle"), by which he meant to denote his own superiority to the emperor, whose device was an eagle. Devices, moreover, were generally borne only by the individual who assumed them, and not by the other members of his family or his descendants, like the crest or cognizance. They were often contrived to typify a special enterprise, the general character of the wearer, or even to designate his name—as the *mulberry* trees in the embroidered trappings of the horse of Thomas Mowbray, duke of Norfolk. On all festal occasions, they figured on triumphal arches, on banners and hangings. At a later period, it became customary to work devices into buildings; friezes and stained windows were often covered with them. This practice has recently much gone out, at least, in its original form. See Radowitz's *Die Devisen und Motto des spätern Mittelalters* (Stutt. 1850).

DE VIGNY, ALFRED VICTOR, Comte, 1797–1863; b. France; poet and novelist. Having been in the army 13 years without seeing active service, he resigned. He had already published several poems, and being in pecuniary ease (having wedded a rich English lady) he started in earnest on his poetical career contemporaneously with Victor Hugo and Lamartine. De Vigny published a volume in 1822, and in 1824 came *Eloa*, a poem of delicate fancy, the story of a "sister of the angels." Soon afterwards he published *The Deluge; Moses; Dolorida*, etc. In 1826, appeared *Cinq Mars*, a historical romance of a conspiracy under Louis XIII. This had great success. In 1829, he translated *Othello* for the Parisian stage, and in 1835, made a drama of the romantic life of Chatterton, the English boy-poet. His best prose work is *Stello ou les Diables bleus*, issued in 1832. His last effort was *Poëms philosophiques, ou les Destinées*, part of which was published after his death.

DEV'IL, or SA'TAN (Gr. *diabolos*, "false accuser;" Heb. *satan*, "adversary"), designates in the Old and New Testament a mighty spirit of evil who has, during unknown ages, ruled over a kingdom of evil spirits, and is in constant and restlessly active opposition to God. This belief, however, was very gradually developed in the Jewish mind; and it is beyond all question, that it acquired clearness and prominence through extra-national influences. In England, the "doctrine of Satan" has hardly received any critical treatment at the hands of scholars; but in Germany, the subject has been most learnedly investigated. The conclusions at which some of the profoundest Biblical scholars of the continent have arrived, and even the principles on which they proceed,

may be rejected by us, but a brief account of their method of historical analysis may be neither uninteresting nor uninstructive. The older Hebrews, it is said, who lived before the period of the Babylonish captivity—judging from the silence of Scripture—knew nothing, and certainly taught nothing, of evil spirits in the later sense—i.e., of beings separated from God, who were evil in the essence of their nature, and worked evil only. *Moral* evil was rather looked upon as properly the act of man; *physical* evil, or adversity, on the other hand, as punishment merited through sin, and inflicted by a just and holy God, who was thus necessarily conceived as the true source of all calamity. The angels who foretold God's purposes, and executed his will, however great might be the physical evil they occasioned, are never accused of *moral* evil. Even in the Mosaic account of the seduction of Eve, there is nothing to induce us to believe that the author regarded the serpent other than as "the most subtle of all the beasts of the field," or that he meant to conceal under so plain a statement an allusion to Satan. It is probable, however, that at some early period in their history, the popular faith of the Jews, partly divorcing itself from its grand religious conceptions of the "one living and true God," and lapsing—as has everywhere been the case with the popular faith—into petty superstitions, had become familiar with the idea of certain fearful unearthly beings haunting wildernesses, similar to the fauns and satyrs of Greece, who might form the connecting-link in the later development of an actual demonism. Traces of this are clearly visible in the Pentateuch. The Hebrew word *seirim*, occurring in Leviticus xvii. 7, which our translators have rendered "devils," means only "hairy ones." Now, the Egyptians worshiped the *he-goat*, and the Hebrews partook, as we know, of their idolatry. Therefore Moses in this verse, forbidding them to commit this sin in future, says: "They shall *no more* offer their sacrifices to *seirim*—i.e., to the Egyptian he-goats. The development of demonism was materially furthered during and after the Babylonish captivity by Medo-Persian influences. In those canonical books of the Old Testament which belong, in their present form, to the post-exilian period—i.e., the period subsequent to the exile—the Jewish conceptions of angels become more definite. They possess different ranks, names, and specific offices. They are the tutelary guardians and helpers of particular lands and peoples, but are everywhere in absolute dependence on God. And now we meet also, for the first time, with an angel called *Satan*, who, however, still figures as a minister of God, and along with the others appears in heaven before the throne of Jehovah, but with the function assigned to him of accuser and seducer. It is he who—1 Chron. xxi. 1 (*Chronicles*, it should be mentioned, is considered by most critics, both orthodox and heterodox, to be the composition of Ezra, and therefore *post-exilian*)—stirs up David to number the people; while in the older Hebrew version (2 Sam. xxiv. 1) the same act is attributed to an angry God, the conception of Satan not *then* having clearly, if at all, presented itself to the Hebrew mind. It is Satan also who throws suspicion on the piety of Job, and with the permission of Jehovah, causes a series of misfortunes to befall him; while in Zechariah iii. 1, he is represented as "resisting" the angel of God, and as a false accuser of the high-priest Joshua. As yet, however, an evil nature is not *expressly* ascribed to him, but, what is much the same, it is assumed that he takes a pleasure in active evil. It is a purely arbitrary and untextual interpretation of Isaiah xiv. 12 ("How art thou fallen from heaven, O Lucifer, son of the morning!") that would force these words to refer to the fall of the D., or determine from them his name. In the Apocrypha, of which only a small part is Palestinian, the rest being either *Chaldæo-Persian* (as, for example, *Tobias* and *Baruch*) or *Ægypto-Alexandrian* (as, for example, *Wisdom*) in its origin, the older Hebrew doctrine of misfortune coming from the angel of Jehovah is, so to speak, dismembered, and demons or evil spirits, in the New Testament sense of the term (*pneumata ponēra*), are for the first time mentioned (and in *Tobias* and *Baruch* frequently) as the authors of calamities. According to the representations of these writings, the evil spirits dwell, like the older Hebrew hobgoblins, in waste places, but associate themselves for the injury or destruction of men, enter into them as tormentors, and can be expelled only by magical or mysterious means. To this class of beings the heathen deities were reckoned to belong. But even here there is no mention of an *organization* or kingdom or prince of demons. The first trace of a *Diabolos* or D. proper (and one in all probability springing from a foreign source) shows itself in the Book of *Wisdom* (ii. 24), in relation to the seduction of Eve, where it is said that through the D. the necessity of death has come into the world.

In the period elapsing between the close of the Apocrypha and the appearance of Jesus, the Jewish ideas of angels, as well as of demons and the D., received an extensive development. This angelology and demonology, wholly foreign to the older Hebrew religion, was derived in all its essential characteristics from the system of Zoroaster, with which the Jews had become familiar by their long and close intercourse with the Persian empire during the exile, and subsequently. It was, however, impossible to transfer the *dualism* of Zoroaster into a creed so purely *monotheistic* as that of the Jews; this would have destroyed the foundation on which their entire history rested. Two beings, equally eternal, equally powerful, was an idea which no Hebrew—mindful of the glorious deliverance of his forefathers out of the land of Egypt, of the law given amidst the thunders of Sinai, of the manna in the wilderness, of the triumphs in Canaan, and the golden psalms of David—could for one moment entertain. But, on

the other hand, now that as a nation the Jews were become weak and of little account, hemmed in, and crushed by mighty and advancing empires, no conception could seem more true, or prove more consolatory, than that which permitted them to attribute their misfortunes to the agency of a demoniacal race, headed by a potentate only inferior to Jehovah himself. They could now believe that God had not forsaken his "chosen people." Thus, the dualism of Zoroaster suggested the kingdom and royalty of Satan, but the doctrine shaped itself in harmony with the national monotheism. The D. and his demons were represented as having been originally *angels*, who had fallen from their "high estate," been punished by God, and had therefore assumed a position of hostility, without, however, being able to materially frustrate the divine purposes. These opinions found an almost universal reception among the people, as well as among those Jewish theologians who, along with the Mosaic law, held oral tradition to be an authentic source of religious doctrine. Indeed, the only Jewish sect which rejected them, was that of the Sadducees, who considered them, as also the doctrines of the resurrection from the dead, of the Messiah, of the Messianic kingdom, of the last judgment, of rewards and punishments, and of angels and demons, to be new, outlandish anti-Mosaic myths and theories. This conflict of opinion among the Jews prevented their ideas of the D. and demons from obtaining, in spite of their broad diffusion, a dogmatic and systematic stability. The populace and the Pharisees believed fervidly in the existence of such evil spirits; but their conceptions had not only all the heat, but all the confusedness of superstition.

In this condition were the Jews when the New Testament lifts up the veil of oblivion that had partially dropped on the face of the nation more than two centuries before, and the light of history again falls brightly on its features. We now find a swarm of demons in Palestine. These unclean spirits, however, can be exorcised. When expelled from the soul of the demoniac, their proper home is "the abyss" (*Eis ten abusson*, Luke viii. 31). According to the popular conceptions, therefore, we must suppose their dwelling to be a dark subterranean region, although, like the demons of the Old Testament, they inhabit also the earth and the air. They were not, as the Greeks and Josephus thought, the evil spirits of dead men, but had angelic natures (see Matt. xxv. 41), and formed a society governed by a chief, called Satan, Devil, Beelzebub, Belial, etc. He is now firmly seated in the popular imagination as a fallen angel; but as yet there is no hint of his having seduced his followers from their allegiance to Jehovah, or of their having fallen at the same time. This idea first appears in the book of Revelation, chap. xii., where mention is made of a great war in heaven between Michael and his angels on the one hand, and the D. and his angels on the other. "And the great dragon was cast out," says the writer, "that old serpent, called the Devil, and Satan, which deceiveth the whole world: he was cast out into the earth, and his angels were cast out with him." Whether or not these popular conceptions of the D. and his influence were materially or spiritually interpreted by Christ himself, it is impossible to say. He may either have accommodated his language to suit the popular mode of realizing the power of evil (a supposition which involves nothing unworthy of his sinless character), *or* (for this is the only other hypothesis compatible with a belief in his divinity) he may have intended to recognize the essential truth of that doctrine of an evil personality which the Jews derived from, or, at all events, developed under the inspiration of Zoroastrian ideas.

But whether Christ meant to accommodate his language to the popular conceptions or not, the primitive church assumed the personality of the D. as an unquestionable fact. The New Testament ideas on this point were not only greatly enlarged, but in many respects entirely changed, partly through the introduction of a considerable number of heathen notions, and partly through the dogmatic tendencies of the time, in consequence of which the various statements in the Bible regarding Satan and evil were *uncritically* and *unhistorically* heaped together, and a doctrine of Satanic agency elaborated *logically* but not *theologically*. Holding firmly to the belief of a Satanic kingdom of darkness opposed to Christ's kingdom of light, the majority of the early Christians ascribed all evil, physical as well as moral, to the D. and his demons; failures of the crop, sterility, pestilence, murrain among cattle, mental maladies, persecutions of the Christians, individual vices, heresies, astrology, philosophy, and especially the whole body of heathenism, with its mythology and religious worship. The heathen gods were believed to be conquered by the work of Christ, but not to be wholly powerless; they sank down into demons, and so a part of their mythology passed into the doctrine of the Devil. It was they who, as demons, meaning to deceive, uttered oracles, were present at sacrifices, and inhaled the sacrificial incense, whereby the notion gained ground that the demon-nature was ever growing more and more sensual and materialized—a notion that reacted again on the conception of hell, which soon began to be painted in coarse, earthly colors, blazing with eternal fire, through which blackened devils and scorched souls flitted in endless torment. From the gross materialism that now vitiated all conceptions of the D. and of demons, sprang the loathsome belief, common enough in the early church fathers, but during the middle ages exhibiting itself only in the superstitions of the vulgar—viz., of the carnal intercourse of devils with women. See WITCHCRAFT.

Concerning the fall of the "devil and his angels," opinions were long diverse. Some

supposed that it occurred through envy; others, through pride; and others again, through concupiscence and excess; some placed it before, and others after the seduction of Eve by the serpent. Several of the fathers (for example, Augustine) believed that man was created to fill up the gap which had been caused in the kingdom of Christ through the apostasy of Satan and those whom he had led astray. Meanwhile, the idea of the importance of the death of Jesus had been dogmatically elaborated. At first, Christians saw in that death a sacrifice, and in his blood a propitiatory power; but soon after, their thoughts reverted to the other scriptural representation of an actual victory over the D., a restoration of the Divine image in man, and the source and condition of holiness; whence was developed a very wonderful dogma concerning the devil. God having declared that whoever should transgress his law, should incur death and damnation; and man having done so, God's justice and veracity compelled him to keep his word. But inasmuch as Eve was beguiled into transgression, and fell as it were unwittingly, it did not seem for the honor or good of the Deity that rational beings, partakers also of his own spirit, should be lost through a trick of the fiend; wherefore Jesus offered himself to the D. as a ransom for the souls of men. The D. thinking "the *man* Christ Jesus" of more value than all the rest of the race put together, closed the bargain immediately. But deceived in his turn by the "appearance of flesh," he did not recognize the Deity concealed beneath it; and not being able to retain the latter (shrinking from it, in fact, horrified and dismayed) he lost *both*—Christ and man. The D. was, however, *actually* deprived only of Christians, in all other men he dwelt and ruled through the force of original sin. In consequence of this he was formally "banished" (until the 3d c.), not only from "demoniacs," but also from all converts from Judaism and heathenism to Christianity; and when the practice of baptism had shaped itself into the dogma, that it was "a necessary preliminary to holiness," exorcism, or "driving out the devil," became a Christian "art," exercised on all new-born children. Those who died unbaptized, were (by that ruthless logic that frequently marks a barbarous theology) sent to hell; for although *potentially* Christ's, the church had not yet rescued them from their satanic master, by the appointed rite, and so the conditions being unfulfilled, the D. carried off his prey. Yet the heart of humanity, stronger in its simple instincts than the most iron creed ever hammered out of the human brain, showed its holy presence even in so fearful a dogma; and although it could not deliver the lost infants from the region of eternal fire, it assigned them less painful pangs, and a less dreadful dwelling-place. But while the power of the D. over all not guarded by Christian faith and rites, was supreme; over those who were so guarded it was utterly weak. No Christian, not even the weakest, could be *forced* by him to do evil. Thus far had the "doctrine of the devil" been developed at the 8th c., and at this point it has essentially remained in the eastern or Greek church; but in the western it took yet another development. This was mainly occasioned by the writings of pope Gregory the great, who partly took up the popular notions himself, infused into them other then prevalent theological opinions, and elevated the result of the incongruous mixture to the dignity of Church doctrine. He calls the D. a "stupid beast," because he hopes for heaven, without being able to reach it, and entangles himself in his own net; but on the other hand, he admits him to have a *potentia sublimitatis*, and utters the profound idea that he cannot comprehend our thoughts. In these three notions lie the essential germs of the Germanic Faust-devil. The old German and Norse mythologies poured a flood of heathen fancies into the "doctrine of the devil." Even Ulfilas, at a much earlier period, had translated the New Testament word *daimon* or *daimonion* by *unhulthô*, i.e., she-devil or sorceress, because the old Germans believed in *female* demons, while the Christain *usus loquendi* contains no trace of such. The peculiarly German conception of a now malignant, now gentle *female* lives to this day in the German phrase, "The devil is beating his mother" (when rain and sunshine quickly alternate). In England and Scotland, too, the phrase is, or recently was current, "The devil and his dam." The Germans have also the proverb, "Where the devil cannot come, there he sends his grandmother." Soon, however, the word *diabolus*, in violation of the New Testament distinction between it and *daimon*, came to signify devils of every or any sort. The Gothic form of the word was *diabulus, diabaúlus;* old Saxon, *diubhul, diubhal, diobol;* old High German, *diufal, tieval, tiubil*, etc. The dwelling of the D. was, of course, hell, which, however, according to old Germanic and Scandinavian notions, was placed in the dreary regions of the north. Although his mischievous powers are to be pretty well controlled till the coming of antichrist, when he expects to hold carnival, yet, like the ancient gods and demons, he occasionally appears on the earth. He then assumes at times a purely human form, but, like Vulcan, who was thrown down from heaven like himself, and the smith Wieland, of German mythology, he is somewhat lame. He is covered with a grey, green, or red cloak, like the Kobolds (q.v.) and dwarfs (q.v.), (the earth and house spirits of the suppressed heathenism): sometimes, also, he appears black and sooty, as befits his dwelling-place, and his opposition to a pure God. But as the old deities, both classical and German, possessed the power of transformation to a most remarkable degree, the D., through his relationship with these, inherited this power when they vanished from the scene. The form he most frequently assumed was that of an animal, approximating, in this respect, to the German forest-spirits and the Greek satyrs and fauns. At one time he shows the foot of a horse or goat with horns and tail; at another, he appears as a black horse, a he-goat, a

hog, a wolf, a hell-hound, a raven, a serpent, a worm, a dragon, or a fly. The conception of the power of the D. was vastly enlarged by the influx of these new fancies. In fact, it rose almost to a new dualism; but on the other hand, also, many mild and friendly *traits* of the heathen gods passed over into the popular conception of the D., and gave to his nature a quite new, humorous, and even merry side. As, after the introduction of Christianity, offerings were still occasionally made to the old gods, the D. shared in these honors. A horse, a he-goat, or a hound was at times sacrificed to him; and to the present day the expression has survived, "To kindle a fire for the devil"—obviously an allusion to altar-flames. Various features of the old Norse gods, especially of Loki and Donar (Thor), the gods of fire and thunder, were also transferred to him. Hence the still current phrases in Germany when thunder is heard: "The devil must be striking," and "The runaway goose is gone to the devil." (*Donner*, "thunder," is the word used for devil in this case.) Every power, too, which, according to the older heathen belief, was lodged in the lesser demons, giants, etc, had now its proper center in the great fiend himself, who could perform all the pranks attributed to the more grotesque creations of the Norse mythology, and work all the evil of the more malignant spirits; but, in general, these beings were rather pressed into his service than absorbed by him, or incarnated in his person.

So did this great, originally Persico-Judaic belief spread itself through all Christian lands, incorporating with itself, first, the kindred conceptions of the ancient classical world, and, ultimately, the rich and varied superstitions of our Teutonic and Scandinavian forefathers. Thus decked out in the costume of many different climes and ages, the image of evil passed into the light of the modern world. Every step forward that it now took robbed it of some potent spell that used to chill the blood and strike the heart with awful horror. Men first lost faith in the D.'s occasional incarnation; then medical science destroyed his claims to the origination of mental phenomena, which he was once supposed to have directly caused; natural science deprived him of his control over the elements; historical criticism plucked from him his borrowed feathers; while metaphysics and a deeper religious exegesis have combined, not, perhaps, to annihilate his personality or deny his influence, but certainly to realize the former under a more spiritual form, and to limit the latter by a reverential belief in the wisdom and goodness of God. See Mayer's *Historia Diaboli* (1780); Horst's *Dæmonomagie* (1817) and *Zauberbibliothek* (1826); and Grimm's *Deutsche Mythologie* (2d edit. 1844); also Moncure Conway's *Demonology and Devil Lore* (1878).

At the outset of this article, it was stated that the "doctrine of the devil" had received little critical treatment from English scholars. The following appears to be the prevalent mode of regarding the subject in this country. The doctrine of the existence of a personal D., the chief of evil spirits, and directly or indirectly the author of at least all *moral* evil, is maintained by reference to the Bible, regarded as containing one revelation of truth harmonious in all its parts, and gradually developed. The Scriptures of the Old and New Testaments being thus regarded, and the supposition of conflict between the doctrines of their different books, or of error in any of them being rejected as inconsistent with a full recognition of their inspiration and divine authority, the doctrine in question is unavoidably deduced from them. It is assumed to appear in the narrative of the fall in Genesis, and the name *serpent* is again applied to the D. in the book of Revelation, where he is described as "that old serpent . . . . which deceiveth the whole world" (Rev. xii. 9); he is believed to be repeatedly mentioned in the Old Testament. The hypothesis of an extra-national origination and development of the idea of the D. would, of course, be repudiated, and orthodox divines would consider it more probable that the Persians borrowed from the Jews than that the Jews borrowed from the Persians. The mention of the D. in the New Testament is held to be conclusive, not only of his existence, but of the belief in that existence (even when not expressed or hinted at) among the older Jews. The warnings and exhortations addressed to Christians are, it is also said, framed on the supposition of dangers arising from his violence, power, and subtlety. It is further argued, that the principal objections urged against the doctrine of the existence of a D. are substantially the same which present themselves to the mind as difficulties when we speculate on that which, however, is so undeniable—the existence of moral evil.

DEVIL-FISH, a name given by fishermen along the southern Atlantic and gulf coasts of the United States to a cartilaginous fish of the ray family, *ceratopterus vampirus*, Mitch. The outline of the fish is nearly an isoceles triangle, the apex at the tail, the altitude of the triangle, or length of the fish, being about half the breadth, from tip to tip, of the pectoral fins. Specimens are described as 10 ft. long, 22 ft. wide, and weighing 4 or 5 tons. A mounted specimen is in the museum of the Chicago academy of sciences. It is a small fish of the kind; 5½ ft. long, 11 ft. broad, 18 in. thick at about 2 ft. behind the mouth; and probably weighed 700 lbs. when alive. The skin is thin and rough, like that of a shark; color, slaty-black above, creamy-white beneath, but darker along the edge. The head, slightly protuberant along the base of the triangle, is retracted; mouth large and cavernous; nostrils near the angles of the mouth, in the under surface of the upper jaw; eyes protruding at the side of the head; ears, or auricular openings which serve the purpose, a little to the rear of the eyes. The mouth

is armed at either side by a flat cartilaginous protuberance, in the specimen mentioned about 12 in. long, and of the breadth and thickness of a man's hand; in life, the creature can twist this into a cone, which resembles a horn, whence the part *cera* in the generic name. These members, perhaps, act like hands in sweeping food into the mouth. There are 5 large, linear, brachial openings on each side of the under surface, in the rear of the lower jaw. The tail is very slender, like a whip-lash, four-sided, and so rough that a lash received from it would cut to the bone. The stomach of this fish contained about two bushels of partly digested algæ, of a species which grows abundantly in southern waters. The evidence is against the supposition that it consumes any considerable quantity of animal food. See CEPHALOPTERA, *ante*.

In his *Travailleurs de la mer*, Victor Hugo gives a thrilling account of a nameless and horrid monster which he calls *pieuvre*, a word rendered by his translators "devil-fish." The celebrity of the narrative has attached the name to the creature there described, but which does not really exist as pictured by the novelist. The account most nearly fits the cephalopodous mollusk called the *poulpe* (see *ante*), which grows to a large size in tropical waters.

The name is also given to a fish better known as the angler, *lophius piscatorius* (see *ante*), and by ignorant fishermen to various other fishes of grotesque appearance.

DEVIL'S ADVOCATE. See ADVOCATUS DIABOLI, *ante*.

DEVIL'S BRIDGE, in Switzerland; a curious bridge over which the road to Italy crossed the Reuss. The original bridge, built in 1118, was partially destroyed by the French in 1799. It was restored, but is no longer in common use. "The Hole of Uri" is the name given to a tunnel near the bridge, through which the road passes.

DEVIL'S DUST, the name sarcastically given to old woolen materials manufactured into some variety of cloth. See SHODDY.

DEVIL-WORSHIPERS, or YEZIDEES, a sect in Koordistan and Armenia, numbering about a quarter of a million. They respect the devil, and look for him to be restored to heaven, at which time they desire his friendly services.

DEVISE, in English law, the conveyance of land by will. As personal property or chattels is said to be bequeathed, so lands are said to be devised. It is said, *Co. Litt.* 111 b. n. 1, that, under the Saxon and Danish rule in England, the owners of land were entitled to convey their lands by will. It is certain that so soon as feudal customs were established in this country, the testamentary power over land ceased; and from the conquest to the reign of Edward IV., this species of property could be transferred by conveyance *inter vivos* only; but during the reign of the latter monarch, a new mode of transfer began to be adopted, called a conveyance to uses (q.v.). By means of this species of conveyance, a party wishing to convey land otherwise than the common law allowed, actually conveyed the land to another person, to such *uses* as he should appoint. The equity courts then regarded the party in whose favor the conveyance had been made as a mere trustee, and obliged him to relinquish the land in favor of any one whom the original owner might appoint. The power of appointment thus remaining in the owner might be exercised by will. By a statute of 27 Henry VIII., this mode of passing land by will was abolished; but, five years after, by 32 Henry VIII. c. 1, followed by 35 Henry VIII. c. 5, it was enacted that all persons having estates in fee-simple should have power to devise the whole of their *socage* (q.v.) lands, and two thirds of their land holden by *knight's service* (q.v.). Finally, by 12 Charles II. c. 24, tenure by knight's service was abolished, and converted into socage; so that the power of devising land was extended to all lands except copyholds (q.v.). But to the general rule that land could not pass by will, there had always existed an exception in favor of lands, which, by the custom of the manor, had always been so conveyed; and this mode of devise by custom continued to exist even after the statute of wills of Henry VIII. For this practice there were two grounds: 1. That the power of devising lands was limited by statute to two thirds of the land held by *knight's service*, whereas devise by custom might carry the whole land. 2. In order to an effectual devise of land under the statutes of Henry VIII., it was necessary that there should be a will in writing, while a verbal or nuncupative will would carry land by custom. By 29 Charles II. c. 3, the statute of frauds (q.v.), this distinction was removed, and it was enacted that a will in writing, attested by three or four witnesses, should be necessary for conveyance of all lands. It must be observed that this power of devising lands was confined to lands belonging to the testator at the time of making his will, so that after-acquired lands would not pass by it; and also, that religious bodies and other corporations were, by the law of mortmain (q.v.), restrained from being devisees of land. Thus stood the law at the period of the recent wills act, 7 Will. IV., and 1 Vict. c. 26. By this statute, devises of land are placed on the same footing as to execution as other wills, and will carry all landed estates belonging to the devisor at the time of his death. See WILLS, and generally on this subject, see Jarman on Wills.

In Scotland, it is usual to convey lands by deed, which has, however, precisely a similar effect to a will, so that the difference between English and Scotch wills is chiefly formal. In foreign countries the power is subject to various rules differing from those in force in England. Hence, where a person resides in one country, and is possessed of

landed property in another, questions of jurisdiction frequently arise as to the law which shall govern the power of disposal. In these cases, it is now a recognized principle that the *lex rei sitæ* is that which must prevail.—See Story's *Conflict of Laws*, p. 719, *et seq.*

DEVI'ZES (anciently *Divisæ, Divisis, De Vies*), a parliamentary and municipal borough, in the middle of Wiltshire, near the Avon and Kennet canal, 22 m. n.n.w. of Salisbury. It lies high at the mouth of Pewsey vale, between the thinly peopled tracks of Salisbury plain and the Marlborough downs. Pop. '71, 6,839. D. returns one member to parliament. It has silk-throwing mills, and manufactures of snuff and malt, and is the seat of one of the most important corn-markets of the w. of England. The corn exchange has standing-room for nearly 3,000 persons. The chancel of St. Mary's church in D. is believed to be nearly as old as the conquest. Roman household gods and coins have been found here. D. arose in a castle built by Roger, bishop of Salisbury, in the time of Henry I. This castle, of which only the walls of one of the dungeons remain, was besieged and taken by Cromwell in 1645. From the time of Henry VIII. till about 1820, D. was the seat of extensive cloth manufactures.

DEVOIRS OF CALAIS were the customs due to the king for merchandise brought to, or carried out of, Calais while our staple (q.v.) was there.—*Cowel's Interpreter.* "Merchants of the west may buy merchandises, so that they find sureties to carry them to the west or to Calais."—2 Rich. II. st. 1. c. 3.

DEVO'NIAN FORMATION, DEVONIAN SYSTEM (*ante*). At the beginning of the Devonian period the dry land of North America was confined to the present territory of eastern Canada and New England. The Alleghany mountains were sketched in a series of islands and coral reefs which made a barrier between the ocean and the inland sea. There were no large rivers; the valleys of the Hudson, the Connecticut, and the St. Lawrence were merely outlined, and the Ottawa had begun its work in the azoic region between the St. Lawrence and Labrador. The Devonian period was occupied by a series of oscillations of level, the amplitude of the variations, and the consequent thicknesses of deposit being greater in the eastern part. The mediterranean of the interior opened s. into the gulf of Mexico, n. into the Arctic sea, and covered all the northern central region of the present continent with shallow lagoons, separated by low sandy areas.

According to the geologists of the New York survey, the D. F. of America is arranged thus, beginning at the top:

DEVONIAN AGE.

5. Catskill period	Catskill red sandstone.
4. Chemung period	Chemung epoch. Portage epoch.
3. Hamilton period	Genesee epoch. Hamilton epoch. Marcellus epoch.
2. Corniferous period	Corniferous epoch, Schoharie epoch. Cauda-galli epoch.
1. Oriskany period	Oriskany red sandstone.

1. The Oriskany sandstone extends from near Oriskany, Oneida co., N. Y., s.w. along the Appalachians into Pennsylvania, Maryland, and Virginia. It appears near Buffalo, in Canada near Waterloo, in Ohio, Indiana, southern Illinois, and Missouri. Its thickness at Oriskany is about 30 ft.; in Illinois, 250 to 300 feet. Its rocks are mostly sandstone, but there are strata of limestone in the Mississippi valley, and in the region w. and n. of Mooschead lake. Its most abundant fossils are *spirifers*, with other mollusks. There are no land-plants in the New York and western beds, but lycopods occur in the upper limestones at Gaspé.

2. The Corniferous period. The cauda-galli grit, chiefly argillaceous sandstone, is 50 or 60 ft. thick in the Helderberg mountains of eastern New York. The name comes from a characteristic fossil sea-weed of feathery form. The rocks of the Schoharie epoch are fine-grained calcareous sandstones, similar in quality and distribution to the preceding, but differing in their fossils, which are very numerous. The upper Helderberg is farther divided into the Onondaga limestone and the corniferous limestone—the latter taking its name from the presence of much imperfect flint or horn-stone (*cornu*, a horn). The corniferous limestones occur in New York, in Ohio along lake Erie, and throughout the Mississippi basin from Michigan to Kentucky, and from Ohio to Missouri. Its greatest thickness, in Michigan, is 354 feet. Its notable fossil plants are lycopods, conifers, and tree-ferns. This period was the coral-reef period of palæozoic times, and corals are found in great number and variety. The falls of the Ohio, at Louisville, are caused by such an ancient reef, and are rich in coral fossils. The remains of vertebrates first appear in the corniferous epoch. They include relics of sharks, cestraciont and hybodont; of ganoids, having the body covered with shining plates of mail, now represented by the gar-pike; and of placoderms, having the body covered with bony plates, such as are worn by the turtles—fishes which seem to have linked the ganoids with the sharks.

3. The Hamilton period includes the Marcellus shales, the Hamilton beds, and the Genesee shales. This formation extends across New York, its greatest thickness, 1500 ft., being e. of the center. It occurs southwardly to Tennessee, and westwardly to Iowa and Missouri; also in the valley of the Mackenzie, so that Meek believed that Devonian rocks are continuous from Illinois to the Arctic ocean, a distance of 2,500 miles. The Hamilton beds furnish superior flagging stones; the Genesee shales produce great quantities of petroleum, and occasionally of gas that may be used for heating and lighting. The vegetable fossils are lycopods, including lepidodendroids, sigillarids, and stigmaria, ferns, equisetæ, and conifers. The animal fossils still abound in corals and brachiopods; in this period appears the goniatites, the ancestor of the modern nautilus. Among articulates we notice a new form of trilobite, and especially the earliest insect remains, in form akin to the ephemeræ. Vertebrates are represented by fishes, like those of the corniferous period.

4. The epochs of the Chemung period are the Portage and the Chemung. The rocks of the lower, or Portage group, appear in western New York, having a thickness of 1000 ft. on the Genesee, and 1400 ft. on lake Erie. The Chemung rocks extend over the southern counties of the state, being about 1500 ft. thick near Cayuga lake. Farther s., in Pennsylvania and beyond, they become 3,000 ft. thick. Ripple-marks, mud-marks, and sun-cracked mud abound, indicating shallow seas, and lands alternately under, and out of, water. Sea-weeds and land-plants alternate.

5. The Catskill period produced shales and sandstones of various colors, chiefly red. This formation has a thickness of 2,000 to 3,000 ft. in the Catskills, and nearly 6,000 ft. in the coal regions of Pennsylvania, but thins out toward the west. It contains few fossils, and these not materially different from those of the lower periods. The Devonian age closed with an epoch of great disturbance along the eastern border. The rocks were uplifted at various angles previous to the deposition of the carboniferous strata. The rising of Maine above the sea was probably completed during this age.

DEVO'NIAN SYSTEM, the name proposed by Murchison and Sedgwick to replace the more characteristic and older term old red sandstone, because the slaty and calciferous strata in Devonshire contain a much more copious and rich fossil fauna than the red arenaceous rocks of Scotland, Wales, and Herefordshire, with which they were shown to be contemporaneous. The older descriptive name, old red sandstone, is still generally retained, and to it we refer for a description of the rocks of the system.

DEV'ONPORT (before 1824, called PLYMOUTH DOCK), a parliamentary and municipal borough, maritime and fortified town, and naval arsenal, in the s.w. of Devonshire, situated on Stonehouse creek, on the e. shore of the estuary of the Tamar (which is 4 m. long by half a mile broad, and called the Hamoaze), 2 m. w.n.w. of Plymouth. It stands on high ground, with ramparts defended by batteries. The s.e. and s. walls are 12 ft. high, with three gates, and externally a fosse cut 12 to 20 ft. deep in the solid rock. The streets are regular, and the footpaths of marble. D. is supplied with water from Dartmoor by a circuitous route of 30 miles. It owes its importance to the dock-yard established here by William III., and still one of the chief naval arsenals in Britain. Locally, the yard is in D., although official documents and popular phraseology frequently refer it to Plymouth. The yard comprises six building-slips, for various rates of vessels. The docks cover an area of 100 acres, and have cost an enormous sum of money. The most recent basin was completed in 1868. Rope-making, sail-making, and anchor-forging are also carried on. D. has residences for the port-admiral and governor, barracks for 2,000 men, a military hospital, telegraph establishment, victualing office, and grand parade. D. has breweries, soap-works, and an extensive trade in refitting and victualing ships. Pop. '71, 64,034, much connected with the dock-yard. D. returns two members to parliament.

DEV'ONSHIRE, a maritime county, in the s.w. peninsula of England, between the Bristol and English channels. Greatest length, 71 m.; greatest breadth, 68; average, 46; area, 2,590 sq.m., three fourths being in pasture or arable. The n. coast, 60 m. long, is mostly steep and rocky; the chief indentation being Bideford bay, 18 m. broad and 8 deep. The s. coast, 100 m. long, is also lined with cliffs, and has Tor bay, 3 by 3½ m., and Plymouth sound, 3 by 3 miles. The general surface is hilly, and the tablelands of Dartmoor in the s. of D., Exmoor in the n.e. of Devon and n.w. of Somerset, and Blackdown in the e. of D. are high, heathy, and rocky. The lower hills are grassy. The loftiest eminence is Yes Tor, in Dartmoor forest, 2,050 feet. The chief rocks are granite in Dartmoor, and Devonian, carboniferous, and Permian strata, with some Silurian strata, magnesian limestone, greensand, chalk, and trap. Copper, tin, iron, and other metals occur, with potters' and pipe clays, Bovey coal, marble, gypsum, fluor-spar, and loadstone. The rivers are very numerous, the chief being the Exe, 54 m. long.; Dart, 36; Tamar, 59; Torridge, 53; and Taw. These rivers have tidal estuaries, 5 to 11 m. long. There is an intermitting spring at Brixham. The climate is humid and equable—cool in summer, and mild in winter. The great mildness of the s. coast in winter has made it much resorted to by invalids, especially those in consumption. Here myrtles flourish in the open air, and, with a little care, the orange and lemon. From its humidity, D. is more grassy than Cornwall, and there are fine meadows along the rivers. In the s., especially in Exeter Vale, the soil is very productive.

The chief crops are grass and clovers, alternating with corn and potatoes. The fertile red loam of Exeter Vale produces wheat, barley, beans, pease, and flax. D. has much oak-wood and extensive orchards. It is famed for clotted cream and cider. The apple-trees grow on the hill-slopes and in the hedges. The chief manufactures are serges, linen, gloves, and lace; the chief exports are butter, cheese, cattle, and sheep. The red Devon breed of cattle is highly valued. Dartmoor mutton and Exmoor ponies are famous. D. has important pilchard, mackerel, dory, and salmon fisheries. The electric torpedo occurs in the estuaries. D. is divided into 33 hundreds, 470 parishes, and 17 poor-law unions. The chief towns are Exeter (the county town), Plymouth, Devonport, Tavistock, Tiverton, and Barnstaple. D. sends 17 members to parliament—6 for the county, and 11 for the above towns. Pop. in '61, 584,531; in '71, 601,374. Prior to the reform act of 1867, D. had 22 members, but by that act, and the Scottish reform act of 1868, the county gained 2 members, while the boroughs lost 7. D. has many British and Roman remains, as stone circles, dolmens, barrows, and camps. The Saxons failed to conquer D. till the 9th century. It was ravaged by the Danes in the 9th and 10th centuries, and by the Irish in the 11th century. At the reformation, 1549, there were great disturbances in Devonshire. In 1688, the prince of Orange landed at Tor bay.

DEW. For any assigned temperature of the atmosphere, there is a certain quantity of aqueous vapor which it is capable of holding in suspension at a given pressure. Conversely, for any assigned quantity of aqueous vapor held in suspension in the atmosphere, there is a minimum temperature at which it can remain so suspended. This minimum temperature is called the dew-point. During the daytime, especially if there has been sunshine, a good deal of aqueous vapor is taken into suspension in the atmosphere. If the temperature in the evening now falls below the dew-point, which after a hot and calm day generally takes place about sunset, the vapor which can be no longer held in suspension is deposited on the surface of the earth, sometimes to be seen visibly falling in a fine mist. This is one form of the phenomenon of dew, but there is another. The surface of the earth, and all things on it, and especially the smooth surfaces of vegetable productions, are constantly parting with their heat by radiation. If the sky is covered with clouds, the radiation sent back from the clouds nearly supplies an equivalent for the heat thus parted with; but if the sky be clear, no equivalent is supplied, and the surface of the earth and things growing on it become colder than the atmosphere. If the night also be calm, the small portion of air contiguous to any of these surfaces will become cooled below the dew-point, and its moisture deposited on the surface in the form of dew. If this chilled temperature be below 32° F., the dew becomes frozen, and is called *hoar-frost*. The above two phenomena, though both expressed in our language by the word dew, which perhaps helps to give rise to a confusion of ideas on the subject, are not necessarily expressed by the same word. For instance, in French, the first phenomenon—the falling evening-dew—is expressed by the word *serein;* while the latter—the dew seen in the morning gathered in drops by the leaves of plants, or other cool surfaces—is expressed by the word *rosée*.

The merit of the discovery of the "Theory of Dew" has been commonly ascribed to Dr. Wm. Charles Wells, who published in 1814 his *Essay on Dew*, which obtained great popularity. The merit should, however, be divided between him and several others. M. Le Roi of Montpellier, M. Pictet of Geneva, and especially prof. Alex. Wilson of Glasgow, largely contributed by experiment and induction to its formation. Its history is very interesting, and the curious reader will be well repaid by a perusal of an article on the subject by Mr. Tomlinson of King's college school, London, in the *Edinburgh New Philosophical Journal* (new series), vol. xiii. No. 1. Jan., 1861.

DEW, Thomas Roderick, 1802–46; b. Va.; graduate of William and Mary college, professor of moral science in that institution, and president, 1836. In 1832, he published an essay on *Slavery*, which is said to have put a stop to a movement then assuming considerable proportions, to proclaim emancipation in Virginia. His most important work is a *Digest of the Laws, Customs, Manners, and Institutions of Modern Nations.*

DEWAS', a t. of Malwa, India, 24 m. n.n.e. from Indur. It is the capital of a petty state or raj under British protection, held conjointly by two chiefs of the lineage of the Puar or Pramara Rajpoots, once very powerful, although now of fallen fortune. The military force of the state consists of 175 horse and 500 foot; the pop. is about 25,000, the revenue about £40,000.

DEW'BERRY, *Rubus cæsius*, a plant of the same genus with the bramble (q.v.), and very nearly allied to it, but having weaker and more prostrate roundish stems, which take root at the end, their prickles unequal and passing insensibly into hairs, the fruit consisting only of a few (1 to 5) grains, which, however, are much larger than those of the brambleberry. The name is derived from the dew-like, bluish bloom which covers the fruit. The D. is common in some parts of Britain, and in many parts of Europe and of Asia. The fruit is very sweet and agreeable, and makes an excellent wine. The D. of North America (*R. procumbens*), abundant in the forests of Canada, is a delicious fruit, much superior to the British fruit of the same name, and more tart. The plant is of very humble growth, scarcely rising above the ground.

DEWEES', WILLIAM POTTS, 1768–1841; b. Penn.; a physician. He selected obstetrics as his specialty, in which he won much reputation. He was professor of the diseases of women and children in the university of Pennsylvania. Among his publications are *System of Midwifery; Treatise on the Physical and Medical Treatment of Children; Treatise on the Diseases of Women;* and *Practice of Medicine.*

DE WETTE, WILHELM MARTIN LEBERECHT, one of the ablest theologians of modern Germany, was b. 14th Jan., 1780, at Ulla, near Weimar, and studied at the university of Jena. In 1807, he was appointed extraordinary professor of philosophy at Heidelberg; in 1809, professor of theology; and in 1810, was called to Berlin. By his popularity as a teacher, as also by his writings, De W. soon acquired a great reputation. In 1819, on account of a letter which he wrote addressed to the mother of the assassin of Kotzebue, he was deprived of his chair. Not long after, however, he was appointed professor of theology in the university of Basel, where his prelections and sermons in a short time secured him universal esteem and applause. In 1829, the grand council of Basel made him a member of the council of education, and granted him the freedom of the city. In 1849, he was elected rector of the university, but died the same year, on the 16th of June.

De W. was a man of comprehensive learning, and acute philosophic discernment. His antipathy to the shackles of dogmatic theology gave keenness and vigor to his criticism. Yet he formed no school, and followed no master, so that it is difficult to describe his position. He cannot be classed either with Paulus, Strauss, or Baur. A temperate but very decided historical rationalism, on a broad basis of moral reverence, would perhaps best express his biblical stand-point. His principal works are: *Beiträge zur Einleitung in das Alte Testament* (Contributions to an Introduction to the Old Testament), 2 vols. (Halle, 1806–7); *Commentar über die Psalmen* (Commentary on the Psalms), Heidelberg, 1811; *Lehrbuch der historisch-kritischen Einleitung in die Bibel Alten und Neuen Testaments* (Historico-Critical Introduction to the Books of the Old and New Testament), 2 vols. (Berlin, 1817–26); *Lehrbuch der Christlichen Dogmatik* (Compendium of Christian Dogmatics), 2 vols. (Berlin, 1813–16); *Christliche Sittenlehre* (Christian Ethics); *Vorlesungen über die Religion, ihr Wesen, und ihrer Erscheinungsformen* (Lectures on Religion, its Essence, and Forms of Manifestation), Berlin, 1827; *Das Wesen des Christlichen Glaubens* (The Nature of the Christian Faith), Basel, 1846; and *Exegetisches Handbuch zum Neuen Testament* (Exegetical Handbook of the New Testament). Besides these, De W. published a critical edition of the entire works of Luther.

DEWEY, CHESTER, D.D., LL.D., 1784—1867; b. Mass.; a botanist, professor of natural philosophy in Williams college; in 1850, was appointed to the chair of chemistry in the university of Rochester.

DEWEY, ORVILLE, D.D., b. Mass., 1794; graduate of Williams college, and divinity student at Andover. He preached in Boston for two years as assistant to Dr. Channing, forming a friendship which was only broken by death. In 1823, he became pastor of the Unitarian church in New Bedford, remaining there ten years. He went to New York in 1835, and while there secured the building of the "Church of the Messiah." About 1844, he quitted the pulpit and lectured in various parts of the country on "The Problem of Human Life and Destiny," and on other subjects. Among his works are *Letters on Revivals; Discourses on Human Nature; Discourses on Human Life; Discourses on the Nature of Religion; The Unitarian Belief;* etc.

DEWITT, a co. in central Illinois, intersected by the Illinois Central and the Indianapolis, Bloomington, and Western railroads; 675 sq.m.; pop. '80, 17,014. It has a level prairie and forest surface. Coal is the chief mineral product, and agriculture the main business. Co. seat, Clinton.

DEWITT, a co. in s. Texas, on the Guadalupe river; 898 sq.m.; pop. '80, 10,061—2,925 colored. It has a rolling and hilly surface and fertile soil. Productions, corn, wool, butter, and cotton. Co. seat, Clinton.

DE WITT, JAN, a celebrated statesman of Holland, b. at Dort in 1625, was the son of Jacob de Witt, a vehement opponent of William II., prince of Orange. Jan inherited his father's hatred of the office of stadtholder, and the family that filled it. His education was carefully attended to, and he soon exhibited remarkable ability. He was one of the deputies sent by the states of Holland in 1652 to Zealand, for the purpose of dissuading that province from adopting an Orange policy. There his eloquence secured him universal confidence, which, however, in such troublous times could not long be retained. In the same year he was made grand pensionary. The Orange party (supported by the populace and the clergy), during the war carried on between England and Holland, was ever striving to increase the power of the young prince (afterwards William III.), who was then a mere infant; the republican, or oligarchic party, composed of the nobles and the wealthier burgesses, at the head of which was De W., sought, on the other hand, to strip the house of Orange of all power, and to abolish entirely the office of stadtholder. During William's minority, the advantage was, of course, with De W. and the republicans. In 1654, on the conclusion of the war with England, a secret article was inserted in the treaty drawn up between De W. and Cromwell, in virtue of which the house of Orange was to be deprived of all state-offices. After the restoration

of Charles II., De W. leaned more to the side of France. This tendency necessarily received an impetus from the renewal of hostilities between England and Holland in 1665. These lasted for two years; and although De W. acted with great vigor, his influence was diminished, and his party was compelled to concede a larger measure of power to the house of Orange. De W.'s prospects became still more clouded when the designs of Louis XIV. upon the Spanish Netherlands became manifest. The Orange party carried their point in the elevation of William to the family dignity of stadtholder. On the invasion of the Netherlands by Louis XIV. in 1672, the prince of Orange was appointed commander of the Dutch forces; and the first campaign proving unfortunate, the popular clamor against De W. greatly increased, who had previously resigned his office of grand pensionary. His brother, Cornelius, accused of conspiring against the life of the stadtholder, was imprisoned and tortured. De W. went to see him on his release. When they were coming out of prison, they were attacked by an infuriated crowd, and were both murdered Aug. 20, 1672. The states-general demanded an investigation, and the punishment of the murderers, but the stadtholder did not take the necessary steps. De W. was personally a man of upright character. His *Memoirs* (which were published during his lifetime) contain much important information regarding the politics of the time.

DE WITT, THOMAS, D.D., 1791–1874; b. N. Y.; graduate of the theological seminary in New Brunswick, N. J., 1812, and entered the ministry of the Reformed Dutch church. He became minister of the collegiate church in New York, 1827, and remained so all his life, a pastoral service of 47 years. He was thoroughly learned, and held many important positions, among them president of the New York historical society, and of the New York tract and mission society. He was one of the few remaining of the Reformed church clergy who could preach in the Dutch language.

DEWSBURY, a manufacturing t. and parliamentary borough in the west riding of Yorkshire, situated at the base of a hill, on the left bank of the Calder, is 32 m. s.w. of York, and 8 m. s.s.w. of Leeds. It is governed by a local board of health, possesses a chamber of commerce, and is the center of the Dewsbury union. Pop. '71, 24,764. D. is noted for its manufactures of low woolen goods—as pilots, sealskins, unions, etc.; and carpets and blankets. There are collieries and ironworks in the immediate neighborhood. Railways—London and Northwestern, and Lancashire and Yorkshire. Calder navigation connects the town with Hull and Liverpool. The parliamentary borough was formed in 1867, and includes Batley and Soothill. Pop. of p. b. '71, 54,940. It returns one member to parliament.

Near D. is situated BATLEY, the principal manufacturing town in the kingdom for low woolen and army cloths. It is governed by a local board of health, and possesses a chamber of commerce. It is on the Manchester and Leeds line of the London and Northwestern railway. Pop. '71, 20,871.

DEXTER, HENRY, a sculptor, b. N. Y., now residing in Massachusetts, who has done some good work. In youth he was a blacksmith. Two of his works are "The Young Naturalist," and "The First Lesson."

DEXTER, HENRY MARTYN, D.D., b. Mass., 1821; a graduate of Yale, and of Andover theological seminary; Congregational pastor in Manchester, N. H., and Boston. He was one of the editors of the *Congregational Quarterly*, and in 1867 was editor-in-chief of the *Congregationalist*, Boston. Besides *Street Thoughts*, *Twelve Discourses*, and various other writings, he has published *Congregationalism*, an authentic work concerning both the principles and the usages of the churches of that order. His latest issue is *History of the Congregationalism of the last Three Hundred Years, as seen in its Literature.* This work contains an invaluable bibliography of Congregationalism, with 7,250 names of publications. As a historical scholar, industrious and keen, he occupies the first place in the department which he has chosen—pressing research to its furthest practicable point, securing accuracy in numberless details, then classifying and analyzing with a critical judgment which unfolds the vital issues.

DEXTER, SAMUEL, LL.D., 1761–1816; b. Boston; gradute of Harvard and a lawyer. He was in the state legislature, and in congress both as representative and senator. In 1800, he was appointed secretary of war, and the next year secretary of the treasury. He was a candidate for governor of Massachusetts, 1814, but was defeated by his republican opponent. He was the president of the first "temperance society" in his state.

DEXTER, TIMOTHY, 1747–1806; b. Mass.; a merchant who rose to great affluence; but memorable chiefly for his eccentricities. He assumed the title of lord Timothy Dexter. Having an itch for authorship he published *A Pickle for the Knowing Ones.* Being troubled by his printers about punctuation, he retaliated by writing a pamphlet without a comma or any other point, but at the end he put half a page of points in a mass, inviting his readers to "pepper the dish to suit themselves." He also organized his own funeral procession in the most elaborate and extensive manner.

DEXTRINE (syn. British gum, torrefied starch). When starch is carefully heated to 400° F., or until vapors arise from it, it becomes soluble in cold and hot water, and loses its gelatinous character; it also has the property, when viewed by polarized light, of turning the plane of polarization to the right; hence its name. It is often used as a

substitute for gum-arabic in the processes of calico printing, and for stiffening different goods; it is also applied to the back of postage-stamps. Its value as a substitute for gum consists in its being more flexible and less brittle when dry than that substance. Starch may be converted into dextrine by the long-continued action of dilute acids at a high temperature; also by the action of diastase (q.v.). Dextrine and starch are isomeric, both being composed of $C_{24}H_{20}O_{20}$; but dextrine may be distinguished from the latter body by its pale buff color, its insolubility in alcohol, and its not being rendered blue by iodine, which gives with it a dingy purple tint.

DEY, a word of doubtful origin, but appropriated by the ruler of Tripoli, and also of Algiers until its conquest by the French. At one period, Tunis likewise was governed by a dey, but this title has long been supplanted by that of bey. See BEG.

DHALAC, an island in the Red sea, off the coast of Abyssinia, in lat. 15° 46′ n., long. 40° 6′ east. It is 30 m. long, 15 m. in average breadth, and 120 m. in circumference. It is composed of coral rock, and its surface in general is flat and sandy. Doobelloo, a village on the e. side, trades with Loheia and Ghizan, ports on the Arabian coast, exchanging fish, sharks, fins, turtle, and pearls, for millet and dates. The groups of islands in the vicinity of D. are called the Dhalac archipelago. The inhabitants are good sailors and skillful fishermen.

DHAMEE', a hill-state of India, of about 25 sq.m., on the left bank of the Sutlej, in about lat. 31° 12′ n., and long. 77° 8′ east. It is merely a collection of mountains and valleys. The general elevation probably exceeds 4,000 ft., and even the margin of the river is 2,283 ft. above the level of the sea. D. contains 5,500 inhabitants, and yields a revenue of about 8,000 rupees a year, of which 360 rupees are paid as tribute to the British government.

DHAR, a t. situated on the table-land of Malwa, in central India, stands in lat. 22° 35′ n., and long. 75° 20′ e., at an elevation of 1908 ft. above the sea. It is said to have at one time consisted of 20,000 houses, implying a pop. of about 100,000, and though very greatly decayed, it yet retains many traces of by-gone magnificence--two large mosques of red stone, ten water-tanks of various sizes, and a fort defended by many considerable towers. It is the capital of a protected state of the same name, having an area of 2,061 sq.m., with 125,000 inhabitants.

DHAR'WAR, a t. in the province of Bombay, close to the frontier of Madras, stands in lat. 15° 28′ n., and long. 75° 4′ east. It has government schools for Mahrattas and Canarese, besides schools established by the natives themselves. D. is the center of a cotton district. Pop. '72, 27,136.

DHARWAR, the district of which the t. before mentioned is the capital, extends in n. lat. from 14° 16′ to 15° 50′, and in e. long. from 74° 50′ to 76°, containing 4,565 sq.m., and (1872) 988,037 inhabitants. Its drainage is divided between the Arabian sea and the bay of Bengal, passing to the latter by the Tumbudra, a feeder of the Kistnah or Krishna, and to the former by the Kali Nadi, through a deep valley of the western Ghauts. The most interesting feature of the country is its suitableness for the growth of American cotton. In 1842, after several previous failures, the New Orleans staple was cultivated with success to the extent of 25 acres; and within five years, the breadth of land thus sown had increased a thousand-fold. In connection with this enterprise, a good road has been constructed to Coompta, on the Arabian sea, where the cotton is shipped for Bombay. It is hence commonly called "Coompta cotton." The prevalent language is Canarese, and there are a number of vernacular schools in the district.

DHOB. See CYNODON.

DHOLE, *Canis scylax*, an Indian species of dog, existing in a wild state in the western Ghauts and some other mountainous districts. It is in size between a wolf and a jackal, with rather long legs, sharp muzzle, wide and pointed ears, straight and not bushy tail, light-bay color, fierce keen eyes, and great courage. The name D. is extended to some other very similar species or varieties, natives of Ceylon, Nepaul, and other parts of the east, to which the common name *red dogs* has been sometimes applied, and for which col. Hamilton Smith has proposed the sub-generic name *chryseus*. They seem not incapable of domestication, but whether any of the domesticated dogs are derived from them is wholly uncertain. There is no reason to think that any of them are the wild offspring of once domestic races. They all want the second tubercular tooth in the lower jaw, have oblique eyes, and the soles of the feet hairy. They hunt in packs. They are all inhabitants of the deepest recesses of wild mountain-forests. A remarkable characteristic of the dholes is their hostility to the feline races, the weaker and the young of which they attack and destroy. To this is ascribed the alarm which the tiger exhibits at the sight even of a domestic dog; and "we may surmise," says col. H. Smith, "that the species of *chryseus* are the instruments nature has appointed to keep down the superabundant increase of the great *felinæ* of the wilderness."

DHOLKA, a t. of India, in the British district of Ahmedabad, presidency of Bombay. It is surrounded by a mud wall 4 m. in circuit. Pop. '71, 20,854.

DHOLPORE', a t. of Hindustan, on the left or n.w. bank of the Chumbul, is in lat. 26° 41′ n., and long. 77° 58′ e., being 34 m. to the s. of Agra, and 37 to the n. of

Gwalior. Here are some elaborately wrought mosques and mausoleums of freestone. Of the former, one is said to have been built by Shah Jehan, the founder of the modern Delhi, in 1634; and of the other edifices, some are of still earlier date. D. is the capital of a protected state stretching along the left bank of the Chumbul, containing 900 sq.m., and 200,000 inhabitants.

DHOORCATEE', a protected state in Hindustan, of not more than 5 sq.m., is in lat. 31° 8′ n., and long. 77° 40′ e., lying in the basin of the Jumna towards that of the Sutlej. Small as it is, it is worthy of notice as containing the peak of Toongroo, which, at an elevation of 10,102 ft. above the sea, forms one of the stations of the large series of triangles in the trigonometrical survey of the Himalayas.

DHUBBOOEE', a decayed t. in Guzerat, belonging to the Guicowar, in lat. 22° 8′ n., and long. 73° 25′ e., lies 78 m. to the n.e. of Surat, and 225 to the n. of Bombay. It presents many memorials of ancient grandeur—such as a rampart of 2 m. in circuit, backed inwardly by a handsome colonnade; a magnificent tank, bordered by a grand flight of stairs and numerous Brahmanical temples—the whole richly adorned with curious sculptures. But a still more remarkable circumstance is, that, in a purely alluvial neighborhood, where even a pebble is unknown, all these structures are of hewn stone. The population, which is inconsiderable in number, shares the place with swarms of monkeys.

DHUMTOUR', or DUMTAUR, a valley of the Punjab, stretches in n. lat. from 34° to 34° 10′, and in e. long. from 72° 55′ to 73° 15′. Here a traveler from the n. first finds the peculiar vegetation of Hindustan. While behind him are luxuriant forests of oak, plane, walnut, and pine, the sugar-cane grows before him in such abundance as to form a principal article of fodder for cattle. The population is distributed into villages, each defended by a small fort against neighboring marauders. The chief town, of the same name, is 16 m. to the e. of the Indus, on the route between Attock and Cashmere.

DHUNCHEE, or DHANCHI, *Sesbania aculeata*, a plant of the natural order *leguminosæ*, sub-order *papilionaceæ*, of a genus having an elongated many-seeded pod, alternately swollen and contracted, as if it contained a string of beads. The D. is an annual herbaceous plant, much cultivated in Bengal upon account of its fiber; it has an erect, sparingly branched stem, 6 to 10 ft. high. It is a plant of rapid growth, and succeeds best in low and wet soils. Its fiber is coarser than hemp, unless when it is cut at a very early period of its growth, is durable in water, but contracts considerably when wetted. It is steeped and prepared very much like sunn (q.v.).

DHWALAGI'RI, once supposed to be the highest peak of the Himalayas, but now ascertained to be at most only the third in point of altitude, is stated at 26,826 ft. above the sea. Its lat. and long. are 28° 42′ n., and 82° 32′ east. The mountain is within the limits of Nepaul.

DIABE'TES (Gr. literally a syphon, from *diabainō*, I go or flow through), a disorder of the general system, of which the principal symptom is a very much increased flow of urine. Diabetes is of two distinct kinds the one, *diabetes insipidus*, is a mere exaggeration of the water-excreting function of the kidneys, accompanied by extreme thirst, and hence called *polydipsia* (Gr. excess of thirst) by some authorities; the other is a more complex disorder of the assimilation, consequent on the formation first, and the excretion by the kidneys afterwards, of an enormous excess of animal sugar (see GRAPE-SUGAR), the sugar being found in excess, not only in the renal excretion, but in the blood, and in nearly all the secretions which have been examined. The pathology of this disease, called *diabetes mellitus* (Lat. *mel*, honey), is very obscure, notwithstanding the numerous recent physiological researches which tend to throw light on the development of sugar in the animal organism, and which must undoubtedly be regarded as bearing on the solution of the problems connected with this disease. Unhappily, the cure of it is still entirely unknown, except in so far as it may be controlled or retarded by good management of the diet, drink, and clothing. All diabetics are subject to progressive emaciation, and they often become subject to true tubercular consumption (q.v.), or other chronic disease of the lungs; it is chiefly in warding off this termination that the medical art can be of service, as well as in relieving the symptoms as they occur. The first fact observed in cases of diabetes is usually the increased flow of urine, when it becomes so great as to amount to a practical inconvenience; and also a considerable increase of the appetite, and an unquenchable thirst, which rarely fail to accompany the disease from the beginning, but often do not attract attention, or at least suggest the idea of anything wrong, till an advanced stage of the disorder. When the patient demands medical assistance, he is usually somewhat thin; the pulse is quiet, the skin cool, the heat of the surface, indeed, habitually rather low and easily depressed. There is often a complete absence of perspiration, which gives a peculiar feeling of harshness to the surface, especially of the palms of the hands. With these symptoms, the first approaches of pulmonary disease may concur. In the very last stages, there is sometimes dropsy of the feet; and the urine may be natural in quantity, or even diminished. For the other characters of diabetic urine, see URINE. The cure consists in removing from the diet, as far as possible, consistently with comfort and due nourishment, everything which easily turns to the formation of animal sugar in the system,

especially all excess of farinaceous food. The complete suppression of sugar-forming food, however, as recommended long ago by Rollo, has not been found possible in practice in the majority of cases. Bread composed of gluten of wheat without starch, or bran-cakes baked with eggs, have been strongly recommended; and in most of the great capitals, as London and Paris, bakers may be found who regularly furnish bread suitable for this unfortunate class of sufferers; indeed any intelligent baker who will take the trouble, may, under medical direction, be got to manufacture such bread when required; or it may be ordered in the form of cakes and biscuits, in quantities at a time, from London houses. Dr. Camplin, himself a diabetic patient, has minutely studied the diet and regimen required, and published a little book, which we have no hesitation in recommending to all concerned, *On Diabetes, and its Successful Treatment*, in which full directions will be found for the manufacture of palatable and useful diabetic bread. The "success" alluded to, however, is simply keeping the disease at bay by constant watchfulness. Medicines proper should be used only under the advice of the physician. There is no specific, and the unguarded use of strong remedies is to be condemned. Flannel should be worn next the skin, and the languid function of the cutaneous perspiration aided by the warm bath. The Turkish bath might possibly prove useful in this disorder, and could hardly do harm if carefully employed; but we have not heard, as yet, of any actual experiments in this direction for the cure of diabetes.

DIABET'IC SU'GAR is a variety of sugar found in the blood and secretions of the higher animals, especially when afflicted with the disease called diabetes. It is a variety of grape-sugar or glucose. See GRAPE-SUGAR.

DIABLERETS, a remarkable mountain of the Bernese Alps, Switzerland, situated between the cantons of Bern and Valais, in lat. about 46° 18′ n., and long. 7° 15′ e., with an elevation of 10,670 ft. above the sea. The D. is composed of limestone strata, the lower beds of which are so soft and shaly, that they are easily disintegrated by the infiltration of water given off from the glaciers on the n.e. The consequence is that, the foundation being worn away, the peaks tumble over into the valley, occasioning the most terrible catastrophes. Three peaks have already fallen in this way, and the two that yet remain threaten to follow sooner or later. In the fall in 1714, 15 people, 100 head of cattle, and 55 châlets were destroyed; and the result would have been much more appalling, had not premonitory noises given the inhabitants timely warning to escape. In 1749, the fall of another peak arrested the course of the Liserne, which thereafter formed two small lakes known as Derborenze.

DIACAUSTIC. See CAUSTIC.

DIA'CHYLON (Gr. literally, from juices—i.e., vegetable juices, a deceptive etymology, as the plaster has really no such composition), the common healing or adhesive plaster, made by combining litharge, or the red oxide of lead, with olive oil, so as to form a kind of soap. The preparation of this plaster is now entirely taken out of the hands of druggists, it being prepared on the great scale by machinery.

DIADEL'PHIA, the 17th class of the Linnæan system, comprising plants of which the filaments are united in two sets of brotherhoods.

DI'ADEM was the name given to the fillet of silk, woolen, or linen which served as the distinguishing ornament of kings. It was generally narrow, being only a little broader on the forehead. The diadem of the Egyptian goddesses and kings bore the symbol of the sacred serpent. The diadem of Bacchus, as it appears in ancient sculptures, was a plaited band going round the forehead and temples, and tied behind, with the ends hanging down. Among the Persians, the D. was bound round the tiara or turban, and was of a blue color, worked with white. The early Roman emperors refrained from using this ornament, in order not to call up recollections of the hated kingly office. Diocletian was the first to introduce it again, and Constantine the great added new ornaments to it. After his time, it was adorned with a single or double row of pearls and precious stones. Queens are also seen on coins ornamented with the D., with the addition of a veil. It was finally superseded by the crown (q.v.).

DIÆ'RESIS (Gr. *diairo*, I divide), a term used in grammar to signify the resolution of a diphthong, or of a contracted syllable, into two syllables; as Lat. *aurœ* into *aurăi*. The name is also given to the mark ·· placed above a vowel letter, to indicate that it is to be independently pronounced, and not in conjunction with a preceding vowel; as in the above example, or in the word *aërial*.

DIAGNO'SIS (Gr. *dia*, through, and *gnosis*, knowledge), the through-knowledge or thorough knowledge of a disease, embracing its points of distinction from other diseases, its symptoms, their relation to one another, and to the state of the different organs and functions of the body, in so far as this can be appreciated during life. D. is usually spoken of in contrast with prognosis, which implies the judgment framed by the physician as to the issues of disease; and also with prophylaxis (*pro*, from, and *phylaxis*, protection), which refers to the warding off disease, when supposed to be impending. D. includes the study of all the vital phenomena of diseases, and also of their appearances after death, in so far as this can aid their discovery during the life of the patient. It is

usual to speak of rational or physiological D., or D. by symptoms—i.e., functional changes; and of physical D., or D. by signs—i.e., objective phenomena appreciable by the senses of the observer. The latter method of D. has been much enlarged in scope, and increased in importance of late years by the modern discoveries in auscultation (q.v.) and percussion (q.v.), and also by the great advances made in physiological chemistry, and by the use of the microscope.

DIAGOM'ETER, a kind of electroscope, in which a dry pile is employed to measure the amount of electricity transmitted by different bodies, or determine their conducting power. Used to detect foreign mixture in olive oil.

DIAG'ONAL, in plane geometry, is a straight line joining any two angles not adjacent, of a rectilineal figure. A line drawn between two adjacent angles would coincide with the boundary-line. A triangle has no diagonal, because any two of its angles are adjacent; a four-sided figure has two diagonals; a five-sided, five; a six-sided, nine; etc. The number of possible diagonals in any figure is found by taking three from the number of sides, multiplying the remainder by the number of sides, and taking half the product. Thus, in the six-sided figure, the process is $\frac{3 \times 6}{2} = 9$. If the diagonals must be so drawn as not to intersect, their number is always three less than the number of sides. It makes no difference whether they all proceed from one angle or not. A diagonal in a solid bounded by planes, is a line joining any two solid angles so situated that the line does not coincide with any line on the surface. To find the number of such diagonals in a given solid: Multiply the number of solid angles by the same number diminished by one, and from half this product subtract the number of edges on the figure, and also the sum of the number of diagonals in all the faces. Thus, the cube gives $\frac{8 \times 7}{2} - 12 - 6 \times 2 = 4$ diagonals.

DIAGONAL SCALE, a system of lines by means of which hundredths of units may be laid down or measured with compasses. When the numbers representing the lengths of the sides of any figure would give lines of an inconvenient size taken from the scale, the numbers may be all multiplied or all divided by such a number as will adapt the lengths of the lines to the required dimensions of the figure.

DIAGORAS, a Greek poet and philosopher, was b. in Melos, an island of the Cyclades. He flourished in the 5th c. B.C., but beyond his reputation for atheism, nothing very positive is known regarding his career. He is said to have been a disciple of Democritus of Abdera, and to have resided during the more important part of his life in Athens. He is alluded to by Aristophanes in the *Clouds* (424 B.C.); and from an epithet applied there to Socrates, it is highly probable that that great philosopher had been a pupil of D., or at least held similar opinions. This will perhaps explain to us the accusation brought against him of atheism. In all likelihood, D. was no atheist, but simply a *disbeliever in polytheism;* and the anecdotes related of him, such as his once throwing, when ill-off for fuel, a wooden image of Hercules into the fire, to cook his dinner, serve to confirm such a supposition. He seems to have been witty and fearless, and probably treated the rude superstitions of the common-place Athenians with dashing contempt. In this way he may have become specially notorious, and so fixed himself in the Greek mind as the *representative* atheist. D. was banished from Athens professedly on account of his impiety, but really on account of his politics. He went first to Pallene, and afterwards to Corinth, where he died. He wrote lyrics of various kinds, and a philosophical work entitled *Phrygioi Logoi.* Personally, he was a man of untainted character, and discharged his duties as a citizen in an earnest and exemplary manner.

DIAGRAM, a figure so drawn that its geometrical relations may illustrate the relations between other quantities. The area of a rectangle is the product of its length and breadth; the diagram of the rectangle becomes the visible symbol, corresponding to the equation $a = bl$; by analogy, the rectangle may be used to symbolize any quantity which is the product of two factors. Similarly, a parallelopiped may symbolize any quantity which is the product of 3 factors; e.g., interest, which is the product of principal, rate, and time, i = p.t.r., may be symbolized by a diagram in which principal is figured by length, time by breadth, and rate by height, the total volume representing the interest.

The purpose of ordinary mathematical diagrams is simply illustration, and it is therefore necessary only that the ideas be clearly presented, accuracy of drawing being unimportant. Other diagrams, as some drawn by engineers and architects, are intended to furnish magnitudes or distances by actual measurement, and their execution cannot be too careful. Other diagrams, like those showing electric connections, require only a proper showing of the parts and the methods of uniting them. A profile diagram shows such an outline as would be formed, for example, if a hill were cut through by a vertical plane, and the material on one side of the plane were removed. Evidently a succession of such profiles might be laid upon the same sheet of paper, the lines being distinctively drawn, and the whole would serve to compare several vertical profiles of the same mass. It is not necessary that vertical and horizontal measurements should con-

form to the same scale, provided that each series of measurements is consistent with itself. Geographical profiles, which include upon a single sheet the outlines of entire continents or ocean-beds, have usually the vertical measurements on a scale several times greater than that used for horizontal distances; otherwise the diagram would be made inconveniently long, or the heights would be inconspicuously small. Yet the impression left by such a diagram is often mischievous, especially upon the illiterate. A topographer's contour map exhibits a series of curves, such as would be formed if a series of horizontal sections were made, and the outlines carefully laid down upon paper. The drawing may be understood to show the horizontal projections of the contour lines upon a surface parallel to the system. In the representations of parts of machinery, particularly those designed to guide workmen in construction, several connected views of the same object are required, each view giving some information which the others cannot furnish. Suppose three planes perpendicular to each other, like the bottom, one side, and one end of a rectangular box, and let an object, as a hexagonal nut, be placed within the triedral angle thus formed. Looking from the front, we see one image of the nut projected against the back of the box; from the side, a different image is seen against the end of the box; from above, a third form appears against the bottom of the box; while from one or other of these figures all the measurements of the nut may be obtained. If now the end of the box were swung outward into the plane of the back of the box, and then both together were laid back into the plane of the bottom, we should have the three co-existent drawings in one plane, and they may be transferred to, or be constructed on, one sheet of paper. In many cases the same points will find representation upon each of the three diagrams, and the fact may be indicated by using the same letter for a point wherever it occurs; while the eye may be led from one position of it to another by lines, conventionally drawn, as fine, or dotted, or broken, to show that they are merely guides and not parts of the diagram.

Many devices have been invented by which diagrams illustrating natural phenomena may be automatically described. Let us suppose that a spring dynamometer is placed where it may receive the draft of a horse when moving a carriage. Let the movement of the spring be shown by an index whose motion is back and forth along a line in the direction of the draft. Fix a pencil to the index, and let its point rest upon a sheet of paper on a plane or a cylinder which moves at a uniform velocity in a direction perpendicular to the motion of the index. The combined movements of the pencil and the paper beneath it will trace a line more or less irregular. If the force of draft were unvaried, the pencil would remain at a constant distance from the edge of the paper, and the trace would be parallel to the edge. If the paper does not move and the pencil varies, the line will be perpendicular to the edge. If both move, and the pencil be obedient to a diminishing force, the trace will be oblique, approaching one edge; while if the force increase, the oblique trace will diverge from the same edge. Such mechanism is often arranged for instruments which indicate meteorological changes, as the force and direction of winds; or the pulsation of the arteries, as in the sphygmograph; or the movements of a clock, combined with the observations of an astronomer, as in the chronograph; applicable also to many physical problems. An application of the same principle has great importance in the indicator diagram, by which the pressure of the steam in the steam-engine and the work done by each stroke of the piston, becomes a matter of record for investigation. The paper moves with the movement of the piston, both in its excursion and return; the pencil moves at right angles to the direction of the motion of the paper, under the influence of the steam-pressure; and the diagram drawn shows for each instant of the stroke the volume and pressure of the steam, while the total area of the diagram indicates the amount of work done.

DIAL, THE, a magazine founded, 1840, in Boston, to represent what was then known as the "transcendental" school of thought in philosophy and religion. It was continued only 4 years, first under the editorship of Margaret Fuller, assisted by George Ripley and Ralph Waldo Emerson; afterwards under Ripley's editorship. It was distinguished for the boldness and ability with which it announced and defended theories of men and society then quite novel. Many able writers contributed to its pages.

DIAL AND DIALING. A *sun-dial* is an instrument for measuring time by means of the motion of the sun's shadow cast by a stile erected on its surface. It is an instrument of very great antiquity, the earliest mention of it being in Isaiah xxxviii. 8; and before clocks and watches became common, it was in general use as a time-keeper. The art of constructing dials to suit any place and situation, was then an important branch of mathematical study; now the subject is more an object of curiosity than utility.

A dial consists of two parts—the *stile* or gnomon, usually the edge of a plate of metal, always made parallel to the earth's axis, and pointing towards the north pole; and the *dial-plane*, which may be of any hard substance, and on which are marked the directions of the shadow for the several hours of the day, their halves, quarters, etc. Dials receive various names, according, mostly, to the positions which they are constructed to occupy. When the dial-plane is on the plane of the horizon, the dial is called a horizontal dial; when perpendicular to that plane, a vertical dial. An equinoctial dial is one whose plane is parallel to the equinoctial plane. Besides these names,

there are others, such as the s. dial, n. dial, e. dial, w. dial, polar dial, declining dial, of which it is useless to write at length. These names all depend on the position of the dial-plane. The cylindrical dial is a dial drawn on the curved surface of a cylinder. The ring dial is an ingenious small portable dial, but rather a curious toy than a philosophical instrument.

A *night* or *nocturnal dial* is an instrument for showing the hour of the night by the shadow of the moon or stars. Moon-dials may be constructed relative to the moon's motion; or the hour may be found by the moon's shadow on a sun-dial by the following rule: Observe the hour pointed out by the moon's shadow; find the days of the moon's age in the calendar, and take three fourths of that number for the hours to be added to the time shown by the shadow to give the hour of the night.

Dialing.—The *stile* of a dial being parallel to the earth's axis, those familiar with spherical trigonometry will readily see that the problem of constructing a dial resolves itself into that of ascertaining where the hour-lines cut a given circle, with a view to the graduation of the dial-plane. We do not here presume the reader to be acquainted with spherical trigonometry, and accordingly proceed to illustrate the principles of dialing in a popular manner, taking our illustrations from Ferguson's *Lectures* (4th ed., 1772, lecture 10), which should be referred to for fuller information. Suppose a hollow and transparent sphere, as of glass, to represent the earth; and suppose its equator divided into 24 equal parts by the meridians, one of them passing through a given place, say London (see HORIZON). If the hour of twelve be marked at the equator, both on the latter meridian and that opposite it, and all the rest of the hours in order on the other meridians, those meridians will be the hour-circles of London, because, as the sun appears to move round the earth in 24 hours, he will pass from one meridian to another in one hour. Then, if the sphere has an opaque axis, terminating in the poles, the shadow of this axis would fall, in the course of the day, on every particular meridian and hour, as the sun came to the plane of the opposite meridian, and would thus show the time at London, and at all other places on the same meridian as London. If the sphere were cut through the middle by a plane in the rational horizon of London, and if straight lines were drawn from the center of the plane to the points where its circumference is cut by the hour-circles of the sphere, those lines would be the hour-lines of a horizontal dial for London; for the shadow of the axis would fall upon each particular hour-line of the dial, when it fell upon the like hour-circle of the sphere. Similarly, if we suppose the sphere cut by *any* other plane facing the meridian, the hour-circles of the sphere will cut the edge of the plane in those points to which the hour-lines must be drawn straight from the center; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will hold of any plane, whether it face the meridian or not, provided it do not coincide with it, or do not coincide with a plane through the poles, and perpendicular to the plane of the equator. In the latter case, the axis would have no elevation above the plane of the dial; in the former, the shadow would not move circularly.

The *universal dialling cylinder*, an invention of Ferguson's, is a glass cylindrical tube, closed at both ends with brass plates, on the centers of which a wire axis is fixed. The tube is either fixed to a horizontal board at an angle equal to the latitude of the place, or moves on a joint, so that it may be elevated till its axis is parallel to the earth's at any latitude. The 24 hour-lines are drawn on the outside of the glass, equidistant from one another, and parallel to the axis. The XII on the upper side of the cylinder stands for midnight; the XII next the board, for noon. When the axis is adjusted for the latitude, and the board leveled, with both XII, noon and midnight, in the plane of the meridian, and the end towards the n., the axis, when the sun shines, will serve as stile, and cast a shadow on the hour of the day among the parallel hour-lines. As the plate at the upper extremity of the cylinder is perpendicular to its axis and parallel to the equator, right lines drawn from the center to the extremities of the parallels will be the hour-lines of an equinoctial dial, and the axis will be the stile. A horizontal plate, if put into the tube, with lines drawn from the center to the several parallels cutting its edge, will be a horizontal dial for the given latitude; and similarly a vertical plate fronting the meridian, and touching the tube with its edge, with lines drawn from its center to the parallels, will be a vertical s. dial, the axis of the instrument in both cases serving for the stile; and similarly for any other plate placed in the cylinder. If, instead of being of glass, the cylinder were of wood, any of these dials might be obtained from it by simply cutting it in the planes of the plates, and drawing the lines on the surface of the section.

DI'ALECT. In speaking of a people having essentially all one language, but living extended over an extensive territory, the name of dialects is given to those varieties or peculiar forms which that language assumes among the various tribes or other local divisions of the people. It is clear that the wider the separation comes to be between the several tribes, and the more they differ in mode of life and other circumstances, the more marked will the differences of D. become. Also, when a particular tribe of this people increases in numbers, and also extends its territory, the same process is repeated, and its D. becomes broken into a number of sub-dialects. The principal check to this tendency to seemingly endless subdivision of language, is furnished by an increasing

degree of common culture and civilization. Where this is wanting, as in Africa and among the native populations of America, the subdivision is practically endless.

Another element is introduced into the problem by the fact, that the civilization of some tribes develops itself more richly and ripens earlier than that of others, while some even undergo decline; this must occasion corresponding differences of dialect. Further, one dialect may become dominant over one or more of the others, through various influences, the chief of which is the power of poetry, especially if favored by external relations. Finally, if to superior manifestations of oratory and poetry in any dialect, the conservative aid of writing be added, there is created a written language, which passes current among other tribes to the same extent that the literature of which it is the vehicle finds favor. It is not always the dialect most perfect in itself, nor yet that of the most powerful tribe or division of a people, that comes to be the written language. Accidental circumstances have, in many cases, decided the rivalry. The Bible happened to be translated by a high German, Luther, into his native dialect; other works on the then all-engrossing subject of religion followed in the same dialect; happily, too, the art of printing had just attained the perfection necessary to give these productions general circulation. It was this concurrence of circumstances that decided that high German should in future be the spiritual bond among the wide-spread German people. For there were other dialects whose claims to the distinction were at that time equal, if not higher. See also ENGLISH LANGUAGE.

When a dialect has thus become the vehicle of written communication, and of the higher kinds of oral address, its character and position become changed; and it stands henceforth in a sort of antagonism to the other dialects, and even to that out of which itself sprung. For written language is chiefly employed in the higher departments of human thought and activity. The intellectual and moral elements, therefore, predominate in it over the sensible; and what it gains in dignity, precision, and pliancy, it loses in richness of inflection, in friendly familiarity and naturalness. In conflict with this standard speech, the dialects must go to the wall. They live for a considerable time, it is true, even in the mouth of the educated classes, becoming, however, gradually more and more confined to the most necessary and familiar forms of intercouse, and losing their characteristics in the stream of the written language. They thus become, after a time, the exclusive possession of the lowr orders, in which position they preserve many relics of old grammatical forms long after these have disappeared in the language of literature, but without the power of advancing or of being enriched by the products of deep thinking; and though they may abound in single expressions of great beauty and delicacy, the general character comes to be low and coarse. But so long as a language lives, the literary standard and the dialects never cease to act and react on one another.

The chief points of difference between the dialects of a language and the standard fall under four heads. The first consists of differences in the elementary sounds or letters, each dialect having a tendency to substitute some one or more vowels or consonants for others. Thus, the standard English *bold*, is in Ireland *bowld;* in Scotland, *bauld; what*, where the *h* is nearly evanescent, becomes, in a Scotsman's mouth, or rather throat, *chwat*, and in Aberdeenshire Scotch, *fat—f* in this sub-dialect being regularly substituted for *wh*, or rather *hw*. 2. Each dialect has peculiarities of grammar: In many parts of England and in Scotland, the plural of *eye* is not *eyes*, but *eyen*, or *een*, like *oxen*. The habitual use of *be* where the standard grammar prescribes *am, is, are*, etc., is prevalent in large districts of England. Of this kind is the use of the strong conjugation for the weak, or *vice versâ*; as *loup, lap, luppen*, for *leap, leaped, leaped*. 3. Peculiarities of vocabulary: These individual words current in one or more districts, but unknown to the standard vocabulary, are properly *provincialisms*. They are generally genuine words of an older stage of the language, that have survived longer in some localities than in others. Some provincialisms, as *bearn* or *bairn*, for child, *marrow* for fellow or match, to *greet* for to weep, are common to Scotland and the n. of England. Others are more local, as to *cleam*, for to fasten or cement; *heppen*, a Yorkshire term for pretty near; *thrippa*, in Cheshire, to cudgel. The exclusion of such words from the standard language is often accidental, and many of them might be and are with advantage resumed; ex., *marrow, gloaming*, etc. 4. Peculiarities of intonation: This is sometimes, though with little propriety, called accent, which means strictly the stress laid upon a particular syllable of a word. There are no doubt local peculiarities of this kind too. The tendency of standard English, especially the more recent, is to throw the accent toward the beginning of the word; in Scotland, the tendency lingers to say *enry'* for *en'vy*. But peculiarities of intonation lie in the different ways in which the *pitch* of the voice is managed—in the musical accompaniment of articulation. Differences in this respect give rise to the monotonous drawl of one district, the angry querulous tone of another, the sing-song of a third, etc.

So long as dialectic varieties of language were looked upon indiscriminately as corruptions and barbarities, they were only noticed by scholars that they might be avoided. A more rational philology, without trenching upon the rules of good writing, considers them as essential parts of the speech of a people, and a knowledge of them as necessary to any thorough investigation of the genius of that speech.

It is obvious that *dialect* is entirely a *relative* term, and that what we call by that

name in one connection, we may call a language in another connection. Thus, Greek and Latin may be called sister-dialects of that primitive language from which it is held that they, as well as the other members of the Indo-European family, branched off. See ARYAN LANGUAGES. Speaking of Greek by itself, however, it is a language, and Ionic, Doric, Attic, etc., are dialects of it. The same holds good with the others. In practice, however nearly related the speech of two peoples may be, we do not apply the term dialects, unless the peoples are mutually intelligible and have a common literary standard. Intelligibility does not go for much, but political relations enter more or less into the notion. Thus, Scotch is sometimes spoken of as a distinct language from English; and yet in no part of Scotland is the common speech so unintelligible to an Englishman as is that of Somerset, which is always a "dialect." This arises from Scotland being thought of as a separate country, which it once was; and its speech as the vehicle of a peculiar literature. See AMERICANISMS.—Dialect is not to be confounded with artificialities, such as the jargon of thieves.

DIALEC'TIC is a Greek word which signified originally "the art of conversation," but came to have a technical signification in the language of philosophy. At first, it implied a regular and scientific method of treating general conceptions or general terms —a sort of anatomy of names, and through them of the things denoted. In the Socratic philosophy, and more especially in that of Plato, dialectic was thus the method of the highest and deepest kind of speculation. Aristotle gave another signification to the word. According to him, a scientific proof or deduction is different from a dialectic proof, which is only a probable deduction. After this, dialectic came round to imply a sort of word-fence, the art of so using the forms of reasoning as to confound your opponent, and make fallacies pass for truth. Dialectic is sometimes used as synonymous with logic. Logic, however, which originated with Aristotle, is properly the science of the forms of thinking; it is less directly concerned with words than dialectic, which in this view becomes a subordinate province of logic—the art of disputation. Dialectic, in fact, is little heard of where philosophy is positive and experimental; it is chiefly used with regard to the more ideal and *à priori* speculations of such philosophers as Kant, Hegel, Schelling, etc.

DI'ALLAGE, or SCHILLER-SPAR, a mineral nearly allied to augite (q.v.), and by some regarded as a variety of it. Its chemical composition is essentially the same. It is seldom found very perfectly crystallized, but usually massive, granular, or disseminated. It has generally a metallic and pearly or silky luster. A very beautiful bright green D. (smaragdite), found in Switzerland, Italy, Corsica, India, Labrador, etc., is prized for ornamental purposes; in Corsica, it occurs disseminated in a feldspar (*Labradorite* or *Saussurite*), which, when cut and polished, appears spotted with it, and is of great beauty, is made into boxes, vases, etc., is much valued, and is known by the names *gabbro* and *verde di Corsica duro*. A variety of D., usually yellowish or brownish, is sometimes called *bronzite*.

DI'ALOGUE, a conversation between two or more persons, implying, however, greater unity of subject and formality than an ordinary conversation. The ancient Greek philosophers were fond of this way of conducting their investigations and conveying their instructions. The Socratic dialogue is a conversation in the form of question and answer, so contrived that the person questioned is led himself to originate those ideas that the questioner wishes to bring before him. The dialogues of Plato are, as it were, philosophical dramas, in which the Socratic method of investigation is brought to bear upon speculative subjects. The form of the dialogue is but ill adapted to the modern state of science. Of the more eminent modern writers in this form, we may mention Erasmus in Latin; Lessing, Herder, and Wieland among the Germans; Petrarch and Machiavelli in Italy; Fénelon and Fontenelle in France; and Berkeley, Hurd, and Harris in England. Landor's *Imaginary Conversations* are a happy effort of this kind. When dialogue is combined with action, we have the drama.

DIAL'YSIS. See OSMOSE.

DIAMAGNETISM. The fact that iron is attracted by the magnet, has been known from very remote times; that bismuth exhibits a repulsive action towards the magnetic needle, has been now known for nearly 100 years. Dr. Faraday was the first (1845) to show that all bodies are more or less affected by magnetic influence, and his beautiful researches on the subject have opened up a new field in the domain of science. He found that the magnetism of bodies was manifested in two ways—either in being attracted by the magnet, as iron; or in being repelled, like bismuth. When a needle or slender rod of iron is suspended between the poles of a magnet being attracted by them, it takes up a position of rest on the line joining the two poles. When a substance behaves itself in this manner, it is said by Faraday to be *paramagnetic*, and to place itself *axially*. A rod of bismuth, on the other hand, being repelled by the poles of the magnet, comes to rest at right angles. Bismuth, and the like substances, he calls *diamagnetic*, and they are said to place themselves *equatorially*. These terms, being both definite and graphic, have been universally adopted. Magnetic is the term used by Faraday to indicate magnetism of either sort, although in general language it is understood to refer to paramagnetic bodies, such as iron, etc. Paramagnetic bodies,

then, are those which manifest the same properties with regard to the magnet that iron does; and diamagnetic bodies are those which, like bismuth, show opposite but corresponding properties; so that in circumstances where paramagnetic bodies place themselves axially, diamagnetic bodies place themselves equatorially; and where the former are attracted, the latter are repelled, and *vice versâ*. A paramagnetic, therefore, not in the elongated form, but in a compact shape, such as a ball or cube, is attracted by either pole of the magnet, when suspended near it; a ball or cube of a diamagnetic, on the other hand, experiences, when so placed, repulsion. The paramagnetism of iron, nickel, and cobalt, becomes manifest in the presence of magnets of ordinary power; but the magnetism of most other substances is so feeble as to be developed only under the influence of the strongest magnets. As electro-magnets far exceed permanent steel magnets in strength, they are selected for investigations on the magnetism of bodies. The soft iron horseshoe of the electro-magnet is enveloped towards its extremities in coils of insulated copper wire which communicate with a galvanic battery by wires. The electro-magnet is fixed in an upright wooden frame. The ends or poles of the magnet rise slightly above the table or board which forms the upper part of the frame. In order conveniently to suspend substances between the poles, and to protect them while under observation from currents of air, a glass frame of simple construction is made to fit the table. The upper plate of the frame admits a wooden ring, into which an upright glass tube is fitted. The thread by which the needle is suspended is wound round a slender movable bobbin at the top, so that it can be elevated or lowered to the proper position. To modify and direct the action of the magnet, two pieces of soft iron are made to rest on the end faces; these are pointed at one extremity, and flat at the other, so that the force of the magnet may be concentrated in the points, when they are turned towards each other; or diffused over the opposite flat surface, when their position is reversed.

To observe the effect of the magnet on liquids, Faraday placed them in long tubes of very thin glass, and suspended them as in the case of solid needles. It was found that some arranged themselves axially, and others equatorially. The attraction and repulsion that liquids experience in the presence of the magnet has been prettily shown by Plucker. A large drop of liquid is placed in a watch-glass, and laid upon two poles of the magnet. If the liquid be paramagnetic, the surface becomes depressed at the interval between the poles, and heaped up over the extreme edges of them. A diamagnetic liquid, on the other hand, shows a depression at each edge of the poles, and a heaping up at the center.

The magnetic nature of flames and gases has been also studied. When the flame of a candle is brought between the poles of a magnet, it is repelled by them, and thrown out horizontally into an equatorial position. To ascertain the magnetism of gases, Faraday inflated soap-bubbles with them, and their para- or dia-magnetism was exhibited by their being attracted or repelled by the poles. He ascertained the same by causing the gases to flow out from glass tubes in the presence of the poles, when the peculiar magnetism of the gas was shown by its choosing an axial or equatorial means of egress.

The following list gives the kind of magnetism displayed by the more common substances:

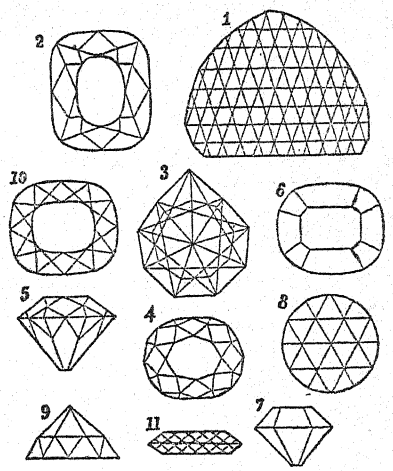
Paramagnetic.—Iron, nickel, cobalt, manganese, chromium, titanium, palladium, paper, sealing-wax, peroxide of lead, plumbago, red-lead, sulphate of zinc, shellac, vermilion, charcoal, proto and per salts of iron, salts of manganese, oxygen, air.

Diamagnetic.—Bismuth, antimony, zinc, tin, cadmium, sodium, mercury, lead, silver, copper, gold, arsenic, uranium, tungsten, rock-crystal, mineral acids, alum, glass, litharge, niter, phosphorus, sulphur, resin, water, alcohol, ether, sugar, starch, wood, bread, leather, caoutchouc, hydrogen, carbonic acid, coal-gas. nitrogen.

The nature of the medium in which the body under examination moves, exerts a powerful influence on the nature and amount of the magnetism it exhibits; thus, if a glass tube be filled with a solution of the proto-sulphate of iron, and suspended between the poles, it will place itself axially. It will do the same if made to move in water, or a solution more dilute of the proto-sulphate of iron. It will be indifferent in a solution of the same strength; but it will place itself equatorially in a stronger solution. Thus, the same substance may appear paramagnetic, indifferent, or diamagnetic, according to the nature of the medium in which it moves. As a general rule, a body shows itself paramagnetic towards one less paramagnetic than itself, indifferent towards one equally magnetic, and diamagnetic towards one more paramagnetic than itself. The same takes place, *mutatis mutandis*, with diamagnetic substances. This has given rise to the theory, that there is no such thing as diamagnetism *per se*, and that bodies are diamagnetic only in media of greater paramagnetic power than their own. This view of the case is, however, rendered highly improbable from the fact, that diamagnetism is exhibited as decidedly in a vacuum as in any medium, and a vacuum cannot be supposed to possess magnetic properties of any kind.

DIAMANTI'NO, a significant name in the diamond districts of Brazil, indicates a river and two towns.—1. The river, apparently an affluent of the Paraguay, and, through it, of the Plate, rises in the province of Matto Grosso, being joined by the Ouro 70 m. to

the n.n.w. of Cuyaba.—2. Of the two towns, the more westerly stands at the confluence above mentioned, having a pop. of 4,500.—3. The more easterly town, again, is in the province of Minas Geraes, and stands amid the head-waters of the St. Francisco at an elevation of 5,700 ft. above the sea. It has about 7,000 inhabitants.



DIAMETER, in geometry, is generally used in speaking of curves, and its most general definition is, a straight line bisecting all parallel chords in a curve. In the circle, ellipse, and hyperbola, all diameters pass through the center, and are there bisected. Only the circle has all diameters equal; and each bisects the chords at right angles to it. In the ellipse, this last is only the case with the two diameters called the major and minor axes. In the parabola, all diameters are parallel to the axis. Many curves of the higher orders have no diameter at all.

We speak also of the diameters of solid bodies of a round shape. In the sphere, lines passing through the center are diameters, and so in the ellipsoid; they are all bisected in the center.

DI'AMOND (corrupted from Gr. *adamant*, untamable, refractory), the most valuable of precious stones after the ruby, and the hardest of all known substances. It consists of carbon (q.v.), a simple or elementary substance, crystallized, and in its greatest purity. Diamonds are commonly colorless and clear like water; although sometimes, from some slight foreign intermixture, they are white, gray, yellow, green, brown, and more rarely orange, red, blue, or black. The luster is adamantine and very high; the transparency perfect in specimens perfectly free from foreign substances, the presence of which, however, even in very small quantity, mars it, and sometimes almost produces opacity. The D. becomes positively electric by friction, but is not electrified by heat, a test which sometimes serves to distinguish it from the topaz. Its specific gravity is about 3.6. Its primary form is a regular octahedron, but it appears also in rhombic dodecahedrons; and its crystals often have curvilinear faces and edges. Its structure is distinctly lamellar. It burns before the blow-pipe in air or in oxygen gas, combining with oxygen to form carbonic acid. Its hardness renders it incapable of being scratched by any other substance, and in cutting and polishing diamonds, diamond-dust is employed. The estimation in which it is held as a precious stone is due to its remarkable hardness, rarity, and brilliancy. The art of cutting diamonds, although long practiced in India and China, was not known in Europe till after the middle of the 15th c., when it was discovered by Louis van Berguen of Bruges. Previous to that time, diamonds were set without being cut, and in that state they have often a rough, dull, and uneven surface. Diamonds are indeed found not only in the form of perfect crystals, but also in rolled grains; and they are obtained partly from alluvial soils and the sands of rivers, and partly from rocks, chiefly a quartzy sandstone or conglomerate, in which they are often associated with gold. A number of localities in India have long been celebrated as productive of diamonds, particularly Golconda (q.v.); they are found also in Malacca, Borneo, and other parts of the east; nor were any diamonds procured in any other part of the world till the beginning of the 18th c., when they were discovered in remarkable abundance in the district of Serra do Frio, in the province of Minas Geraes, in Brazil. Previous to that time, diamonds found in Brazilian gold mines had been disregarded as mere pebbles; their nature became known in consequence of some of them accidentally finding their way to Europe. In 1829, they were discovered in the Ural mountains. They have also been found in Rutherford co., North Carolina; in Hale co., Georgia; in the province of Constantine, Algeria; in Australia; and in South Africa. Diamond mines consist in general of mere diggings and washings of alluvial deposits. In Brazil, the method pursued is to rake the alluvial matter backwards and forwards on inclined planes, over which a stream of water is made to run, till the lighter particles are carried away, when large stones are picked out by the hand, and what remains is carefully examined for diamonds. The work is carried on by slaves, and when a diamond of 17 carats is found, the slave who finds it is entitled to his liberty. Large diamonds are comparatively rare among those of Brazil, all the notable diamonds in the world being Indian. Brazil produces yearly from 25,000 to 30,000 carats of diamonds, of which, however, not more than 9,000 carats are capable of being cut, the rest being either very small or of inferior quality. The small and inferior diamonds are called BORT, and command a ready sale for their use in the arts, being pounded in a steel mortar, and much employed in the form of diamond-dust by lapidaries for cutting and polishing diamonds and all kinds of gems, and even for polishing rock-crystals for spectacles. Minute fragments or splinters of bort are also used for making fine drills, which are used for drilling small holes in rubies and other hard stones to be employed in watch-making, gold and silver wire-drawing, etc., and for piercing holes for rivets in china, in artificial enamel teeth, etc. The use of small diamonds by glaziers for cutting glass is well known. The diamonds so used are uncut, and they are so mounted as to act upon the glass not by an angle, but by a curvilinear edge of the crystal. The cut is only to the depth of about one two-hundredth part of an inch, but is sufficient to make the glass readily break in accordance with it.

Diamonds are cut into various forms, but principally into *brilliants* and *rose diamonds*. The *brilliant* cut is the most expensive and difficult, but is also that which best brings out the beauty of the stone. It has an upper or principal octagonal face, surrounded

with many facets, and other things being equal, the greater the number of facets, the more valuable is the diamond. The lapidaries of the east, however, sometimes multiply facets to hide imperfections of the stone. *Rose diamonds* have a flat base, above which are two rows of triangular facets, the six uppermost uniting in a point. Rose diamonds are made of those stones which are too broad in proportion to their depth to be cut as brilliants. Stones still thinner are cut as *table-diamonds*. The art of sawing diamonds, when too thick in proportion to their surface, was invented by a Dutchman named Dalbeck in the beginning of the 19th century.

Diamonds.

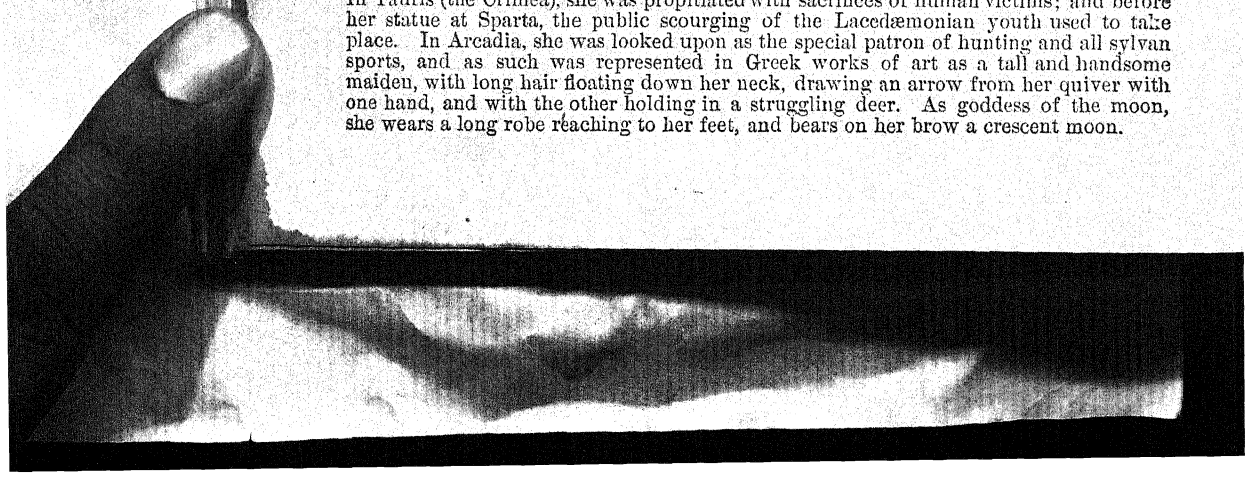
1, the Koh-i-noor; 2, Regent or Pitt diamond; 3, Grand Duke; 4, 5, vertical and lateral appearance of the brilliant diamond; 6, 7, vertical and lateral appearance of the brilliant diamond before being recut; 8, 9, vertical and lateral appearance of rose-cut diamond; 10, 11, the table-cut diamond.

The value of diamonds is variously estimated. The rule generally given is to square the number of carats the diamond weighs, and then to multiply by the price of a single carat. Thus, a rough diamond of 12 carats weight, one carat being estimated at £2, would cost $12 \times 12 \times 2 = £288$. The value of a diamond is much increased by its being cut, although the actual weight is diminished. Beyond a certain weight, no rule of calculation can be applied, owing to the limited number of purchasers, and the most fabulous values have been assigned to famous diamonds. The price of diamonds varies according to the supply and changes in fashion, and is now lower than formerly.

There is a way of falsifying diamonds by joining an under part of some other stone to an upper part of genuine diamond. Some varieties of sapphire, hyacinth, and topaz, are often passed off for diamonds. The first two may be distinguished by their greater specific gravity, the latter by its becoming electric when heated. Rock-crystal, and glass or "paste" imitations, are lighter than true diamonds, and less hard and brilliant. The best test of a genuine diamond is hardness. Care must be taken, however, to avoid breaking off its angles, in testing it by scratching other substances with it, as, though hard, it is somewhat brittle.

Some particular diamonds, from their unusual magnitude, or from circumstances of their history, are of such interest as to entitle them to notice. The collection of the emperor of Brazil is said to contain an uncut diamond—the Braganza diamond—of the enormous weight of 1680 carats, or about 12 ounces; but it is suspected to be only a fine colorless topaz.—The largest diamond certainly known is that belonging to the rajah of Mattan, weighing 367 carats. It is egg-shaped, with an indented hollow near the smaller end. Many years ago, the governor of Borneo offered for it $500,000, two war-brigs fully equipped, a number of cannon, and a quantity of powder and shot. But the rajah refused to part with it, the fortunes of his family being supposed to be connected with it, and the Malays ascribing to water in which it has been dipped the power of healing all diseases. Perhaps the most famous diamond is the Koh-i-noor (q.v.), once a boasted possession of the great Mogul, and now belonging to the queen of Great Britain. It is said to have weighed 900 carats in the rough; but now, after various cuttings, weighs 123 carats. The Orlow diamond, belonging to the Russian emperor, and which was once the eye of an Indian idol, is said to have weighed, when rough, 779 carats, but is now cut, egg-shaped, and weighs 194 carats.—The Regent diamond, or Pitt diamond, which weights in its cut state 136¾ carats, is unrivaled in its limpidness and its form, its diameter and depth being nearly equal. It was found in Golconda, was brought from India by an English gentleman named Pitt, the grandfather of the first earl of Chatham, and by him sold to the duke of Orleans for £130,000. It decorated the hilt of the sword of state of the first Napoleon, was taken by the Prussians at Waterloo, and now belongs to the king of Prussia.—The Sancî diamond, weighing 106 carats, has a still more interesting history. It belonged to Charles the bold, duke of Burgundy, who wore it in his hat at the battle of Nancy, where he fell. A Swiss soldier found it, and sold it to a clergyman for a gulden. It passed into the possession of Anton, king of Portugal, who was obliged to sell it, the price being 100,000 francs; and it shortly afterwards became the property of a French gentleman named Sanci, whose descendant being sent as ambassador to Soleure, king Henry III. required the diamond as a pledge; but the servant who was carrying it to the king was attacked by robbers on the way and murdered, not, however, till he had swallowed the diamond. His master, fully confident of his faithfulness, caused his body to be opened, and found it in his stomach. This diamond came into the possession of the crown of England, and James II. carried it with him to France in 1688. Louis XV. wore it at his coronation.

In 1835, it was purchased by a Russian nobleman for half a million of rubles (£80,000). The Sanci diamond is said to have been the first diamond which was cut in Europe.



DIAMOND BEETLE, *Curculio imperialis*, a beetle or coleopterous insect of the tribe to which the name WEEVIL is generally appropriated, but remarkable for the splendor and exquisite beauty of its colors, in which it is thought to be unrivaled even among coleopterous insects. It is of a golden-green color, with two black longitudinal bands on the thorax, and several rows of depressed spots on the elytra (wing-covers), which exhibit a beautiful and sparkling green with intervals of black. It is a native of warm parts of South America.

DIAMOND HARBOR, the port of Calcutta for large ships, is situated on the left side of the Hoogly, about 30 m. below the capital, with which it is connected by an excellent road and by electric wires. As the adjacent country is swampy and unhealthy, the spot is marked only by a few native huts. The commercial value of the locality, however, is likely to increase, in proportion as the silting up of the river above impedes the upward navigation.

DIAMOND NECKLACE, THE, a wonderful piece of jewelry, made in Paris about the year 1775, and intended for Madame Du Barry, the favorite of Louis XV. She, however, was excluded from court on the death of Louis (1774), and before the necklace was finished. After being made, this beautiful ornament, adorned with 500 diamonds, was discovered to be so costly that no one could purchase it. It was valued at 1,800,000 livres, which in present sterling money is equal to about £80,000.

The prince-cardinal de Rohan, a wealthy, vain, and profligate man, persuaded by a woman named De Lamotte, who waited about court, that the queen (Marie Antoinette) regarded him with an eye of favor, became so infatuated with the idea that he was ready to do anything, however extravagant, in order to preserve this feeling in the queen. De Lamotte had stated to the cardinal that the queen was desirous of obtaining this glorious necklace, and that not having sufficient money just then, she would sign an agreement to purchase it if the cardinal would become security. The cardinal consented. The agreement was approved of and signed with the royal signature, as also with that of the cardinal, who, on the 1st Feb., 1786, carried off the treasure to Versailles, where it had been agreed the queen should send for it. On the following day, a person dressed in the uniform of one of the court valets, entered the apartments of the cardinal, and repeating as he entered the words, *de par la reine*, "in the name of the queen," he advanced to the table whereon the casket containing the treasure lay, and bore it away. In a few days De Lamotte, her husband, and the *soi-disant* valet, having all disappeared from Paris, were busily engaged separating the diamond necklace into portions, and selling them. The whole transaction had been a trick; the messages from the queen, verbal and written, were without foundation, the latter, indeed, being forged by the "valet," who was skilled in imitating handwriting. The plot was discovered by means of the maker of the diamond necklace, who, not receiving any money when the period of the first installment had arrived, went to court, demanding to know if the necklace had been delivered to the queen. In a few months the cardinal found himself in the Bastile, where those by whom he had been duped were already sent. In May, 1786, the trial of the prisoners was brought to a close. De Lamotte was branded on each shoulder with the letter V (for *voleuse*, thief), and was sentenced to be imprisoned for life. All the others were acquitted. The queen was falsely supposed by the populace of Paris to have been implicated in the plot, and the odium resulting from it was cast upon her, even at the last, when she sat on the cart that bore her through a raging and cursing mob to the guillotine.

DIAN'A, a Roman goddess, corresponding in most of her attributes to the Grecian Artemis. According to the myths, she was the daughter of Jupiter and Latona, and the twin-sister of Apollo. She was born, along with her brother, on Mt. Cynthus, in the isle of Delos, which till then had been a floating island, but was fixed by Neptune in its present place, that Latona might there give birth to her children in peace and safety from the persecutions of the jealous Juno. D. was worshiped by Greeks and Romans alike, as both a destroying and a preserving goddess. In the former capacity, she was represented as a full-grown virgin, armed with bow and arrows, with which she avenged herself on her enemies; as a preserving deity, she watched over the sick, and helped the unfortunate. Young girls, and women in childbirth, were the objects of her special care. She was herself beyond the allurements of love; and the ministers of her worship were vowed to lives of the strictest chastity. As sister of the sun-god Apollo, D. was regarded as the goddess of the moon; hence her Greek name *Selene*, and her Latin names *Lucina* and *Phœbe*. Her worship was conducted with splendid rites in different cities. Her temple at Ephesus was one of the seven wonders of the world. In Tauris (the Crimea), she was propitiated with sacrifices of human victims; and before her statue at Sparta, the public scourging of the Lacedæmonian youth used to take place. In Arcadia, she was looked upon as the special patron of hunting and all sylvan sports, and as such was represented in Greek works of art as a tall and handsome maiden, with long hair floating down her neck, drawing an arrow from her quiver with one hand, and with the other holding in a struggling deer. As goddess of the moon, she wears a long robe reaching to her feet, and bears on her brow a crescent moon.

DIANA, TEMPLE OF, at Ephesus, a magnificent structure built at the public charge, and recorded one of the seven wonders of the world. Chersiphron was the chief architect. According to Pliny, 220 years were spent before it was completed. It was 425 by 225 ft., covering more than two English acres, supported by 127 columns of white marble, 60 ft. high, each weighing 150 tons, and presented by as many kings. On the night of the birth of Alexander, it was fired by Erostratus, an obscure person, who did it solely to secure immortality for his name, and ever since "the aspiring youth who fired the Ephesian dome outlives in fame the pious fool who built it." Having been rebuilt, it was again destroyed by the Goths, 256 A.D.

DIAN'E DE POITIERS, 1499–1566; Duchess of Valentinois and mistress of Henry II. of France. When but 13 years of age she was married to the count of Maulvner, grand seneschal of Normandy, by whom she had two daughters. Her father was condemned to death for favoring the escape of the constable de Bourbon, but her tears and her beauty so prevailed with Francis I. that the father's life was spared. She was a widow 40 years old when she became the mistress of Henry (then dauphin), who was but half her age. At that time the duchess d'Etampes was the favorite of Francis, and the two women ruled the court; but when Henry became king, Diane was the real ruler, and at once sent her rival into exile. Notwithstanding the beauty and the rights of his wife, Henry was controlled by Diane during his whole reign. After his death she disappeared from public sight.

DIAN'O, a t. of southern Italy, in the province of Salerno, 45 m. s.e. of the town of Salerno. It occupies a beautiful situation on an isolated hill overlooking the river Calore, and in the fertile vale of Diano, which takes its name from the town. There are several churches and an old castle. The commune has a pop. of about 6,000.

DIANTHUS. See PINK.

DIAPA'SON, a term in music by which the ancient Greeks designated the octave. In modern music, D. is used to denote the range, or compass of the voice, or of an instrument. The French use the term as equivalent to *pitch*. D. is also the English name given to certain stops of pipes in the organ, of 8 ft. pitch, which are considered the fundamental stops, of which there are generally two—a stopped D. and an open D. on each manual. See ORGAN-BUILDING.

DIAPA'SON REGULATOR. The French, who give the name of *diapason* to the tuning-fork, have lately made attempts to use that instrument in connection with clockwork, partly as a means of counting very small intervals of time. M. Duhamel made an arrangement in which a cylinder, by means of a screw-tapped end, was made to advance a little in the direction of the axis; this cylinder was covered with blackened paper, and was rotated by means of clockwork. A diapason had a style or marker, made of a small bit of pointed spring, fixed to the end of one of the prongs. On the diapason being sounded in the usual way, and the spring placed lightly against the cylinder, the style traced a sinuous white line on the black paper. The sinuosities became visible representatives of minute intervals of time, the prongs vibrating possibly hundreds of times in a second. M. Lissajous devised an electrical apparatus to prolong the vibrating of the prongs; but it was too complexed for practical use. M. Breguet then proposed clockwork for this purpose, superseding the pendulum and the spiral spring by a diapason. The diapason regulates the rate of motion of the train of wheels by the equability of the vibration of the prongs, while the train of wheels tends to increase the time during which the prongs vibrate and sound. An index carried by an arbor round a dial, may be made to count or record the vibrations. Breguet's experiments have gone as far as instruments giving 200 simple vibrations (100 double or to-and-fro vibrations) per second. There are means of making the diapason more or less acute in sound, or with a greater or less number of vibrations in a second, by mechanical treatment of the prongs: it can, by a proper distribution of metal, be made to yield any required note within certain limits; and thus, with the aid of the style, the paper, and the cylinder, it may be made to give a kind of visible existence to excessively minute intervals of time, such as $\frac{1}{200}$th part of a second. Fuller details are given in Breguet's description of the apparatus in the *Revue Chronometrique*.

DI'APER (Ital. *diaspro*), a term derived from *jasper* or *diasper* (see letter D), which stone being much used in ornamenting jewelry, originated the Mid. Lat. name *diasprus*, for a texture ornamented or variegated in an analogous way. In textile manufactures, the term is applied to fabrics with patterns of geometrical regularity, such as are produced by the kaleidoscope, woven in their texture, and produced with shafts and heddles, without the Jacquard machine. In architecture, DIAPER-WORK, or DIAPERING, is a kind of decoration applied to plane surfaces, and consists of a small pattern either of flowers, leaves, or arabesques, carved or painted. The flower, or other object, is generally inclosed in a small frame, and these frames, which touch each other at the edges, constitute in themselves a sort of mathematical diapering. When the pattern is carved, it is generally sunk; and when painted, it consists of a darker shade of the same color as the plane surface, by which the effect of shadow is communicated to it.

DIAPRÉ is applied in heraldry to fields and charges, relieved by arabesque and geometrical patterns. These patterns were generally of a darker shade of the same

tincture. This being merely an ornamental device, not affecting the heraldic value of the objects to which it was applied, was generally left to the fancy of the painter.

DIAPHAN'OSCOPE (Gr. *diaphanos*, transparent; *skopeo*, I see), a dark box, suitably constructed for exhibiting transparent photographs or other pictures. It may or may not be furnished with a lens.

DIAPHORE'SIS (Gr.), the cutaneous perspiration, whence

DIAPHORET'ICS, remedies to excite the secretions of the skin. The simplest of all D. are baths, which may be either warm baths of water, or of vapor, either simple or medicated. See BATHS. The most powerful of all, however, as regards educing perspiration, is probably the so-called Turkish bath, which consists essentially in the use of a sweating process, by means of air heated to a temperature of 140°, or even more. The following remedies, used internally, are powerful D.: antimony, ipecacuanha, opium (these three either singly or in combination); ammonia, and the carbonate or acetate of ammonia (spirit of mindererus), sarza, guiacum, dulcamara, and sassafras. On most of these substances, special articles will be found. A favorite formula is Dover's powder, consisting of a grain of opium, and a grain of ipecacuanha in each ten grains of the powder. This in doses of from five to eight grains, followed by warm drinks and plenty of blankets in bed, usually produces copious perspiration, and is very soothing and useful in many commencing inflammatory and febrile complaints. James's powder, in doses of from 3 to 8 grains, is often added to the above in domestic prescriptions; but neither of these medicines should be used rashly, as in certain states of the system they may prove dangerous; and they should never be given to very young children.

DI'APHRAGM (Gr. *diaphragma*, a partition). This is the name applied in anatomy to designate the transverse muscle which, in man and the mammalia generally, separates the cavity of the thorax or chest from that of the abdomen or belly. In form, it is nearly circular; it is fleshy at its edges, tendinous in its center, and ending in a point below. In front, it is attached to the ensiform cartilage of the sternum, or breast-bone; laterally, to the inner surfaces of the six lower ribs; and posteriorly, to two tendinous arches on either side, termed the *ligamenta arcuata*, and to the anterior surface of the bodies of the second, third, and fourth lumbar vertebræ on the right, and only the second and third on the left side; these origins from the vertebræ forming two large fleshy bellies (termed the *crura*), which ascend to join the central tendinous portion. The D. presents three principal openings: one quadrilateral, in the tendinous center, for the upward passage of the inferior vena cava; one of an elliptic shape, formed by the two crura for the œsophagus and pneumogastric nerves; and a third for the aorta, the azygos vein, and the thoracic duct.

The diaphragm is in relation superiorly with the pleuræ and pericardium, inclosing the lungs and heart; inferiorly, on the left side with the stomach and spleen, on the right with the convex upper surface of the liver; posteriorly, with the kidneys and supra-renal capsules and the duodenum; and by its circumference with the ribs and intercostal muscles, with the sternum, and with the vertebral column.

It is convex superiorly, and concave inferiorly. When it contracts, its upward convexity approximates to a plane surface, and the cavity of the chest being thus enlarged, air rushes in to fill the partial vacuum, and expands the lungs during the act of inspiration. It is thus an inspiratory muscle, and is the sole agent in tranquil inspiration. The enlargement of the thoracic cavity caused by the contraction of the diaphragm, must obviously be associated with a corresponding diminution of the abdominal space. Hence this muscle, by its action on the abdominal viscera, aids in the expulsion of the fæces and urine.

Spasmodic action of the diaphragm produces hiccough and sobbing; and in laughing, the alternate contractions and relaxations of this muscle occur with increased rapidity. Stoppage of the action of the diaphragm, whether from great external pressure or from paralysis, is very speedily fatal.

DIAPHRAGM, a partition with a hole in it, employed, not only in landscape and portrait lenses for photography, but also in telescopes, microscopes, and other optical instruments, for the purpose of cutting off the superfluous rays of light, and producing greater intensity or sharpness of the image, as well as to correct aberration.

DIAPHRAGM SHELL. See SHELL.

DIARBEKIR, a t. of Asiatic Turkey, capital of a vilayet of the same name, is situated on the right bank of the Tigris, at a short distance from the river, the intervening space being occupied by rich gardens; lat. 37° 55′ n., long. 39° 52′ east. The town, which is circular in shape, covers a considerable area, and is surrounded by high strong walls, flanked with towers, and pierced by four gates. The streets are dirty, and the houses for the most part are built of rough stone, plastered with a composition of mud and straw, but some of the better class are of black basalt. It has numerous handsome mosques, khans, and bazaars, and five Christian churches. Extensive manufactures of silk, cotton, and other goods, affording, with an active commerce between Aleppo and Bagdad, employment to about 40,000 families, were at one time carried on here; but the manufactures and trade have now greatly declined, and the population of D. does not amount to more than 8,000 families, 6,300 of whom are Turkish, the rest being Greek,

Armenian, Catholic, and Jewish. The silk manufacture, which is now the staple, is said to be improving. D. occupies the site of the ancient *Amida*, which was a place of importance in the reign of Constantius, by whom it was strengthened and enlarged. In this reign it was taken by the Persians, from whom it was again captured by the Romans; but in 502, the Persians once more became masters, and put 80,000 of the inhabitants to the sword. After many vicissitudes, it passed into the hands of sultan Selim in 1515. Many Roman and Saracenic remains still exist here.

DIARRHE'A (Gr. *dia*, through, and *rheō*, I flow), a disease or rather a tribe of diseases, characterized by an increase in the discharges from the bowels, which are usually unduly liquid, sometimes overcharged with bile, and sometimes the contrary. Diarrhea has many varieties and many causes; but the whole tribe of diarrheal diseases present certain relations in common, which have been studied of late years to a considerable extent from the preventive or sanitary point of view. Thus, it is observed of all of these diseases, without exception, that they are more apt to prevail during summer and autumn than during the earlier seasons of the year; and it is also well established that their prevalence is to a great extent dependent on the intensity of the solar heat, so that a temperature above 60° F. seems to be almost essential, under ordinary circumstances, to their epidemic diffusion. Moreover, it has been shown that the decomposition of organic matters in the neighborhood of human dwellings, and the introduction of the products of decomposition into the food, drink, or air used by the healthy, has been a direct exciting cause of diarrhea in a great number of instances where the disease has been locally epidemic; from which it is inferred that the real source of diarrheal diseases is usually to be found in a morbid poison closely associated with the process of putrefaction, although not, perhaps, necessarily generated during that process. It has been noticed that cold and wet seasons are the least favorable to the production of diarrhea, which is explained on the theory above alluded to by the rapid removal in such seasons of all organic débris; and there is little doubt that this explanation is correct, as the converse is equally true, the combination of heat with long continued drought being almost sure to waken into life the epidemic seeds of diarrhea. Again, it is noticed that where drainage is imperfect, and drinking water impure, diarrheal diseases are specially apt to occur (see CHOLERA); the class of the population most apt to be affected being those who occupy low levels, or who are otherwise exposed to the influence of this aqueous or gaseous poison. Infants are especially apt to suffer from diarrhea, and a large number of the infantile deaths in many English towns are caused either directly by this disease, or by the abuse of stimulants and narcotics for its cure.

Diarrhea is either simple, bilious, or choleraic; the last form has already been discussed. See CHOLERA. The ancients applied the name *lientery* to a diarrhea in which the dejections consisted of matters not digested, or very partially so; this form is, however, very unusual, at all events in this country. Dysentery (q.v.) is also a form of diarrheal disease; as is the form of fever (q.v.) called gastric, typhoid, or enteric fever. Simple and bilious diarrhea probably often differ only in degree; they are both distinguished from the advanced stages of cholera and dysentery by the presence of abundance of biliary coloring matter in the stools, and by the absence of the distinctive features of the other two diseases as described elsewhere. Diarrhea frequently depends on organic disease, either of the intestines themselves, or of the liver, kidney, or spleen. It is also one of the most common symptoms of the advanced stage of consumption (q.v.).

When diarrhea is plainly the consequence of improper food or drink, when it is very recent, when the strength of the patient is not much impaired, when there is much griping pain or distension of the belly, when the evacuations are very unnatural in character, and especially when they are dark colored and very fetid; when the disease has been preceded by habitual constipation (q.v.), and when there is no organic disease to be discovered, it is well to let diarrhea run its course, at all events for a time, and either to aid it by small doses of very simple laxatives, or, at all events, to abstain from hastily checking the discharge, which in these cases is to be regarded as a truly curative and beneficent process, calculated to disburden the system of some poisonous or deleterious substance, and only requiring time for the restoration of the patient to health. In other cases, especially of febrile diarrhea, an emetic of ipecacuanha at the very beginning will sometimes remove the disease with remarkable rapidity; and in most forms of diarrhea it may be alleged that this medicine (in doses of from one to five or even ten grains) is well borne. Sometimes it is combined with opium in the form of Dover's powder. Vegetable astringents, as catechu, kino, tannin, matico, logwood, are also much employed both in acute and chronic cases; some prefer the acetate of lead, with opium (which, however, is perhaps more suitable to dysentery). It should be observed that in some forms of diarrhea the use of opium, though a most powerful remedy, is contraindicted by the state of the constitution; it should in no case be largely given without medical advice. In many chronic cases the metallic tonics and astringents are of service—e.g., iron, sulphate of copper, zinc, and bismuth. In a very large class of cases, especially of infantile diarrhea, depending upon a too acid state of the secretions, the leading remedy is chalk, either in powder or in the very serviceable form of the mistura cretæ (mixture of chalk) of the pharmacopœias, from one to three dessert-spoonfuls of which may be given after every disturbance of the bowels. Lime-water,

mixed with milk in the proportion of one to four or five, is easily given to very young children, and serves nearly the same purpose.

DI'ARY (Lat. *diarium*, from *dies*, a day), means simply a daily record. It does not, however, comprehend every sort of daily record, but only such as have reference to the writer personally. In it the *littérateur* inscribes the daily results of observation, reading, or thought; to the mercantile man, it serves the purpose of an order or day book; while the physician finds it indispensable as a register of engagements. The use of diaries has become so general, especially in England, that the making of them now forms an important branch of the book-manufacture. Letts & Co., of London, issue annually upwards of a hundred varieties of diary, from the large folio to the smallest pocket volume. The usual diary may be described as a book with a separate blank space for every day in the year, these spaces varying in size and form, as the particular bent or profession of the diarist may render necessary. Bound up with these diaries is a summary of the important events of the past year, a list of the acts of parliament passed during the previous session, an enumeration of public holidays, terms, etc., a great amount of valuable information regarding banking and insurance businesses, with a vast quantity of miscellaneous memoranda, so that the proprietor possesses in one book a D. and an almanac.

Diaries have often furnished the historian with invaluable material, supplying the absence of public records, and furnishing minute and graphic details of the social condition and of the secret springs of public events that are not to be looked for in more formal records. Perhaps the most notable in this respect are the diaries of Evelyn and Pepys.

DIASCHIS'MA, the Greek name of a small musical interval which only appears in the mathematical calculation of greater intervals. The D. is, (1) the difference between the great half tone and the small *limma*, or the remainder when the latter is subtracted from the former, 2,048:2,025; (2) the difference between the *diesis* and the *syntonic comma*, also 2,048 : 2,025. The D. and the small *limma* added together always make the greater half tone, or 16 : 15; and the *syntonic comma* added to the D. always make the *diesis*, 128:125.

DI'ASTASE is a peculiar ferment developed during the germination of all seeds. An impure solution of D. may be procured by adding one part of hot water to two parts of ground malt (see BEER), or freshly germinated barley, and, after standing for a short time, straining through a cloth. The proportion of D. in malt is not more than 1 part in 500 parts, and yet it performs important functions. Thus D. has a powerful action upon starch, and at a temperature of 150° Fahr. 1 part is considered powerful enough to change 2,000 parts of starch into dextrine, and then into grape sugar. When obtained separately, D. is a white tasteless substance. See GERMINATION.

DIATHERMANCY, a word used to express that quality in bodies by which rays of heat are allowed to pass through them; in other words, it may be called "transparency" to heat. More correctly speaking, D. has the same relation to radiant heat that transparency has to light. Bodies which have the property of D. are called diathermanous bodies. The earliest observers of the phenomena of D. supposed that the diathermanous body absorbed the rays of heat and then gave them out; but the fallacy of this idea was shown by Prévost, who ignited substances by rays of heat after passing them through ice. The phenomena of D. have, however, been more extensively examined by Melloni, Tyndall, Bunsen, Kirchhoff, and Balfour Stewart. The experiments of Melloni, who was the pioneer in the investigation, were of a brilliant character, and the apparatus used by him is a good example of that which has been used so effectively of late years in the rapid advancement of modern science. The thermo-electric pile of Nobili was employed to measure the rays of heat, and compare those which were passed through different substances with those passed through air alone. He found, among other things, that rock-salt was almost perfectly diathermanous; there was a loss of only 7.7 per cent, which he attributed to reflection. The following table shows the D. of various solids, and also that their D. varies with the intensity of the heat which is the source of the rays. The substances were $\frac{1}{10}$ of an in. thick.

Substances.	Locatelli Lamp.	Incandescent Platinum.	Copper at 752° F.	Copper at 212° F.
Rock-salt	92.3	92.3	92.3	92.3
Fluor-spar	72	69	42	33
Beryl	54	23	13	0
Iceland spar	39	28	6	0
Glass	39	24	6	0
Rock-crystal	38	28	6	3
Smoky quartz	37	28	6	3
Carbonate of lead	32	23	4	0
Sulphate of baryta	24	18	3	0
Feldspar	23	19	6	0
Borate of soda	18	12	8	0
Selenite	14	5	0	0
Alum	9	2	0	0
Ice	6	0.5	0	0

The equal D. of rock-salt to the rays of heat of different degrees of intensity as shown in the above table was taken by Melloni as evidence that its D. was perfect. Rays of very low refrangibility, however, will not all pass through rock-salt. Fluor-spar is seen to be comparatively diathermanous, but Iceland-spar and glass show very great variation in D. to rays of different intensity. Feldspar does not vary much in property from them, but alum and ice are almost completely *athermanous*. The following list shows the percentage of rays transmitted through liquids, held in glass cells, $\frac{1}{10}$ of an inch thick:—Bisulphide of carbon, 63; bichloride of sulphur, 63; oil of turpentine, 31; olive-oil, 30; naphtha, 28; oil of lavender, 26; sulphuric ether, 21; alcohol, 15; acetic acid, 12; distilled water, 11.

After rays of heat have been passed through a body, it will then pass through a second body of the same kind, a phenomenon which might be expected from the nature of radiation. The rays being already sifted, and those transmitted which the molecular structure of the body will allow to pass, they possess the wave-lengths required to make their way between the molecules of the medium. Another quality rather more remarkable, which bodies possess, is, that they are athermanous to rays of heat which are generated in the same substance. Thus rock-salt is nearly athermanous to heat radiated by rock-salt. The absorbing and radiating powers of bodies are reciprocal and equal; therefore the D. of a body is inversely proportional to its radiating power. The investigations of Tyndall on the D. of various liquids and gases possess great interest. He found that as a rule elementary bodies were more diathermanous than compound bodies. A solution of iodine in bisulphide of carbon placed in a prism of transparent rock-salt was found to transmit 99 per cent of all the rays of heat emitted by a non-luminous body. Elementary gases and their mixtures were found almost perfectly diathermanous, while many compound gases were diathermanous only to rays containing much light. The amount of heat transmitted by nitrous oxide gas is only $\frac{1}{250}$th of that which will pass through dry common air, a proof that the atmosphere is merely a mechanical mixture. The following list shows the relative absorbing power of various gases, or their D. in inverse proportion: Air, 1; oxygen, 1; nitrogen, 1; hydrogen, 1; chlorine, 39; hydrochloric acid, 62; carbonic oxide, 90; carbonic acid, 90; nitrous oxide, 355; marsh gas, 403; sulphurous acid, 710; olefiant gas, 790; ammonia, 1195. These gases are all perfectly diathermanous to luminous heat. The above numbers were obtained only with heat of low refrangibility. These gases were held in tubes of rock-salt. If glass had been used, it would already have sifted out all the rays to which these gases are athermanous, and the results above indicated would not have been obtained. Ozone, which is an allotropic condition of oxygen (q.v.), was found to be very athermanous. But on heating the ozone it became perfectly diathermanous like oxygen. This proves that ozone is not, as some have supposed, a compound of oxygen and hydrogen, because the heating would produce some vapor, and this would prevent the contents of the tube from being diathermanous, for aqueous vapor was found to be quite opaque to the dark rays of the spectrum, although diathermanous to the luminous rays. The subject of D. has much interest in relation to the study of meteorology, and the effects of moisture on climate.

DIATHER'MANOUS. See HEAT.

DIATH'ESIS (Gr. *dia*, through, and *tithēmi*, I place or arrange), a Greek word signifying a disposition or arrangement, and applied by the old medical authors to the predisposition or constitution of the body which renders it prone to certain diseased states. Thus the tubercular, scrofulous, gouty, rheumatic, cancerous, or calculous diatheses, are described as something different from the corresponding diseases, but leading to these as natural or probable consequences, under certain conditions or exciting causes. The study of diathesis apart from existing disease, however, is almost always unsatisfactory, and leads to over-refinement and the pursuit of intangible abstractions, without due regard to evidence; inasmuch as the existence of a state which *is not* disease, but *leads to* disease, can rarely be established upon an unassailable basis.

DIATOMA'CEÆ, or DI'ATOMS, a group of organized beings, now generally regarded as belonging to the vegetable kingdom, and ranked as a sub-order of *algæa;* but formerly reckoned among animalcules, a view of their nature still entertained by some naturalists. Lindley makes D. an order of his *algal alliance* of thallogenous plants, including *desmidieæ* (q.v.) as a sub-order, and distinguishing the true D. as another sub-order, under the name *cymbelleæ*. The D. are generally of a brown color, although they not unfrequently become greenish when dry. They are remarkable for their siliceous covering, composed of two pieces or valves, and their angular shape, and are among the most beautiful and interesting of microscopic objects, exhibiting great variety of markings—striæ, dots, etc.—regularly and symmetrically arranged. The valves, or pieces of the siliceous covering, are always equal in length, but their sides often differ much in breadth. All within appears to be only a single cell; but many of these cells are often united or in contact, according to some mode of arrangement characteristic of the particular species. D. are found both in salt and fresh water, also on the surface of damp rocks and walls, garden-paths, flower-pots, the glass of hot-houses, etc. They may generally be obtained in great numbers by allowing water in which they exist to stand for a few hours, and then pouring off all except the more muddy or slimy part at the bottom.

They may often be seen to move a little in the water or slime in which they exist, particularly those of most elongated form; and this was once regarded as a very conclusive evidence of their animal nature, but is now believed to be no more so than the movements of vegetable zoospores, and to be owing to their imbibing and emitting fluids in the processes of their vegetable life. They increase by division (whence the name diatomaceæ, Gr. through-cutting), which takes place not transversely but longitudinally; and the lines which mark its progress are almost always visible in them. In this process, new siliceous valves are formed along the line of division, the old valves remaining on the outer sides, and each new diatom cell having an old valve and a new one. True reproduction takes place by conjugation (q.v.), and by the formation of *sporangia* (see SPORE). D. very rapidly putrefy, but their siliceous shields resist decomposition more perfectly than almost any product of organic nature, and are found in immense numbers in many marls, clays, and rocks. They are capable of resisting even the action of fire, and of the gastric-juice of the stomachs of animals, and are found in pumice and volcanic ashes, and in guano. The abundance of the D. as existing organisms, corresponds with what we infer from their remains in the oolite, chalk, etc., as to former geological periods. Britain is known to possess hundreds of existing species. Dr. Hooker found them in such numbers in the Antarctic ocean as to give an ochreous brown color to its surface as far as the eye could reach, and to the icebergs floating in it; whilst a submarine deposit is in process of formation, composed of their siliceous shields. Thus these minute organisms, unimportant as they may be deemed individually, fill no insignificant place, collectively, in the general scheme of creation.

Fossil D. have been observed in strata of every age. Though so minute in the individual, they form, in the aggregate, considerable thicknesses of rock—they have, in fact, in common with the associated and nearly as minute and simple organisms of the animal kingdom, the foraminifera, produced greater changes, and left more lasting records than any effected by higher members of either kingdom. In the older rocks, D. have not been noticed in any quantity, their existence, however, in the clay-slates of the lower Silurians was discovered by Mr. A. Bryson, and has been subsequently noticed by other observers. In tertiary strata they occur in abundance. There is good reason for believing that the siliceous substance of flint was obtained, to a large extent, from these organisms; many of their frustules may yet be discerned in it. Tripoli-stone consists entirely of their siliceous plates, hence its value as a polishing agent. Several extensive deposits of tripoli are found in Bohemia—one at Egea is two miles in length, and averages 28 ft. in thickness; another at Bilin, forming the upper layer of a hill, is 14 ft. thick; it is composed chiefly of a species of *gallionella*, with specimens of *navicula*, etc., as many as forty-one thousand millions exist in every cubic inch of the stone! The city of Richmond, in Virginia, is built on a stratum of diatomaceous earth, 18 ft. thick. Similar deposits are found in different localities in Britain, as at Premnay, Dolgelly, Lough Mourne, Raasay, and Mull. From the last locality, Gregory has given a catalogue of 150 species. The whitish powder of which the deposit consists is called in Sweden Bergmehl (q.v.), and is, in seasons of scarcity, mixed by the poor with their food, though probably without any advantage, save increasing its bulk. D. occur in more or less abundance in marl, peat, guano, estuary mud, and other recent deposits.

DIATONIC, a term used in the science of music, originally from the Greek, meaning "by tones," or "from tone to tone." The diatonic species of the ancient Greeks—apart from their chromatic and enharmonic species—formed the foundation of their whole system of music, and was arranged in tetrachords composed of one semitone and two whole tones. The diatonic scale of modern music is a combination of the Greek tetrachord, forming a succession of sounds progressing from degree to degree, by tones and semitones in a certain fixed order, neither omitting nor repeating; the position of the semitones varying, as the scale is major or minor.

DIATONIC SCALE OF COLORS, the seven primary colors of a solar spectrum, or rather the spaces occupied by them, which Newton supposed to be of the same length as the strings that sound the diatonic scale in music. The theory is not well founded.

DIATRIBE (Gr. *diatribè*, a disputation, or critical exercise) was a name originally given to a critical examination of a literary work, and at a later period to a bitter and violent criticism, either written or spoken, on any subject, in any department of literature.

DIAZ, BARTOLOMMEO, a Portuguese navigator of noble birth, who flourished during the latter half of the 15th century. His residence at the court of king John II. brought him into contact with many scientific men, among others the German cosmographer Behaim (q.v.). D. took a great interest in geographical discovery, and his knowledge and abilities were so highly estimated, that the king gave him the command of two vessels with a view to following up the discoveries already made by Portuguese adventurers on the w. coast of Africa. D. soon reached the limit which had been attained in s. Atlantic navigation, and first approached land in 26° s. lat. After disembarking at various places, and taking possession of the shores in the name of the Portuguese king, he sailed round the southern extremity of Africa without suspecting it, and cast anchor at the mouth of the Great Fish river, a little to the e. of Algoa bay. A storm now rose, and drove him into Algoa bay. He there found, near Port Elizabeth, his

companion-vessel, from which he had been separated before rounding the cape; but unfortunately the greater part of its crew had been murdered by the blacks. He now, for the first time, noticed his discovery, and called the cape, in remembrance of his danger, *Cabo de todos los tormentos* (Cape of all the Storms)—a name which the king of Portugal afterwards changed into its present, *Cabo de Buena Esperanza* (Cape of Good Hope). D. arrived in Lisbon Dec., 1487, and was at first greeted with enthusiasm, but soon saw Vasco da Gama preferred before him, and was compelled to act under the latter in the grand expedition of 1497. Vasco da Gama even sent him back to Portugal after they had reached the Cape Verd isles, so that he had no share in the honor of discovering a maritime route to the Indies. Three years after, he joined the expedition of Cabral, the discoverer of Brazil, but was lost in a storm, 29th May, 1500.

DIBBLE AND **DIBBLING.** The common garden dibble is an implement too well known to require any lengthened description. A round piece of wood, about an inch and a half in diameter, sharpened at the point, is the most simple and common form. To allow it to be more easily pressed into the ground, a handle is usually added. This is all that is needed for a garden dibble. In some parts of England, where labor is plentiful, large breadths of wheat are put in with the dibble. Several dibbles are usually joined together, and made of sufficient length to enable a man to perform the operation, as he walks backwards, without much stooping. Children follow with the seed, and drop two or three grains of wheat in every hole. The dibbler is often used to put in beans. By dibbling, a considerable saving of seed is effected. From one bushel to six pecks of wheat is the usual quantity required to sow an acre. Dibbling is thought to be advantageous for light lands which are in good condition. More recently, several ingenious machines for dibbling have been constructed. The one most worthy of notice is Newberry's horse-dibble, which sows from one to seven rows, and accomplishes the operation with great nicety and accuracy. Being an expensive machine, however, it has not come into general use. Dr. Newington has invented a hand-dibble, a very perfect implement of its kind; the same machine makes the holes and deposits the seed at once. This has been a useful article on small holdings, and it is the greatest favorite at the present moment.

Dibbles of every kind are unsuitable for stiff or clayey soils; the soil, compressed and hardened around the hole which they make, not readily admitting the young fibers of the root, and retaining water to the injury of the young plant.

DIBBS, the English name of a game of great antiquity, played by boys and girls; and in Russia, as is described by Dr. Clarke, it is played sometimes even by old men. It consists in throwing up the small joint-bones of the legs of sheep, and catching them first on the palm and then on the back of the hand. The antiquity of this simple kind of play is proved by figures on Grecian vases, on which females are seen kneeling and engaged in the sport. In Scotland, where the game is more usually played with small pebbles or shells, it is called "the chucks."

DIBDIN, CHARLES, musician and poet, was b. at Southampton in 1745, educated at Winchester, and at the early age of 16 made his literary *début* in London, by writing an opera called *The Shepherd's Artifice*, which was produced at Covent Garden theater, of which he afterwards became musical manager. In 1789, he commenced giving a series of musical entertainments in the city, entitled *The Whim of the Moment*, which acquired a great celebrity. After several vicissitudes, he withdrew, in straightened circumstances, from public life in 1805, when government granted him, in consideration of his literary merits, a pension of £200. He died in 1814. D. is an admirable writer of sea-songs, of which he composed about 1200. Neptune, and not Apollo, seems to have inspired him. In fact, he is the only song-writer who has reached the heart of "the mariners of England." His verses smack of the briny deep, and reflect with astonishing felicity the easy, childlike virtues and the fearless courage of the English tar. It is known that they had a great effect during the war between France and England in supplying the navy with volunteers, and they have even been quoted in mutinies to the restoration of order and discipline. Among D.'s happiest pieces are *Poor Jack* and *Poor Tom Bowling*. The last edition of D.'s songs, with a memoir by T. Dibdin, illustrated by G. Cruikshank, appeared in 1850 (3d ed. 1863). D. also wrote a great number of dramatic pieces, etc.—He left two sons, CHARLES D. (d. 1833) and THOMAS D. (d. 1841), both of whom composed songs and dramas.

DIBDIN, Rev. THOMAS FROGNALL, nephew of Charles D., the famous writer of sea-songs, was b. at Calcutta in 1776. He lost both his parents when hardly four years of age, and was brought up by his mother's brother, a Mr. Crompton. He studied at St. John's college, Oxford, but left the university without taking a degree. After a short and unsuccessful career as a lawyer, he entered the church in 1804, and from that period until his death, 18th Nov., 1847, continued to labor as a bibliographist with a diligence that would have been more commendable if it had been accompanied with a stronger judgment and a greater accuracy. D.'s principal works are an *Introduction to the Greek and Roman Classics* (1802), *Typographical Antiquities*, 4 vols. (1810–19), *Bibliomania* (1811), *The Bibliographical Decameron* (1817), *Bibliotheca Spenceriana* (1814), *Bibliographical, Antiquarian, and Picturesque Tour in France and Germany* (1821), *The Library Companion* (1824), and *Reminiscences of a Literary Life* (1836). All D.'s books contain valuable and

rare information, but are far from trustworthy in matters of detail. Many of them are exquisite in typography and artistic decoration.

DIBRANCHIATES, a division of cephaloid mollusks, having two gills or branchiæ, an ink-gland, and nearly always a rudimentary internal shell, such as the cuttle-fish, the octopus, the squid, and the argonaut, and the extinct belemnites. The female argonaut has a single-chambered shell not connected with the body, for the protection of her eggs. With this exception, they are naked.

DICÆ'UM, a genus of beautiful birds, which are best known in India and Australia. Their nests are purse-shaped and made from the down of plants. They fly with great rapidity, and are remarkable for their sweet and long-drawn-out notes.

DI'CAST, a body of 6,000 Athenian citizens chosen annually by lot from the whole people, except slaves, to assist in the administration of justice. They were divided into 10 sections, each section having the powers and performing the duties of a court of justice. The evidence in a cause was taken beforehand, and the members of the D. were kept in ignorance of the cases to come before them, being sworn, as jurors are in the present age, to decide according to the law and the facts.

DICE (plural of die), small cubes of bone or ivory, marked on their six sides with black dots, from one up to six in number. Two dice are employed in certain games of chance, such as backgammon; also in throwing for high stakes, or settling some dispute in which the decision is referred to the highest number thrown. In this latter point, the throwing of dice is equivalent to what is usually spoken of as "casting lots." The throwing of dice is in all cases effected by means of a small tubular box, which, held in the hand, is shaken at will by the player. When the dice are true cubes, there is no plan by which any kind of shaking can bring out a desired number. In order to repress gambling, and secure players against deception, the state, by the act 9 Geo. IV. c. 18, imposed a duty of 20*s.* on each pair of properly made dice, which were accordingly stamped, and a penalty was imposed on the sale of unstamped. Nevertheless there appears to have been a pretty free sale of unstamped dice under the name of "bones" at an insignificant price. In 1862, the stamp-duty was abolished, yet the repeal of the restriction has not to any extent stimulated the use of dice. Unscrupulous gamblers adopt the odious practice of loading dice, by plugging them with lead on a particular side, so that the higher numbers may turn up. Where there is any suspicion of this trick, the thrower should be requested to turn down the mouth of the box abruptly, to prevent the dice from rolling, and improperly adjusting themselves. See GAMBLING.

DI'CE, the goddess of justice in Greek mythology, daughter of Zeus and Themis, and sister of Eunomia. The tragedians represent her as an avenging and rewarding deity.

DICEN'TRA, the name of certain showy herbaceous perennials found in the United States and elsewhere. A curious specimen is known by the name "Dutchman's breeches," because the corolla resembles that article of attire. The flowers are cream-colored, tipped with white. Another species is called "squirrel corn," its tubes resembling maize It has fragrant flowers, of greenish white tinged with red, and is found in rich forest-lands. There are other varieties, but the most beautiful is an importation from Japan, and is popularly known as "the bleeding heart." It has large rosy blossoms, each flower is an inch long, and its blossoming continues for several weeks.

DICHLAMY'DEOUS (Gr. *dis*, twice, and *chlamys*, a covering), a term in botany, applied to those flowers which have both a calyx and a corolla. Flowers in which the calyx and corolla are very similar, and unite to form a *perianth*, are dichlamydeous, as well as those in which they are very different. Decandolle divides dicotyledonous or exogenous plants into *dichlamydeous* and *monochlamydeous;* the former including the three sub-classes of *thalamiflorœ*, *calyciflorœ*, and *corolliflorœ*, whilst the latter form a single sub-class.

DICHOTOMOUS (Gr., divided into two equal parts), a term often used in botanical description to designate branching by repeated forkings. The veins of the fronds of ferns and of the leaves of some coniferous trees, the stems of some ferns, the fronds of some algæ, and the stems of a few phanerogamous plants, are dichotomously branched. The stem of the mistletoe is generally divided in this manner, and it is a remarkable characteristic of that of the doom palm.

DICHOT'OMY, in anthropology, is the name given to the theory that considers man as having a twofold nature, physical and spiritual, or, in popular language, as body and soul. In this it is opposed to *trichotomy*, which makes a triple division—body, soul, and spirit: giving the name "soul" to all, besides the body, which man has in common with brutes, e.g., certain instincts, affections, and rational faculties; and using "spirit" to designate that in man in which his morality and immortality inhere, and by which he is distinguished from the other animals. See SOUL, *ante*.

DI'CHROISM (Gr. *dis*, twice, *chroma*, a color) is a term chiefly used in crystallography to designate the property which many doubly-refracting crystals possess of exhibiting different colors, when viewed in different directions. It, or the allied term *dichromatism*, has also been applied to those fluids which appear of different colors

when viewed by reflected and refracted light; when seen in thick or thin layers, etc. For example, venous blood, or any blood impregnated with carbonic acid, hydrogen, or nitrogen, appears, when seen in moderately thin layers, to be of a purple color; while in extremely thin layers it appears green.

DICHROITE, or IOLITE, a silicate of magnesia, iron, and alumina, found in prisms, and sometimes used as a gem because of its changeable colors.

DICK, THOMAS, LL.D., a well-known religious philosopher, was b. in 1774, near Dundee, Scotland, educated at the university of Edinburgh, and intended for the ministry in connection with the Secession church. After a brief pastorial charge, however, he devoted himself to teaching, lecturing, occasional preaching, and authorship. D. proved himself to be a truly useful writer; but although his productions obtained a great popularity both in England and America, they brought him very little pecuniary return. Towards the close of his life, a small pension was granted him in consideration of his literary services. He died at Broughty Ferry, near Dundee, 29th July, 1857, in the 83d year of his age. D.'s principal works are *The Christian Philosopher* (1823); *The Philosophy of Religion* (1825); *The Philosophy of a Future State* (1828); *Celestial Scenery* (1838); *The Sidereal Heavens* (1840); and *The Practical Astronomer* (1845). Several of D.'s writings have been translated into other languages; one, even into Chinese.

DICK BEQUEST', the name given to a fund bequeathed by James Dick of Finsbury square, London, for the benefit of the parochial school-masters of Moray, Banff, and Aberdeen. Mr. Dick was b. at Forres, Morayshire, in Nov., 1743. Having entered mercantile life in the West Indies at the age of 19, he amassed a considerable fortune, which he subsequently increased in London. He died on the 24th May, 1828, leaving the chief part of his fortune for the purpose above mentioned. The sum bequeathed amounted in 1833 to £113,147 4*s.* 7*d.*, since increased to £122,000. These funds, being invested in heritable securities, yield (after deducting all expenses) for annual distribution a sum which amounts, on an average, to £4,000. Mr. Dick's object was "to encourage active school-masters, and gradually to elevate the literary character of the parochial school-masters and schools." Acting on this declaration of the testator's wish, the trustees in whom the administration became vested* ordained first, that with a view to raise the literary character of the school-masters, none should, after a certain date, participate in the bequest who had not passed, to the satisfaction of examiners appointed by them, an examination in the English language and literature, geography, arithmetic, geometry and trigonometry, algebra to quadratic equations inclusive, Latin, Greek, history, and chronology. To these branches have lately been added an examination in the art of teaching and in physics. To those who highly distinguish themselves in these examinations, a sum of money is awarded by the trustees, and they are entitled to a small allowance during their term of office. Further, with a view to raise the literary character of the schools, and to encourage *active* school-masters, the trustees appointed a visitor, who should report annually to them on the condition of the schools, making a round of all those schools, whose teachers claim participation, once in three years—now, once in two years.

In allocating the fund at their disposal, the trustees take into consideration the number of scholars attending each school, the branches taught, the fees paid, and the salary fixed by the school board. Each of these elements has attached to it a certain value, the object of this being to make it the interest of teachers and school-boards to promote the education of the parish. The sum to which a teacher may be entitled in consequence of the position he holds on the books of the trustees in the above respects, is allowed, increased, restricted, or refused, according to the report of the visitor on the condition of the school. The highest sum paid to any teacher in 1877, for example, was £59 8*s.* 5*d.*; the smallest, £18; the average about £30. A small proportion of teachers do not participate in consequence of their having failed to comply with the conditions of the trustees.

There can be no doubt that the operation of this bequest has been most advantageous. There is no district in Scotland in which the parochial schools are so uniformly taught by highly qualified men; the results of the teaching, it would not probably be easy to equal anywhere. The rights of the teachers of these schools, and of their successors, to participate in the bequest, are not prejudiced by the education act of 1872.

DICKENS, CHARLES, novelist and humorist, was b. at Landport, in Hampshire, in Feb., 1812. His father, Mr. John Dickens, was employed for some years in the navy pay department, but at the conclusion of the war with France was pensioned, and became a parliamentary reporter. In this pursuit his son was soon distinguished for uncommon ability; and after a literary engagement—at a very early age—upon *The True Sun*, he attached himself to the staff of the *Morning Chronicle*. In this newspaper he gave the first evidence of his talents in the lively essays, entitled *Sketches by Boz*, published in 1836. Encouraged by their success, he undertook to write the letter-press of the *Adventures of Mr. Pickwick*, the illustrations of which were to be executed by the then more famous Mr. Seymour, a comic draughtsman. The result was as though Shakespeare

*The keeper and deputy-keeper of the signet (Edinburgh), the treasurer of the society of writers to the signet, and eight commissioners chosen by and from among the commissioners of the signet.

had been engaged to write the libretto for an opera of Mr. Balfe's. The *Pickwick Papers*, which had an enormous commercial success, commenced also an era in English literature. It was the first of a series of fictitious works exhibiting the life and manners of the middle and lower classes, which up to that time had had scarcely any exponent. In one respect, however, this book had neither predecessor nor progeny. Neither before nor since has there ever been such a literary embodiment of healthy animal spirits. There is none like it for unflagging but never unwise merriment—for humor that is very much the reverse of dry. That Mr. D. gave us no more *Pickwick Papers* is to be lamented, but may be easily explained by the fact, that he never had the advantage of being five-and-twenty again. Since then, however, he has given us many works more admirable in other respects. *Nicholas Nickleby*, his next effort, was, as a story, greatly in advance of it. It was also the first of those social novels which form so marked a feature in modern literature. It was aimed at the wrongs and cruelties inflicted upon their wretched pupils by the cheap schoolmasters of Yorkshire—and it hit its mark. After this beginning, our author set lance in rest against many a social monster. He may be sometimes wrong, but he can scarcely be accused of want of honesty of purpose; while quite as little can partisanship (except that he is always for the poor) be laid to his charge, since at the very time that the country gentlemen were shaking their heads at him for his want of reverence for "land," he incensed the manufacturing interest by the publication of *Hard Times*. His sarcasm is of a rather peculiar character; too good-natured to sneer, and with eyes, notwithstanding their indignant fire, that never lose sight of the ludicrous side of things, his style is mocking argument. After *Nicholas Nickleby* came *Master Humphrey's Clock*, containing the *Old Curiosity Shop* and *Barnaby Rudge*. In the former of these, and in the character of Little Nelly, he first exhibited that power of setting forth child-life and child-thought which may have been said perhaps, before the publication of George Eliot's works, to be peculiarly his own. *Barnaby Rudge* was his first, and, with the exception of his subsequent *Tale of Two Cities*, his only attempt to describe the past; and it was a successful one. It is probably, with reference to plot and circumstance, his best novel, barring *David Copperfield*. The *Old Curiosity Shop* began in a curious dreamy manner, which, although obviously a favorite one with our author, he soon perceived was unappreciated, and had the prudence to discontinue. This disposition of his mind towards the weird and the grotesque he subsequently developed with greater success in his *Christmas Stories*. After a voyage across the Atlantic, Mr. D. published, in 1842, his *American Notes for General Circulation;* but a much more admirable result of that expedition appeared in his *Martin Chuzzlewit*. This was certainly the greatest of his humorous works since the *Pickwick Papers*, and it may almost be said to have been his last. From this period, his animal spirits—a rare gift among even comic authors, and rarely lasting so long as in his own case—appeared to have deserted him. His humor, except in some rich creations, such as Mr. Micawber, was no longer so apparent, while, on the other hand, his wit and pathos increased. *Dombey and Son* was considered a falling off in one who stood so high; but his death of little Dombey brought tears to the eyes of lawyers. When men were expecting that he should wane and weaken like other prolific writers before him, he produced a novel as fresh as the dawn. In this, he, for the first time, adopted the autobiographical form, and that perhaps offered him some advantages; but at all events, the result was admirable. *David Copperfield* is, in our judgment, by far his greatest work, and will endure—though for very different reasons—as long as the *Pickwick Papers*. Its Agnes is one of the most charming female characters in the whole range of fiction. *Bleak House*, *Hard Times*, *Little Dorrit*, the *Tale of Two Cities*, *Great Expectations*, and *Our Mutual Friend*, afterwards succeeded one another with almost periodical punctuality, and an audience larger than any English author ever had awaited each. We must also note *Oliver Twist*, one of his most popular works, the first installment of which appeared in 1837 in *Bentley's Miscellany*. No prose-writer was ever more quotable or more quoted than he. In 1845, the *Daily News* was started under Mr. D.'s editorial auspices, but the task appears to have been ungenial, for he soon withdrew from it. In 1850, he commenced a weekly periodical entitled *Household Words*, afterwards merged in *All the Year Round*. In 1867, he again visited America, giving numerous readings, and meeting with a brilliant reception. He was till the last engaged in writing a new novel, *The Mystery of Edwin Drood*, which was left unfinished. He died on June 9, 1870. His *Life* was written by John Forster (3 vols. 1871–74).

DICKINS, Asbury, 1773–1861; son of John, the Methodist minister. In 1801, he was associated with Joseph Dennie in the *Portfolio*, a weekly publication. He spent some years in Europe, and on return was given a place in the treasury department, and afterwards in the state department, where he was acting secretary. In 1836, he was chosen secretary of the United States senate, and filled the office 25 years, until his death.

DICKINS, John, 1747–98; a native of London, educated at Eton. He came to America before the revolution, and was one of the most zealous and efficient promoters of the Methodist Episcopal church in the country. He preached in Virginia and North Carolina, and in 1783, took charge of the John-street church in New York city. In 1789,

he was stationed in Philadelphia, and there established the "Methodist Book Concern," afterwards removed to New York.

DICKINSON, a co. in n.w. Iowa, on the Minnesota border; 430 sq.m.; pop. '80, 1901. Spirit lake occupies a considerable part of its area. Agriculture is the principal business. Co. seat, Spirit Lake.

DICKINSON, a co. in central Kansas, on the Kansas river, crossed by the Kansas Pacific railroad; 846 sq.m.; pop. '80, 14,973. The surface is chiefly prairie and fertile, producing wheat, corn, oats, etc. Co. seat, Abilene.

DICKINSON, ANNA ELIZABETH, b. Philadelphia, 1842. Her father died when she was but two years old, and she received a rudimentary education in a Quaker school. When but 14, she wrote for the *Liberator* an article on "Slavery." At 17, she taught school in Bucks county. The next year she made her first speech at a meeting of Progressive Friends (Quakers) in Philadelphia, her subject being "Woman's Rights and Wrongs," and thenceforward she was a frequent speaker, chiefly on total abstinence and slavery. Near the close of 1861, she added politics, and strongly supported the war for the union. Of late years she has devoted her attention to lecturing and to the drama, writing *A Crown of Thorns*, and *True to Herself*, and acting in these plays with moderate success.

DICKINSON, JOHN, LL.D., 1732–1808; b. Md., educated in London, a lawyer in Philadelphia; deputy to the first colonial congress, and a member of the continental congress of 1774, to which body he presented several important papers. He spoke against the declaration of independence, deeming it premature, and was one of the few members who did not sign that document. He was representative from Delaware in congress in 1779. In 1783, he founded Dickinson college, Carlisle, Penn., to which he gave a liberal endowment.

DICKINSON, JONATHAN, 1688–1747; b. Mass.; graduate of Yale. He was for 30 years a Presbyterian minister in Elizabethtown, N. J., and was in high repute in all the region. In 1746, he was elected president of the college of New Jersey. He wrote a number of theological works.

DICKINSON COLLEGE, at Carlisle, Pa., was established as a Presbyterian institute, 1783, but passed under Methodist control in 1833. It was named for John Dickinson, one of its principal founders. It has a productive endowment of about $215,000, with an annual income of from $14,000 to $15,000. The campus embraces about nine acres, with a beautiful growth of trees. The buildings, three in number, are of stone, substantial, commodious, and well adapted to their purposes. The apparatus for illustration in scientific studies is valuable, and annually increasing. The astronomical observatory is provided with an achromatic telescope, having an object-glass of five inches, and a focal distance of seven feet, equatorially mounted, and furnished with right ascension and declination circles. There is a museum of natural history and geology, and a library of 28,458 volumes. The old classical curriculum is maintained, with allowed divergencies in junior and senior years in favor of scientific and theological students. All the students physically competent are under military instructions and drill. There is a preparatory school under the immediate control of the faculty. The number of professors (1880) is 12; of the students, 120. President, J. A. McCauley, D.D. Among the eminent alumni may be mentioned president Buchanan, chief-justice Taney, and postmaster-general Creswell.

DICKSON, a co. in n. Tennessee, on the Cumberland river and its affluents, intersected by the Nashville and Northwestern railroad; 650 sq.m.; pop. '80, 12,460—2,230 colored. It has a rolling surface and fertile soil. The Cumberland river is navigable for steamboats. The productions are corn, tobacco, etc. Co. seat, Charlotte.

DICKSON, SAMUEL HENRY, LL.D., 1798–1872; a physician, b. S. C.; graduate of Yale, 1814; studied medicine in the university of Pennsylvania. In 1824, he was appointed to the professorship of the institutes and practice of medicine in the medical college of Charleston. In 1847, he was professor of the practice of medicine in the university of New York. In 1858, he accepted a similar chair in the medical college in Philadelphia. He published many volumes and papers on medical subjects.

DICLINOUS (Gr. *dis*, twice, and *klinē*, a bed), a term in botany, signifying that flowers are unisexual, having stamens only, or pistils only, and opposed to *monoclinous* or *hermaphrodite*. It is much used by some botanical authors.

DICOTYLEDONOUS PLANTS are those of which the embryo is ordinarily furnished with two seed-lobes or cotyledons (q.v.) opposite to one another, or with more than two, which in that case are verticillate. In general there are only two cotyledons; a greater number being of rare occurrence, but being found in some of the *coniferæ*, as spruce-fir, larch, etc., in *ceratophyllum*, etc. It is not, however, always quite easy to determine whether a plant belongs to the class of dicotyledonous plants or to that of monocotyledonous plants (q.v.), as sometimes, in the former, only a single cotyledon presents itself, which is the case with a number of species of the sub-genus *bulbocapnos* in the genus *corydalis*; or the cotyledons are altogether wanting, as in dodder (*cuscuta*), or the embryo is in so rudimentary a state in the seed, that it at first consists only

of a pair of cells as in *monotropa*. The habit of the plants is therefore also to be taken into account, and particularly the structure of the stem and its mode of increase. The *radicle* of the embryo in dicotyledonous plants generally elongates itself by degrees until it forms the root of the plant itself; wherefore Richard designated these plants *exorhizæ* (Gr. *exo*, outward, and *rhiza*, a root). The stem is exogenous (q.v.), and usually branched. The leaves have branching veins, and exhibit great variety of form. They are articulated to the stem. The calyx and corolla, when both present, are usually more distinct and dissimilar than in monocotyledonous plants.

DICOTYLES. See PECCARY.

DI'CRANUM, a genus of mosses, having a single *peristome* of sixteen equidistant bifid teeth and the *calyptra* splitting up on one side (*dimidiate*). See MOSSES. The species are numerous, and some of them are among the most common British mosses, growing on the ground and on moist rocks. Many of them have elongated branching stems.

DICTA'TOR, in the earliest times, was the name of the highest magistrate of the Latin confederation, and in some of the Latin towns the title was continued long after these towns were subjected to the dominion of Rome. In the Roman republic the D. was an extraordinary magistrate, irresponsible and endowed with absolute authority, whose original name was *magister populi*. The frequency of *crises*, or critical periods, in the quick, aggressive growth of the Roman state, necessitated such an office. The first D. (T. Larcius or M. Valerius) was appointed 501 B.C., nine years after the expulsion of the Tarquins. According to Livy, the immediate cause of this dictatorship was a formidable war with the Latins. In general no one could be appointed D. who had not been previously consul, and this condition was very rarely dispensed with. Niebuhr is of opinion that the D. was originally created or elected by the curiæ, like the kings, but it is more probable that the senate passed a decree ordering one of the consuls to name or proclaim (*dicere*) a dictator. Originally, of course, the D. was a patrician; the first plebeian who filled the office being C. Marcius Rutilus, 356 B.C., who was nominated by the plebeian consul M. Popillius Lænas. The dictatorship could not *lawfully* be held longer then six months, nor was it ever so, except in the cases of Sulla and Cæsar, which were altogether peculiar. It must not be supposed that during a dictatorship the functions of the other magistrates were positively suspended. The consuls and other regular authorities continued to discharge their proper duties, but in subordination to the direction and command of the D.; being for the time simply his officers. The superiority of his power, when compared with that of the consuls, appears chiefly in these three points: he was far more independent of the senate; he had a more extensive power of punishment, without any appeal; and he could not be called to account after his abdication of the dictatorship for anything he had done during the period of his office. The *limits* of his power were as follows: he could not touch the treasury; he could not leave Italy; and he could not ride through Rome on horseback without previously obtaining the permission of the people. While the consuls had only 12 lictors, the D. was preceded by 24, bearing the *secures* and *fasces*. To him also belonged the *sella curulis* and the *toga prætexta*. The last legally elected D. was M. Junius Pera, who entered on his office 216 B.C. From this time *nominal* dictators were frequently appointed for the purpose of holding the elections, but even these finally disappeared, 202 B.C. Henceforth, in critical times, a sort of dictatorial power was conferred on the consuls by the senate by the well-known formula: "That the consuls should see to it, that the state should receive no damage." This practice rendered the appointment of *dictators* no longer necessary.

DICTIONARY, is merely the English form of *dictionarium*, a word not to be found in classical Latin, though of frequent use in that called monkish or mediæval. A D. is, as every one knows, a book, but, in the widest sense of the word, its contents admit of no more strict definition than that they are arranged according to the order of the alphabet, and that every word within the scope professed to be embraced by the D. must have its proper place accordingly. It may be further said that the D., in order to distinguish it from a mere list or index, must contain explanations or information about each word thus included within its scope, except in cases, of which many examples may be found in the present work, where it is sufficient to refer for a part or the whole of the account of one word to what is said under some other word. There are several other terms that are used synonymously, or nearly so, with dictionary. The Greek word lexicon is in common use for a D. of languages. It is not entirely so limited, however, in practice, as may be seen in such works as the *Lexicon Juridicum* of Calvinus or Kahl, which is just a D. of Roman and feudal law, of the same kind as sir Edward Tomlin's *Law Dictionary* is of English law. The word encyclopædia has generally a wider meaning; but there are often several books exactly of the same kind, of which some are called dictionaries, and others encyclopædias. Glossary and vocabulary are nearly synonymous with a D. of a language; and the words thesaurus, catalogue, directory, gazetteer, and index, are sometimes used as a title when D. might be not inapplicable.

Dictionaries may be divided into two classes—(1) dictionaries whose object is to explain words and phrases; and (2) those that aim at giving information about things.

1. Dictionaries of language are, again, divided into various sub-classes or species. The most common kind—what, indeed, is understood by the term D. (and the equiva-

lent Greek term *lexicon*) when used by itself—is an alphabetical list of the words composing any language, either explained in the same language, or interpreted by the corresponding words of one or more other languages. To indicate that all, or nearly all, the words of the language are embraced, the name *thesaurus* (treasury) is sometimes used. *Special* dictionaries contain only the words used by single authors, or classes of authors. A *glossary* is a D. of unusual terms. An *etymological* D. is one in which the derivation of words is the sole or a prominent object.

2. Dictionaries of things (Ger. *realwörterbücher*), or of information, are also of various kinds. When the whole field of human knowledge is embraced, we have an alphabetical encyclopædia. The name encyclopædia or cyclopædia is sometimes given to dictionaries of special departments of knowledge, as the *Cyclopædia of Anatomy and Physiology;* but in all such cases, D. seems the correcter term. See ENCYCLOPÆDIA.

There is no kind of information, within wide or narrow bounds, that may not be thrown into the D. form. Dictionaries of apt quotations from the classics, the Scriptures, or the fathers, were much in vogue in the 17th century. There are dictionaries of biography, of geography, of dates, of architecture, of cookery, of political economy, of fortification—in fact, of every object of human knowledge and practice. As dictionaries of this class are of the same nature, except as to the restriction of their field, as encyclopædias properly so called, we reserve some notice of the more important of them for that head.

Dictionaries of language, in our sense of the word, are of modern origin. The Greeks and Romans had no idea of a book embracing all the words of their own or any foreign tongue. Glossaries, however, of unusual words and phrases were early current. The earliest work of the kind extant (though much interpolated) is the Homeric lexicon (Gr. *Lexeis Homerikai*, "Homeric words") of Apollonius, an Alexandrine grammarian of the time of Augustus. More extensive compilations, such as the lexicon of Suidas (q.v.), and the *Etymologicum Magnum* (q.v.), were made in the middle ages. A real D. became first possible after the invention of printing. A broad and sure basis for Greek lexicography was laid by Henry Stephens (q.v.) in his *Thesaurus* (1572); the Latin *Thesaurus* of Robert Stephens, which did the same for Latin, had appeared in 1531. Previously to the discovery of printing, and for some time after, the explanations of Latin words were given in Latin. "The earliest *printed* vocabulary with which we are acquainted in which the words of any modern language answering to the Latin are inserted, is the *Promptorius Puerorum*, published by Pynson in 1499, in which English words are followed by their supposed Latin equivalents" (*Quarterly Review*, Sept., 1855). Some of the more important dictionaries will be noticed under the heads of the several languages.

DICTUM DE KENILWORTH was an edict or award between king Henry III. and all those barons and others who had been in arms against him, and so called because it was made at Kenilworth castle, An. 5 Henry III., containing a composition of five years' rent for the lands and estates of those who had forfeited them in the rebellion.—*Cowel's Interpreter.*

DICTYOGENS, in botany, a class established by Lindley for the reception of a comparatively small number of natural orders, genera, and species, usually included by other botanists among *endogens* or endogenous plants (q.v.), but which, whilst they agree with endogens in the structure of the embryo, differ from them in the stem and leaves. The annual branches or aërial stems have indeed the endogenous structure, but the rhizomes or subterranean stems more resemble the structure of exogenous plants (q.v.), with pith, medullary rays, and wedge-like vascular bundles. The leaves are broad and net-veined, usually disarticulating with the stem. The most important natural orders referred by Lindley to this class are *dioscoreaceæ* and *smilaceæ*, and the most important plants belonging to it are the different species of yam and sarsaparilla.

DICTYS OF CRETE, one of the early historians from whom certain Roman writers imagined that Homer derived material for the *Iliad* and the *Odyssey*. According to an introduction prefixed by an unknown writer to the Latin translation entitled *Dictys Cretensis de Bello Trojano*, the author followed Idomeneus, king of Crete, in the Trojan war; the manuscript of his work, written in Phœnician characters, was found in his tomb at Gnossus at the time of an earthquake in the 13th year of Nero's reign, and translated into Greek by Nero's order. A Latin version of the first five books is all that has come down to us; but this is generally regarded as a forgery. The main interest of the work consists in the fact that, with the work of Dares, it was the medium through which Homeric legends were introduced into the literature of the middle ages. (From *Encyclopædia Britannica.*)

DICYNODON, the name given by Owen to a genus of fossil reptiles, whose remains have been found in South Africa. The true age of the rock in which they occur has not been ascertained; the accompanying organisms seem to indicate that it is triassic. Few bones of these animals, save those of the skull, have been sent to this country. A complete restoration of one would be a most valuable addition, not only to paleontology, but to systematic zoology as well; for the numerous skulls that have been examined, have been sufficient to show that this is one of those anomalous forms which unite in their structure the characteristics of widely different animals. It has affinities with the

crocodile, the lizard, and the tortoise, though perhaps the completely closed orbits and the sharp compressed jaws ally it more closely to the last-named animal. Its lower jaw also is covered with a horny plate, as in the tortoise. The most remarkable peculiarity is the existence of a pair of large sharp-pointed tusks, one from each side of the upper jaw, growing downwards as in the mammalian morse or walrus. The generic name, meaning "two canine teeth," has been given to them from these singular tusks, which are peculiar to this genus. The articulating surfaces of the vertebræ are both hollow—a fish-like peculiarity, from which it might be argued that these reptiles were good swimmers; probably they lived constantly in the water, but the construction of the bony passages of the nostrils proves that they must have come to the surface to breathe air. Four species have been discovered.

DIDAC'TIC POETRY, that kind of poetry which aims, or seems to aim, at instruction as its object, making pleasure entirely subservient to this. It has been disputed whether or not the existence of a kind of poetry especially entitled to the name didactic, consists with the very nature and object of the poetic art. For it is held that, to point out instruction as the peculiar object of one kind of poetry, is to overlook the high aim of all poetry; and that a poem may be in the highest sense didactic, which yet is epic, dramatic, or lyric in its form; and the book of Job, the Psalms, and other poems contained in the Sacred Scriptures, are quoted as examples. In the poems generally called didatic, the information or instruction given in verse is accompanied with poetic reflections, illustrations, episodes, etc. The *Georgics* of Virgil have been the model according to which didactic poems have very generally been composed; and the literature of all European nations contains many productions of this kind; whilst no subject is so unpromising that it has not found some one to select it as a poetic theme.

DIDEL'PHIS. See OPOSSUM.

DIDEROT, DENIS, a celebrated French encyclopedist and philosophical writer, was born at Langres, in Champagne, 5th Oct., 1713. He was educated for the church at the college of his native town, and subsequently at that of D'Harcourt, Paris; but disliking the clerical office, and after having made a trial of law, a profession which he also found uncongenial, he finally resolved, after various vicissitudes, upon becoming a *littérateur*. For some years, however, his mode of life was very precarious. On one occasion, being reduced to the greatest extremities, he seriously resolved that if the world should ever prosper with him, he, not ignorant of misfortune, would never disregard the applications of the indigent. This resolution was religiously kept; for after having attained a position of comparative affluence, he was continually surrounded by applicants desirous of obtaining assistance, which, whether in the shape of money or instruction, D. was always willing to afford them. Although very poor, D. married in 1743. Necessity now drove him to increased exertions. He translated the *History of Greece* from the English of Stanyan, receiving for this work the sum of 100 crowns. Soon afterwards followed the *Essai sur le Mérite et la Vertu;* the *Pensées Philosophiques*, written, it is said, in the space of four days; and the *Interprétation de la Nature*. Shortly after appeared his *Lettre sur les Aveugles*, for the writing of which he was confined three months in the prison of Vincennes. Believing that it was, among other things, his vocation to regenerate the theater, he produced a melodrama (1758), entitled *Le Père de Famille*. It was unsuccessful, and was followed by others equally so, so that it was said, "Le Père de Famille a été le père d'une famille déplorable."

But D.'s great work was the *Encyclopœdie*, of which he and D'Alembert were the joint editors. It was commenced in 1749. D., besides revising all the articles, wrote the departments of history, of ancient philosophy, and of the mechanical arts. He also wrote art criticisms from 1765 to 1767, showing a readiness in interpreting the meaning of a picture, and a power in reproducing it vividly in words, unequaled by any writer of his time. Towards the latter portion of his life, D., who had never been able to save any money, determined to sell his library, to provide for his only daughter. The empress Catherine of Russia, having been informed by her French ambassador of his intention, bought the library, on condition that D. himself should be librarian, and undertake the care of it at a salary of 1000 francs yearly. In 1773, he set out for St. Petersburg to thank his imperial benefactress, returning in the following year. But his health, which was impaired by this journey, soon after gave way, and he died on the 30th July, 1784.

D. had worked at the encyclopædia for the space of about 30 years. His fitness, natural and acquired, for this species of literary labor was complete. With the advantage of an excellent education, he had a great love of truth, and a curiosity to ascertain the real relations of any subject upon which he was engaged. He was distinguished by a swiftness and dexterity of intellect, that enabled him to catch the salient points of his topic, and to present them in the best light. As regards religion, D. was an atheist, sincere even to fanaticism in his opinions, and anxious to indoctrinate his countrymen with his own skepticism. The *encyclopœdie* became a vehicle for the indirect propagation of his views. One of the last recorded sayings of D. is very characteristic: "The first step towards philosophy is incredulity;" but, unfortunately, D. thought it was also the last. An edition, in 20 vols., of all D.'s works, by Assézat and Tourneux, was com-

pleted in 1877. See John Morley's monograph on *Diderot and the Encyclopædists* (2 vols., 1878).

DIDIUS SALVIUS JULIANUS, MARCUS, for a brief period emperor of Rome, under the name of Marcus Didius Commodus Severus Julianus. He was quæstor, ædile, and prætor; commanded a legion in Germany, and was governor of Belgic Gaul, and afterwards of Dalmatia and lower Germany. He was consul and proconsul in Africa, and governor of Bithynia in Asia Minor. When Pertinax was assassinated, the throne was offered to the highest bidder by the prætorians, and Didius bought it, thus becoming emperor; but whenever he appeared in the streets he was greeted with the epithets of "robber" and "parricide." The legions abroad did not recognize him, and proclaimed Septimus Severus as the true emperor. Severus marched to Rome and was recognized by the senate. Didius was deserted, and after two months' reign was killed by a soldier.

DIDO, or ELIS'SA, according to the legend, the foundress of Carthage, was the daughter of a king of Tyre, called by some Agenor or Belus, by others Mutgo or Matgenus. His successor, Pygmalion, the brother of D., murdered her husband and uncle, a priest of Hercules named Acerbas; by Virgil, Sichæus. With the treasures of Sichæus, which Pygmalion had sought for in vain, and accompanied by many Tyrians, D. escaped to sea. She landed in Africa, not far from the Phœnician colony of Utica, and built a citadel called Byrsa (from Gr. *Bursa*, the hide of a bull), on a piece of ground which she had bought from the Numidian king Hiarbas. The meaning of the word Byrsa, gave rise to the legend that D. purchased as much land as could be encompassed with a bullock's hide. After the agreement she cut the hide into small thongs, and thus inclosed a large piece of territory. Here she built the city of Carthage. To avoid being compelled to marry Hiarbas, she stabbed herself on a funeral pile, which she had caused to be erected, and after her death was honored as a deity by her subjects. Virgil ascribes the death of D. to her unrequited passion for Aeneas; but many of the ancient writers conceived that the poet had committed an anachronism in making her contemporary with the Trojan prince. The more general opinion was, that D. had built Carthage somewhere between 50 and 100 years before the foundation of Rome.

DIDOT, the name of a celebrated family of French printers and publishers.

D., FRANÇOIS, the first of the family that attained eminence, was b. in 1689, and d. in 1757. His principal professional achievement was the publication of the *Voyages* of his friend the abbé Prévost, a work in 20 volumes, perfect as regards the text, and enriched with a great number of engravings and geographical maps. D. had eleven children, of whom two—FRANÇOIS AMBROISE D. (b. 1730, d. 1804) and PIERRE FRANÇOIS D. (b. 1732, d. 1795)—acquired considerable distinction as printers. HENRI D. (b. 1765, d. 1852), eldest son of Pierre François, made himself famous as an engraver, letter-founder, and mechanician. He was 66 years old when he engraved, for his well-known "microscopic" editions of eminent authors, those characters which are the *ne plus ultra* of typographical art. A daughter of the third son of Pierre François married Bernardin de Saint Pierre, who was for some time associated with the Didots in their paper manufactory of Essonne; and in his country-house near this place wrote his *Paul et Virginie*. PIERRE D., eldest son of François Ambroise (b. 1760, d. 1853), still further increased the fame of the family. His Louvre editions of *Virgil*, *Horace*, *Racine*, and *La Fontaine* are magnificent. At the exhibition of the products of industry in 1801, a jury declared his *Racine* to be "le plus parfaite production typographique de tous les âges." Besides a great number of works, not less remarkable for their typographical perfection than for their literary value, such as the *Voyages de Denon*, D. published a collection of the French *chefs-d'œuvre*, dedicated *Aux amis de l'Art Typographique*. D. was also an able *littérateur*.

D., FIRMIN, brother of the preceding, and son of François Ambroise D., was b. at Paris in 1764. As a printer, and especially as an engraver and founder, he raised the family name to the pinnacle of professional eminence. The absolutely perfect Roman characters used in the Louvre editions printed by his elder brother, were engraved and cast by him. Firmin D. applied the stereotyping process to the Logarithmic Tables of Callet, a work that required to be executed with the most rigorous accuracy, and which, through this means, is perfectly free from error or blemish. The whole of the French, as well as most of the Italian and English classics, were published by him according to the same process. These stereotypic editions (the word *stereotypie* was invented by Firmin D.) were wonderfully correct and cheap; *Virgil* is without a blemish, is ornamented with vignettes, and was sold for 15 sous (7½*d.*); it was a kind of revolution in the book-trade of France. The most distinguished foreigners were accustomed to visit D.'s establishment as one of the great sights of Paris. The emperor Alexander, when in Paris in 1814, minutely examined every department of it; and placed under D. two young Russians, to be instructed in all the branches of typography. Some of the most celebrated continental printers served their apprenticeship with him. In 1827, Firmin D. retired from business, to devote himself wholly to his duties as *député*. A sage friend of freedom, he attached himself to the moderate and constitutional opposition, headed by Royer Collard. D. also obtained considerable reputation as an author by his tragedies, *La Reine de Portugal* and *La Mort d'Annibal*, and several volumes of metrical translations from the classics. He died 24th April, 1836.

D., AMBROISE FIRMIN, and HYACINTHE, sons of the preceding, b. 20th Dec., 1790, and 11th Mar., 1794, long carried on the family business (aided by their sons, ALFRED and PAUL D.), under the firm of Firmin Didot, Frères. Ambroise died in Feb., 1876; but in the hands of the survivors, the business still retains its magnitude.

DIDRON, ADOLPHE NAPOLÉON, 1806–67; a French archæologist. By the advice of Victor Hugo he turned his attention to Christian archæology, and examined nearly all the old church edifices of France. In 1839, he went to Greece to study the eastern churches. In 1844, he started a periodical, *Annals of Archæology*, devoted to his favorite subject, and was the editor until his death. In 1845, he established in Paris a special archæological library, and at the same time a manufactory of painted glass. In the same year he became a member of the legion of honor. His most important work is *Christian Iconography*.

DIDY'MIUM is a very rare metal found in the minerals CERITE, ALLANITE, etc.

DID'YMUS, OF ALEXANDRIA, 309–394; an ecclesiastical writer. Although he became blind at the age of four, before he had learned to read, he succeeded in mastering all the sciences then known, and on entering the church was placed at the head of the Alexandrian school of theology. Most of his works are lost, but we possess a translation by Jerome (one of his pupils) of his treatise on the Holy Ghost, and a translation by Epiphanius of his comments on the canonical epistles. A treatise against the Manichæans in Greek is also extant.

DIÉ, ST., a t. of France, in the department of Vosges, is situated on the Meurthe, 25 m. n.e. of Epinal. It is handsomely built; its streets clean and regular. D. is also the seat of a bishop, has an old cathedral church, and various important educational institutions. It has manufactures of cotton goods, with some trade in corn, cattle, flax, hemp, paper, ironmongery, etc. There are copper and iron mines, ironworks, and marble quarries in the neighborhood. Pop. '72, 9,454.

DIE'BITSCH-SABALKANSKI, HANS KARL FRIEDRICH ANTON, Count, 1785–1831; Count von Diebitsch and Narden, a Russian field-marshal, native of Silesia. At the age of 12 he entered the Prussian army, but left it four years later for the Russian service. He was wounded at Austerlitz, fought at Eylau and Friedland, being promoted to captain after the Friedland conflict. In 1812, he distinguished himself by the re-capture of Polozk, and by a defense which saved Witgenstein's corps, which was then in retreat. He was made maj.gen., and with gen. Yorck took possession of Berlin. After the battle of Lutzen he was sent to Silesia, and had a share in negotiating the secret treaty of Reichenbach. After the battle of Leipsic, he was made lieut.gen. In 1814, he urged the march of the allies on Paris, for which the emperor conferred on him the order of St. Alexander Newski. In 1815, he married, attended the congress of Vienna, and was made adjt.gen. to the emperor. He was present at Alexander's death at Taganrog. The emperor Nicholas made him baron and count. In the Turkish war, 1828, he had the chief command, took Varna, crossed the Balkans, and made peace at Adrianople. The crossing of the Balkan mountains was commemorated in the addition of *Sabalkanski* to his name, and his elevation to the rank of field-marshal. On the outbreak in Poland in 1830, he was given the chief command. He died of cholera in June of the next year.

DIE'DENHOFEN, called by the French Thionville, a t. in Germany on the Moselle, and the railroad from Metz to Luxemburg, 15 m. n. of Metz; pop. '71, 7,155. It has a botanic garden, a gymnasium, and many manufactories. The Carlovingian rulers sometimes resided here. Subsequently it belonged successively to Luxemburg, Burgundy, Austria, and Spain. In 1643, it was annexed to France. In 1870, it was taken by the Germans, and by the treaty of 1871, was annexed to Germany.

DIEFFENBACH, JOH. FRIED., a celebrated surgeon of recent times, was b. in Königsberg in Prussia, in 1792. He had begun the study of theology when the war of liberation broke out, in which he took part as a volunteer. In 1816, he exchanged the study of theology for that of medicine, and especially surgery. After studying at Bonn and elsewhere, and traveling in France, he took his degree in 1822, and commenced practice in Berlin, where he soon attained distinction as an operator, and in 1840 was promoted to be professor and director of clinical surgery. He died in 1847. Besides eminent skill in all the usual operations with the knife, D. introduced many improvements, particularly in the art of forming new noses, lips, eyelids, and the like, as well as in cutting the muscles for squinting and stammering. Of his writings, we may mention *Die Transfusion des Bluts und die Einspritzung der Arzneien in die Adern* (Berl. 1828), *Ueber die Durchschneidung der Sehnen und Muskeln* (Berl. 1841); *Die Heilung des Stotterns* (Berl. 1841); *Die Operative Chirurgie* (12 vols., Leip. 1844–48), his chief work, which has been translated into several languages.

DIE'GO, SAN, the best harbor in upper or American California, next to that of San Francisco, is in lat. 32° 45′ n., and long. 117° 8′ west. It is 6 m. long, and varies in breadth from 1 to 2; and it is 6 or 7 fathoms deep, even to the shore. The climate is singularly equable and salubrious. The exports of D. consist mainly of gold bullion, wool, wheat, flour, barley, hides, honey, wine, and olive oil; and in 1874 had a value of nearly £500,000. The town has two daily papers and two weeklies. Pop. '70, 2,300.

North San D., a hamlet 4 m. to the n. of the city, was the first place in California settled by white men.

DIELYTRA, a genus of plants of the natural order *fumariaceæ*, in appearance and habit much resembling fumitories of extraordinary size. *D. spectabilis*, a native of Siberia and the northern provinces of China, was introduced into Britain from the island of Chusan in 1846, and rapidly became a general favorite, on account of its long racemes of drooping, delicate, rosy-pink flowers. It is now to be seen not only in greenhouses, but, as commonly as almost any flower, in cottage-windows, and even in cottage-gardens, although in the northern parts of Britain it seldom attains its full luxuriance in the open air. It is one of the favorite plants of the Chinese.

DIEPENBECK, ABRAHAM VAN, a distinguished Flemish painter, was b. probably in 1607, at Hertogenbosch (Bois-le-Duc), and at first confined himself to painting on glass, in which he acquired the reputation of being the first of his time; but having conceived a disgust for this kind of painting, on account of the cracking of the glass, which he could in no way prevent, he abandoned it, and became a pupil of Rubens. He then went to Rome, and on his return to Belgium became a sort of assistant to his master. In 1641, he was elected president of the Antwerp academy, an honor which he retained till his death, in 1675. D. painted much, and with wonderful facility, on tapestry and wainscoting. He certainly imitated Rubens, but with great freedom and force of coloring. His works consist, for the most part, of designs for title-pages, theses, devotional subjects, and the decoration of books. They exhibit great fertility and liveliness of genius, but are in general hurriedly and imperfectly finished. His masterpiece in this way is the *Tableaux du Temple des Muses* (Paris, 1655), a series of designs, 59 in number, engraved by the best artists of the time—Bloemart, Maltram, etc. Those of Bellerophon, Orpheus, the Dioscuri, Leander, etc., have been pronounced unsurpassed. His oil-paintings on canvas are few, but the churches of Antwerp have many windows painted by him. D. resided in England for some time during the reign of Charles I., and painted several landscapes and animals for William Cavendish, duke of Newcastle.

DIEPPE, a seaport t. of France, in the department of Seine-Inférieure, at the mouth of the river Arques, on the English channel, lat. 49° 55', long. 1° 5' e. D. is situated between two high ranges of chalk cliffs, is regularly built, with tolerably wide, clean streets running parallel to the sea; and the houses—built for the most part of stone and brick, with high slanting roofs—have a picturesque appearance. It is walled, has a castle occupying a high cliff at the w. end of the town, which it commands, as well as the harbor, which is situated to the n.e., and admits vessels of 500 tons burden. West of the old castle lies the little fishing suburb of Pollet, far from beautiful in appearance, but exceedingly interesting from the fact that the inhabitants differ in language, manners, and costume from the rest of Upper Normandy, and are supposed to be descendants of those Saxons who settled on the French coast during the period of the Merovingian kings. Some interesting historical associations attach to the castle of Dieppe. Here Henry IV.—the people of D. having been the first to acknowledge his right to the throne of France—retired before the forces of the league, previous to the decisive battle of Arques, fought within 4 m. of D.; and here the duchess of Longueville, so noted as a leader of the party of the Fronde, sought refuge for a time from the royal power she had defied. The castle is now occupied as a barrack. The other principal buildings are the churches of St. Jacques and St. Remi, the theater, and a bathing establishment. The town has several squares, and is adorned by nearly 70 fountains, which derive their supply of water from an aqueduct about 3 m. long. D., being one of the principal watering-places of France, has a great accession of visitors during the summer months; and a large number of huts for the accommodation of bathers, bathing-machines being dispensed with, line the shores. The manufactures are lace, fine linen, and paper; and the carved articles of horn, bone, and ivory have long been famous. There are also ship-building yards, sugar-refineries, rope-walks, and distilleries; and the fisheries—both coast and Newfoundland—are important, almost the whole of the population of the suburb of Pollet being engaged in them. D. is a favorite landing-place of English tourists visiting France. Pop. '76, 19,471. The rise of Havre has greatly injured the trade of Dieppe.

DIE'-SINKING, the art of engraving the die or stamp used for striking the impression on coins, etc., and for stamping thin plates of metal into various devices.

The importance of die-sinking has much increased of late on account of the great extension of the process of stamping thin metal. Many kinds of work formerly bent into shape by the hammer and punch, are now struck by a few blows between suitable dies. As examples of these, we may mention the ornamental work of gas-fittings, window-curtain cornices, common jewelry, ornamental trays, dishes, boxes, etc. For such purposes, a pair of dies is required, one in relief, the other in intaglio, and the metal is pressed between them. Not only are ornamental articles stamped in this manner, but useful articles, composed of many parts, are made entirely by cutters and dies, each part being cut and stamped by a pair of dies, and then the parts united by another pair, the junction being effected by overlaps, which the uniting dies press into their places. See BUTTONS. The astonishing cheapness of many of the Birmingham products is mainly due to the use of dies for doing by a single blow the work that

formerly required long and tedious manipulation. For further information on this, see STAMPING.

The most ancient and familiar application of dies, is in the striking of coins and medals; the method of sinking the dies used for this purpose will serve to illustrate the general method of die-sinking. Suppose the coin to be of the size of a shilling: a cylindrical piece of steel, about 3 or 4 in. in length, and 2 in diameter, is prepared by slightly rounding one end of the cylinder, then turning and smoothing upon the middle of this a flat face equal to the size of the coin. This blank die, which is carefully softened, is then engraved with the device of the coin in intaglio. This is a very delicate and artistic process, and is effected by a great number of careful touches with small and very hard steel tools. The face of the die is now hardened by placing it face downwards in a crucible upon a layer of bone-dust, or a mixture of charcoal and oil. In this position it is raised to a cherry-red heat, then taken out, and plunged in water. When properly tempered, it is in a state to be used for stamping the coin; but dies of superior workmanship, from which many impressions are required, are not thus directly used, as the expense of engraving is very great, and the risk of breakage considerable. This first engraved die, called the matrix, is therefore reserved only for making other dies. An impression in relief is made from this matrix on a small block of steel, which is called the puncheon; this is retouched and hardened, and from it the dies directly used for striking the coins or medals are impressed.

When the engraving is not very costly, a small number of impressions required, or a soft metal is to be stamped, as in livery buttons, for example, the work is stamped directly from the engraved die or matrix. When the device is in high relief, and the metal is hard, many heavy blows are required. Some of the finest large bronze medals require 200 or 300 blows for each impression, and the medal has to be annealed by heating between every 2 or 3 blows. It is on this account that the difference between the price of pewter and bronze medals of the same subject is so great, the pewter being so much softer. Copper, though harder than pewter, is much softer than bronze, and hence the reader will easily understand why the device on the new bronze coinage, manufactured at the new mint of Birmingham, is in much lower relief than the old copper coinage, as it would not pay to use repeated blows and annealing in striking common coins. An impression in high relief or deep intaglio may be obtained by a single blow by the *cliché* method. For this, a fusible alloy is used, such as type-metal, or still better, an alloy of 2 parts bismuth, 1 lead, and 1 tin, which fuses at about 212°, and becomes pasty before solidifying. The metal is poured into a box or tray a little larger than the die, and when in a pasty condition, the die is placed over it, and struck smartly with a heavy mallet or a coining-press. A steel die is by no means necessary for this; sharp impressions may be obtained from bronze medals themselves, or even from wood and plaster casts. A cliché mold may be made in the first instance from the medal, and then a cliché relief from this mold, if the process is skillfully conducted. The skill required consists mainly in striking the blow with a force proportionate to the depth of the impression and the softness of the metal, and in selecting the right moment for doing so, just as the fused metal is on the point of solidifying; for, if too fluid, it will merely be driven aside; and if at all set, an imperfect impression results. The metal should be of about the consistence of melted sealing-wax, and then the surface is set by contact with the cool die or medal, while the body of the metal still yields to the pressure. Cliché molds are admirably adapted for electro-depositing.

DIES IRÆ, the name generally given (from the opening words) to the famous mediæval hymn on the last judgment. On account of the solemn grandeur of the ideas which it brings before the mind, as well as the deep and trembling emotions it is fitted to exite, it soon found its way into the liturgy of the church. The authorship of the hymn has been ascribed to Gregory the great, St. Bernard of Clairvaux, Umbertus, and Frangipani, the last two of whom were noted as church-hymnists; but in all probability it proceeded from the pen of the Franciscan, Thomas of Celano, a native of the Abruzzi, in the kingdom of Naples, who died about the year 1255. When the church adopted it, and made it a portion of the service of the mass, cannot be ascertained with any exactness, but it must have been in any case before 1385. Several alterations were then made in the text; that, however, is believed to be the original which is engraved on a marble tablet in the church of St. Francis at Mantua. Germany has produced many translations of the hymn, such as those of Schlegel, Fichte, and Bunsen. It was translated into English by Richard Crashaw in the 17th c., and by Lord Macaulay, Lord Lindsay, the Rev. Isaac Williams of Oxford, and others in our own day. Sir Walter Scott has introduced two or three of the opening verses into his *Lay of the Last Minstrel*. The following are the most effective stanzas of the original Latin:

Dies iræ, dies illa
Solvet sæclum in favilla,
Teste David cum Sibylla.

Tuba mirum spargens sonum
Per sepulchra regionum
Coget omnes ante thronum.

Mors stupebit et natura,
Quum resurget creatura
Judicanti responsura.

Liber scriptus proferetur,
In quo totum continetur
Unde mundus judicetur.

Judex ergo cum sedebit,
Quidquid latet apparebit,
Nil inultum remanebit.

Quid sum miser tunc dicturus,
Quem patronum rogaturus,
Quum vix justus sit securus?

Rex tremendæ majestatis,
Qui salvandos salvas gratis,
Salva me, fons pietatis.

Recordare, Jesu pie,
Quod sum causa tuæ viæ:
Ne me perdas illa die.

Quærens me sedisti lassus,
Redemisti cruce passus,
Tantus labor non sit cassus.

Qui Mariam absolvisti
Et latronem exaudisti,
Mihi quoque spem dedisti.

Inter oves locum præsta,
Et ab hœdis me sequestra,
Statuens in parte dextra.
Amen.

DI'ESIS, a term used by the ancient Greeks, in the division of musical intervals, of which they had three varieties. In modern music, the D. is understood to be the difference between the small and the great semitone, as from C to C sharp, and from C to D flat.

DIESKAU, Ludwig August von, 1701–67; a German soldier who served in the French army, adjutant to marshal Saxe, whom he accompanied in the campaigns in the Netherlands, becoming brig.gen. in 1748. He was sent to Canada in 1755, to command the French troops. With a force of 200 regulars, 600 Canadians, and 600 Indians, he moved up lake Champlain to attack fort Edward. When within 2 m. of the fort he first apprised his troops of his intention, but the Canadians and Indians, fearing the English cannon, declined. But on Sept. 8, 1755, the attack was made. The French marched along the road directly upon the English center, halting 150 yards from the breastworks. The French regulars made the central attack, while the Indians and Canadians dispersed on the English flanks. As soon as the English artillery began to play the Canadians fled to the swamps, and Dieskau was compelled to order a retreat, which was in fact a rout. The baron, who had received a wound in the leg, was found leaning against a stump, entirely alone. While feeling for his watch, an English soldier, suspecting him to be reaching for a pistol, fired into his hip, and he was taken to the fort a prisoner. He was liberated in 1763, and returned to Paris, where he died.

DIEST, a t. of Belgium, in the province of Brabant, on the river Demer, 17 m. n.e. of Louvain. It is a walled town, and its fortifications have recently been so improved as to render it a place of great strength. D. has considerable manufactures of hosiery and woolen goods, but its chief products are beer—which is of excellent quality, and largely exported—and gin. Here a great horse-fair is held annually. D., which was once a feudal barony, under the dominion of the princes of Orange, was taken by Marlborough in 1705. Pop. '70, about 8,000.

DIESTERWEG, Friedrich Adolf Wilhelm, 1790–1866; a German teacher educated at Tübingen. In 1832, he was made director of the seminary for teachers of the Berlin city schools, which charge he held till 1850. He wrote many text-books on mathematics, geography, etc., and manuals for teachers, all of which have wide popularity. He was an advocate of the theories of Rousseau, Pestalozzi, and modern liberalism in general.

DI'ET. Man and animals generally require that their food should be of such a nature as to compensate for the wear and tear of the tissues which is perpetually going on, and as at the same time to keep up the animal heat at its proper standard. Various classifications of the food of man have been at different times proposed, but those which have been most generally accepted are that of Dr. Prout—in which the different kinds of food are grouped in definité chemical classes—and that of Liebig, which has reference solely to the ultimate destination of the food in the animal economy.

Dr. Prout classifies all kinds of food under these heads: 1. The *aqueous;* 2. The *saccharine;* 3. The *oily* or *oleaginous;* and 4. The *albuminous;* to complete which, we ought to add 5. The *gelatinous,* and 6. The *saline*—whilst Liebig makes only two classes: 1. Those consisting of nitrogenized matters, which are adapted for the formation of blood, and which he terms the *plastic elements of nutrition;* and 2. The non-nitrogenized substances, which from their large amount of carbon, serve (as fuel) to keep up the animal heat, and which he names the *elements of respiration.* Recent investigations, however, throw doubt on Liebig's view, that before food can be made available for the performance of work, it must first be turned into muscular tissue and then oxidized. Now it

seems most probable that it is the oxidation of the non-nitrogenous substances, and not of muscle, that contributes chiefly to the production of muscular force. Starch, fat, and the other non-nitrogenous substances would therefore have to be regarded as force-producers, and not, as formerly, mere heat-givers. We shall therefore adopt Prout's classification. It was based on the consideration, that the milk (the only *single* article of natural food that serves to support the animal body) is made up of substances which may be taken as representatives of his groups; for this, our earliest natural diet, contains water, sugar (representing his saccharine group), butter (representing his oleaginous group), caseine (a nitrogenous matter very similar to albumen, and representing his albuminous group), and salts; and recent researches have shown that the yolk of the egg, which serves for the nourishment of the chick or other young animal before birth, similarly contains one or more representatives of the aqueous, saccharine, oleaginous, albuminous, and saline groups.

We shall now briefly consider these individual groups, and the uses to which the substances included in them are applied in the animal economy.

1. The *aqueous* group includes water and all the fluids which we use as drinks; and we must additionally bear in mind that all the varieties of animal and vegetable food which we term solids, in reality contain it, generally in great abundance; thus, for example, uncooked beef contains from 70 to 80 per cent, and some vegetables even a larger proportion of water. The uses of water are sufficiently obvious from the abundance in which it occurs in all the most important fluids of the body, as the blood, and the various digestive fluids. See DIGESTION, ORGANS AND PROCESS OF.

2. The *saccharine* group includes the different varieties of sugar, starch, gum, and cellulose, together with vinegar. This group is chemically characterized by all its members being included in the formula $C_aH_bO_b$; that is to say, they consist of carbon, together with hydrogen and oxygen in the proportions in which these elements form water. Hence (excepting vinegar) these substances have received the name of carbo-hydrates.

Of the sugars, grape-sugar or glycose is the most important, partly from its frequent occurrence in ordinary articles of food, such as fruits of most kinds, honey, etc., and partly because it is the form of sugar into which starch (a most abundant ingredient in most kinds of vegetable food) is converted by the saliva, and pancreatic and intestinal juices, before it is fitted for absorption or any further changes. Since the sugars (which may thus be regarded as including starch) do not, in the normal condition, pass into the excretions, but are oxidized in the blood into carbonic acid and water, as ultimate products, they must contribute materially to the support of the animal heat. But they have other uses which we shall endeavor to explain, and which will, we trust, be intelligible if this article is read in conjunction with that on DIGESTION, to which we have already referred. Before becoming oxidized into their final products, they undergo various phases of less perfect oxidation, in which lactic, acetic, butyric, and other acids are evolved, of which the most important and abundant is lactic acid, which is found in considerable quantity in the small intestine, where it is doubtless of service in contributing to dissolve any nitrogenous matters which have escaped the action of the gastric-juice. Another use of these acids which are developed from the sugars is, that by acidifying the albuminous intestinal contents, they greatly increase their diffusibility through the intestinal membranes into the lacteals, and probably the capillaries. Here we probably have the clew to the therapeutic use of acids in various disorders of the chylopoietic viscera. Under certain conditions, the sugars are also converted into fat in the body.*

The remaining carbo-hydrates are of little or no value as food. There has been much difference of opinion as to whether gum can be taken up and applied to any definite uses in the organism; but the great mass of the most trustworthy observations seem to show that it passes through the system unchanged. Independently of experiments on animals by Boussingault, Lehmann, and others, Dr. Hammond (an American chemist and physician) found from experiments upon himself (1) that gum is altogether incapable of assimilation, and therefore possesses no calorifacient or nutritive power whatever, but is, on the contrary, a source of irritation to the digestive organs; and (2) that in consequence of the above fact, the solids of the urine during a purely gum-and-water diet are entirely derived from the waste of the tissues of the body, while the carbon exhaled (as carbonic acid) from the lungs is derived from the consumption of the fat.

Cellulose, or the substance of the vegetable cell, resists the action of the digestive fluids, and reappears unchanged in the fæces.

Vinegar is probably only of use indirectly in softening animal textures which are taken as food.

3. The *oleaginous* group includes all the fats and oils, whether derived from the animal or the vegetable kingdom. The members of this extensive group are composed of carbon (ranging from 60 to 80 per cent) and hydrogen, with a little oxygen. Fat which has been taken with the food is mainly absorbed by the lacteals, although a portion of

* The researches of Boussingault on milch-cows, of Milne Edwards and others on bees, and of Lacaze-Duthiers on the insects inhabiting galls, distinctly show that starch and sugar are capable of being converted into fat in the animal organism.

it passes directly into the capillaries of the villi, as has been shown by microscopic examination, which has revealed the presence of fat-granules amongst the blood-corpuscles. The modifications which are impressed upon the fats, in order to prepare them for absorption, are explained in the article DIGESTION. Their uses in the system are various. In their oxidation in the organism, whether the process be gradual or rapid, a large amount of heat is liberated; and that they are oxidized, and for the most part ultimately resolved into carbonic acid and water, is evident, because they neither appear in any quantity in the excretions nor accumulate beyond a certain point in the organism. Moreover, in artificial, and doubtless in natural digestion, the presence of a little fat accelerates the solution of nitrogenous matters taken as food. Lastly, the occurrence of fat in milk, in the egg, in all plastic exudations, and in all highly cellular organs, is a clear indication that this substance plays an important part in the process of cell-formation; hence we may probably explain the therapeutic use of such medicines as cod-liver oil.

4. The *albuminous* group contains all those substances which are chemically known as the proteine-bodies (see PROTEINE), viz., albumen, fibrine, caseine, and the allied vegetable compounds, all of which are composed of very nearly the same proportions of carbon, hydrogen, nitrogen, and oxygen; while additionally they contain a little sulphur or phosphorus, or both: they all contain on an average abous 15 per cent of nitrogen, a substance which has not occurred in the preceding groups. All these proteine-bodies, such as occur in the fluids of the egg, in animal flesh, in the curdy matter of milk, etc., are dissolved by the gastric-juice and intestinal fluid, and converted into matters termed *peptones*, which, although similar in their ultimate composition to the substances from which they are derived, differ from them in their greater solubility and more their ready diffusibility through animal membranes. Like the fats, they are chiefly absorbed by the lacteals, but to some extent by the capillaries. A reference to the chemical composition of the milk and of the fluids of the egg, shows that all the nitrogenous tissues in the body of the young animal must have been primarily derived from albumen or caseine; and it is established beyond all doubt that these substances are throughout life the essential producers of blood, and consequently of the various nitrogenous structures which are are built up from that fluid.

5. The *gelatinous* group (which formed a part of Prout's albuminous group) includes the different varieties of gluten, obtained by boiling, from many animal tissues; as, for example, bone-cartilage, tendons, skin, hoofs, etc. All soups and jellies which stiffen on cooling contain it, and such substances are popularly, but erroneously, regarded as highly nourishing. Unlike the preceding group, from which they only slightly differ in ultimate composition, they do not appear to form new blood, and their uses are still so questionable, that we will merely notice one function of them, which has been suggested by Liebig—viz., that these substances may go directly to the formation of such tissues as yield gluten on boiling, and which, if this food were not taken, would have to derive their nourishment from the members of the preceding group.

6. The *saline* group. With the exception of common salt (chloride of sodium), which we take instinctively in additional quantity with most kinds of food, the members of this group are unconsciously taken in the different articles of solid and fluid food on which we live. Want of space prevents us from noticing the different foods which yield the individual salts; but when we invariably find phosphate and carbonate of lime in the bones, in fixed and definite proportions; when we invariably find a nearly fixed proportion of chloride of sodium, alkaline phosphates, and other soluble salts, in the blood, flesh, milk, etc.; and when, further, we find that these substances are being constantly eliminated by the urine, it is obvious that they must be replaced by the food if we would keep the organism in its normal state. The evil consequences of a deficiency of any of these ingredients of food are well known; thus, when too little phosphate of lime (to which bone owes its firmness and hardness) is taken into the system, or when too much is again taken out (as occasionally, during pregnancy, when the fetal bones require it for their ossification), fractures do not readily unite.

It is only comparatively recently—during the last quarter of a century—that physiologists have satisfied themselves, that in order to supply the wants of the system, food must consist of a combination of these groups; and that animals which are fed exclusively on food belonging to one of the groups—as, for example, albumen or fibrin—perish under symptoms of inanition, as certainly as if they had been deprived of all nourishment. As in the infant's milk we find the albuminous, oleaginous, saccharine, and saline groups represented by the caseine, butter, sugar, and salts, so, for other periods of life, the food, whether derived from the animal or vegetable kingdom, must contain a due (although not necessarily the same) proportion of the different types. Again, in judging of the nutritive value of any kind of food, we must take into consideration its digestibility. Thus, the experiments made by Dr. Beaumont on Alexis St. Martin, a Canadian, in whom there was, in consequence of a gun-shot wound, a fistulous opening leading from the exterior to the interior of the stomach, and recent experiments made by Busch on a woman with a fistulous opening into the jejunum (see ALIMENTARY CANAL), show, for example, that hard-boiled eggs, meat that has been boiled for a long time, and hard cheese, which is poor in fat, are less easily and rapidly digested than soft-boiled or fresh eggs, meat steeped in

vinegar, or moist, fat cheese, and that starch is much more readily converted into sugar when boiled than in the raw form.

As the nitrogenous constituents of the food (articles containing albumen, fibrin, etc.) are chiefly employed in the formation of the blood and the reproduction of the tissues, it was at one time thought that the quantity of nitrogen which any kind of food contained might be taken as a measure of its nutritive value; but this test is not altogether to be relied on, since the nitrogen in part depends upon the gluten-yielding matters, which probably contribute little or nothing to the formation of textures.

Both daily experience and chemico-physiological observations show us that the best kinds of food contain both fat and carbo-hydrates, in addition to albuminous matters. Instinct teaches us to combine highly amylaceous foods with fats; as, for example, bread and butter, beans and fat bacon; and the increased digestibility of such mixtures proves, no less than the simultaneous occurrence of fat and sugar in the milk and in the egg-fluids, that both substances are necessary, as independent ingredients of food, although, perhaps, one may temporarily serve as a substitute for the other. Unfortunately, we have no trustworthy data for enabling us to determine the proportion in which the different nutrient groups should be combined, so as to form the food best suited to the general wants of the organism. The proportions occurring in human milk are the following: 10 parts of plastic or blood-forming matter (caseine), 10 parts of fat (butter), 20 parts of a carbo-hydrate (sugar), and 0.6 of a part of salts. For the wants of adult life, a lesser ratio of plastic matter (albumen, etc.) would probably suffice.

The absolute quantity of food required for the maintenance of the human body in health varies so much with the age, sex, and habits of the individual, and with the circumstances in which he may be placed, that it is impossible to fix a standard applicable to every case; but from the consumption of food by large bodies of healthy men, such as our soldiers and sailors, we can determine with tolerable accuracy the *average* daily quantity. We extract the following remarks from Todd & Bowman's *Physiological Anatomy and Physiology of Man*. "Each seaman in the British naval service is allowed from 31 to 35½ ounces of dry nutritious food daily, of which 26 ounces are vegetable, and the rest animal; the latter consisting of 9 ounces of salt meat, or 4½ of fresh. Sugar and cocoa are also given. The soldier is allowed a pound of bread, and three quarters of a pound of meat. In most of the London hospitals, full diet, which is given to convalescent patients who need a liberal diet, consists generally of half a pound of meat, with from 12 to 14 ounces of bread, half a pound of potatoes, a pint of milk, and sometimes beer or porter—a pint of the former, or half a pint of the latter. The former dietary is destined for men who must be in readiness for the most active athletic exercises, requiring not only great muscular strength, but also considerable power of enduring fatigue. The latter is intended to recruit the powers of those who have been suffering from disease. If, now, we compare with these a dietary which has been found sufficient for the support of health in a state of more or less confinement, with a moderate amount of daily labor, we may fairly infer that the proper allowance for persons not engaged in actual manual labor lies between these extremes. In the union workhouses of England, able-bodied men obtain about 25 ounces of solid food daily, of which the quantity of meat does not exceed 5 or 6 ounces. In prisons, it has been found necessary to give a certain amount of animal food to prisoners who are subject to hard labor. Each of such prisoners, if confined to a term exceeding three months, and kept at hard labor, has a daily allowance of about 36 ounces of food, of which meat constitutes only a very small portion—namely, about 16 ounces in the week. The prisoner has obviously the advantage of the poor man, whose only crime is poverty; but there is doubtless sufficient justification for this in the fact, that the labor of the prisoner, and the mental depression which long-continued restraint and confinement induce, render a greater amount of nutriment necessary than the indigent would require, who seek in the workhouse a shelter from absolute want." For further details on this subject, which is one of great practical importance, we may refer to a paper by Dr. Lyon Playfair, "On the Food of Man under Different Conditions of Age and Employment," published in 1854, in the 56th volume of the *Edinburgh New Philosophical Journal*, and to a memoir by Dr. E. Smith upon "Prison and other Dietaries." See also Dr. Pavy's *Treatise on Food and Dietetics* (2d ed. 1875).

It appears, then, that a daily amount of food, varying from 35 to 25 ounces, is sufficient to maintain health; and of this a fourth or fifth part ought to be animal food; but in special cases, much more or much less may be taken without apparent injury. The smallest quantity of food upon which life is known to have been supported with health and strength, is that on which Cornaro—whose history is recorded in most books on D and dietetics—states that he subsisted, in order to reduce extreme corpulence, for a period of 58 years—viz., 12 ounces of food, chiefly vegetable, with 14 ounces of light wine. In contrast with Cornaro's case, we may refer to instances recorded by Parry and other arctic voyagers of the voracity of the natives of those cold regions. A young Esquimaux, who was allowed "unlimited diet," availed himself of the privilege to the extent of devouring, in 24 hours, 35 lbs. of various kinds of food, including tallow-candles; and the Cossacks of Siberia are reported to consume daily from 12 to 20 lbs. of animal food.

An article upon D. would be imperfect without a reference to the best mode of dressing meat, for cooking and digestibility are closely allied. Most persons find meat that has been broiled most easily digested. The fire should be brisk, so that the albumen on the surface of the meat may be coagulated rapidly, and thus retain the internal juices. A similar rule applies, for the same reason, to boiling and roasting. When meat is to be boiled, it should be plunged into water already boiling; while, if soup is to be made, the meat should be put into cold water, and the temperature slowly and gradually raised —the object, in the former case, being to retain, in the latter, to extract, the nutritious fluids. (See BOILING and BROILING.) Fried meat and rich stews are usually very indigestible. Salted meat is not only harder and more indigestible than fresh meat, but the process of salting extracts important salt, and much of the nutrient juice from the meat; the only exception being fat pork, which is rendered more digestible by salting. On this subject, see Liebig's *Researches on Food*, 1847.

We shall conclude with a notice of certain substances which, although they are hardly entitled to be termed foods, may fairly be considered, from the universality of their use, to exert a definite influence on the organism, and to supply certain existing, although, perhaps, undefined wants. We refer to alcohol, tobacco, tea, and coffee.

From three series of observations made upon himself, Dr. Hammond arrives at the conclusion, that "alcohol increases the weight of the body, by retarding the metamorphosis of the old, and promoting the formation of new tissues, and limiting the consumption of fat." The respiratory and urinary excretions, and the fæces, were invariably diminished. These effects occurring when the amount of food was below the quantity required to maintain the weight of the body, were productive of no deleterious result to the system; but when the food was sufficient to balance the waste from the excretions, and still more, when an excess of aliment over the demands of the system was ingested, the health was disturbed, and disease almost induced. Hence the laboring-man, who can hardly find bread and meat enough to preserve the balance between the formation and decay of his tissues, finds in alcohol an agent which, if taken in moderation, enables him, without disturbing his health, to dispense with a certain quantity of food, and yet keeps up the weight and strength of his body. On the other hand, he who uses alcohol when his food is more than sufficient to supply the waste of tissue, and, at the same time, does not increase the amount of his physical exercise, or drink an additional quantity of water (by which the decay of tissue would be accelerated), retards the metamorphosis, while an increased amount of nutriment is being assimilated, and thus adds to the plethoric condition of the system which excessive food has a tendency to produce.

Tobacco, according to the experiments of the same excellent observer, resembles alcohol in these respects, that when the food is sufficient to preserve the weight of the body, it increases that weight; and when the food is not sufficient, and the body, in consequence, loses weight, it restrains that loss; but it differs from alcohol in being unattended with any unpleasant effects upon the circulation, though its action on the brain is apparent in increased nervous excitement, followed by a pleasant feeling of ease and contentment. In these experiments, Dr. Hammond, who was not in the habit of using tobacco in any form, smoked 450 grains daily.*

Tea and coffee are usually believed to have a somewhat similar effect to that which, as we have shown, is produced by alcohol and tobacco. The power of tea in arresting the waste of tissues has, however, been called in question. The value of alcohol and other stimulants was the subject of an elaborate controversy in several numbers of the *Contemporary Review* for 1878

DIET, the assembly of the German states, a body of very ancient origin, in which the monarch formerly deliberated with his subjects upon measures proposed for the interests of the empire. It was a feudal, not a representative, body. When feudalism was destroyed it became a congress of princes, the emperor no longer presiding in person but by commissioners, and the princes sending envoys. The emperor was, theoretically at least, elected by universal suffrage, the chief men naming the candidate and the people ratifying their choice. The forms and rules of election were settled by the Golden Bull of 1356. The diet was constituted of the electoral college, the princes of the empire spiritual and temporal, and the free imperial cities. The electoral college was composed of three archbishops, representing the German church, and four secular electors. The princes, save in the matter of electing an emperor, had the same rights as the electoral college. The powers of the free imperial cities were quite limited. Each of the three colleges voted separately. When they agreed on a measure it was submitted to the emperor for ratification or for rejection, but he had no power to modify it. No measure affecting the welfare of the empire could be passed without the assent of the diet. The regular meetings were held twice a year. After the close of the thirty years' war the power of the body declined, until, in the words of Frederick the great, it became

* Dr. Brinton, in his excellent article on "The Stomach and Intestine," in the *Cyclopædia of Anatomy and Physiology*, refers to an instance of the partial starvation of a large ship's crew on a long voyage, in which the *chewers* of tobacco were alleged to have endured hunger far better than the other sufferers, while the *smokers* did not enjoy the same advantage. This fact, however, does not invalidate our statement, and only shows, as we might *à priori* have expected, that the effects of chewing are more powerful than those of smoking. When the system receives its due supply of food, tobacco, if used at all, should be used in moderation.

"a mere shadow, a congress of publicists more busied with forms than things, like dogs who bay the moon."

DIET, Desertion of. The proceedings under a criminal libel are in Scotland spoken of technically as a D., and when the libel is abandoned by the public prosecutor, or where he fails to appear, he is said to desert the diet. The effect of a judgment of the court declaring that the D. has been deserted, is to free the accused from prosecution under the particular libel or writ, but not to prevent a new process being raised on the same grounds. Where a defect or informality has been discovered in the libel, the prosecutor may apply to the court to desert the D. *pro loco et tempore*, by which means he reserves his right to insist of new, which would be lost were he to allow the trial to proceed to an acquittal. If the prosecutor's motion be, that the court shall desert the D. *simpliciter*, the accused will be thereby finally discharged; and this motion it is in his power to make, even after a verdict of guilty has been returned by a jury. In point of law, the lord advocate, or his depute who is prosecuting in his name, has it in his power at the very last to save the life of a prisoner, either by moving the court to desert the D., or by declining to move for sentence. The power, however, is one which public opinion in the present day effectually restrains him from exercising, and which, if once exercised, would certainly be abolished.

DI'ETARY, Military. The chief matters concerning the D. or sustenance of the troops in the British army, and, indirectly, in those of other countries, will be found noticed under Bakeries, Army; Commissariat; Cookery, Army; and Ration.

DIETARY, Naval. In fitting out ships for the royal navy, the quantity of victuals is calculated on two data—the established allowance or ration of certain articles, and the average experience of past years in regard to certain others. Under the first category, the ration is everywhere equal, from the admiral down to the humblest sailor; under the second, the differences are very wide. Certain articles are regarded as "non-guaranteed" to the ordinary crew, to be given or withheld according to circumstances; such as fresh meat, preserved meat, lemon-juice, and wine.

The D. in relation to kind and quantity of food has been changed from time to time. In 1844, the daily ration was set down thus: 1 lb. biscuit, ¾ lb. salt meat, ½ lb. vegetables, 1½ oz. sugar, 1 oz. chocolate, ½ oz. tea, and ½ pint rum. When the meat was beef, ¾ lb. flour was added; when pork, ½ pint of pease in lieu of the flour. Besides these daily allowances, ½ pint oatmeal was given weekly, and vinegar when wanted, usually also half a pint per week. Fresh vegetables being not at times obtainable, preserved vegetables may not be in store, and circumstances may render it easy to obtain supplies of fresh meat, suet, raisins, currants, loaf-bread, rice, sago, coffee, cocoa, barley-meal, butter, cheese, onions, leeks, wine, beer, etc. At such times the dietary undergoes a temporary change, very acceptable to the crew. If the sailors draw less than their rations, they receive a money equivalent at stated intervals. The cost of the dietary to the state, on the basis of 1844, was about £18 per man per annum.

The British government have never attempted the temperance system in the navy, but they offer facilities to such seamen as choose to adopt it. In 1847, a plan was introduced for giving tea and sugar in lieu of rum. Many of the seamen have in this way abandoned spirituous liquors, but not to so great an extent as the seamen of the U. S. navy.

In 1859, the D. was made more liberal in several particulars. The scale of provisions now stands thus: Daily—biscuit or soft bread, 1½ lbs.; spirit, ⅛ pint; sugar, 2 ozs.; chocolate, 1 oz.; tea, ½ oz. Weekly—oatmeal, ½ pint; mustard, ½ oz.; pepper, ¼ oz.; vinegar, ½ pint. Daily when procurable—fresh meat, 1 lb.; vegetables, ½ lb. Daily when these are not procurable—salt pork or salt beef, 1 lb.; split pease, ⅛ pint; or 9 ozs. flour, ¾ oz. suet, 1½ ozs. currants or raisins.

The D. for emigrants is regulated by law. Every emigrant-ship is bound to be provided with certain kinds and quantities of provisions, according to the number of emigrants and the length of the voyage. The chief owners of passenger-ships engaged in the Australian and other distinct trades, now pay great attention to this subject, as one which affects the good name of the several firms.

DIETERICHS, Joachim Frederick Christian, an eminent veterinary surgeon, was b. on the 1st of Mar., 1792, at Stendal, in Prussia. In 1818, he undertook, at the instance and expense of the Prussian government, a tour through France, Würtemburg, Bavaria, Austria, and Hungary. On his return, he was appointed to a chair in the veterinary college in Berlin, which he held for four years. In 1830, he accepted a post in the general military school of Berlin, where, in 1841, he was appointed professor in ordinary. His publications, which are widely known, and have been translated from the German into various languages, include *Pulmonary Consumption in Cattle* (Berlin, 1821); *Manual of Veterinary Surgery* (1822); *Manual of Special Pathology and Therapeutics for the Use of Veterinary Surgeons* (1828); *Manual of the Practical Knowledge of Horses* (1834); *Manual of Obstetrics* (1845); *Manual of the Education of Domestic Animals* (1848); *The Principal Defects of Horses, and the Mode of Diagnosing Them* (1853).

DIETERI'CI, Karl Friedrich Wilhelm, 1790–1859; a native of Berlin, educated at Königsberg, devoting his attention chiefly to mathematics. He was an engineer in

Blücher's army, 1813–15, and in 1820 was engaged in the ministry of public instruction. In 1834, he became professor of political science in the university of Berlin, and in 1844, was placed at the head of the statistical bureau. He published a number of important works on political economy and statistics.

DIETRICH OF BERN, the name under which the Ostrogoth king, Theodoric (q.v.) the great, appears in the German heroic legends; in which by Bern, his capital, Verona is to be understood. As early as the 7th c., he would seem to have become the center of a distinct cycle of legends. A little later, he was, with a not unusual disregard of all historical truth, brought into connection with the traditions of Attila, or Etzel. According to these legends, D. is said to have fled from Italy before Ottacher (Odoacer), or Ermanarich; to have met, along with his attendant vassals, with a hospitable reception from Etzel; but after many years, to have again got possession of his kingdom. The extermination of the royal house of Burgundy by Attila, which is an historical event, was the cause that D., as well as Etzel himself, was woven into the Burgundian and Frankish Siegfriedssage; and thus he appears, in the second part of the *Nibelungen*, at Etzel's court, and is handled by the poet with special predilection. There have been numerous poems, besides, of which D. was the center and principal hero. It is very probable that the *Hildebrandslied*, of the 8th c., is a fragment of such a poem. Except this, we have only late versions of these legends; for example, *Schlacht vor Raben* (Ravenna) of the 13th c.; *Alphart's Tod* (13th c.); *Zwerg Laurin, oder der kleine Rosengarten* (15th c.); *Dietrich's Ahnen; Dietrich's Flucht*, etc.

DIETS OF COMPEAR'ANCE, in the law of Scotland, are the days on which a party to a civil or criminal process is cited to appear in court. Formerly, there were two diets, because there were two summonses; but by the judicature act, in 1825, it was enacted that all summonses should henceforth proceed on one diet. By 13 and 14 Vict. c. 36, s. 21, the period allowed to the defender (see INDUCIÆ) was shortened from 20 to 14 days for persons within Scotland; and for persons in Orkney, or in Shetland, or furth of Scotland, from 40 and 60 days respectively, to 21 days in both cases. In the sheriff-courts, the period is 6 days (16 and 17 Vict. c. 80). See SUMMONS, INDICTMENT, INDUCIÆ.

DIEU ET MON DROIT (God and my right). The parole of Richard I., at the battle of Gisors, 1198, signifying that he was not subject to France, but owed his power to God alone. They were victorious over the French, and the battle word was adopted as the motto on the coat of arms of England. During the reign of queen Anne, *Semper eadem* ("Always the same") was substituted, but the former motto was restored by her successor.

DIEZ, FRIEDRICH CHRISTIAN, the founder of the philology of the Romanic languages, was b. at Giessen, 15th Mar., 1794, and educated at Giessen and Göttingen. During the greater part of the years 1819–20, he lived, at Utrecht as a domestic tutor. In 1822, he went to Bonn as a *privat-docent*, and in 1830 was there appointed professor of modern literature. His first work, *Altspan. Romanzen*, was issued in 1821. Since then, he has published a great number of valuable works on the Romanic languages, two of which are worthy of special mention—the *Grammatik der Romanischen Sprachen* (Grammar of the Romanic Languages, 3 vols., Bonn, 1836 to 1842), and the *Etymologisches Wörterbuch der Romanischen Sprachen* (Etymological Dictionary of the Romanic Languages, Bonn, 1853). The last of these works, in particular, is recognized not only by Germans, but by the scholars of all the Romanic nations, to be the basis for the scientific study of all the Romanic languages. He was actively engaged in work till his death, May 29, 1876.

DIFFERENTIA'TION, in mathematics, the process of finding the differential of a function. When a function of two or more independent variables is differentiated as if all the variables but one were constants, the operation is called partial differentiation.

DIF'FERENCE; DIFFERENCES; CALCULUS OF FINITE DIFFERENCES. The word difference means usually the excess of one quantity over another of the same kind, and this is its meaning in arithmetic. In the higher branches of mathematics, however, it has a peculiar meaning, which we shall briefly explain. When we have a series of numbers connected by a regular, though not obvious law, the character of that law may be detected by forming a new series of the *differences* between each term of the original series and the next, and then treating the new series (which we may call the series of "first differences") in the same way; and so on, till we reach a series of differences the law of which is manifest. Thus,

Given series, . .	4,	7,	11,	18,	31,	54,	92,	151
First differences, .	3,	4,	7,	13,	23,	38,	59	
Second differences, .	1,	3,	6,	10,	15,	21		
Third differences, . .	2,	3,	4,	5,	6			

The law of the series of third differences is manifest; we see that its next term must be 7, which gives 28 as the next term of the series of second differences, 87 as the next of

the first differences, and so 238 for that of the original series, which we can thus continue to any number of terms. To take a simpler case. Let the series be

		43,	47,	53.	61, 71
First differences, ...		4,	6,	8,	10
Second differences, ...		2,	2,	2	

Here the law is manifest in the first differences, and we should be able to calculate the series if we knew the first terms of the three series; viz., 43, 4, 2. It is on this principle that calculating machines (q.v.) can be constructed to compute tables of logarithms, etc. Out of the method of differences sprung the calculus of finite differences, first treated by Dr. Brook Taylor, under the name of the method of increments. This calculus has nothing to do with the transcendental analysis. See CALCULUS DIFFERENTIAL, etc. It deals with the changes of functions when *definite* increments are made to the variables; while the transcendental analysis considers only their changes when indefinitely small or infinitesimal additions are made to the variables. It would be out of place here to attempt an account of the calculus of finite differences. See FUNCTIONS.

DIFFERENCES, in heraldry, though often, or indeed generally, confounded with marks of cadency (q.v.), have, in strict usage, a totally different function—the former being employed to distinguish brothers and their descendants after the death of the father, the latter whilst he is still alive. Differences in this limited sense may consist either of a chief added to or a bordure placed round the plain shield borne by the head of the house; or should the shield exhibit any of the ordinaries (q.v.), as the bend, fess, pale, etc., the difference may be indicated by an alteration on the lines. The proximity of the bearer to the head of the house is indicated by the character of the line by which the differencing chief, or bordure, or ordinary is marked off from the field, the following being the order usually observed: the first or eldest brother, on the death of his father, inherits the pure arms of the house; the second brother, if the difference is to consist of a bordure, carries it plain; the third, ingrailed; the fourth, invected; the fifth, embattled; etc. Other modes of differencing have been invented by heralds, and are not unknown to practice; such, for example, as changing the tinctures either of the field or of the principal figures, of which Nisbet gives many famous examples—altering the position or number of the figures on the shield, adding different figures from the mother's coat or from lands, and the like. Where the cadet is far removed from the principal family, if the field be of one tincture, it is sometimes divided into two, the charge or charges being counter-charged, so that metal may not lie on metal, or color on color. The confusion between differences and marks of cadency, above referred to, is by no means peculiar to the heraldic usage of England, though there it is more prevalent than in Scotland. In France, the cadets of the house of Bourbon have been in the habit of continuing these marks, and at the present day, as in Mackenzie's time, the label or lambel is to be seen on the arms of all the members of the Orleans family. That no distinction between what we call marks of cadency and differences was there observed, is further apparent from the fact that, whilst such was the practice of the house of Orleans, the house of Anjou carried a bordure gules, and that of Alençon a bordure gules charged with eight bezants. In Germany, sir George Mackenzie says that the several branches of great families distinguish themselves only by different crests (*Precedency*—Works, ii. 616); and he gives as the reason, that all the sons succeed equally to the honors of the family. In Britain, and in France, some change is always made on the shield as carried by the head of the house; but the practice even of good heralds has been so irregular, as to bring the rule very nearly to what Mackenzie holds to be the correct one—viz., that every private person should be allowed, with the sanction of the proper authorities, "to make what marks of distinction can suit best with the coat which his chief bears."

DIFFERENCES, CALCULUS OF. See DIFFERENCE.

DIFFERENTIAL CALCULUS. See CALCULUS.

DIFFERENTIAL THERMOMETER. See THERMOMETER.

DIFFRACTION, or **INFLECTION,** of the rays of light. It was observed by Grimaldi that if a beam of the sun's light be let into a dark room through a very small hole, the shadows of things in this light will be larger than they ought to be if the rays passed by the bodies in straight lines, and that these shadows have three parallel fringes, bands, or ranks of colored light adjacent to them.

This phenomenon was originally known under the name of diffraction, and was supposed to arise from the refraction of the atmosphere. This explanation was disproved by the observations of Newton, who, from the conception which he was led to form of it, called the phenomenon the "inflection of the rays of light." It is now identified with a larger class of phenomena, which have been much more completely explained in the later development of the theory of light, and are assigned, on the hypotheses of Fresnel, to the interference of undulations. See INTERFERENCE. The observations and experiments of Newton on the subject, as detailed in the third book of his work on Optics, are, however, extremely interesting and instructive, and with regard to accurate observation and description, apart from the imperfect state of the theory, leave nothing to be desired.

Having made in a piece of lead a small hole with a pin, whose breadth was the 42d part of an inch, Newton let into the darkened chamber a beam of the sun's light. In this light, the shadows of all bodies were bordered with three parallel fringes or bands of colored light. The shadow of a hair, too, was found to be much broader than the hair itself, and fringes of light were observed within it.

Again admitting light into the darkened apartment by a hole a quarter of an inch wide, he allowed it to pass between two knife-edges parallel to one another. In this case, owing to the breadth of the hole by which the light was admitted, the fringes did not appear within the shadows of the knives until the knife-edges were brought to approach one another, when they appeared. By making the hole smaller through which the light was admitted, they became more distinct. "As the knife-edges continually approached one another, the fringes grew distincter and larger, until they vanished. The outmost fringe vanished first, and the middlemost next, and the innermost last; and after they were all vanished, and the line of light which was in the middle between them was grown very broad, a shadow began to appear in the middle of this line, and divide it along the middle into two lines of light, and increased until the whole light vanished. This enlargement of the fringes was so great, that the rays which go to the innermost fringe seemed to be bent above twenty times more when this fringe was ready to vanish than when one of the knives was taken away."

The order of these phenomena is then made clear by the following experiment: "I caused the edges of two knives to be ground truly straight, and pricking their points into a board, so that their edges might look towards one another, and meeting near their points, contain a rectilineal angle, I fastened their handles together with pitch, to make this angle invariable. The distance of the edges of the knives from one another at the distance of four inches from the angular point, where the edges of the knives met, was the eighth of an inch; and therefore the angle contained by the edges was about 1° 54′. The knives thus fixed together I placed in a beam of the sun's light, let into my darkened chamber through a hole the 42d part of an inch wide, at the distance of 10 or 15 ft. from the hole." When the fringes of the shadows of the knives fell perpendicularly upon a paper at a great distance from the knives, they were in the form of hyperbolas.

The best mode for exhibiting the phenomena of diffraction, and that now generally adopted for that purpose, is as follows: The rays of sunlight being reflected horizontally through an aperture into a darkened apartment, are concentrated by a combination of lenses to a very small focus. By this means the light is made to diverge from a very small circle, with the advantage of a greater concentration of light than is obtained by simply admitting the sunlight through a small aperture. The edges of the shadows of every object placed within the cone of light diverging from this focus, will exhibit the fringes above described.

By means of metal-leaf arranged upon a plate of glass, shadows can now be thrown upon a screen, so as to exhibit at once all the most peculiar phenomena of this class.

On the assumption of Fresnel, the explanation of the whole phenomena above described is most complete and satisfactory, the fringes and dark lines being produced by the undulations alternately strengthening or destroying each other. A very beautiful experiment, devised by Fresnel for the purpose, is found to furnish a complete verification of the theory. See INTERFERENCE.

DIFFUSION, the gradual dispersion of particles of one liquid or gas among those of another—or of the particles of a solid in a liquid holding it in solution. It is of the greatest importance in terrestrial physics, being the cause of the uniform composition of the atmosphere at all elevations, and one of the causes of the speedy dissipation of noxious gases and vapors in the open air, and of the nearly uniform saltness of the sea, etc., so necessary to animal and vegetable life.

We shall consider the above cases in detail, and in addition the transfusion, as it has been called, which occurs when different gases or liquids are separated from each other by a porous plate or membrane. The principal experiments on this subject are those of Graham and Bunsen—to be found in the *Philosophical Transactions* or Graham's *Chemistry*, and in Bunsen's *Gasometry*.

1. *Diffusion of Gases.*—If two flasks be filled, one with hydrogen, the other with chlorine, and connected by a long tube fitted into their necks by corks—in whatever position the compound apparatus be placed it will be found that the gases mutually interpenetrate—in this particular case the color of the chlorine enables us to follow by the eye the course of the diffusion. When the mixture has attained its permanent state, each of the gases is found to be uniformly diffused through the whole containing space, precisely as it would have been had the other not been present. In fact, the presence of a second gas seems merely to affect the *time* which the first takes to distribute itself equably throughout the vessel, and in no other way to influence the final result. (Dalton, long ago, suggested the analogy of the passage of water among stones in the bed of a river.) The pressure of the mixture is the sum of the pressures corresponding to each of the gases, if separately occupying the space which they jointly fill; and the same is true of a mixture in any proportions of any number of gases, so long, at all events, as they do not act chemically upon each other.

Precisely the same is true of vapors. If, for instance, a few drops of ether be injected into an exhausted receiver, there will be an almost instantaneous conversion of a definite quantity into vapor, so that its tension shall have a certain value depending on the temperature alone. If air be present in any quantity whatever, the vaporization will proceed more slowly, but the final amount converted into vapor will be the same as in the former case. A familiar illustration of this is afforded by the dew-point, which is a temperature merely, having no connection with the height of the barometer.

Next let us take the case of a gas forced by difference of pressure, from one vessel to another through a very small hole in a thin metallic plate—one of the vessels, for instance, being full of the gas, and the other connected with an air-pump kept continually in action. Experiment and theory, such as it is, agree in giving in this case, for the velocity with which the different gases pass through the orifice, under similar circumstances as to pressure, a result inversely proportional to the square root of the density of each gas. Now, if, instead of the plate with the small hole, we substitute a thin layer of bladder or other membrane, or a thin disk of plaster of Paris, it appears from experiment that the results are sensibly the same. Thus, if we have the same gas at different pressures on opposite sides of such a layer or disk, the rate of passage of the gas through it, from greater to less pressure, will, for the same pressures, but different gases, vary according to the above law; and, moreover, the presence of a second gas will in no degree modify the rate of transfusion of the first. If, therefore, a glass tube, say an inch in diameter, and 2 or 3 ft. long, have a diaphragm of plaster of Paris formed near one end, and that end ground flat, so as to be perfectly closed by a glass plate, it may be filled with hydrogen by displacement, its other and lower extremity being plunged into water, and care being taken not to wet the diaphragm. If the glass plate be now removed, transfusion will take place—hydrogen passing out as if into a vacuum, and the constituent gases of air entering also as if into a vacuum. On account of the comparative lightness of hydrogen, the velocity with which it escapes will be considerably greater than that with which the others enter; so that the immediate effect will be a rise of the water in the tube. After a short time, the whole of the hydrogen escapes, and the tube will contain only air. The proportion of the volume of the latter to that of the hydrogen may be calculated from the above law—remembering that the hydrogen is practically diffusing into a vacuum all along, and the air entering by the pressure of the atmosphere in excess over that of the air in the tube. Allowing for the unavoidable errors of experiment, the verifications of these results are very satisfactory. It has been attempted to deduce these laws as consequences of the dynamical theory of gases. See a remarkable paper by Maxwell in the *Philosophical Magazine* for 1860.

Bunsen has suggested the application of the method of diffusion to the very important question in gas analysis—whether the constituents of a gas, as determined by the usual methods, are merely *mixed*, or are chemically united. It is evident that, in general, the diffusion rate of a mixture of two gases will differ from that of a compound of the same.

2. *Diffusion of Saline Matters in Solution.*—If a strong brine be placed in the bottom of a tall glass jar, pure water may be carefully introduced above it, so that no immediate mixture takes place. If the whole be allowed to stand, the salt is gradually diffused through the vessel, which, after a sufficient time, will be found to contain a brine of uniform strength. Experiments have been carefully made to determine, in such a case as the above, the distribution of the salt through the vessel at various periods *before* the permanent state has been arrived at. They have been compared with the results of the theory now to be explained, and the coincidence has been found very satisfactory. The theory assumes that the rate of diffusion between contiguous layers of the water in the cylinder is proportional to the excess of salt in one layer above that in the next—the co-efficient of proportionality involving a special constant of diffusion for the particular salt experimented upon. This is precisely the assumption that is made about the linear conduction of heat in a homogenous solid, or the propagation of electricity in a wire. The partial differential equation to which all of these cases are reducible, $\left(C\frac{du}{dt} = \frac{d^2u}{dx^2}\right)$, was obtained, and its complete solution exhibited in various forms long ago by Fourier, in his *Théorie de la Chaleur*, one of the most remarkable mathematical investigations of last generation. See HEAT, CONDUCTION OF, and ELECTRICITY, THEORY OF. It is curious to consider the heating of a metallic rod, or the solution of a few crystals of salt in a tall glass jar full of water, as problems thus directly allied to the signaling through the Atlantic cable.

Graham's method of determining the diffusion co-efficient of a salt in water was simple, and yet admitted of great precision in the determinations. A number of glass bottles, cast in the same mold, had their mouths ground flat, so as to be accurately closed by a plate of glass, which—when the bottle, filled with a solution of known strength, had been carefully placed in one of a series of equal glass jars, and covered with a constant amount of water—could be slipped off without producing any considerable disturbance in the fluid. After a measured time, the glass plate was replaced, and the amount of salt which had left the bottle accurately determined.

The following are the most important of the laws thus obtained; they are quite consistent with the theory above mentioned. For solutions of the same substance, of dif-

ferent degrees of strength, the rate of diffusion is proportional to the strength of the solution. Different salts seem to arrange themselves in groups as regards their diffusion co-efficients, the latter having simple numerical relations to each other. Analogy of chemical composition and of crystalline form appear to be the principal elements in the arrangement of the groups. The quantity diffused increases with the temperature, and at the same rate for all salts. The presence of a second salt in the solution, or in the water into which the diffusion takes place, if not in large quantity, appears not to affect the result, supposing, of course, that no chemical action takes place. It is evident that by this process a partial separation may be effected of salts which have different rates of diffusion, and do not act chemically on each other; and it is found that in certain cases even chemical compounds, such as alum, may be partially decomposed by the same means.

3. *Diffusion of Liquids. Osmose.*—If sulphuric acid be carefully poured through a tube into the bottom of a vessel filled with water, colored by an infusion of litmus, or red cabbage, the change of color of the vegetable dye will enable us to trace the gradual diffusion of the acid in the water. Here, the process, though probably on the whole quite analogous to the case of gases, occupies more time; but the final result is, as in the former case, an almost uniform mixture of the two fluids. There is no necessity for any special remark on this part of the subject, particularly as we have already adverted to the theory of this process. But if different fluids be separated by a membrane or diaphragm, some extremely remarkable results are obtained, which were first carefully examined by Dutrochet. These have been attributed to the action of osmotic force, something of the same kind as capillary force, and probably a closely connected, if not identical form of molecular action. The theory of these actions is not yet well understood, but we shall endeavor to give from analogy a few attempts at explanation.

If an inverted funnel, with a very long stem, have a bladder tied over its mouth, and, being filled to the neck with sirup of sugar, be suspended so that the bladder is entirely under the surface of water in a dish, the sirup will pass through the bladder into the water, and the water will pass through in the opposite direction, but in far greater quantity—producing the extraordinary effect of a rise in the level of the fluid in the tube, which can with precaution be made to amount to a yard or two in the course of a few days. The points of the attempted explanation of this phenomenon are somewhat as follows: The bladder has more capacity for, or will absorb more of, water than of sirup. The first effect, then, is to saturate the bladder with water, very slightly mixed with sirup. On the lower side of the bladder, water, with a small quantity of sugar in solution, is diffusing into pure, or nearly pure water, this process will be a slow one; at the upper side, water (nearly pure) is diffusing into a strong sirup. Here, then, the effect is much greater, and thus a greater quantity of water passes upwards than of sirup downwards. Similar effects may be produced with a vast number of other liquids. Combined with capillarity, it is believed that these experiments explain the motion of the sap in vegetables, and various other phenomena in the vegetable and animal kingdoms.

DIGAM'MA, an obsolete letter of the Greek alphabet, equivalent in sound to the English *v*. In some of the earlier Greek dialects the old γ was a kind of aspirate, which, from its form, like one capital Γ over another, was called digamma, and written F. The Pelasgians carried this aspirate into Italy, where it remained in Latin as a real consonant, in such words as *vinum, ovum*, from the Greek Foῖνος, Fῶον. The digamma had disappeared as a character from the Greek language before the days of Homer.

DIGBY, a co. in s.w. Nova Scotia, on the bay of Fundy; 1300 sq.m.; pop. '71, 17,037. It has a rough surface, with numerous mountains, valleys, and lakes, and some small rivers. Digby is the chief town.

DIG'BY, a small seaport of Nova Scotia on the bay of Fundy, reputed for its curing of a variety of small herrings or pilchards, which are smoked and dried for export; they have a high flavor, and are known in trade as Digbies. Pop. '71, 1570.

DIGBY, Sir KENELME, the son of sir Everard Digby, noted as one of the gunpowder plot conspirators, was b. in 1603, three years before the execution of his father. He was brought up in the Protestant faith, and at the age of 15 was entered at Gloucester hall, Oxford. After leaving the university, where he had acquired the reputation of great ability, he spent two years in continental travel. He returned to England in 1623, and was knighted in lord Montague's house. Under Charles I., he was a gentleman of the bedchamber, and held several public offices. In 1628, he equipped a squadron at his own expense, and sailed first against the Algerines, and subsequently against the Venetians. In 1632, on the death of Dr. Allen, of Gloucester hall, D. inherited his collection of books and manuscripts. In 1636, when in France, he was converted to the Roman Catholic faith. He returned to England in 1638, and on the breaking out of the civil war, he was imprisoned as a royalist in Winchester house, but in 1643 he was allowed to retire to France. At Paris, he was received with favor by the court, and made the acquaintance of Descartes. After Charles I. had fallen, D. returned to England, but the parliament forbade him the kingdom, under penalty of death. Retiring to the continent, he traveled in France and Italy; but in 1655, he was again in England, and was in frequent attendance at the court of the protector. He went again

to France, and busied himself with the preparation of philosophical papers. He returned to England in 1661, and died there in 1665. D. married a daughter of sir Edward Stanley of Tongue castle, in Shropshire, by whom he had one son.

His works are numerous, and on a great variety of subjects, comprising *A Conference with a Lady about the Choice of a Religion* (Par. 1638); *Observations on Spenser's Fairy Queen* (Lond. 1644); *A Treatise on the Soul, proving its Immortality* (Par. 1644); *Of the Cure of Wounds by the Powder of Sympathy* (Lond. 1658); and *Discourse on Vegetation* (Lond. 1661), etc. *The Private Memoirs of Sir K. Digby,* etc., *written by Himself,* were published in London in 1827. D.'s library, which was removed to France when the civil war broke out in England, became, on his death, the property of the French king.

DIGBY, KENELM HENRY, son of the Rev. William Digby, dean of Clonfert, b. 1800; educated at Cambridge, and graduated in 1823. He soon afterwards became a convert to the Roman Catholic church and began to write semi-religious works, among which are *Mores Catholici, or Ages of Faith; Compitum, or the Meeting of Ways at the Catholic Church; The Broad Stone of Honor, or Rules for the Gentlemen of England; Evenings on the Thames;* etc.

DIGEST, a name often given to the pandects (q.v.) of the civil or Roman law, because they contained "Legalia præcepta excellenter digesta."

DIGESTER, PAPIN'S, is a strong boiler with a closely-fitting cover, in which articles of food may be boiled at a higher temperature than 212° F. As its name implies, it was invented by Papin, and a common form is the *autoclave,* where the lid can be turned round under clamps or ears, and thus be rendered steam-tight. The lid is fastened down by a screw, and the steam generated in the boiler is allowed to escape at a stop-cock, or by raising a weighted valve. The increased pressure to which the contents of the boiler are exposed, causes the boiling-point of the water to rise to 400° F., and occasionally higher. The digester is of great value as a means of preparing soups of various kinds, and especially in the extraction of gelatine from bones.

DIGESTION, ORGANS AND PROCESS OF. The function or process of digestion is one of the chief of those organic functions which are directly concerned in maintaining the life of the individual, inasmuch as it is that through which the animal is enabled to receive aliment, and to prepare or modify it for being assimilated to, and appropriated by, the various organs of the body, or, in other words, for being converted into blood.

The general expression, "function of digestion," includes several minor or subordinate processes. According to Milne Edwards, the acts of the digestive function may be classed as follows: 1. There is the prehension of the food; 2. Its mastication; 3. Its insalivation; 4. Its deglutition; 5. Its chymification or stomachal digestion; 6. Its chylification or intestinal digestion; 7. Defecation; and 8. The absorption of the chyle.

Before examining these acts in succession, and the mechanism by which each is effected, we must have clear conceptions regarding the classification of food, the quantity of food, and other allied subjects, which are discussed in the article DIET; and we should likewise have some knowledge of the causes of those sensations which we call *hunger* and *thirst,* which are, or ought to be, our natural guides regarding the periods for taking food, and the quantity to be taken. The immediate cause of ordinary hunger cannot be explained; but that it is due to some peculiar condition of the gastric mucous membrane, seems probable from the fact, that the sensation continues after division of the pneumogastric nerves, from which the stomach mainly derives its nervous fibers, if we correctly interpret the feelings of the animals on which the experiments were made. In extreme hunger, the sufferer complains of a sense of sinking, which is referred to the region of the stomach, while general faintness and sometimes considerable pain are present. Hunger, or the want of food which occasions it, may be diminished by rest, sleep, or any cause that retards the general change which is perpetually going on in all the tissues of the body. We have shown in the article DIET, that tobacco and alcohol have a power of limiting the disintegration of the tissues, and thus of keeping off or diminishing hunger. When the sensations of extreme hunger are not relieved by food, the body begins to feed upon its own tissues, and the symptoms of starvation (q.v.) begin to manifest themselves. The period at which death occurs from abstinence, varies greatly in different animals—young animals always dying sooner than older ones. In man, total privation of food usually causes death in about a week; but if a little drink be allowed, life is considerably prolonged.

Thirst is dependent upon a peculiar condition (probably undue dryness) of the mucous membrane of the upper part of the digestive tube. The thirst in febrile affections is, however, probably due to the morbid state of the blood.

We now proceed to the consideration of the different acts of which the digestive function is made up.

1. In the act of prehension, man and many of the lower animals (monkeys, squirrels, etc.) employ the hands or anterior extremities and mouth; the lips and anterior teeth, and, to a certain extent, the tongue, being also employed in this function. In the lower animals, however, the modes of prehension are various. Some (like the giraffe) twist the tongue around the leaves and young branches of trees; others (the ant-eaters) have a remarkably long tongue, covered with a viscid secretion, and by thrusting this organ into ant-

hills, etc., secure their prey; and in the chameleon among reptiles, and the woodpecker among birds, the tongue seems specially developed for prehensile purposes. In the elephant, this act is accomplished by the prolongation of the nostrils into the organ popularly known as the trunk, In other mammals (the ruminants and solipeds), the large pendulous lips are the organs employed. In birds, the bill (which is a modification of the lips) is always the prehensile organ of that class.

The prehension of fluids is effected in two ways: sometimes the liquid is poured into the mouth, and is allowed to fall into it by its own weight; in other cases, the tongue is used after the fashion of a piston, being drawn within the mouth so as to exhaust the anterior part of that cavity, and fluids are thus forced to enter by atmospheric pressure.

2. Mastication is effected in the cavity of the mouth by means of the teeth. This cavity is bounded superiorly by the palate or roof of the mouth, and in other directions by the cheeks, lips, and tongue. Projecting into its interior, above and below, is an arched series of teeth, which are firmly fixed by roots into corresponding sockets in the upper and lower jawbones. The upper jaw (and consequently the dental arch imbedded in it) is immovable, or only movable with the entire head; but the lower jaw, with its teeth, is capable of moving upwards, downwards, backwards, forwards, and laterally, by means of the powerful muscles of mastication. It is by the varied movements of the lower teeth against the upper, through the action of these muscles, that the food is broken down or masticated. For information regarding the structure, etc., of the teeth, see TEETH; see also DENTITION.

The operation of mastication is very important, since the more the food is broken down the more easily will it mix with the saliva and other fluids which participate in the digestive process.

3. Insalivation is effected by the admixture of the secretions of the three pairs of salivary glands (the parotids, the submaxillaries, and the sublinguals) and of the buccal mucus with the triturated food. A brief description of these structures is given in the article GLAND. The common saliva, formed by the combined secretion of these various secreting organs, is a colorless, turbid, viscid, inodorous, and tasteless fluid, which, after standing for some time, deposits a layer of pavement epithelium (see EPITHELIUM) and mucus corpuscles. In the normal state, its reaction is alkaline, but the degree of alkalinity varies, and is greatest during and after meals. Saliva does not contain more than five or six parts of solid constituents to 995 or 994 parts of water, the most important ingredients being an organic matter termed *ptyaline*, and sulphocyanide of potassium, neither of which substances occurs in any other solid or fluid of the body. The daily quantity of saliva secreted by an adult man is estimated at about 48 ounces, but determinations of this kind must be regarded only as approximations to the truth, since the activity of the salivary glands is dependent upon various influences and conditions. Thus, movement of the lower jaw, as in masticating, speaking, or singing, increases the secretion; as also do acrid and aromatic substances, and dry hard food; while the use of moist and soft food is accompanied by a scanty secretion.

The uses of the saliva in reference to digestion are partly mechanical and partly chemical. The mechanical uses are almost too apparent to require notice. The moistening of the dry food by the saliva serves the double purpose of adapting it for deglutition and of separating the particles, and thus allowing them to be more freely acted on by the other digestive fluids; moreover, from its viscidity, it lubricates the bolus of food, and thus facilitates deglutition; and it is probably also subservient to the sense of taste. The great chemical use of the saliva is to convert the amylaceous (or starchy) portion of the food into glycose or grape sugar, and thus to promote its absorption.

4. Deglutition is the act by which the food is transferred from the mouth to the stomach. The pharynx, or cavity into which the mouth leads, takes so slight a part in the digestive process, that we need scarcely allude to any anatomical details connected with it. It is sufficient to observe that between it and the mouth is the pendulous or soft palate, which is a movable muscular partition that separates the two cavities during mastication. As soon, however, as the latter act is accomplished, and the bolus is pressed backwards by the tongue, the soft palate is drawn upwards and backwards, so as to permit the passage of the food into the pharynx. The bolus or pellet of food having arrived near the esophagus or gullet (which is continuous inferiorly and posteriorly with the pharynx), is driven into it by the action of certain muscles, which almost surround the pharynx, and are termed its *constrictor* muscles. All voluntary action ceases as soon as the food is pressed backwards by the tongue into the pharynx. It is impossible to recall the pellet, and it is necessarily carried on (without even our cognizance) into the stomach. On receiving the food forced into its upper extremity by the action of the constrictor muscles of the pharynx, the esophagus is dilated (for it usually lies in a collapsed state, with its walls in contact, or nearly so); this contact of the pellet with its mucous membrane causes its muscular walls to contract, and the food is thus driven, by a series of these contractions, into the stomach. The act of deglutition is now completed.

5. Stomachal digestion or chymification is the next process to be considered. The whole of the alimentary canal (q.v.), (fig. 1) below the diaphragm (q.v.), or great muscular partition which separates the cavity of the chest from that of the abdomen or belly,

possesses the following points in common, in relation to structure: The stomach, the small intestine, and the large intestine, are all lined by mucous membrane, have a muscular coat, consisting of two sets of distinct fibers—namely, circular fibers which surround the tube or viscus after the manner of a series of rings, and longitudinal fibers running in the same direction as the intestine itself—and are invested with a serous membrane, the peritoneum (see SEROUS MEMBRANES), which at the same time retains the viscera in their proper position, and permits their necessary movements.

The human stomach is an elongated curved pouch, lying almost immediately below the diaphragm, and having the form of a bagpipe. It is very dilatable and contractile, and its function is to retain the food until it is duly acted upon and dissolved by the gastric juice, which is secreted by glands lying in its inner or mucous coat, and then to transmit it, in a semi-fluid or pulpy state, into the duodenum. Its average capacity is about five pints. The parts of it which have received special names are the greater curvature (fig. 1) *b*, the lesser curvature, upon its upper border, and the cardiac, *c*, and pyloric, *d*, extremities.

The mucous membrane, or lining coat of the stomach, is thick and soft, and lies in irregular folds, in consequence of the contraction of the muscular coat, unless when the organ is distended with food. On opening the stomach, and stretching it so as to remove the appearance of folds, we perceive even with the naked eye, but better with a lens, numerous irregular pits or depressions, irregular in shape, and averaging about $\frac{1}{200}$th of an inch in diameter. To see them properly, the mucus with which they are filled must be washed out (fig. 2, A). These pits are so shallow as not to dip into the mucous membrane to a greater extent than $\frac{1}{6}$th or $\frac{1}{8}$th of the thickness. The rest of the thickness is chiefly made up of minute tubes, running parallel to one another, and vertically to the surface of the stomach (fig. 2, B). These are the gastric tubes or glands which secrete the gastric juice from the blood in the capillaries which abound in the

B, stomach-tube from the middle of the human stomach, magnified about 150 diameters: *a*, wall of the tube, lined with large oval nucleated cells; *b*, the same cells isolated; *c*, nucleated cells of columnar epithelium, occupying the upper parts of the tubes; *d*, blind extremity of the tube.

mucous membrane. They pass in twos, threes, or fours from the bottom of each pit, and usually subdivide into several tubes, which, after running a more or less tortuous course, terminate in blind or closed extremities. These tubes are filled with epithelial cells, whose contents are composed of granules, with which oil-globules are often mixed, and each tube is invested with capillaries, which usually run in the direction of its long axis. In the pyloric or duodenal end of the stomach, these tubes (at least in the dog and several other animals whose stomachs have been carefully examined in a perfectly fresh state) are considerably wider than those which we have described, and differ from them also in other respects; and hence some physiologists believe that while they collectively secrete the gastric juice, one set may secrete the acid fluid and the organic matter

termed pepsine, and the other mucus; the free acid and the pepsine are, as we shall shortly see, the two essential constituents of the gastric juice.

When food is introduced into the stomach, three special phenomena are induced in that viscus: 1. There are certain movements induced which are dependent on its muscular coat; 2. The mucous membrane is altered in appearance; and 3. There is the secretion of the gastric juice. Each of these phenomena requires a brief notice.

On killing an animal while the act of digestion is going on, and at once laying open its abdomen, we find that the stomach is in a contracted state, firmly embracing its contents, and with both its orifices so closed as to prevent the escape of the food, this contraction being due to the stimulation of the muscular coat by the food. If we examine the movements of the stomach during digestion, which we can do either by exposing the stomach of a living animal, or by sending a magneto-electric current through this organ in an animal just killed, we perceive that, in the cardiac half or two thirds, the movements are extremely slow, the muscular coat apparently contracting on the food, and progressively sending it towards the pylorus; whilst in the pyloric end of the stomach the movements are more energetic and rapid, resembling the peristaltic or vermicular movement, which we shall presently describe as occurring in the intestinal canal. When the transverse constriction has reached the firmly shut pylorus, a relaxation lasting about a minute ensues, followed by a repetition of the circular contractions. The movements which these contractions impress upon the food are described by Dr. Beaumont in the following terms: "The food entering the cardiac end of the stomach, *c*, turns to the left, descends into the splenic extremity, *s*, and follows the great curvature towards the pyloric end, *d*. It then returns in the course of the smaller curvature, and makes its appearance again at the cardiac aperture in its descent into the great curvature to perform similar revolutions. These revolutions are effected in from one to three minutes." This account, given by Dr. Beaumont, is based on the observations which he made in the stomach of Alexis St. Martin, a Canadian, with a fistulous opening into the stomach, whose case is referred to in the article DIET. Dr. Brinton, however, adopts a modified view, which is probably the correct one. He supposes that the semi-fluid food entering at *c* (fig. 3), the cardiac orifice, goes in the directions marked *a*, partly along the greater and partly along the lesser curvature; and that these two currents of food meet at the closed pylorus, when they are both reflected into the direction *b*, forming a central or axial current, occupying the real axis of the stomach which unites the two apertures. The mutual interference of these currents at their borders causes a uniform admixture of the various substances composing them, while the reflection of the upper and lower currents into one another insures an equal contact of all the mass with the secreting surface of the mucous membrane.

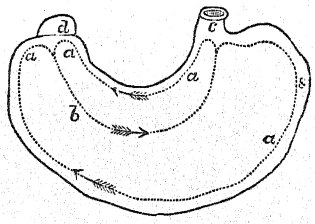

FIG. 3.

Diagram to show the general direction of movement impressed on the semi-fluid food in the stomach.

aa, the hemispherical or surface current, carrying the semi-fluid food towards the closed pylorus, where it is reflected into *b*, the central current, which unites the cardiac (*c*) and pyloric (*d*) openings.

The changes in the mucous membrane are mainly the following: The inner surface of the healthy fasting stomach is of a paler pink tint than after the introduction of food, and while in the latter case the reaction of the moisture on the surface is very acid, in the former it is neutral, or even alkaline. Dr. Beaumont found (in the case of Alexis St. Martin), that, on the introduction of food into the stomach, the vessels of the mucous membrane became more injected, and that its color became changed from a pale pink to a deep red. A pure colorless and slightly viscid fluid, with a well-marked acid reaction, was then observed to distill from the surface of the membrane, and to collect in drops, which trickled down the walls, and mixed with the food.

That the *gastric juice*, which is the term applied to the acid fluid which Dr. Beaumont saw exuding from the mucous membrane, and which is secreted or formed in the gastric tubes which we have already described, is capable of exerting a solvent action on food, is proved by numerous experiments. It was first ascertained by Reaumur (1752), who obtained some of this fluid by making animals swallow sponges with a string attached, by which he could withdraw them. He thus showed that alimentary substances out of the body were altered by this fluid in the same manner as they are changed in the stomach, and disproved the favorite theory of that period, which ascribed all the changes which the food underwent in the stomach to a species of trituration. The subject of *artificial digestion*, or digestion out of the body, has, since that period, been carefully investigated by many observers, and there is now no doubt that the changes which the food undergoes in the stomach are essentially chemical, and not mechanical.

Two years before Beaumont's experiments, Dr. Prout had ascertained not only that an acid fluid is secreted by the gastric mucous membrane of rabbits, hares, horses, dogs, etc., during digestion, but that the acid is the muriatic or hydrochloric acid, and it was supposed that the solvent action of the gastric juice was due to this source. But experi-

ments showed that the solvent action is not due simply to the acid of the gastric juice and that the latter must contain some other ingredient which, either alone or in combination with the acid, can exercise this power. It was then discovered that the addition of a portion of the gastric mucous membrane to water acidified with hydrochloric acid produced a perfect digestive fluid, due attention being paid to the temperature, which should be kept at about 100°, or about the normal temperature of the interior of the animal body. Later observations showed that we can obtain from the gastric mucous membrane the special organic matter on which its digestive power depends, and to this substance the name of *pepsine* has been given. The two essential elements of the gastric juice are then: 1. A free acid, which in some cases seems to be hydrochloric alone, and in others a mixture of hydrochloric and lactic acids; and 2. An organic matter, which is found on analysis to be highly nitrogenous, and to be allied to the albuminates, and which we term pepsine. The best analysis of human gastric juice is that made by Schmidt of Dorpat, who, in 1853, had an excellent and rare opportunity of examining it in the case of an Esthonian peasant, Catharine Kütt, aged 35 years, and weighing about 118 lbs., in whom there had existed for three years a gastric fistula or opening, three or four lines in diameter, under the left breast, between the cartilages of the ninth and tenth ribs. The introduction of dry pease and a little water into the stomach, through the opening, occasioned (even in the morning, on an empty stomach) the secretion of from 5 to 7 ozs. of a clear limpid fluid with an acid reaction, which, however, was much less strong than Schmidt had observed in previous experiments on the gastric juice of dogs and sheep, in which he had artificially established similar fistulous openings. The following table gives the mean of two analyses of the gastric juice of Catharine Kütt, with corresponding mean results of the same fluid in the sheep, a purely herbivorous animal, and in the dog, a purely carnivorous animal.

	Human Gastric Juice.	Sheep's Gastric Juice.	Dog's Gastric Juice.
Water	994.40	986.15	971.17
Solid constituents	5.60	13.85	28.83
Pepsine	3.20	4.20	17.51
Hydrochloric acid	0.20	1.56	2.70
Chlorides of sodium, etc.	2.08	6.00	5.88
Phosphates	0.12	2.09	2.74

The only impurity that could affect these analyses, is the saliva that possibly might have been swallowed.

The quantity of the gastric juice secreted in 24 hours was determined by Bidder and Schmidt (*Die Verdauungs-säfte*, etc.) in the sheep to be $\frac{1}{3}$th, and in the dog $\frac{1}{15}$th of the weight of the body. If the latter ratio were true for men, a man of ten stone weight would secrete about 14 lbs. of this fluid daily. In the case of Catharine Kütt, the mean daily quantity amounted to no less than 31 lbs., or to more than a fourth part of the weight of her body. On this calculation, a man of ten stone would daily secrete 37 lbs. of gastric juice.

The uses of this fluid in reference to digestion are clear. It serves not only to dissolve, but also to modify the nitrogenous elements of the food (such as albumen, fibrin, casein, and, in short, all animal food except fat, and the blood-forming portion of vegetable food), converting them into new substances, termed *peptones*, which, although they coincide in their chemical composition, and in many of their physical properties, with the substances from which they are derived, differ essentially from them in their more ready solubility in water, and in various chemical relations. Thus, albumen is converted by the gastric juice into albumen-peptone, fibrin into fibrin peptone, etc. According to the investigations of Meissner, the albuminates are simultaneously decomposed or broken up into peptones and substances which he terms *parapeptones*, which latter are not further changed by the action of the gastric juice, but are converted into peptones by the action of the pancreatic juice, with which they come in contact in the duodenum.

All the best observers agree that the gastric juice exerts no apparent action on the non-nitrogenous articles of food—namely, the fats and the carbo-hydrates (sugar, starch, etc.); as, however, the fats exert a favorable influence on the digestion of nitrogenous matters, it is probable that they undergo some slight, although not appreciable, modification. Gelatine and the gelatinous tissues are, as far as is known, the only nitrogenous articles of food which are not converted into peptones and parapeptones by the action of the gastric juice.

Although the main object of the gastric juice is to dissolve the albuminates, etc. (e.g., the contents of the egg, flesh, cheese, etc.), it appears from the experiments of Lehmann, Schmidt, and others, that it cannot dissolve the quantity necessary for the due nutrition of the organism. According to Lehmann, gastric juice can only dissolve $\frac{1}{50}$th of its weight of coagulated albumen, while Schmidt makes the quantity as low as $\frac{1}{125}$th. Now, since a dog secretes about $\frac{1}{15}$th of its weight of gastric juice daily, it would only be able—even taking Lehmann's estimate, which is more than twice as high as Schmidt's—to digest 5 parts of dry or coagulated albumen for every 1000 parts of its

weight; but a dog, in order to keep in condition on an exclusive flesh diet—and this is its natural food—should take 50 parts of flesh, containing 19 parts of dry albuminates, for every 1000 parts of its weight. Hence its gastric juice only suffices for the digestion of half the albuminates necessary for nutrition—a result which is in accordance with the observed fact, that a considerable portion of the albuminates enters the duodenum in an undissolved state, and which will be explained when we consider the part which the intestinal juice—the fluid secreted by the various glands lying in the mucous membrane of the small intestine—takes in the digestive process. On comparing the experiments made on dogs with those made on Catharine Kütt, it appears that in the human subject the gastric digestion of the albuminates is much more imperfect than even in the dog.

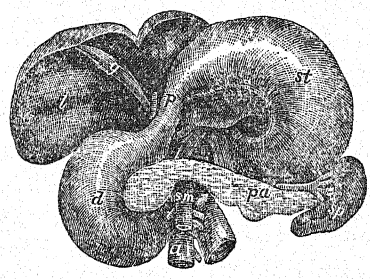

FIG. 4.

The under surface of the stomach and liver, which are raised to show the duodenum and pancreas.

st, stomach; *p*, its pyloric end; *l*, liver; *g*, gall-bladder; *d*, duodenum, extending from the pyloric end of the stomach to the front, where the superior mesenteric artery (*sm*) crosses the intestines; *pa*, pancreas; *sp*, spleen; *a*, abdominal aorta.

The process of gastric digestion is slow. According to Beaumont's researches on Alexis St. Martin, the mean time required for the digestion of ordinary animal food, such as butcher's meat, fowl, and game, was from two hours and three quarters to four hours.

The next point to be considered is: What becomes of the matters that are thoroughly dissolved in the stomach? Are they absorbed, without passing further down the canal? or do they pass through the pyloric valve into the duodenum, and are they finally taken up by the lacteals? Two of our highest authorities in physiological chemistry, Frerichs and Donders, maintain that the absorption of the peptones commences in the stomach; but the view generally adopted is, that the albuminates, etc., which are converted into peptones, are for the most part taken up by the lacteals. The rapidity with which

aqueous solutions of iodide of potassium, the alkaline carbonates, lactates, citrates, etc., pass into the blood, and thence into the urine, saliva, etc., shows that the absorption of fluids must take place very shortly after they are swallowed, and there is little doubt that the blood-vessels (capillaries) of the stomach constitute the principal channel through which they pass out of the intestinal tract into the blood. As the veins of the stomach, which are formed by the union of these capillaries, contribute to form the portal vein (see CIRCULATION, ORGANS OF), the absorbed matters pass directly to the liver, and probably stimulate it to increased secretion (fig. 4).

6. We must now follow the progress of the semi-fluid mass known as the *chyme*, from the stomach into the small intestine, and notice the changes which are collectively impressed upon it, and are known as *chylification* or intestinal digestion. But before

we can satisfactorily do this, we must say a few words regarding the intestinal mucous membrane, with its various glands, etc., and on the changes which take place in it during digestion.

The mucous membrane of the small intestine resembles that of the stomach in so far as it is of considerable thickness, and consists in a great measure of laterally grouped tubes. The reader is referred to fig. 5, which exhibits a section of the mucous membrane of the small intestine in the dog. These tubes, which form the great mass of the middle portion of the section marked *b*, are commonly called the *follicles of Lieberkuhn*, although they were first described by Brunner. They are straight, nearly uniform in diameter throughout their entire length, and are parallel to one another, and perpendicular to the inner surface of the small intestine on which they open. Nothing is known of the exact nature of their secretion; but in association with the secretions of other glands, they combine to yield the intestinal juice whose characters and uses will shortly come under our notice.

The projecting bodies marked *a* in the figure are termed the *villi;* they are minute processes of the mucous membrane of the small intestine, and obviously serve to increase to a great extent the amount of absorbing mucous membrane. They first appear in the duodenum, where they seem to develop themselves as elongations of the partitions between the cells or pits into which the tubes open. Comparatively scanty in number at first, they become very numerous (covering the whole surface) in the further part of the duodenum and the rest of the small intestines, giving to the mucous membrane a velvet-like or pilous appearance; they finally cease at the ileo-cæcal valve, which forms the boundary between the small and large intestine. In man, they are conical in shape, and measure from $\frac{1}{3}\frac{1}{5}$th to $\frac{1}{6}\frac{1}{0}$th of an inch in length. They vary much in shape and size in the lower mammals and in birds. (In carnivorous animals, as the dog, they are longer and more filiform than in man.)

The structure of a villus (fig. 6) is somewhat complicated, but we must endeavor to explain it, because, without tolerably accurate knowledge on this point, no one can understand how most of the essential elements of food (the albuminates and fatty matters) make their way from the intestine to the blood. Each villus is provided with an abundant set of capillaries, which doubtless absorb fluid matters, which thus find their way directly from the bowels into the blood (fig. 7). A single artery enters its base, and passing up its center, divides into a capillary plexus, which almost surrounds the villus immediately beneath the mucous membrane. From these arise small veins, which usually pass out of the villus in two, three, or more trunks, and contribute to form the portal vein. See CIRCULATION.

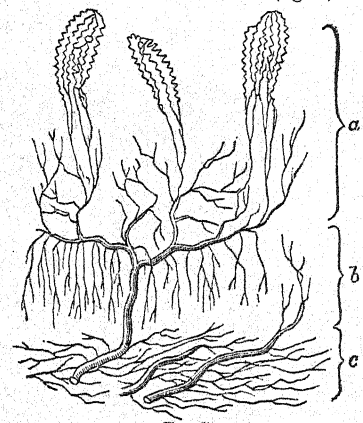

FIG. 7.
Vertical section of the coats of the small intestine, showing the capillaries and the beginnings of the portal vein. The arteries are not seen, not having been penetrated by the injection which has been thrown into the portal vein.
a, vessels of the villi; *b*, those of the tubes or follicles of Lieberkuhn; *c*, those of the muscular coat.

The villus also contains in its interior one or more *lacteals*, which are vessels with club-shaped closed extremities, which absorb the chyle from the intestine. Their milk-white appearance, when they are filled with chyle, suggests the origin of their name. The tissue which occupies the cavity of the villus, in which the lacteals are imbedded, and which supports the capillary plexus, is in a great measure made up of nuclei and granules, except at the free extremity, where a vesicular structure, resembling very minute fat globules, is apparent.

There is abundant evidence that the function of the villi is connected with absorption, and mainly with the absorption of chyle. 1. The villi exist only in the small intestine, where the absorption of food goes chiefly on. 2. They are most developed in that part of the intestine where chyle is first formed. 3. They are turgid, enlarged, and opaque during the process of chylification, and small and shrunken in animals that have been kept fasting for some time before death.

In addition to the villi, the mucous membrane of the small intestine presents numerous transverse folds, which are termed the *valvulæ conniventes*, from their valvular form and from their movements under water resembling the winking motion of the eyelids (fig. 8). Each fold passes round three fourths or more of the gut; and in the lower part of the duodenum, and in the jejunum (the parts in which they are most fully developed) they are often more than half an in. in depth; further on, they diminish in depth, length, and number, and in the lowest part of the ileum they can scarcely be traced. Their object clearly is to increase the extent of the absorbent mucous membrane.

In addition to Lieberkuhn's follicles or tubes, which exist in the whole of the smaller intestine, there are other glandular or secreting structures, imbedded in the submucous tissue of certain portions of the intestinal tract, which require consideration. These

are: 1. Brunner's glands, which occur only in the duodenum; 2. Solitary glands, which seem to occur in all parts of the intestine, both small and large; and 3. Peyer's glands, which are usually confined to the ileum.

Brunner's glands are most abundant at the pyloric end of the duodenum. In structure, they resemble the pancreas, their ultimate elements being bunches of vesicles, from which minute ducts arise, which coalesce and form larger ducts, through which the secretion is poured into the duodenum. It is believed that they secrete a fluid similar to the pancreatic juice. The *solitary glands* occur in all parts of the intestine, but are perhaps more numerous in the jejunum than elsewhere. Each gland is a simple membranous flask-shaped vesicle, the neck corresponding to the surface of the intestine, while the rounded base lies in the submucous tissue. The neck presents no opening, and how the contents, which consist of nuclei and granular particles, are discharged into the intestine, is not clearly known. As we never see them larger than a mustard-seed, we may presume that, on attaining that size, they burst. *Peyer's glands* (fig. 9) are apparently mere aggregations of solitary glands, forming oval patches in the ileum. These patches vary in size and number, being largest towards the cæcum, where their long diameter sometimes measures 3 or 4 in., and smallest towards the jejunum; while their number varies from 15 to 20, or even more. Nothing certain is known regarding the uses of these solitary or aggregated glands; but as they are largest during the digestive process, we must infer that they are in some way connected with that function. Possibly the peculiar odor of the fæces may be due to their secretion. In typhoid or enteric fever, and in phthisis, these glands become ulcerated, which probably occasions the diarrhea so common in these diseases.

Brunner's glands are much more developed in the herbivora than in the carnivora; Peyer's, on the other hand, are most developed in the latter.

We have endeavored, in the preceding sentences, to give the reader some idea of the complicated structure of the mucous and submucous coat of the small intestines; we now proceed to notice the chief uses of the muscular coat of the intestine. This coat,

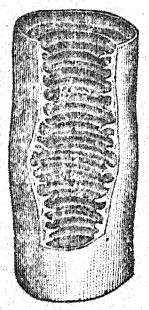

FIG. 8.

Small intestine distended and hardened by alcohol, and laid open to show the valvulæ conniventes.

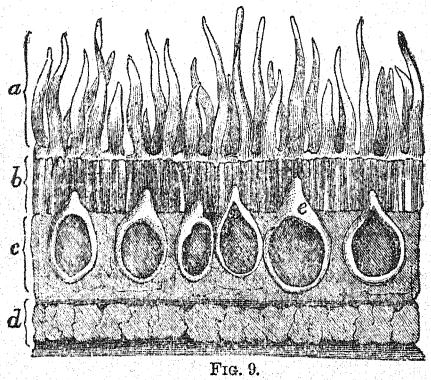

FIG. 9.

Vertical section through a patch of Peyer's glands in the dog. *a*, villi; *b*, tubes of Lieberkuhn; *c* submucous tissue, with the glands of Peyer imbedded in it; *d*, muscular and peritoneal coats; *e*, apex of one of the glands projecting among the tubes.

as has been already mentioned, consists of two layers of muscular fibers—namely, circular and longitudinal fibers, of which the former lie next to the submucous coat. The peristaltic or vermicular action by which the substances which enter the duodenum from the stomach are moved onwards, is due to this muscular coat. A person who has once seen the abdomen of an animal laid open immediately after death, will have a better idea of the nature of this movement than can be afforded by any description. It commences about the pyloric third of the stomach, from whence successive wave-like movements are propagated through the entire length of the intestinal canal. It is the rapid succession of these alternate contractions and relaxations that impels the intestinal contents onwards, and occasion those movements which, from their resemblance to the writhings of a worm, have been termed *vermicular*. It is very probable that the rapidity of this movement varies in different individuals—those persons, for example, whose bowels act twice daily having a more rapid vermicular motion than those in whom the act of defecation occurs only once in the twenty-four hours.

We have now to consider the effects produced on the chyme by the different fluids with which it becomes mixed in the small intestine. These fluids are: 1. The bile; 2. The pancreatic juice; and, 3. The intestinal juice.

The bile (see BILE) is a faintly alkaline or neutral fluid, containing two essential constituents, one of which is of a resinous nature, while the other is a pigment. The resinous constituent is not precisely identical in all kinds of bile, but it generally consists of a soda-salt whose acid is either glyco-cholic or tauro-cholic acid (q.v.), or of a mixture

of these salts. Strecker, to whom we are mainly indebted for our knowledge of the chemistry of the bile, states that in most mammals the resinous constituent merely differs in the varying proportions in which the taurocholates and glycocholates are intermixed, the former usually preponderating. According to Lehmann, the resinous constituent amounts to at least 75 per cent of the solid residue. The bile-pigment occurs in the bile of different animals under two forms—namely, as a brown and as a green pigment, the latter probably only differing from the former in being mere highly oxidized. There has never been a case in which physiologists have had an opportunity of directly observing the quantity of bile that is secreted by the human subject, and all our information on this subject is derived from observations on animals, in which the *ductus choledochus communis* (see LIVER) has been tied, and a fistulous opening established into the gall-bladder. If the same proportion of bile to bodily weight holds good in man as in the dog, a man weighing ten stone would secrete daily about five pounds of bile. All observers agree, that the amount of the biliary secretion varies directly with the quantity of food; and as animals with biliary fistulæ (in whom all the bile escapes externally, instead of making its way into the duodenum) usually have voracious appetites, experiments on this point are easily made. There is great discrepancy of opinion as to how soon after a meal the bile flows most abundantly into the intestine. According to Kölliker and Müller, whose experiments were made on dogs fed only once a day, very little bile is secreted in the first and second hour after a meal, more in the third, fourth, and fifth; the maximum being sometimes attained in the fifth, sometimes not till the eighth hour.

Numerous and somewhat discrepant views have at different times been advanced regarding the functions of this fluid; we shall here only notice those functions which are connected with digestion. One use that has been ascribed to it, is to neutralize in the small intestine the acid chyme which emerges from the stomach. But the bile can contribute little or nothing to the neutralization of the free acid, because, in the first place, the bile is very slightly alkaline, and often perfectly neutral; and secondly, because the chyme in the intestine is still acid after the admixture of the bile. Again, the bile has been asserted to possess a special solvent action on the chyme; but none of the ordinary constituents of the latter seem to be essentially changed, even when digested for a long time with fresh bile. Again, much importance has been attached to the antiseptic action of the bile on the contents of the intestinal canal, in favor of which view it is alleged that when no bile is poured into the intestine, the fæces have a putrid odor, as is sometimes observed in patients with jaundice, and as was noticed by Frerichs in animals in which the *ductus choledochus* had been tied. Another use that has been assigned to the bile is, that it exerts a stimulating action on the intestinal walls, and thus acts as a natural purgative; and in support of this view, it may be mentioned that jaundice (in which the bile does not flow into the intestine) is often accompanied by extreme constipation, and that purified ox-gall, taken either in the form of pill or enema, produces an undoubted purgative action. But the main use of the bile seems to be to promote the digestion of fatty matters, and it accomplishes this end not so much by any solvent chemical action on the fats (which at most is extremely slight), as by a peculiar physical action both on the fats and on the intestinal walls, disintegrating the former, and impressing on the latter (by moistening the villi) a peculiar condition which singularly facilitates the absorption of fatty matters. This view is fully confirmed both by direct experiments out of the body, and by comparing the relative qualities of fat that are retained in the body and applied to the purposes of life by animals with biliary fistulous openings, and by healthy animals.

The pancreatic fluid which is poured into the duodenum at the same spot with the bile (see fig. 1), is a colorless, clear, somewhat viscid and ropy fluid, devoid of any special odor, and exhibiting a strong alkaline reaction. This fluid, as yielded by different dogs with permanent fistulous openings, varies considerably in chemical composition; the collective solid constituents ranging from 1.5 to 2.3 per cent, the organic matters from 0.9 to 1.6, and the mineral matters from 0.62 to 0.75.

The most abundant and important of the solid constituents is a peculiar substance termed *pancreatine*, or pancreatic diastase or ferment, in combination with soda, to which this fluid owes its principal chemical and physiological properties. Calculating from the quantity of pancreatic juice secreted by dogs of known weight, we may infer that a man weighing ten stone secretes daily about ten ounces of this fluid.

One of the chief uses of the pancreatic juice in relation to digestion, is to convert into sugar the amylaceous or starchy matters which have escaped the action of the saliva, and have passed unchanged into the duodenum. It possesses this property in a far higher degree than the saliva; and, as might be expected in reference to this use, the pancreas is found to be much more developed in herbivorous than in carnivorous animals. Bernard, the representative of the modern school of physiology in France, claims for this fluid another important function; he believes that he has proved that it is solely by the action of this secretion that the fat is reduced to a condition in which it can be absorbed and digested; that is to say, that it is decomposed into glycerine and a fatty acid. See FATS. This view, has, however, not been generally accepted, and it seems probable that although the change described by Bernard takes place when fat and pancreatic juice are simply mixed together in a test-tube, it does not actually

take place in the intestine, the acid gastric juice probably acting as an interfering agent. An attempt has lately been made by Corvisart and Meissner to prove that, like the gastric juice, this fluid can dissolve albuminous matters; but this view cannot be substantiated. Considering the large quantity of pancreatic fluid which is yielded in 24 hours, Schmidt, who has made the digestive juices the subject of his special study, is of opinion that the function of this fluid is not so much to promote the conversion of starch into sugar, as for the purpose of diluting the chyme, and for reconverting the soda (which in the pancreas has been separated from the chlorine of the chloride of sodium, and has combined with the pancreatine) into chloride of sodium. He shows, from numerical calculations, that more than half of the chloride of sodium existing in the blood which circulates through the pancreas, is broken up into hydrochloric acid and soda, of which the former is separated by the gastric glands, while the latter unites with the pancreatine. Meeting again in the duodenum, the hydrochloric acid and the soda reunite, and re-form chloride of sodium, which is again absorbed, and re-enters the circulation. This is perhaps one of the most singular decompositions and reunions occurring in the animal body.

Of the last of the fluids poured into the intestine, and co-operating in the digestive process, the *intestinal juice*, we know comparatively little. It is the aggregate secretion of the various glands which we have described as occurring in the walls of the small intestine. It is a colorless, or sometimes yellowish, ropy, viscid fluid, which is invariably alkaline. We are not aware of any special or characteristic constituent in it, such as occurs in the other chylopoietic fluids. Its daily quantity is probably nine or ten ounces. It seems to unite in itself the leading properties of the pancreatic and gastric juices; that is to say, it resembles the former in converting starch into sugar, and the latter in dissolving flesh and other albuminous bodies.

We shall conclude this part of the subject with a few remarks on the chemical composition of the contents of the small intestine. On laying open the gut, we usually find a semi-solid admixture of imperfectly digested and indigestible substances and of the constituents of the digestive fluids in a more or less changed condition. The reaction of this mass varies in different parts of the canal, and in some measure with the nature of the food. Thus, the contents of the stomach always redden litmus paper, whatever kind of food has been taken; the duodenal contents are also always acid, but in a far less intense degree; in the jejunum we meet with only a faint acid reaction, which altogether disappears in the ileum; while in the cæcum, and sometimes in the lower part of the ileum, an alkaline reaction occurs. After a purely flesh diet the acid reaction disappears shortly below the duodenum, while, after the sole use of vegetable food, it may sometimes be traced even to the cæcum. As a general rule, the contents of the large intestine are alkaline.

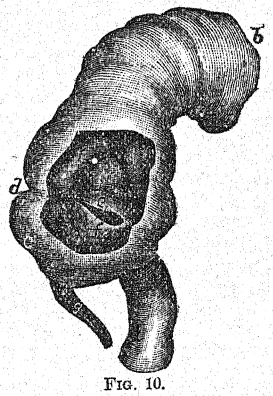

FIG. 10.

Cæcum inflated, dried, and opened to show the arrangement of the valve.

a, termination of the ileum; *b*, ascending colon; *c*, cæcum; *d*, a transverse construction projecting into the cæcum; *ef*, lips of the valve separating the small from the large intestine; *g*, the vermiform appendix of the cæcum.

In consequence of the rapid absorption that goes on along the intestinal surface, we meet with a comparatively small amount of soluble matters in these contents. Among these soluble matters we often find glycose (or grape-sugar), which seems to owe its origin to the metamorphosis of starch, and not to sugar having been present in the food; for after saccharine food has been taken, we rarely meet with it in any quantity in the small intestine, its absorption taking place with great rapidity. In the alcoholic extract of these contents we can almost always find evidence of the presence of biliary constituents. In the duodenum, and for a little way beyond it, we find glycocholic and tauro-cholic acid; descending a little further, they rapidly diminish, till we find the products of their disintegration; while in the large intestine, little more than a trace of these products can be detected. These chemical observations confirm the experiments of Schmidt, which show that nearly half the bile which is poured into the duodenum is decomposed before it reaches the middle of the small intestine.

We have now arrived at the seventh stage of the digestive process, that of *defecation*. The line of demarcation between the small and large intestine is very obvious, and by the peculiar arrangement of the ileo-cæcal valve (see fig. 10), matters are allowed to pass forward with facility, while regurgitation is impossible. For anatomical details regarding the large intestine, we may refer to the articles ALIMENTARY CANAL, CÆCUM, and COLON. The contents of the large intestine differ very materially from those which we have been considering in the last paragraph, and constitute the fæces. They are more solid and homogeneous, and are often molded into a definite shape by the cells of the colon. The only essential change which the contents undergo in this part of their course is, that they increase as they pass onward in solidity, in consequence of the absorption of fluid from them by the mucous membrane. They are propelled forward

into the rectum by the vermicular action which has been already described. Here they accumulate, being prevented from escaping by the contraction of the sphincter muscle—a band of strong muscular fibers surrounding and closing the gut at its lower extremity. The act of defecation, or of expulsion of the fæces from the rectum, is effected partly by the muscular fibers of that part of the intestine which are stimulated to contraction by a certain degree of distension, and which are to a certain extent under the influence of the will, and partly by the simultaneous contractions of the abdominal muscles and of the diaphragm, which, by reducing the antero-posterior and transverse diameters of the abdominal cavity, compress the intestinal canal in such a manner as greatly to assist the expulsive action of the rectum. These forces, or some of them (for usually the detrusive action of the muscular fibers of the rectum is sufficient), overcome the passive contraction of the sphincter, and the act of defecation is the result.

The fæces consist of a mixture composed of undigested particles of food (such as vegetable cellular tissue, fragments of tendon, skin, and half-digested muscular fiber), of epithelium and mucus (derived from the intestinal walls), and of traces of decomposed biliary matters. Their peculiar odor is ascribed by some to the secretion of Peyer's glands, and by others to decomposed bile; while Liebig refers it to a decomposition of albuminous matters, founding his view upon the fact, that by burning albumen with potash, he could manufacture in the laboratory odors of a fecal character. The last is the least probable view. Their color varies with the food. On a mixed diet, they are of a yellowish-brown tint; on a flesh diet, much darker; and on a milk diet, quite yellow—and they become darker on exposure to the air. Their reaction is most commonly but not invariably alkaline. Their daily quantity is very variable; the mean of 17 observations made by a German physiologist, Wehsarg, was about 4.6 ounces, of which very nearly one ounce was solid matter, the rest being water; the largest and the smallest quantities being ten, and rather more than two ounces. Liebig, many years ago, made the observation that the insoluble salts of the food are mainly carried off by the fæces, while the soluble salts are for the most part eliminated by the urine. For further details on the chemistry of this subject, we must refer to the elaborate Memoirs of Dr. Marcet, published in the *Philosophical Transactions*.

8. The absorption of the chyle forms the completion of the digestive act. The coats of the intestines contain two perfectly distinct sets of vessels—one through which blood circulates, and the other containing a milky or transparent fluid, chyle or lymph, which, after a somewhat circuitous route, is poured into the blood. We have already referred to the fact, that fluids are absorbed from the stomach and intestine by the veins and capillaries of the mucous membrane; we now proceed to notice the mode in which the vessels of the second kind, the lacteals, act as absorbing agents. The lacteals are merely a portion of the great lymphatic system of the body, which will be described in a future article. See LYMPHATICS. They commence, as has been previously mentioned, in the villi, and possibly also in the intervening mucous membrane; and when an animal is killed while the digestive process is going on, they have, in consequence of their being distended with chyle, the peculiar white or milky appearance which procured for them their name of *vasa lactea*, from their discoverer, Asellius, in 1622. They pass in great numbers, and in a reticulated arrangement, between the layers of the mesentery, the portion of peritoneum (q.v.) which surrounds the gut, and retains it in its proper position. After passing through the mesenteric glands, where their contents seem to become more highly organized, they make their way to the right side of the aorta in the lumbar region, where they finally discharge themselves into an elongated pouch, termed the *receptaculum chyli*. From this pouch, the thoracic duct, containing the chyle, passes upward along the vertebral column till it reaches the level of the arch of the aorta, behind which it runs to the left side, and discharges its contents into the subclavian vein, close to its origin with the internal jugular, its orifice being protected by two valves. The nature of these contents has been already described in the article CHYLE. This chyle is, in reality, incipient blood, which has been formed, as we have already seen, from the food, and has been absorbed from the intestine by the lacteals. We have now traced it to its entrance into the general circulation, and it only remains for it to pass, in conjunction with the venous blood with which it is mixed, through the lungs, in order to be converted into new and perfect arterial blood, fit for the highest processes of organization.

We shall conclude this article with a notice of some of the most striking peculiarities presented by the digestive organs in the lower animals.

In the mammalia, we have three different forms of stomach—the *simple*, the *complex*, and the *compound*. In the *simple* form, the organ consists of a single cavity, as in man, but the form may vary to a great extent. It is most simple and relatively smallest in carnivorous animals. This is the most common form of mammalian stomach. In the *complex* stomach, that viscus is made up of two or more compartments communicating with one another, but often without presenting any marked difference of structure. The kangaroo, the porcupine, and the squirrel, afford good examples of this form of stomach. In the cetacea, the stomach consists of from five to seven cavities, that communicate with each other; but whether their functions are similar or different is not known. The *compound* stomach occurs in the ruminants (the cow, sheep, camel, etc.);

it consists of four distinct cavities, differing very materially in their size, and in the arrangement and structure of the lining mucous membrane. The first, and by far the largest cavity, is the paunch or *rumen;* it occupies a great part of the abdominal cavity, and is the receptacle into which the food is received when first swallowed. The second cavity is termed (from the peculiar arrangement of the lining membrane, which forms deep polygonal cells) the honey-comb or *reticulum.* The third cavity presents a foliated appearance internally, and is hence popularly known as the manyplies. In anatomical works, it is sometimes termed the *psalterium,* and sometimes the *omasum.* The fourth division, termed the reed or *abomasum,* is somewhat of a pyriform shape, and is the true digestive stomach, in which alone gastric juice is secreted, all the preceding cavities being merely for the purpose of preparing the food for the more essential changes which it is here destined to undergo. The food first passes in a crude unmasticated state into the paunch, which, like the crop of birds which we shall presently notice, serves as a receptacle for the food until the act of feeding is concluded, and moistens it with the fluid secreted from its walls. The water, however, which the animal drinks, seems to pass directly into the second stomach. During rumination, small portions of the food pass from the paunch into this second stomach, from whence they are returned, in the form of pellets, to the mouth, where they undergo thorough mastication, and are then returned, as a pulp, by the œsophagus directly into the third stomach. The direction of the food into one or other of these cavities is altogether independent of the will, and results from a peculiar arrangement and property of the lower end of the œsophagus, which does not terminate at its opening into the paunch on one side, and the second stomach on the other, but is continued onwards as a deep groove or semi-canal, with two lips. If these lips come in contact, they form a perfect canal, leading directly to the third stomach; while if they remain open, the food passes into the first or second stomach. The dry food first swallowed opens the lips and escapes into the paunch, while the masticated food, being soft and pulpy, passes along the groove, without opening its lips, into the third stomach. Here it is diffused over a large surface of mucous membrane, and doubtless undergoes certain changes before entering the fourth or true stomach. In the camel, the dromedary, and the llama, numerous rows of large quadrangular deep water-cells are developed on the parietes of the second stomach, and on the part of the paunch next to that cavity. These cells are surrounded by muscular fibers, which, by their contraction, exclude the food from their interior, and by their gradual opening, the water is allowed to mix in successive small quantities with the food. It is by this arrangement that these animals only require to drink at comparatively long intervals. The intestinal canal of the ruminants is of great length, being sometimes, as in the sheep, more than thirty times the length of the body of the animal; and in herbivorous animals generally, as compared with carnivorous, the canal is very long.

It is in the large intestine that, next to the stomach, we find most varieties of structure. Cuvier has given the following *résumé* of the principal facts connected with this subject, to which, however, there are numerous exceptions: 1. In man, the orangs, and the wombats, there are both cæcum and vermiform appendix. 2. In the other quadrumana, the digitate carnivora, the marsupiata, the rodentia, the pachydermata, the ruminantia, the solipeds, and the amphibious mammals, there is a cæcum (often in vegetable-feeders larger than the stomach, and probably subservient to the digestive process), but no vermiform appendix. 3. In the odentata, the plantigrade carnivora, and the cetacea, there is neither cæcum nor vermiform appendix.

In birds, as in all other classes of animals, the alimentary canal varies according to the nature of the food, being long and capacious, and in some parts highly muscular, in the granivorous tribes, while it is much more simple in those which live on fish and other animal food. We take the common fowl as a good example of the former class. The œsophagus, about the middle of its course, and a little above the union of the clavicles (the furculum), presents an enlargement termed the crop or *ingluvies,* which varies in form and structure according to the food, and is provided with numerous glandular follicles. Just before terminating in the gizzard, the œsophagus again dilates to form a second but smaller cavity, known as the glandular stomach, *proventriculus,* or *ventriculus succenturiatus,* from whence a copious secretion of gastric juice is poured out and mixed with the food, which, having previously been macerated by the secretion of the crop, now passes on to the gizzard, which is a muscular organ of immense strength, which grinds and crushes whatever is placed in its central cavity—a process that is facilitated by the presence of hard pebbles, which are instinctively swallowed by the bird, and act the part of millstones. There is no very marked division in birds between the large and small intestine, the theoretical limit being indicated by the presence of two (sometimes only one) cæcal appendages.

There are no special points that we need notice regarding the digestive organs of reptiles, except that as the ophideans (serpents) and saurians (lizards) are mostly carnivorous, and most of the chelonians (tortoises) are herbivorous, the apparatus in question is more simple in the former than in the latter.

The amphibia afford us an excellent illustration of the close connection between the nature of the food and the development of the intestinal canal. In the young tadpole of the common frog, which lives upon the soft vegetable matter of our fresh-water ponds and ditches, the stomach is narrow and elongated, and the intestine is of extra-

ordinary length, and of nearly equal diameter throughout, being coiled up in a spiral manner, and distending the capacious abdomen. As the tadpole becomes metamorphosed into a frog, it changes its vegetable food for slugs, worms, grubs, flies, etc., and, at the same time, the alimentary canal becomes very much shortened, and its divisions into stomach, etc., more distinctly marked.

In osseous fishes, the alimentary canal is generally shorter and more simple than in the higher vertebrata, in many—as, for example, the herring—being shorter than the body, and, excepting the stomach, running in nearly a straight line through it. In the cartilaginous fishes, as the sharks, rays, etc., a spiral valve winds in close turns from the pyloric to the anal extremity, leaving merely a small central aperture, along which the contents slowly progress. By this singular arrangement, the intestine, although short in proportion to the length of the animal, presents an enormous absorbing surface.

The limits within which we must confine this article preclude us from noticing the various modifications which the digestive organs present in the various departments of the invertebrate animals; and we shall conclude with a few remarks upon the mode in which digestion is carried on in some of the lowest and simplest animals. The *hydra* or fresh-water polype is a minute animal, consisting of nothing but a bag or stomach, with tentacles surrounding its single orifice. The animalcules, etc., which the hydra catches by these lasso-like tentacles (see HYDRA), are drawn into the interior, where they are digested, and applied to the nutrition of the organism, the insoluble portions being rejected by the aperture through which they entered. In the *actinophrys sol*, or sun-animalcule, there is no persistent aperture; but when its radiating filaments—from which it derives its name—have secured a particle of organized matter fit for its nourishment, they twist over it, compress it against the globular body, which first yields, and becomes concave at the point, and finally closes over it, the prey being distinctly visible in the interior. This astomatous animalcule can thus form a mouth and stomach when it requires them. The indigestible remains are ejected by a corresponding reverse process. The *amœba* or *sponge-proteus* neither has a mouth and stomach, nor can it construct these organs: it simply folds itself around the solid particles from which it derives its nourishment, and imbibes their nutritious fluids through its cell-wall. We might adduce various other examples of animals devoid of a stomach, but we have brought forward sufficient evidence to show that the old doctrine, that this organ is a necessary constituent of an animal, cannot be sustained, when we approach that debatable-land which separates the two great organized kingdoms of nature.

DIGGES, an English family of note in the 16th and 17th centuries. LEONARD, b. 1574, wrote *Tectonicum*, briefly showing the exact measuring and speedy reckoning of all manner of lands, squares, timbers, stones, steeples, etc.; *Pantometria*, a practical geometrical treatise; and *Prognostication Everlasting of Right Good Effect, or Choice Rules to Judge the Weather by the Sun, Moon, and Stars.* THOMAS, son of Leonard, was an Oxford graduate, and a soldier. He wrote on mathematics and astronomy. Sir DUDLEY, son of Thomas, was the author of *Rights and Privileges of the Subject*, and the *Compleat Ambassador*. His son DUDLEY, d. 1642, was the author of *Unlawfulness of Subjects taking up Arms against their Sovereign.*

DIGGING. The operation of digging is performed with a spade or pronged fork. The spade or fork is thrust in with the foot, and the mass of earth is first loosened by the lever-power of the handle, then lifted and inverted. When this operation is performed in spring or summer, the ground should be dry, so as to obtain pulverization as easily and to as great extent as possible. In stronger soils, which are dug in autumn, a little moisture is desirable, as the land lies fallow, and the frosts of winter afterwards pulverize and reduce it to a proper degree for receiving the crops in spring. Digging is almost entirely confined to the cultivation of gardens, for though a most efficient means of cultivating the soil, it is too expensive for field-crops. It is almost always resorted to, however, in this country for digging over or trenching land which has been in timber, or full of stones or bowlders. Until recently, the spade was the only implement used for digging in gardens, but steel forks are coming rapidly into use, being lighter and more easily driven into the soil. Besides preparing the land for plants, the spade and the fork, chiefly the latter, are used for taking crops, such as potatoes and carrots, out of the ground.

DIGIT (Lat. *digitus*, the finger), a term applied to the ten symbols of number, 0, 1, 2, etc., to 9; thus, 305 is said to be a number of three digits. Numbers were originally indicated by the fingers, and hence the name. Astronomers use digit to signify a twelfth part of the diameter of the sun or moon, and speaks of an eclipse of seven digits, meaning that seven twelfths of the diameter is covered.

DIGITA'LINE is an active principle present in *digitalis purpurea*, or foxglove.

DIGITA'LIS, a genus of plants of the natural order *scrophulariaceæ*, natives chiefly of the s. of Europe and temperate parts of Asia. One only, the common FOXGLOVE (*D. purpurea*), is a native of Britain, and is very abundant in some parts of the country, its large purple flowers often giving a gay appearance to dry banks and steep hills. It is not unfrequently admitted into flower-gardens, particularly a white-flowered variety.

Its English name, and the botanical name D. (Lat. *digitale*, the finger of a glove), both refer to the form of its flowers. The central and southern parts of Europe produce several species with yellow flowers, one of which, *D. grandiflora*, is not an uncommon ornament of gardens. *D. purpurea* is much valued in medicine. It was first brought into repute by Dr. Withering. Its leaves and seeds are the parts used, generally the former. They are narcotic and poisonous. The leaves have a disagreeable smell when fresh, and a bitter nauseous taste, and are violently emetic and cathartic; but when dried and administered in small and repeated doses, they are diuretic, and therefore sometimes useful in dropsy; and are still more valuable on account of their sedative power over the action of the heart and the circulation of the blood, and are used in diseases of the heart, aneurisms, hemorrhages, etc. They appear also to possess some peculiar power over the brain and nervous system, and have been employed in insanity, epilepsy, and other diseases. They are administered generally in the form either of tincture or infusion. They ought to be collected before the flowers expand. They owe their active properties to a peculiar crystalline principle called *digitaline* (q.v.). The use of D. as a medicine requires great caution on account of a property which it possesses—very remarkable in a vegetable medicine—of cumulative action on the system. Many if not all of the species of D. appear to possess similar properties with *D. purpurea*, and to be capable of being substituted for it.

DIGITA'RIA. See MILLET.

DIGITIGRA'DA (Lat. finger-walking), in the zoological system of Cuvier, one of the tribes of the *carnivora* (q.v.), distinguished by walking on the toes alone, the heel not touching the ground. Among the digitigrade quadrupeds are included the most carnivorous of the *carnivora*, the feline and canine families, hyenas, civets, weasels, etc. The weasel family (*mustelidæ*), however, forms a connecting link, in respect to the character derived from the mode of walking, between the tribe D. and the tribe *plantigrada* (q.v.), being, in fact, semi-plantigrade, and not walking on the mere tips of the toes, like the other digitigrada.

DIGNE (Lat. *Dinia*), a t. in the department of the Basses-Alpes, on the Bléonne, 60 m. n.e. of Marseilles, occupies a picturesque situation upon a mountain slope, and is encircled by walls, but its streets are narrow, crooked, and steep, and the houses mean and squalid. Its chief building is the préfecture, once the bishop's palace, a very ordinary edifice. The principal manufactures of D. are articles of leather, and it has a trade in dried fruits, honey, wax, woolen and linen cloth, kid-skins, etc. In the neighborhood there are several hot saline springs, temperature 104° F. Pop. '76, 5,540. Of Dinia, which is mentioned by Pliny, nothing remains. It is known that it embraced Christianity at an early period, and has given title to a bishop since the year 340. In the year 1629, a plague reduced the population of D. from 10,000 to 1500.

DIGNITARY, in canon law, originally signified an ecclesiastic of superior rank than a priest, such as bishop, dean, etc.; it now includes also canons and prebendaries.

DI'HONG, or SANPO', the largest feeder of the Brahmaputrá, rises on the n. side of the Himalayas, near the sources of the Sutlej and the Indus, in lat. 30° 25′ n., and long. 82° 5′ e., and bursts through that great mountain-chain near lat. 28° 15′ n., and long. 95° 10′ e., having pursued through Thibet an easterly course of about 1000 miles. Finally, it joins the more easterly branch of the Brahmaputra, near the n.e. angle of Assam.

DIJON, a t. of France, in the department of Côte d'Or, formerly capital of the old duchy of Burgundy, in lat. 47° 20′ n., and long. 5° 2′ e., and about 195 m. s.e. of Paris by railway. D. occupies a most delightful situation in a fertile plain on the right bank of the Ouche, and at the base of the vine-clad hills which produce the famous Burgundy wines. The environs are exceedingly beautiful. D. is surrounded by old walls, originally having but five gates, and the ramparts being tastefully planted with fine trees, furnish very agreeable promenades. The town is for the most part well and regularly built, and the streets spacious and clean. Among the public buildings, which are numerous and imposing, the chief are the cathedral, a massive Gothic structure, dating from the 13th c., with a tall wooden spire, above 300 ft. high; the church of Notre Dame, a noble specimen of the purest Gothic architecture; the church of St. Michael, with a splendid renaissance front; the theater, a handsome building, with a fine Corinthian portico; and the palace of the dukes of Burgundy, now used as the town-hall, and much modernized externally, but possessing interiorly some of its earlier features, and containing a museum very rich in monuments of the middle ages, besides a library of 50,000 volumes, and several hundreds of manuscripts. D. is also the seat of a university academy with three faculties—law, science, and letters—and possesses, in addition, a royal college, a theological seminary, a botanic garden, and an academy of art. The manufactures of D. consist of woolen cloth, blankets, hosiery, leather, vinegar, chemical products, etc.; and there are salt refineries, distilleries, and breweries; but the town is mainly dependent on its trade in the wines of Burgundy. Pop. '76, 45,607. D. dates from Roman times, its ancient name being *Dibio*. It came into the possession of the Burgundians in the 5th c., and from them passed to the Franks. In the 9th c., it was ruled by counts of its own, under the suzerainty of the bishops of Langres. In the 11th c., it was united to the duchy of Burgundy, of which it became the capital, and the usual

residence of the dukes, who rebuilt and greatly enlarged and improved it. In Oct., 1870, after a sharp engagement before the city, D. capitulated to a German force. There was again severe fighting here in Jan., 1871.

DIKAMAL'LI, a gum-resin which exudes, in amber-colored transparent drops, from the ends of young shoots of *gardenia* (q.v.) *lucida*, an Indian tree. It has a very powerful fragrance, and has been found extremely useful in hospitals, in keeping away flies, and especially as a dressing for wounds and running sores.

DIKE. See DYKE, *ante.*

DIKE, in geology. See DYKE, *ante.*

DIKOWA, or DEEGOA, a large t. of Bornu, Central Africa, about 30 m. s.w. of lake Tchad. It is in a great cotton growing district, and is a place of considerable trade. The spinning and weaving of cotton are also extensively carried on. The houses are mostly of clay, but each has its court-yard. Pop. supposed about 30,000.

DILAPIDA'TION, in English law, is where an incumbent suffers his parsonage-house or outhouses to fall down, or be in decay, for want of necessary reparation; or pulls down or destroys any of the outhouses or buildings belonging to his living; or destroys woods, trees, etc.; for it is said to extend to committing or suffering any willful waste on the inheritance of the church.—Stephens' *Eccl. Law.* D. is a species of the legal injury known as waste (q.v.). A rector or vicar is bound to keep his residence and the chancel of the church in repair, but not to supply or maintain anything in the way of ornament, as painting, white-washing, or papering. An ecclesiastical person suffering the church-property to get out of repair, is subject to an action for D. at the instance of his successor (13 Eliz. c. 10, s. 2); and by 14 Eliz. c. 11, s. 18, the money so recovered must be applied to the repairs. By 5 and 6 Vict. c. 108, s. 19, being an act to empower ecclesiastical corporations to grant long leases, it is provided that the incumbent shall not be liable for D. occurring during such leases.

DIL'ATORY PLEAS. See PLEA.

DILEMMA. A true D. is defined by Whately as "a conditional syllogism with two or more antecedents in the major, and a disjunctive minor." The following D., of the kind called destructive, will perhaps convey a clearer notion than any definition: "If this man were wise, he would not speak irreverently of Scripture in jest; and if he were good, he would not do so in earnest; but he does it, either in jest or earnest; therefore, he is either not wise or not good." There being two conclusions, one or other of which your opponent must admit, he is in a manner caught between them; hence we speak of the *horns* of a dilemma.

DILETTANTE (pl. *dilletanti,* Ital.), in its original sense, is synonymous with an *amateur,* or lover of the fine arts. It is often used as a term of reproach, to signify an amateur whose taste lies in the direction of what is trivial and vulgar, or of a critic or connoisseur whose knowledge is mere affectation and pretense. It is sometimes assumed, in a spirit of self-depreciation, by those who are unwilling that their critical acquirements or artistic productions should be judged by the rules which would be applied to those of persons who had made a professional study of art. It was in this sense that it was assumed by the Dilettanti Society (q.v.).

DILETTANTI SOCIETY, a body of noblemen and gentlemen by whose exertions the study of antique art in England has been largely promoted. The society was founded in 1734, and held its meetings at the Thatched House tavern in St. James' street. It was in its beginnings simply an amateur club, its object being to combine social and friendly intercourse with the cultivation of artistic knowledge and the gratification of artistic tastes. But its funds having accumulated to a large amount, its members resolved, in 1764, to fit out an expedition for the purpose of collecting details and drawings of the most remarkable artistic monuments of antiquity. The persons selected for carrying out this important undertaking were Mr. Chandler, of Magdalen college, Oxford, the editor of the *Marmora Oxoniensis;* Mr. Revett and Mr. Stewart, the authors of the magnificent work on Athenian antiquities; and Mr. Pars, a talented young artist. Having spent two years in Greece, they returned in 1766, bringing with them the materials for the two splendid volumes on the antiquities of Ionia, which were published at the expense of the society. Architecture had been the first object of their inquiries, but their attention was now turned to sculpture, which was then at the lowest ebb in England. A series of the finest antique statues, bas-reliefs, and busts were selected and engraved with the greatest care. This work appeared in 1809, with dissertations by Payne Knight. In 1811, a second architectural exploring-party was dispatched by the society to Asia Minor, consisting of Mr. (afterwards sir William) Gell, Mr. Bedford, and Mr. Gandy. Two volumes were issued, one in 1817 entitled *The Unedited Antiquities of Attica,* and a second on *Antique Sculpture* in 1835. For these spirited exertions in their behalf, the public have been indebted to a club of some sixty private gentlemen.

DILIGENCE, in the law of Scotland, is a term used in various significations. 1. It means the care incumbent on the parties to a contract with regard to the preservation of the subject matter. 2. The warrants issued by courts for enforcing the attendance of witnesses and the production of writings. 3. The process of law by which person,

lands, or effects are attached either on execution (q.v.) or in security for debt. In the second of these senses, it corresponds to the English *subpœna;* and in the third, generally to execution. The first can scarcely be regarded as a technical meaning.

DILIGENCE, the name given in France to a public conveyance of the nature of a stage-coach. It is a huge, strong-built vehicle, with four broad wheels, weighing about 5 tons, and is drawn by 4 stout horses, at the rate of about 6 miles an hour. It consists of 3 chief compartments: the front, called the *coupé*, for 3 persons; the second, called the *intérieur*, for 6 persons; and, lastly, the *rotonde*, entered from behind, for 6 persons. Aloft in front, is the *banquette*, where the *conducteur* is seated; and behind this, underneath a thick leather covering, passengers are sometimes huddled among luggage and goods, with little regard to their comfort. All the places in the body of the vehicle are numbered, and assigned in the order of booking. Usually an effort is made to be booked early, in order to secure corner-places. In booking, it is customary to pay only a portion of the fare, called *arrhes;* the remainder being paid at the end of the journey. For the arrhes, a receipt or bulletin ought to be given. Without this security, a traveler may be put down half-way and cheated out of his fare, or he may be compelled to pay over again. The driver being concerned only with the horses, the entire management of the vehicle, including the charge of the drag or break, devolves on the conducteur, a trustworthy but most dictatorial personage, dressed in a blue cloth jacket and cap, and having a badge on his breast indicative of his dignity. The greater number of the diligences in France belong to two companies in Paris—the *Messageries Impériales* and the *Messageries Générales.* The system of diligences, however, has been latterly much broken up by railway transit.

DILKE, Sir CHARLES WENTWORTH, 1810–69; a native of London, educated at Cambridge. He assisted his father, the editor of the *Athenæum,* in literary work, and gave much attention to the learned societies. He was a zealous promoter of the great exhibition of 1851, at the close of which the queen offered him knighthood, which he declined. He was one of the English commissioners to the New York exhibition of 1853, and prepared the report upon it. He was also one of the five royal commissioners for the exhibition of 1862. In 1865, he was a member of parliament, and in 1869, representative of England at the St. Petersburg horticultural exhibition. He was knighted by the queen soon after the death of the prince consort.

DILKE, Sir CHARLES WENTWORTH, b. 1843; son of sir Charles Wentworth; an English politician, author, and lawyer; educated at Cambridge. He has traveled extensively in the United States, Canada, and the British countries in the east, and embodied his observations in *Great Britain; a Record of Travel in English-speaking Countries during* 1866–67. In 1868, he was chosen a member of parliament. After his father's death he became the editor of the *Athenæum,* and succeeded to the title. In politics he is a strong republican leader.

DILL, *Anethum,* a genus of plants of the natural order *umbellifera,* having compound umbels without general or partial involucres, the border of the calyx minute but 5-toothed, yellow involute petals, and dorsally compressed lenticular fruit. The COMMON D. (*A. graveolens*) is an annual or biennial plant, which grows wild in corn-fields in the east and in the countries around the Mediterranean, but is quite hardy in Britain. It has from a very early period been in general cultivation as an aromatic, stimulant, and carminative. It has a stem 1 to 4 ft. high, bearing at top a flat umbel of 10 to 30. rays; the leaves much divided, and the final segments thread-like. It has a strong peculiar aromatic smell and taste; the leaves are sometimes used for flavoring pickles, sauces, etc. The fruit (*dill seed*) is used in medicine, chiefly for relief of flatulence and griping in infants, and is administered in the form of *dill water,* in the preparation of which *oil of dill* is employed; a pale-yellow essential oil, on which the properties of the plant depend, and which is obtained by distillation.—SOWA D. (*A. sowa*) is a native of Bengal, and is much cultivated in the East Indies for its fruit, which is variously used in medicine and flavoring. It is a common ingredient in curries. The plant much resembles common D., but its flavor is stronger.

DILLEN, or DILLENIUS, JOHANN JAKOB, 1687–1747; a German botanist, educated at Giessen. He went to England in 1721, and was a co-laborer with William Sherard, the most eminent English botanist of the time. In 1728, he was appointed professor of botany at Oxford. He wrote many works upon his favorite themes, some of which received high praise from Linnæus.

DILLENIA'CEÆ, a natural order of exogenous plants, consisting chiefly of trees, shrubs, or half-shrubby plants, natives of tropical and subtropical regions, allied to the natural order *ranunculaceæ* (q.v.), but very different in general habit, and also to *magnoliceæ,* which in habit they more resemble. They have usually alternate leathery leaves, without stipules. The flowers are sometimes solitary, sometimes in racemes or panicles; the calyx of 5 persistent sepals; the corolla of 5 deciduous petals. The stamens are numerous. The fruit consists of 2 to 5 distinct or coherent, dry or succulent, carpels. The seeds have an aril. Astringency is a general property of the order; and a number of species are used as vulneraries and for other medicinal purposes in their native countries. Some species of *dillenia* are large trees, and afford excellent timber.

The young calyces of *D. scabrella* and *D. speciosa* have a pleasant acid taste, and are used in curries, and the fruit of *D. speciosa*, although very acid, is eaten with sugar; the juice, mixed with water, is employed in India as a cooling beverage in fevers. The fruit of *D. elliptica* is used to make a sauce for fish in Amboyna. Many of the plants of this order are remarkable for the magnificence both of their foliage and their flowers. It contains about 200 known species.

DIL'LINGEN, a t. in Bavaria on the Danube, 24 m. n.w. of Augsburg; pop. '75, 5,029. Its principal buildings are the royal palace, the royal gymnasium and Latin school, two Episcopal seminaries, a Capuchin monastery, a Franciscan nunnery, a deaf and dumb asylum, and some fine churches. The principal occupations are ship-building, the shipping trade, and the manufacture of paper, cloth, and cutlery. The place was taken by the Swedes in 1632 and 1648, by the Austrians in 1702, and by the French in 1800.

DILLMANN, CHRISTIAN FRIEDRICH AUGUST; b. 1823; a native of Würtemberg, educated at Tübingen. In 1854, he was appointed professor of oriental languages at Kiel, and in 1864, he accepted a call as professor of theology at Giessen. In 1869, he succeeded Hongstenberg in the university of Berlin, as professor of Old Testament exegesis. He is noted chiefly for researches in the Ethiopic language, of which he has published a grammar, dictionary, and other works.

DILMAN', a t. of northern Persia, in the province of Azerbijan, 50 m. n.n.w. of Urumiyah, and 10 m. w. of the northern extremity of the lake of that name. It is of considerable extent, has clean streets, and is surrounded by gardens and orchards. D. is a new town; the former town of the same name, distant about 4 m., is now in ruins. It is described by St. Martin as a very ancient Armenian city, and the large plain in which it was situated is still inhabited by Armenians, Catholics, Nestorians, etc. Pop. of D. estimated at 15,000.

DILUENTS (Lat. *diluo*, I dilute), medicines whose purpose is to dilute the blood, and increase the quantity of the excretions generally. The simplest and best of diluents is water; but all watery fluids, such as lemonade, soda-water, beer, infusions or ptisans, tea, etc., may be regarded as coming under this designation. See DEMULCENTS.

DILU'VIUM, a term formerly given by geologists to those strata which they believed to have been formed by the deluge, and more particularly to the bowlder clay. The altered opinions as to the origin of these beds have caused the word to fall into disuse. When the adjective—diluvial—is employed by modern writers, it is to characterize those accumulations of gravel or angular stones which have been produced by sudden or extraordinary currents of water.

DI'MA, a large t. of Abyssinia, in the state of Amhara, on an affluent of the Abai, 150 m. s.s.e. of Gondar. The houses are mostly of stone, and the church is one of the largest edifices in Abyssinia. The town is divided into many quarters by stone walls.

DI'MAN, JEREMIAH LEWIS, D.D., b. R. I., 1831; a graduate of Brown university and Andover theological seminary. After traveling abroad, he was settled over the First church (Congregational), Fall River, and in 1856, over the Harvard church in Brookline, Mass. He was appointed to the chair of history and political economy in Brown university in 1864.

DIME, the tenth part of a U. S. dollar (see DOLLAR), and equal to about fivepence English.

DIMENSION. In geometry, a line, whether straight or curved, has only one dimension, or measurement—namely, length; a surface has two—length and breadth; and a solid has three dimensions—length, breadth, and thickness, or depth. These three measurements or dimensions determine all forms of extension.—In algebra, the term dimension is applied in much the same sense as *degree*, to express the number of literal factors that enter into a term. Thus, x^2, xy, $2ab$, are all of two dimensions, or of the second degree; x^3, x^2y, abc $\frac{a^2bc}{d}$, are of three dimensions, etc.

DIMIDIA'TION, in heraldry, a mode of marshaling arms, adopted chiefly before quartering and impaling according to the modern practice came into use, and subsequently retained to some extent in continental though not in English heraldry. It consists in cutting two coats of arms in half by a vertical line, and uniting the dexter half of the one to the sinister half of the other. Coats of husband and wife were often so marshaled in England in the 13th and 14th centuries. Mr. Planché traces the double-headed eagle of the German empire to a dimidiated coat, with half an eagle for the eastern, and another half for the western empire.

DIMINU'ENDO (Ital. diminishing), a term in music, having reference only to the power of the sound, and in no way affecting the *tempo*, as many think. D. can be applied to a single note, when it is a long note, as well as to a passage of many notes. D. is so nearly of the same meaning as decrescendo, that it is frequently marked with the same sign, thus 

DIMINU'TIONS, a word sometimes used in heraldry for differences, marks of cadency, and brisures, indifferently.

DIMINUTIVES are forms of words, chiefly of substantives, in which the primitive notion has become lessened or diminished, as *hillock=a little hill*. With littleness is associated the idea of neatness, and also of needing protection; hence D. are used as terms of endearment; sometimes they imply contempt. There is perhaps no language without D.; and the most common method of formation is by the addition of a syllable. This, however, is not the only method; *tip* from *top*, by attenuating the vowel, and *kid* from *goat*, are as genuine D. as *hillock*. The commonest of the English diminutive affixes are *ock*, *kin*, *el* or *le*, which are of Gothic origin, and *et* or *let*, of classical origin; as in *bullock*, *lambkin*, *kernel* (little corn), *lancet*. According to Dr. Latham, the termination *ling*, or rather *ing*, was originally patronymic; "Ida was the son of Eoppa," was expressed in Anglo-Saxon by *Ida wæs Eopping*. From the notion of the filial relation, the transition is easy to that of littleness and endearment, as in *darling*, *duckling*. Contempt predominates in *shaveling* (a monk) and others.

D. often occur in proper names; *Perkin* is the diminutive of *Peter*, *Jenkin* of *John*. These have settled down into permanent and distinct names; but in the language of fondness and familiarity, *Charles* becomes *Charley*, *John*, *Johnny*, etc. In Lowland Scotch, this form of diminutive is not confined to proper names, but is applied to every object, animate or inanimate—*laddie*, *horsie*, *wifie*, *firie*. Sometimes one diminutive affix is joined to another, as *lassock*, *lassockie;* and in expressions like *a wee*, *wee bit horsikie*, the diminution is carried to the fifth degree. It is principally in the mouths of the people and in friendly familiarity that these diminutive forms are most common; and some languages and dialects are rich in them beyond others. Italian is remarkable in this respect, especially the Tuscan dialect: *casa*, house, becomes *casarella*, little house, and *casarellina*, pretty little house; from *fratello*, brother, which is itself a diminutive of the Lat. *frater*, children, it is said, may be heard forming such fond names as *fratellinucciettinetto*. The affectionateness and bonhomie of the Germans expresses itself largely in this form; *vater*, father, becomes *väterchen*, dear father; and even the pronoun *du*, thou, is made into *duchen*, and *duli*.

D. are not confined to nouns: *whitish* is the diminutive of the adjective *white;* and *tipple*, *scribble*, *dandle* are examples of diminutive verbs. Opposed to D. are AUGMENTATIVES, which abound in the Romanic languages, especially in Italian, and express not only largeness, but coarseness and vulgarity; *casotia* is a large house; *cavallaccio*, a worthless horse. Our word *balloon*, which is of foreign origin, is of this form, and means a large ball. Such words as *drunkard*, *braggart*, *buzzard*, seem to be genuine English augmentatives.

DIMITY, a stout figured cotton-fabric, used chiefly for bed-hangings. The figure or stripe is raised on one side, and depressed on the other, so that the two faces present reversed patterns. D. is commonly white, or of a single color; but variegated dimities are now made, the pattern and the ground being of different colors.

DIMORPHOUS (Gr. *dis*, twice; *morphe*, shape or form) is the term applied to a substance when it exhibits the property of crystallizing in two distinct forms or systems. See CRYSTALLOGRAPHY. Thus, sulphur, as found crystallized naturally, and as obtained by the spontaneous evaporation of its solution in bisulphuret of carbon, or in chloride of sulphur, presents itself in crystals of the form of octohedra, with a rhombic base, and thus belongs to the *prismatic system;* but when sulphur is heated to fusion, and then slowly cooled, prismatic crystals of an amber color are obtained, which belong to the *oblique system*. The latter form of sulphur is not permanent, and the crystals gradually become opaque, and pass into the form of numberless octohedra. In their turn, the octohedral crystals, when kept at a temperature of 230° F. for some time, pass into the prismatic form. Carbon is another illustration of *dimorphism*. Thus, carbon crystallizes in the diamond in the regular system as the octohedron and allied forms; while in the condition of graphite or black lead (q.v.), as obtained by the cooling of its solution in fused cast-iron, it is in the form of hexagonal crystals belonging to the rhombohedral system. Carbonate of lime and iodide of mercury are also good examples of dimorphism; and some substances, such as the sulphate of nickel, sulphate of zinc, seleniate of nickel, and the seleniate of zinc, crystallize in three different systems, and are thus *trimorphous*.

DI'NABURG, a fortified t. and important military station in Russia on the Dwina, reached by the St. Petersburg and Warsaw railroad, 120 m. s.e. of Riga; pop. '69, 29,613. It has many manufactories, and a flourishing trade.

DINAGEPORE', the district of the below mentioned city, stretches in n. lat. from 24° 53′ to 26° 38′, and in e. long. from 88° 2′ to 89° 16′, containing 4,126 sq.m., and '71, 1,501,924 inhabitants. The country is flat, its only eminences being mere undulations; and, from the proximity of the Himalayas, the whole tract is little but a net-work of water-courses, many of the channels, however, becoming periodically dry. The winds are more variable than is usual elsewhere in India, and hail-stones are occasionally of such weight as to kill men and cattle. Rice is the principal crop, and fish are singularly plentiful.

DINAGEPORE', a city of the province of Bengal, with '71, 13,042 inhabitants, stands 261 m. to the n. of Calcutta, in lat. 25° 34' n., and long. 88° 38' east. It is watered by an offset of the Attree, called the Purnabada, which, through the Mahanunda, enters the Lower Ganges from the left. The place is devoid of architectural pretensions.

DINAN, a very old t. of France, in the department of Côtes-du-Nord, on the Rance, 30 m. n.w. of Rennes, and 14 s. of St. Malo. The situation of D., on the summit of a steep hill of granite, and with the Rance flowing through a valley 250 ft. below, is romantic in a high degree. It is surrounded by old walls, pierced by four gates, and was formerly defended by a strong castle, part of which has been converted into a prison. In the older district, the streets are crooked, narrow, and steep, many of the buildings being crazy constructions of wood; but in some parts, its overhanging houses, and arcades resting on carved granite pillars, present many picturesque architectural features, attractive to the antiquary and the artist. The cathedral of St. Sauveur is a beautiful ornate edifice, built in the Romanesque style, containing the heart of the famous French warrior Bertrand du Guesclin. D. has manufactures of fine linen and of sail-cloth, of cotton and woolen goods, beet-root-sugar, etc. It has also some barge-building yards, and, owing to its position near the mouth of the Rance, has a good coasting and inland trade. Pop. '76, 7,978. A few miles off lies the village of Corseult, built on the ruins of the capital of the ancient Curiosolitæ. In the fields round about the village are still occasionally found ancient utensils, Roman coins, and traces of a temple dedicated to Mars.

DINANT, a t. of Belgium, in the province of Namur, 14 m. s. of the city of that name. It is situated on the Meuse, in the midst of extremely picturesque scenery. The most noteworthy buildings of D. are the church of Notre Dame, an ancient and richly decorated Gothic structure, and the town-house, once the palace of the princes of Liége. D. his several salt-refineries, mills for sawing marble, some quarries of which are worked in the vicinity, paper-mills, breweries, and tanneries. It has also manufactures of woolen stuffs, paper, hats, cards, and cutlery. The gingerbread of D., composed of rye-flour and honey, is famous, and has an extensive sale. Pop. '70, 1,600. D., which dates from the 6th c., has suffered greatly from frequent sieges. In 1466, Philip, duke of Burgundy, attacked it with a strong force, and, when the town was taken, in retaliation for the hanging of the messengers whom he had sent to summon the town to surrender, he ordered 800 of the inhabitants to be tied in couples, back to back, and cast into the Meuse. At this time, also, the town was burned, and the walls leveled.

DINAPORE', an important military station in the Indian province of Behar, stands on the right bank of the Ganges, 10 m. above Patna, in lat. 25° 37' n., and long. 85° 7' east. The barracks are spacious and elegant; and the pop.—exclusive of a garrison of between 14,000 and 15,000—numbers (1871) 27,914. In the mutiny of 1857, D. acquired an unenviable notoriety. On 25th July, nearly eleven weeks after the commencement of the outbreak, the native troops, consisting of three regiments, rose against their officers, and that in the presence of a European force, which, if well handled, was as able, as it was ready, to crush them. After escaping with comparatively little loss, the insurgents clinging instinctively together, carried on a desultory warfare on their own account with various success. See ARRAH.

DINAR'CHUS, the orator, son of Sostratus, b. Corinth, 361 B.C. At 25 he was a writer of speeches for the law courts. He had been a pupil of Theophrastus, and early gained oratorical repute. In 324 B.C., he wrote three or more of the speeches in the case of the prosecution of nine men for taking bribes from Harpalus, the fugitive treasurer of Alexander. The speeches were "Against Demosthenes," "Against Aristogiton," and "Against Philocles."

DINARIC ALPS, that branch of the Alpine system which connects the Julian Alps with the western ranges of the Balcan. It extends in a south-easterly direction, from Mt. Klek, e. of Fiume, to the mouth of the Narenta; and stretching along the borders of the Adriatic, it spreads its ramifications through the greater part of Croatia, Dalmatia, and Herzegovina. The D. A., the highest summits of which are Mt. Dinara and Mt. Prolok, seldom exceed 7,000 ft. in height. The range is principally calcareous.

DINDIGUL', a t. of India, in the British district of Madura, presidency of Madras, at the extremity of a valley of the same name, on a feeder of the Cauvery, 247 m. s.w. of Madras city. It is 700 ft. above the level of the sea, and built on a gentle declivity; the streets are wide, the houses well built, and the bazaar plentifully supplied. The pop. is supposed to be between 6,000 and 7,000, exclusive of the military. The fort is situated on a wedge-shaped mass of gneiss, which rises to a height of 280 ft., perfectly naked, except near the summit, where some stunted trees and shrubs grow on patches of thin soil. The ascent is on the eastern side by a flight of stone steps, the other sides being nearly perpendicular. Near the summit, there is a well of great depth, popularly reputed unfathomable, which yields excellent water.

DINDORF, WILHELM, b. 1802; a German critic and philologist. He was a zealous student of classical literature, and became professor of literary history. He has published critical editions of Demosthenes, Aristotle, Sophocles, Euripides, and Josephus. His editions are held as high authority.

DING'ELSTEDT, FRANZ VON, b. 1814; a German poet, native of Hesse. In 1843, he was librarian to the king at Stuttgart; became superintendent of the royal theater at Munich in 1850, director of the court opera at Vienna in 1867, and director of the city theater there in 1871. His early poems were mainly political. At a late period he wrote *Night and Morning*, and the *House of Barneveldt*, a tragedy. He married Jenny Lutzer, a famous singer.

DINGLE, a seaport, the most westerly town in Ireland, is situated in co. Kerry, in a hollow on the n. side of Dingle bay, near the west end of a mountainous peninsula (30 m. by 7), 39 m. w.n.w. of Killarney. It chiefly consists of one street, and has an antique aspect, some of the present houses having been built in the 16th c., in the Spanish style, with stone balconies, etc. Pop. '71, 2,117. The chief exports are corn and butter to Liverpool. D. was incorporated in 1585. In the 17th c., it had much trade with Spain, exchanging tanned hides, Irish friezes, woolen stockings, salt beef, salmon, and butter, for wines and spices. Dingle bay is an indentation of the sea, on the w. of Kerry, between Brae head, Valentia isle, on the s., and Dunmore head and Blasket isles on the n., from which points, which are 18 m. apart, it runs 24 m. e.n.e., narrowing to 7 miles. The harbor is a landlocked creek in the bay, admitting ships of 300 tons up to the town of D., and forming a pretty safe retreat from the prevalent w. winds of Dingle bay.

DINGO, *Canis dingo*, the native dog of Australia, regarded by some naturalists as a distinct species, by others as a mere variety of *canis familiaris*. It exists both in a wild and in a domesticated state; but there is no good reason for thinking that the wild race has originated from dogs introduced from some other country by man. The domesticated D. is about the size of a shepherd's dog, the wild one is larger. The wild D. is found in all parts of Australia. It is of a tawny color, has a large head, with muzzle somewhat fuller than the shepherd's dog. The ears are short and erect, the tail bushy, but not so bushy as that of a fox. In running, the D., unlike dogs in general, carries the head high, the ears ereet, and turned forward. In a wild state, it does not bark. It is very destructive to the sheep of the colonists, and its delight is to kill as many as possible before proceeding to eat. It is very fierce and courageous, but capable of strong attachments.

DINGWALL, a royal and parliamentary burgh, the county town of the united counties of Ross and Cromarty, in the s.e. of Ross-shire, at the head or s.w. end of the Cromarty firth, 11 m. n.w. of Inverness. In Scandinavian, D. means law or court hill; and in Gaelic, it is called Inverpheoran. It consists chiefly of a long street, and lies low, on what was formerly a swamp, amid rich, fertile, and well-wooded ground, at the entrance to the beautiful valley of Strathpeffer, the famous sulphureous springs of which are five miles to the west. A short canal brings vessels drawing 9 ft. of water up to the town, where there is a station of the Highland railway, and also of the Dingwall and Skye railway. Its prosperity depends on agriculture. Pop. '71, 2,125, many speaking Gaelic, though all understand, and usually speak, English. It unites with Tain, Dornoch, Wick, Kirkwall, and Cromarty in sending one member to parliament. Near to D. is a vitrified fort, on a conical hill, and there are traces of an ancient castle, where the earls of Ross held their courts.

DINICHTHYS (Gr. meaning "terrible fish"), the largest of the fossil fishes of the Devonian formation. Its body, according to Dr. Newberry, was 15 or 18 ft. long, and 3 ft. thick. The jaws were armed with two strong, sharp front teeth, and were also arranged at their joints in such a manner as to act like a pair of shears. This structure has a strong resemblance to the jaws of the lepsidosiren, a living fish, the nearest allied to the reptiles. The head and forepart of the body was covered with large plates.

DINKELSBUHL, a t. of Bavaria, situated on the Wernitz, 44 m. s.w. of Nuremberg. It is an ancient walled town, and was formerly a free city of the empire. It has important manufactures of hosiery, coarse linen, straw-hats, paper, etc.; and a dye-work, brewery, and mills. D. suffered much during the thirty years' war. Pop. '71, 5,213.

DINNER. See MEALS.

DINOC'RATES, a Greek architect of the time of Alexander the great. He applied to the courtiers for an introduction to the Macedonian king, but was put off from time to time with vain promises. Impatient at the delay, he is said to have laid aside his usual dress, besmeared his body in oil in the manner of an athlete, thrown a lion's skin over his shoulders, and, with his head adorned with a wreath of palm branches, and a club in his hand, made his way through a dense crowd which surrounded the royal tribunal to the place where the king was dispensing justice. Amazed at the strange sight, Alexander asked him who he was. He replied that he had come into the royal presence to make known a scheme which would be worthy of the consideration of the greatest monarch in the world. Out on Mt. Athos, a mountain rising like a pyramid to a height of 6,780 ft., topped with a cone of white limestone, he proposed to construct the gigantic figure of a man, holding a large city in his right hand, while in his left he held a gigantic tank large enough to contain all the water from the brooks in the peninsula. The story goes that the king was not displeased with the idea, though thinking it impracticable. Alexander, however, was so delighted with the man, and his bold and

daring conceptions, that he carried D. with him on his campaigns against Darius. He was employed by the king to design and lay out the city of Alexandria. The city was founded in 332 B.C., but the untimely death of D. prevented it from assuming the proportions intended by its designer. The Ephesians, whose temple of Diana had just been burnt down, employed him in its reconstruction. But perhaps the most original of all his conceptions was his design for a temple to Arsinoë, wife of Ptolemy II., king of Egypt. The roof of the building was to have been composed of a mass of loadstones, strong enough to hold floating in the air and suspended within the temple an iron statue of the queen.

DINOR'NIS (Gr. *deinos*, terrible or wonderful, and *ornis*, a bird), a genus of large birds of the tribe *brevipennes* (q.v.), of which no species is now known to exist, but of which the bones have been found in New Zealand, in the most recent deposits, in the sand of the sea-shore, in swamps, in the soil of forests, in river-beds, and in caves: and concerning which, along with other large birds nearly allied to them (*palapteryx* and *aptornis*), traditions are still current among the natives, rendering it probable that they continued to inhabit New Zealand, if not to the 18th, at least to the 17th century. The name by which these birds are known in the traditions of New Zealand is *moa*. They are said to have been decked in gaudy plumage, for the sake of which they were objects of pursuit, as well as for their flesh, which was much esteemed. They are also described as having been stupid, fat, and indolent birds, incapable of flying, living in forests and mountain-fastnesses, and feeding on vegetable food. With all this, the inferences deduced from their bones by comparative anatomists perfectly agree. These bones are not properly fossil or mineralized, but retain great part of their animal matter. It is even thought not impossible that some of the smaller species of D. may yet be found alive; of the larger ones, this can no longer be hoped. And these much exceeded in size any existing bird, some of the bones being at least twice the size of those of the ostrich; but the body seems to have been more bulky in proportion, and to have more resembled that of the dodo, although the legs were long, and *D. giganteus* must have stood at least ten feet and a half in height. The frame-work of the leg is the most massive of any in the class of birds, and the bones are remarkable for the solidity of their structure. The toe-bones of *D. elephantopes* almost rival those of the elephant.

The number of bones of D. which have been found is great; several species have been distinguished, and an almost complete restoration of skeleton has been effected. The first bone ever seen by a naturalist—a bone of the leg—was brought under the notice of prof. Owen in 1839; and it is worthy of being borne in mind, that from that one bone he assigned to the D. its true place in the system of nature, and pointed out some of the most important characters which are now most fully proved to have belonged to it.

DINOSAU'RIA (Gr. terrible or wonderful lizards), an order of extinct lizards, which are found in the lias, oolite, and wealden, and disappear in the lower cretaceous beds. They were gigantic reptiles, with a structure approaching nearer to the mammalian type than any other of their class. Their bodies were supported, at a considerable height, on four strong limbs, and the sacrum was composed of five amalgamated vertebræ. The principal genera are megalosaurus (q. v.), iguanodon (q.v.), and hylæosaurus (q.v.).

DINOTHE'RIUM (Gr. terrible or wonderful beast), a remarkable extinct animal, the cranial bones of which are found in the miocene formations of Germany, France, etc. The animal was provided, like the elephant and the walrus, with a pair of long tusks; but these projected from the end of the lower jaw, which is deflected downwards, at a right angle to the body of the jaw. In addition to the two tusks, there were five double-ridged grinders on each side of both jaws. The nasal cavity is large, apparently supplying attachment for a trunk, as in the elephant. No body or limb bones have yet been found so associated with those of the skull, as to show that they belonged to the same animal. Hence the true position of the D. has not been satisfactorily determined. Cuvier and Kaup have referred it to the neighborhood of the tapir, supposing it to have been an inhabitant of large lakes. De Blainville, on the other hand, makes it a herbivorous cetacean, like the manatee.

DINWIDDIE, a co. in s.e. Virginia, between the Appomattox and Nottaway rivers, crossed by the Atlantic, Mississippi, and Ohio, and the Petersburg and Weldon railroads; 540 sq.m.; pop. '80, 35,375—20,329 colored. It has a rolling surface and good soil, producing tobacco, corn, etc. Co. seat, Dinwiddie Court-house.

DINWIDDIE, ROBERT, 1690–1770; native of Scotland; lieutenant-governor of the Virginia colony, 1752–58; in the latter year he returned to England. He appointed Washington adjutant-gen. of one of the military districts of the colony, and also commissioned him to remonstrate with the French gen. on the Ohio, for invading British possessions. Dinwiddie's arrogance and peculiar ideas concerning his own importance made him very unpopular. When he left the country he was suspected of having appropriated for his own use $100,000 of the public money.

DIOCESAN is a bishop viewed in relation to his own clergy or flock.

DIOCESAN COURTS. See CONSISTORY and COMMISSARY.

DI'OCESE (Fr., from Gr. *dioikesis*, administration; and *dioikeo*, to govern), the territory over which a bishop exercises ecclesiastical jurisdiction. The term occurs as early as the time of Cicero, as the special designation of districts in Asia Minor. In the organization of the Roman empire introduced by Constantine the great, the designation diocese was applied to the larger divisions, which were subdivided into provinces. About the middle of the 5th c., the dioceses of the empire were the East, Egypt, Asia, Pontus, Thrace, Macedonia, Dacia, Illyria, Italy, Africa, Gaul, Spain, and Britain. The dioceses were governed some by prefects, some by proconsuls, and others by vicars. The provinces were under rectors. The government of the Christian religion, as established by Constantine, was in so far adapted to this division, and the term diocese and others passed over to ecclesiastical matters. At first, a diocese meant the collection of churches or congregations under the charge of an archbishop. The name came afterwards to be applied to the charge of a bishop, which had previously been called a parish. England and Wales are divided ecclesiastically into two provinces, viz., Canterbury and York, the former being presided over by the primate of all England and the latter by the primate of England; each of which is subdivided into dioceses, and these again into archdeaconries, rural deaneries, and parishes. A diocese is synonymous with the see of a suffragan bishop.

DIOCLETIA'NUS, VALERIUS, b. in humble life near Salona, in Dalmatia, 245 A.D., inherited from his mother, Dioclea, the name of Diocles, which he afterwards enlarged into D., and attached as a cognomen to Valerius, a name of the most patrician associations. He adopted a military career, and served with distinction under Probus and Aurelian, accompanied Carus on his Persian campaign, and finally, on the murder of Numerianus having been discovered at Chalcedon, he was proclaimed emperor in 284 by the army on its homeward march. The suspected assassin of Numerianus, the prefect Arrius Aper, he slew with his own hands, in order, it is alleged, to fulfill a prophecy communicated to him, while still a lad, by a Druidess of Gaul, that he should accede to a throne as soon as he had killed an *aper* (wild-boar). In 285, D. commenced hostilities against Carinus (the joint-emperor along with the deceased Numerianus), who, although victorious in the decisive battle that ensued, was murdered by his own officers, thus leaving to D. the undisputed supremacy. His first years of government were so molested by the incursions of barbarians, that, in order to repel their growing aggressiveness, he took to himself a colleague—namely, Maximianus—who, under the title of Augustus, became joint-emperor in 286. D. reserved for himself the charge of the eastern empire, and gave the western to Maximian. Still the attacks of the barbarians continued as formidable as ever. The empire was menaced by the Persians in the e., by the Germans and other barbarians in the w.; and in order to provide for its permanent security, D. subjected it to a still further division. In 292, Constantius Chlorus and Galerius were proclaimed as Cæsars, and the distribution of the Roman empire was now fourfold: D. taking the e., with Nicomedia as his seat of government; Maximian, Italy and Africa, with Milan as his residence; Constantius, Britain, Gaul, and Spain, with Trêves as his headquarters; Galerius, Illyricum, and the entire valley of the Danube, with Sirmium as his imperial abode. It was upon his colleagues that most of the burden of engaging actively in hostilities fell, as D. seldom took the field in person. Among the conquests, or rather re-conquests, that were made under his rule, may be enumerated that of Britain, which, after maintaining independence under Carausius and Allectus, was, in 296, restored to the empire; that of the Persians, who were defeated, and compelled to capitulate in 298; and that of the Marcomanni, and others of the northern barbarians, who were driven beyond the Roman frontier. D., after 21 years' harassing tenure of government, desired to pass the residue of his days in tranquillity. On the 1st of May, 305, accordingly, he abdicated the imperial throne at Nicomedia, and compelled his colleague, Maximian (much against the latter's will), to do likewise at Milan. D. sought retirement in his native province of Dalmatia, and for 8 years resided at Salona (see SPALATO), devoting himself to philosophic reflection, to rural recreation, and to horticultural pursuits. Two years before his abdication, he was instigated by his colleague, Galerius, to that determined and sanguinary persecution of the Christians for which his reign is chiefly memorable. He died in 313

DIODA'TI, JEAN, a Swiss theologian, was b. in Geneva in 1576, He belonged to a noble Italian family, originally of Lucca. His progress in letters was so rapid, that Beza caused him to be appointed professor of Hebrew at the age of 21. In 1608, he became a pastor of the Reformed church, and in the following year, professor of theology. About this period, he endeavored to spread the doctrines of the reformation in Venice and other cities of Italy, but without success. In 1614, he went to Nîmes, where he preached for three years; and in 1618, he was sent to the synod of Dort, to represent the Genevese church. Here his talents were so highly estimated that he was one of the divines appointed to draw up the articles of the synod. He died at Geneva in 1649. D. was a somewhat intolerant Calvinist; but as a preacher, he was eloquent, persuasive, and conscientious. His Italian translation of the Bible appeared in 1607; his French, in 1644. Among his other works may be mentioned his *Annotationes in Biblia* (1607); *De Fictitio Pontificiorum Purgatorio* (1619); and *De Justa Secessione Reformatorum ad Ecclesia Romana* (1628).

DI'ODON (Gr. two-toothed), a Linnæan genus of fishes, now giving its name to a family, *diodontidæ* (*gymnodontes* of Cuvier), of the order *plectognathi*. The fishes of this family have no distinct teeth, but their jaws, which are shaped like the beak of a parrot, are covered with a substance like ivory, formed of the teeth consolidated together. This is reproduced as fast as it is worn away by use, and the mouth is admirably adapted for grinding down the crustaceans and sea-weeds on which these fishes feed. Their flesh is mucous, and that of some is regarded as poisonous. None of them are used for human food. Some of them, particularly of the genera D. and *tetraodon*, have a remarkable power of inflating their bodies by filling their stomachs with air, the stomach being extremely dilatable, and assuming a globular form when distended, whence they have received the name GLOBE-FISH, whilst from the spines, which stand out in all directions, like those of a hedgehog when rolled up, as if for defense of the inflated body, some of them have been designated PORCUPINE FISH. When distended with air, they float in the water with the back downwards but are not incapable of swimming in this position, as was formerly supposed. The *diodontidæ* are fishes of warm seas; one or two species, occasionally wafted by the currents to more northern shores, are among the rarest of British fishes.—The SUNFISH belongs to this family. The name D. has recently—with the effect only of confusion—been given to a new genus of cetaceous animals, of which one very rare species has occurred on the British coast.

DIODO'RUS, SICULUS, a Greek historian, was b. at Agyrium, in Sicily. Little is known of his life beyond what is told by himself. He lived in the times of Julius and Augustus Cæsar, traveled in Asia and Europe, and lived a long time in Rome, collecting the materials of his great work, the compilation of which occupied thirty years. This work, the *Bibliotheca* or Library, was a history of the world, in forty books, from the creation to the Gallic wars of Julius Cæsar. It was divided by the author into three parts—the first of which, in six books, comprises all the Greek and foreign myths down to the Trojan war; the second, in eleven books, contains the history from the year 1184 B.C. to the death of Alexander the great; the third, in twenty-three books, continues the narrative of events from that date to the year 60 B.C. Of the *Bibliotheca*, the first five books are extant entire; the next five books are wholly lost; the next ten are complete; and of the remainder of the work, considerable fragments have been preserved. Had D. possessed any powers either of criticism or of arrangement, his work would have been of the greatest importance; but he was in both respects so deficient, that his history has no practical value beyond what belongs to an immense mass of raw, and now scarcely available material. His narrative is colorless and monotonous, and his diction, generally clear and simple, holds a sort of middle place between the pure Attic and the colloquial Greek of his time. The best editions of D. are Wesseling's (Amst. 1746), the Deux-ponts (1793–1801), and Dindorf's (Leip. 1828–31).

DIŒ'CIOUS (Gr. *dis*, twice; and *oikion*, a habitation), in botany, a term applied either to plants or flowers, when not only the flowers but the individual plants are unisexual—i.e., when male and female flowers are produced upon separate plants. D. plants form a distinct class in the Linnæan sexual system; but in thus placing them apart, if the principle of arrangement had been strictly maintained, great violence would often have been done to natural affinities; D. species frequently occurring in genera and families usually *monœcious* (q.v.) or *hermaphrodite*, and also monœcious and hermaphrodite species in those which are usually diœcious. Familiar examples of D. plants may be seen in most species of willow. Amongst cultivated plants, hemp, spinach, and the date-palm may be instanced.

DIOG'ENÉS, the cynic philosopher, was a native of Sinope, in Pontus, where he was born about 412 B.C. His father, Icesias, or Icetas, by name, and a banker by occupation, was convicted of having swindled, and so the young D. had to leave Sinope. His youth had been that of a spendthrift and a rake; but on coming from Sinope to Athens, he became interested in the character of Antisthenes, by whom, however, his first advances were repelled. In spite of his inhospitable reception, D. renewed the attempt to find favor with Antisthenes; but though often driven away by blows, his perseverance at last prevailed; and Antisthenes, moved with compassion, consented to admit him as a pupil. D., from being an extravagant debauchee, plunged into the opposite extreme of austerity and self-mortification. He would roll in hot sand during the heat of summer; in winter, he would embrace a statue covered with snow. His clothing was of the coarsest, his food of the plainest. His bed was the bare ground, whether in the open street or under the porticoes. His permanent residence (if such it could be called) was a tub, which belonged to the Metroum, or the temple of the Mother of the Gods. His eccentric life did not, however, cost him the respect of the Athenians, who admired his contempt for comfort, and allowed him a wide latitude of comment and rebuke. Practical good was the chief aim of his philosophy; for literature and the fine arts he did not conceal his disdain. He laughed at men of letters for reading the sufferings of Ulysses, while neglecting their own; at musicians who spent in stringing their lyres the time which would have been much better employed in making their own discordant natures harmonious; at savans for gazing at the heavenly bodies, while sublimely incognizant of earthly ones; at orators who studied how to enforce truth, but

not how to practice it. He was seized by pirates on a voyage to Ægina, and carried to Crete, where he was sold as a slave. When asked what business he was proficient in, he answered: "To command men." His purchaser was Xeniades of Corinth; but the slave soon came to rule the master, acquired his freedom, was appointed tutor to the children, and spent his old age as one of the household. It was here that he had his interview with Alexander the great. The king opened the conversation with: "I am Alexander the great," to which the philosopher answered: "And I am Diogenes the cynic." Alexander then asked him in what way he could serve him, to which D. rejoined: "You can stand out of the sunshine." Alexander is said to have been so struck with the cynic's self-possession, that he went away, remarking: "If I were not Alexander, I should be Diogenes." In spite of his early excesses and his subsequent privations, D. lived at Corinth till 323 B.C., when he died, at the age of 90.

DIOG'ENES OF APOLLONIA, flourished in Athens about 460 B.C. He was a pupil of Anaximenes, and a contemporary of Anaxagoras. He believed air to be the source of all being, and all other substances to be derived from it by condensation and rarefaction.

DIOG'ENÉS LÄER'TIUS, the author of a biographical history of the Greek philosophers, seems to have been born at Laerta, in Cilicia, and to have taken his surname from that town. So little is known of his personal history, that the very age in which he flourished is a matter of doubt. By some it is assigned to the end of the 2d, and by others to the middle of the 3d c. after Christ. His name has been kept alive by his *Lives of the Philosophers*, a work which contains a great mass of interesting information regarding the private lives and habits of the most eminent philosophers of antiquity. Though the work is utterly worthless in respect of plan, coherence, or criticism, it yet contains so many piquant anecdotes, and so many valuable quotations from lost works, that Montaigne's wish was perhaps a justifiable one—that instead of one Laertius, we had had a dozen. The best edition of Laertius is that of Hübner, 2 vols. 8vo (Leip. 1828–31).

DIOME'DEA. See ALBATROSS.

DI'OMEDE ISLANDS, a group about the middle of Behring's strait, form, as it were, a number of stepping-stones between the most easterly point of Asia and the most westerly of America. Their names are Fairway, Crusenstern, and Ratamanow; and their central point is in lat. 65° 46′ n., and long. 168° 55′ west.

DIOME'DES, the bravest, after Achilles, of all the Greeks who took part in the Trojan war. His exploits occupy a prominent place in the record of the heroic deeds sung by Homer in the *Iliad*. He vanquished in fight Hector and Æneas, the most valiant of the Trojans; and even Mars and Venus, when they took the field on the Trojan side, were attacked and wounded by him. In the games instituted by Achilles in honor of Patroclus, he gained the prize in the chariot-race, and worsted the mighty Ajax in single combat. Along with Ulysses, he carried off the Palladium, on which the fate of Troy depended. On returning to Argos (to the crown of which he had succeeded after the death of Adrastus), he found that his wife had proved unfaithful in his absence. Leaving home, he went, according to one tradition, to Italy, where he took part with the Trojans against Turnus. Several cities on the southern shores of that country claimed to have been founded by him.

DIOME'DES, son of Mars and Cyrene, king of the Bistones in Thrace. It was this Diomedes, and not the Trojan hero, who fed his mares upon human flesh. After he was slain by Hercules, the mares had the pleasure of eating their master.

DION OF SYRACUSE, 408–353 B.C.; brother-in-law of Dionysius the Elder; an admirer and pupil of Plato. Because of his stern moral character Dion became odious to the king, who banished him, confiscated his property, and gave his wife to another man. Dion made war upon Sicily and defeated the tyrant, but was soon supplanted by the intrigues of Heraclides and again banished. He was recalled soon afterwards, but the people complained of his tyrannical conduct, and he was assassinated.

DION CASSIUS COCCEIA'NUS, a celebrated Greek historian, was b. at Nicæa, in Bithynia, 155 A.D. He held various high offices of state under the Roman emperors, was twice consul, and enjoyed the intimate friendship of Septimius Severus. He is best known by his *History of Rome*, in 80 books, of which only 18 (from the 36th to the 54th) have reached us complete. The others are only known to us from fragments and abridgments. His high position gave him free access to the national archives, and as an authority on some points, especially on the imperial epoch of Roman history, his work is not without very considerable value. He wrote on the model of Thucydides, to whom, indeed, he is far inferior, both in vigor of judgment and acuteness of criticism; yet many passages of his History might be quoted as among the best samples of the rhetoric of the age in which he lived. D. died at Nicæa, but the date of his death is not known. The best edition of his History is that of Sturz (Leip. 1824–43).

DION CHRYSOSTOMUS (Golden-mouthed), an eminent Greek rhetorician, was b. at Prusa, in Bithynia, towards the middle of the 1st century. His father, Pasicrates, paid great attention to his education, which was also enriched by travel. D., after residing for some time in his native town, came to Rome, where, however, he had the mis-

fortune to excite the suspicion of the emperor Domitian, and was in consequence obliged to flee. On the accession of Nerva, 96 A.D., he returned to Rome, and was honorably received. Nerva's successor, Trajan, held D. in the highest estimation, even permitting him to ride beside himself in the imperial chariot. His excellent disposition procured him many friends, while his remarkable powers of oratory excited universal admiration. He died at Rome about 117 A.D. D. left a very great number of orations, of which 80 are still extant in whole, with fragments of 15 others. They discuss questions in politics, morals and philosophy, and are written in pure Attic Greek. According to Niebuhr, he was "the first writer after Tiberius that greatly contributed towards the revival of Greek literature." Good editions of D.'s orations are those of Reiske (Leip. 1784), Emperius (1844), and L. Dindorf (1857).

DIONÆA, a very curious and interesting genus of plants of the natural order *droseraceæ*, having a 5-partite calyx, 5 petals, 10 to 20 stamens, and one style, with 5 closely united stigmata. Only one species is known, *D. muscipula*, sometimes called VENUS'S FLY-TRAP and the CAROLINA CATCHFLY PLANT. It grows in marshy places in the warmer parts of North America, as far n. as North Carolina, and is a perennial plant, with a rosette of root-leaves, from the midst of which arises a leafless stem (scape) about 6 in. high, terminating in a corymb of white flowers. It is remarkable for the irritability of its leaves. The leaf-stalk is elongated, winged, and leaf-like, and bears at its extremity an orbicular leaf, set round at the margin with stiff hair-like "spines," and having on its upper surface many small glands, and three delicate irritable hairs on each side, so placed that an insect can hardly traverse the leaf without touching one of them, when the two sides of the leaf immediately fold together upon it, and lay hold of it, the marginal bristles crossing one another, and preventing the possibility of escape. The leaf does not open again till the whole substance of the insect has been absorbed by the plant, and nothing but the skeleton of the captive remains. For this purpose, the plant exudes a secretion of a character somewhat similar in its digestive properties to pepsine; and under the influence of this, the material of the insect capable of yielding nourishment to the plant, is digested, and ultimately absorbed by the same glands that secreted the fluid. This process of digestion and absorption sometimes occupies three weeks.—See *Insectivorous Plants*, by Charles Darwin (1875).

DIONYSIA, feasts of Bacchus, celebrated especially in Attica. The lesser Dionysia were held in country places in Dec., when the vine was grown. There was a vintage festival, songs, dances, impromptu plays, a phallic procession, and rustic sports. The greater Dionysia were held in Athens in Mar., as a festival of joy for the departure of winter and the promise of summer. The ancient image of the god was conveyed from one sanctuary to another, with a chorus of boys and a procession wearing masks and singing odes. The festival culminated in tragedies, comedies, and satiric dramas, in the great theater of Dionysus.

DIONYSIUS, THE AREOPAGITE, is mentioned in the Acts of the Apostles (chap. xvii., verse 34) as one of the few persons in Athens converted to Christianity by Paul. A history has been invented for him by the church. It is said that he was in Egypt when the crucifixion happened, and observing the eclipse that accompanied it, exclaimed: "Either God himself is suffering, or he sympathizes with some one who is suffering." At the time when Paul visited the metropolis of Greece, D. was a member of the council of the Areopagus, whence his name. Tradition also declares that the apostle installed him as the first bishop of Athens, and that he suffered the fate of a martyr. The writings which are falsely current under his name treat of such topics as the heavenly hierarchy, the names of God, the ecclesiastical hierarchy, etc. Their theology is of the mystical kind. The style, contents, and historic allusions clearly indicate that the author of these writings could not have flourished before the close of the 5th c., and, in fact, the writings first made their appearance in the 6th century. Dazzling neoplatonic phantasies concerning the divine essence, angels, and holy spirits, splendid descriptions of the ceremonies of the Catholic worship, glorifications of the priestly hierarchy, panegyrics on monastic life, and mystical interpretations of church doctrine, made the works immensely attractive, especially to the Greek monks, whose manner of life was preeminently contemplative. According to a recent hypothesis, the so-called writings of D. are the composition of some Christian Platonist, who, in opposition to the not yet wholly extinguished Gnosticism, sought to incorporate with Christianity the forms, ideas, and ceremonies of the Dionysian (Bacchic) mysteries. The translation of the work into Latin by Scotus Erigena, in the dawn of the middle ages, gave a new impulse to monasticism in the western church, and may be almost said to have created its mystic theology. The *Areopagitic theology* was, in fact, the name given during the middle ages, and even as late as the 18th c., to that mystical method of apprehending religious truth made current by the writings ascribed to D., and afterwards formally introduced into Latin Christianity by Hugo St. Victor in the 12th century. This theology proceeds upon the principle, that the divine spirit is indispensable even to the understanding of man.

DIONYSIUS, THE ELDER, tyrant of Syracuse, was b. 431 or 430 B.C. He was originally a clerk in a public office, but manifested at an early period a passion for political and military distinction. When the Agrigentines, after the conquest of their city by

the Carthaginians, accused the Syracusan generals who had failed to relieve them of treachery, D. supported their accusations before the people of Syracuse, and induced the latter to appoint new commanders, of whom he himself was one. But in a very short time he supplanted his colleagues also, and, when only 25 years of age, made himself, by the help of his mercenaries, absolute ruler of the city. To strengthen his "tyranny" (the name given by the Greeks to any *usurped* authority, however wisely and beneficently exercised), he married the daughter of Hermocrates, the late head of the aristocratic party, and thus attached the followers of that leader to himself. After he had fiercely suppressed several insurrections, and conquered some of the Greek towns of Sicily, he made preparations for a great war with the Carthaginians. It broke out 397 B.C. At first, fortune favored D., but after a short time he suffered a series of reverses, so calamitous, that all his allies abandoned him, and he was shut up in the city of Syracuse, apparently without hope of escape. When he was about to fall a victim to despair, a pestilence broke out in the Carthaginian fleet. D. took courage, and suddenly attacking his enemies by land and sea, obtained a complete victory. In the years 393 and 392 B.C., the Carthaginians renewed hostilities, but were defeated on both occasions, and D. was enabled to conclude a most advantageous peace. He now turned his arms against lower Italy, and in 387 B.C., after a siege of 11 months, captured Rhegium. From this time he continued to exercise the greatest influence over the Greek cities of lower Italy, while his fleets swept the Tyrrhenian and Adriatic seas. But D. was not contented with the reputation of being the first warrior and statesman of his age; he wished to shine as a poet also. He even ventured so far as to contend for the prize at the Olympic games, and about the end of 388 B.C., sent thither a splendid embassy, comprising the best reciters of the time, whose utmost skill, however, could not induce the judges to decide in his favor. D. was more successful at Athens, where he several times obtained the second and third prizes for tragedy, his last production even obtaining the first. He also invited many poets and philosophers to his court, his treatment of whom, however, was not always courteous. In 368 B.C., he renewed the war with the Carthaginians, whom he wished to drive out of Sicily altogether, but died in the following year, before he could accomplish his design. It was rumored that his death was hastened by his physician, at the instigation of his son. D. was unquestionably a most vigorous ruler, but unscrupulous as to the means he employed to secure his ends, and tormented in his last years by the suspicion that he was surrounded with traitors.

DIONYSIUS, THE YOUNGER, son of the preceding, celebrated his entrance into public life, 367 B.C., by a splendid festival, which lasted ninety days. His political education had been designedly neglected by his father, and in consequence he grew up an indolent, pleasure-loving, and dissolute prince. Dion, a relative of his father, sought to improve him by the instructions of Plato, but his endeavors were frustrated by Philistus, the historian, who disgracefully encouraged the excesses of the youth. Dion was banished, but afterwards returning to Sicily, expelled D. from Syracuse. The latter fled to Locri, the birthplace of his mother, Doris, where he was hospitably received. He repaid the kindness of the Locrians by making himself master of their city, which he ruled despotically for several years. In 346 B.C., the course of events enabled him to return to Syracuse, but he could not firmly re-establish himself. His cruelties drove the citizens to ask the aid of the Corinthians against him. Timoleon was sent to their assistance, and D., shut up in the citadel of Syracuse, was compelled to surrender, 343 B.C. He was brought to Corinth, where he soon squandered the wealth which he had carried away from Sicily, sunk into obscurity, and died in extreme poverty.

DIONYSIUS, OF ALEXANDRIA, SAINT, d. 265 A.D., at Alexandria, where he was born. He was of a noble pagan family, but was an early convert to Christianity, and under the tutelage of Origen became a priest, and chief of the Alexandrian school of theology. In 247, he became a bishop. In the persecution of Decius, about this time, he was arrested and condemned to death, but was rescued by peasants, and remained concealed for a year in the Libyan desert. In 257, he was again exiled, but restored three years later. He was a voluminous writer, but most of his works are lost.

DIONYSIUS, OF HALICARNASSUS, a learned critic, historian, and rhetorician, was the son of one Alexander of Halicarnassus, and was b. probably about the middle of the century before Christ. He came to Rome at the termination of the civil wars, 29 B.C., and resided there for 22 years, familiarizing himself with the language, literature, and antiquities of the Romans. His death occurred shortly after 7 B.C. D.'s most valuable work is unquestionably his *History of Rome*, although it does not exhibit the finest qualities of his mind. The author was an admirable rhetorician, but had very little political discrimination, and no perception of the difference between a myth and a historic fact. Yet, inasmuch as it contains a mine of information about the constitution, religion, history, laws, and private life of the Romans, it will always command the regard of scholars. Of the 20 books of which it originally consisted, we possess only the first 9 in a complete form, the 10th and 11th nearly so; and of the rest, only a few fragments. The first edition of the Greek original was that by Stephens (Paris, 1546), but a very good Latin version was published as early as 1480. Angelo Mai

published (Milan, 1816) a collection of the fragments of the lost books from a MS. in the library at Milan, the genuineness of which has been doubted by Niebuhr. The rhetorical and critical works of D. are of the highest literary merit. The principal are his *Censura Veterum Scriptorum*, his *Ars Rhetorica*, and his *De Compositione Verborum*. The first complete edition of the history (or Archæologia, as D. called it) and rhetorical works was that of Fr. Sylburg (Frankfort, 1586); one of the best is that of Reiske (6 vols., Leip., 1774–77).

DIONYS'IUS, or DENIS, 1261–1325; King of Portugal, son of Alfonso III., whom he succeeded, 1279. He married Elizabeth of Aragon. His reign was wise and just, and the beneficial reforms he instituted gained him the title of "father of his country." He built cities and fortifications, and founded the university of Lisbon, the only one in the kingdom.

DIONYS'IUS EXIG'UUS, a Roman monk of the 6th c., a native of Scythia. He was the compiler of the first regular ecclesiastical code for the western church. He is more widely known in chronology as the founder of the "Dionysian Æra" which was observed by Christians for more than a thousand years. Before this the Christian era had started from the death of Christ; he fixed it as nearly as possible at the time of the birth.

DIONYSUS. See BACCHUS, *ante*.

DIOPHANTINE ANAL'YSIS is that section of the theory of unlimited or indeterminate problems which attempts to find rational and commensurable values answering to certain equations between squares and cubes. This class of problems was first and and chiefly treated of by Diophantus (q.v.), who has given his name to the theory of their solution. We shall not here attempt to explain the nature of the analysis, which is very subtle, and guided by few general rules. The difficulties of the solution of diophantine problems in most cases fail to be overcome by the skill and ingenuity of the analyst. We confine ourselves to stating the following examples of the problems solved by the D. A.: 1. To find 2 whole numbers the sum of whose squares is a square. 2. To find 3 square numbers in arithmetical progression. 3. To find a number from which 2 given squares being severally subtracted, each of the remainders may be a square.

DIOPHAN'TUS, a distinguished Greek mathematician, lived at Alexandria, according to some, about the middle of the 4th c.; according to others, about the close of the 5th. His name first occurs in the life of Johannes Damascenus, written by John, patriarch of Jerusalem, in the 8th century. He is commonly represented as the inventor of algebra, but he himself speaks of that science as known before his time. It is possible he may have been acquainted with Hindu algebra; at all events, according to De Morgan, there is a very great similarity between the Hindu algebra and that of Diophantus. He occupied himself chiefly with the class of problems characterized in the preceding article. Of his valuable work, the MS. of which was discovered in the 10th c., *Arithmetica*, consisting originally of 13 books, only 6 have been preserved. Besides this we possess a book on polygonal numbers. The best edition is that of Fermat (Toulouse, 1670); there is a German translation by Schulz (Berl. 1821).

DIOP'SIS, a genus of dipterous insects of the same great family with the house-fly, remarkable for the prodigious prolongation of the sides of the head, so as to form stalks for the eyes, which are thus removed to a distance from the body of the insect, almost equaling in some species the length of its wings. All the species are found in warm parts of the old world.

DIOP'TRICS is that branch of geometrical optics (see OPTICS) which treats of the transmission of rays of light from one medium into another, differing in kind. It consists of the results of the application of geometry to ascertain in particular cases the action of what are called the laws of refraction. When a ray of homogeneous light is incident upon a surface, the angle which its direction makes with the normal or perpendicular to the surface at the point of incidence is in D., as in catoptrics, called the angle of incidence. The angle which the refracted ray makes with the same line is called the angle of refraction. This being premised, we may state the laws of refraction. 1. The incident and refracted ray lie in the same plane with the normal, at the point of incidence, and on opposite sides of it. 2. The sine of the angle of incidence, whatever that angle may be, bears to the sine of the angle of refraction a constant ratio dependent only on the nature of the media between which the refraction takes place, and on the nature of the light. According to the second law, if we call the angle of incidence i, and that of refraction r, we shall have $\sin i = \mu \sin r$, where μ is a quantity depending upon the nature of the media and of the light. It will have, for instance, a certain value for refraction from vacuum into glass, another from glass into water, and so on; also, it will have one value for red light, another for green, and so on. The quantity μ is called the refractive index, and is greater than 1 when refraction takes place from vacuum into a medium, and in general is greater than 1 when the refraction

is from a rarer into a denser medium, and less than 1 when the opposite is the case. In D., the laws of refraction may be considered as depending for their truth upon experiment; in physical optics, they are deductions from an hypothesis respecting the constitution of light. They are not merely approximately true; they are absolute physical laws.

Before proceeding to consider the simpler leading cases of refraction, one or two interesting propositions in dioptrics require to be explained.—1. If the refractive index for a medium, when light is incident upon it from vacuum, be μ, and the index for another medium, under the same circumstances, be μ', then, when light proceeds from the second medium into the first, the refractive index is $\frac{\mu}{\mu'}$. The proof of this proposition depends upon the two following experimental laws: (1.) If a ray of light proceed from a point to a second, suffering any reflections or refractions in its course, then, if it be incident in the reverse direction, i.e., from the second point, it will follow the exactly reverse course to the first point. This is proved by experiment, but may be accepted as axiomatic. (2.) If a ray pass from vacuum through any number of media, having their faces plane and parallel, when the ray emerges into vacuum its direction will be parallel to that which it had before incidence. To deduce the proposition from these laws, let i be the angle of incidence from vacuum upon the first medium, r the angle of refraction, which will also be the angle of incidence upon the second medium. Also let r' be the angle of refraction into the second medium, which will also be the angle of incidence upon the second bounding surface. By the second of the preceding experimental laws, the angle of emergence into vacuum will be i. Hence we shall have by the first of these laws, $\sin i = \mu' \sin r$ at the first surface, and $\sin i = \mu \sin r'$ at the second. From these equations, we have $\sin r = \frac{\mu}{\mu'} \sin r'$, which proves the proposition. It follows that if μ be the refractive index from vacuum into a medium, that from the medium into vacuum will be $\frac{1}{\mu}$.—2. Our second proposition relates to what is called the *critical angle*. If i be the angle of incidence of a ray within a medium, the refractive index of which is μ, and r the angle of refraction into vacuum, then we have from the former proposition $\sin i = \frac{1}{\mu} \sin r$. From this formula, if i be given, r may be found, and a real value will be given to r so long as $\sin i$ is $\angle \frac{1}{\mu}$; but when i has a value greater than that determined by the equation $\sin i = \frac{1}{\mu}$, the formula fails to give us a value of r, for the sine of an angle cannot be greater than 1. And experiment shows that, in fact, there is no refracted ray when the angle of incidence is greater than that above assigned, the ray being wholly reflected within the medium. The angle of which the sine is $\frac{1}{\mu}$ is called the *critical angle*. For glass, it is about 41° 45′; for water, about 48° 30′. This angle is sometimes called the angle of *total reflection*. In internal reflection at the surfaces of media, the reflected light is more nearly equal in intensity to the incident than in any other case of reflection. While it thus appears that refraction from a denser into a rarer medium is not always possible, it may be added, that it is always possible from a rarer into a denser.

We shall now investigate some simple cases of refraction. 1. And first of refraction at a plane surface. Let DIMN (fig. 1) be any medium bounded by a plane DI, and let R be a radiant point, and RD and RI two incident rays of a divergent pencil proceeding from R to the surface of the medium; then RD being perpendicular to the surface, suffers no refraction, but proceeds along DM within the medium; but RI is refracted in the direction IN, which, produced outwards, meets the normal DF in F. Therefore, a small pencil of rays proceeding from R, and having RD, perpendicular to the surface, for axis, will be refracted into another pencil diverging from the imaginary focus F; for all the rays intermediate between RD and RI will converge very near F when the pencil is small. An eye within the medium, and between N and M, would thus, the pencil being small, see the luminous point R, as if it were at F, or further off than it really is. In the opposite case, in which the luminous point is within the refracting medium, similar reasoning shows that after the rays emerge from the plane surface into the air, they will, if the pencil be small, appear to proceed from an imaginary focus nearer to the surface than the luminous point.

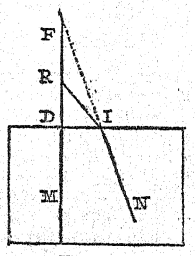

Fig. 1.

2. The case of refraction through a prism, which we are next to consider, is, in fact, the case of refraction through a medium bounded by plane surfaces which are not parallel. Conceive two planes at right angles to the plane of the paper, and making on

that plane the figure BAC (fig. 2). The question is as to the laws of transmission of a ray, SPQR, of homogeneous light through the prism. Draw mn' and $n'n$ perpendicular to the sides. Then $n'PQ$ and $n'QP$ are respectively the angels of refraction at the first, and of incidence at the second surface. Now, as $n'QA$ and $n'PA$ are each of them right angles, and as all the angles in the figure $n'QAP$ are equal to four right angles, it follows that the angles at n' and at A together are equal to two right angles. But the angle at n', together with the angles $n'PQ$ and $n'QP$, are equal to two right angles; therefore must the angles $n'PQ$ and $n'QP$ together be equal to the angle at A. In other words, in refraction through a prism: *The sum of the angles of refraction at the first surface, and of incidence at the second, is equal to the angle contained between the plane sides of the prism.* From this it might be shown, that the deviation of a ray caused by passing through a prism is always towards the thicker part of the prism, if the medium be denser than the surrounding atmosphere. It is a geometrical proposition which the student may solve for himself, that if i be the angle of incidence at the first surface, and e that of emergence at the second, and if α be the angle of the prism, then σ, or the change of direction of the ray in its passage, is obtained from the formula $\sigma = i + e - \alpha$.

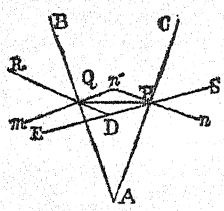

FIG. 2.

3. We now take up the case of refraction at a single spherical surface of a medium denser than the surrounding air. And first, of parallel rays refracted at a convex spherical surface. Let ABQP (fig. 3) be the refracting medium, whose terminating convex surface is spherical, C being the center of the surface, and V its vertex. Let XV be the axis of a pencil of parallel rays, of which any ray, RI, is incident at I. Then, if CIN be a normal, the angle of refraction, CIF, will be less than the angle of incidence, RIN, and the refracted ray will thus turn towards the axis, and meet it at some point, F. When the pencil is small, or the aperture, AVB, of only a few degrees, the rays will clearly nearly all converge to the same point, F. To find the position of F, we have, in the triangle ICF, the angle $CIF = r$, the angle of refraction, and ICF, the supplement of ICV or NIR (by parallel lines), i.e., of i, or the angle of incidence. Therefore, IF is to CF : : sin i is to sin r. And as for a very small pencil, IF may be taken = VF, we have FV : FC : : sin i : sin r, or : : μ : 1. And putting FV = F, the principal focal distance, and VC = R, we have $F = \frac{\mu}{\mu - 1} R$. If the medium be crown-glass, for which the value of μ is $\frac{3}{2}$, we have $F = \frac{\frac{3}{2}}{\frac{3}{2} - 1} R$, or $F = 3R$; i.e., the principal focal distance is equal to three times the radius of the sphere. The student may, by similar reasoning, ascertain for himself the focus of parallel rays incident on a concave spherical refracting surface, as also the focus in the case of a pencil of parallel rays within the medium and emerging from it. The case of a divergent pencil is incapable of such elementary treatment as to justify its insertion here. For branches of the subject treated under separate heads, the reader should refer to the articles CAUSTIC, LENS, and REFRACTION. Under REFRACTION, he will find a table of the values of μ—the refractive index for various media and kinds of light. See also the articles SPECTRUM and CHROMATICS.

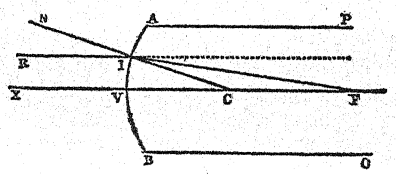

FIG. 3.

DIORA'MA. See PANORAMA.

DIOSCORËA'CEÆ, a natural order of plants, of which the genus *dioscorea* (see YAM) is the type. They are twining shrubs, with large tubers, either above or below ground. They are generally classed with endogenous plants; they are among the *dictyogens* of Lindley. There are about 120 known species. The most important plants of the order are the different species of *dioscorea* or yam (q.v.). Black bryony (q.v.) is its only representative in the British flora. *Testudinaria elephantipes*, a s. African species, sometimes called *elephants' foot*, and *Hottentots' bread*, has a large fleshy rhizome, with a rough cracked bark, which is used as food by the Hottentots in times of scarcity.

DIOSCO'RIDÊS, PEDANIUS, or PEDACIUS, a Greek physician, was a native of Anazarba, or Anazarbus, in Cilicia, and flourished in the 1st or 2d c. of our era. He accompanied the Roman armies as physician through many countries, and collected a great store of information and personal observation on plants. In his great work, *De Materia Medica*, he treats of all the then known medicinal substances and their properties, real or reputed, on the principles of the so-called "humoral pathology." Two other works bear the name of D., but their genuineness is very questionable. During 15 centuries, D. maintained undisputed authority in botany and in materia medica, an authority which he still holds among the Turks and Moors. The best editions

of D. are by Saracenus (Frankf. 1598) and Sprengel (2 vols., Leip. 1829). The *De Materia Medica* has been translated into the Italian, German, French, and Spanish languages. There is also an Arabic translation in MS. in various libraries of Europe.

DIOSCOR'IDES PEDA'NIUS, a Greek botanist of about the 2d or 3d c. after Christ. He traveled far and wide studying plants, and wrote a famous work on their nature and medicinal qualities. The work is still held in high esteem.

DIOSCU'RI, See CASTOR AND POLLUX, *ante*.

DIOSMA. See BUCKU.

DIOSPYROS. See DATE PLUM and EBONY.

DIP, in geology, is the inclination of strata downwards into the earth. The amount or angle of dip is the degree of deviation from a level line, or the plane of the horizon. The point of dip is the point of the compass to which the dip is inclined.

DIP OF THE HORIZON, the angle comprehended between two lines drawn from the point of observation, one horizontal, the other a tangent to the surface of the sea; the apparent angular depression of the visible horizon.

DIPHTHE'RIA, or DIPHTHERI'TIS (Fr. *diphtherite*, from Gr. *diphthera*, a pellicle), a name first applied by M. Bretonneau of Tours, a distinguished French physician, to a form of very fatal sore throat occurring epidemically, chiefly in children, and apt to be confounded both with croup (q.v.) and with malignant sore throat *angina maligna*), as it is found in connection with scarlet fever (q.v.). Diphtheria is distinct from both these diseases, not only in its symptoms, but in the character and position of the morbid changes on the mucous membrane. In croup, there is a pellicular membrane, indeed, but it is almost confined to the air-passages, and centers in the larynx (q.v.); in diphtheria, it usually begins in the pharynx or back of the throat, and often extends down the esophagus, or gullet. Croup is also a much more decidedly inflammatory disease than diphtheria. Malignant or ulcerative sore throat has even less in common with diphtheria; for in the latter there is no ulceration in the majority of cases, the mucous membrane being merely covered over with a more or less thick veil of false membrane; in both affections, however, there is enlargement of the glands behind the ear and in the neck, generally in the neighborhood of the parts internally affected. The throat affection in diphtheria is often accompanied by a very low and dangerous form of fever, with great and rapid loss of the patient's strength, which is still further reduced of course by the inability to take food; in other cases, the disease is fatal by suffocation, and tracheotomy has been performed (in some few instances successfully) to relieve the patient from impending death. After the acute disease is over, the recovery may be delayed by paralytic symptoms of various kinds; or simply by extreme debility, with exhaustion and loss of appetite. Diphtheria was supposed by Bretonneau to be contagious, but it is doubted by many whether the evidence of contagion is sufficient. There is no good evidence of any specific cure. The use of the tincture of muriate of iron in large doses (fifteen to twenty drops frequently repeated) has been recommended; also various disinfectants and caustics applied to the throat, as nitrate of silver, hydrochloric acid mixed with honey, and latterly Condy's disinfecting fluid; but all of these have also frequently failed in the hands of experienced physicians. Diphtheria does not appear to be so much under the influence of known sanitary conditions as other epidemics; at least its modes of origin and diffusion are still extremely uncertain.

DIPHTHERIA, or DIPHTHERITIS (*ante*). This is really a very old disease with a modern name, unfortunate because misleading, and the cause of much inefficient treatment. By many the disease has been regarded as a local more than a general affection, but within the last twenty years thorough study has revealed its nature and causes so that few things are more certain than that it has for many centuries been one of the dangerous diseases of the human race. That its characteristics were always precisely what they now are is not probable, because the sanitary condition of the world centuries ago, when devastating *plagues* swept the face of the earth, would be likely, especially when large numbers of human beings were collected together, to give this disease a more general inflammatory and malignant character. The causes which are now known to produce the disease have always been present wherever the human family has congregated in numbers, and wherever even a few have lived together without regard to cleanliness. It is thought that descriptions of the disease can be traced to a time anterior to Hippocrates (460 B.C.), and there is no doubt of its identity with that described by Aretæus of Cappadocia (100 A.D.), who called it Ulcus Syriacum and also Malum Egypticum. Several other ancient authorities describe it, but during the dark ages little is recorded that is trustworthy. One of the earliest treatises upon it in modern times was by Hecker, who gives an account of an epidemic which prevailed in Holland in 1337. Besides the names given it by Aretæus, it has been called *cynanche maligna*, *cynanche gangrenosa* (cynanche means, literally, "dog-choke"), putrid fever, malignant inflammation of the pharynx, and putrid sore throat. The last name was the one adopted by the celebrated Dr. John Fothergill in his description of the epidemic which appeared in London in 1745. Some have contended that the disease which he described was malignant scarlet fever, but so accurate an observer and great physician as Dr. Fothergill, drawing the distinctions, as he does, between the diseases, could not

have been mistaken. His treatise, published in his works, is in many respects unexcelled. Of course some of the remedies now found most efficient were either not then known, or not obtainable in their best form, but his general treatment was more rational than much of more modern date; indeed it was not greatly different from that which an experienced physician of the present day would employ if limited to the remedies which were then available. The disease is well described by Dr. Samuel Bard of New York, in the first volume of the Transactions of the American philosophical society, in the review of an epidemic which appeared in 1771. The disease did not again attract the special attention of *writers* until 1818, when Bretonneau published his opinions and gave it the name under which it is now generally known, claiming, in his first papers upon the subject that the disease was at first local, and that the constitutional affection resulted from infection propagated by the local disease. The origin of diphtheria was ascribed by Vogel to the development of a microscopic organism, the *oidium albicans*, but this is also largely developed in Thrush, and is present in various diseased conditions of the mouth and throat. The present doctrine is, simply, that the disease is caused by certain disease germs, but what they precisely are has not been determined. This much is certain—D. is a septic disease, never found where no septic origin can be assigned. Feculent matter, passing through stages of putrefication and fermentation, such as obtains in sewers, cess-pools, and vaults of privies, and all manner of conduits or receptacles of waste matter, and the effluvia engendered in piles and masses of garbage, or of human or animal excrement, are the now recognized causes of diphtheria. Wherever these causes are constant, there the disease is constantly developed and is *endemic*. The only apparent exception to this is that at certain seasons of the year putrescent and feculent matter is liable to develop other diseases, when D. may occupy a more or less subordinate place. Again, there may be times when the septic causes are in abeyance; but when they become active, the disease becomes *epidemic* if the air is sufficiently impregnated with the infectious germs. In regard to the question of contagiousness or infectiousness, the following may be said, premising, however, a few words explanatory of these terms. In many respects contagiousness and infectiousness are synonymous, and some writers use only the former word. But there is this difference—such diseases as scarlet fever and small pox are contagious, and they are communicated through the air as well as by contact. There are other diseases which are contagious only by contact, as the itch. It would be more correct to call itch an infectious disease. Most other diseases which are communicated in the same manner are infectious. It appears, therefore, that there is some confusion in the use of the terms, and it is for this reason that some authorities use only the word contagious. But there are two distinct modes, and some diseases are communicated only by one of these modes; and if we desire to express the difference, the employment of the two terms is convenient, but care should be taken to distinguish clearly what idea it is intended to convey. If D. be a communicable disease, but not in the same manner as scarlet fever, we distinguish the difference by calling the former an infectious disease; and that D. has been communicated by contact there is no reasonable doubt. There have been many instances when diphtheritic expectorations have communicated the disease by being projected into the mouth or eyes of the attendant. Bretonneau and others maintained this. It is a matter of dispute as to whether exposure to the air breathed by patients having the disease is capable of communicating it, but the great mass of authority is now on the side of the affirmative. What is the explanation of this disagreement? The poison of D. is a species of ferment, and like many other ferments, it requires a certain quantity to produce a given effect. The contagious virus of small-pox is different; the minutest quantity, when inhaled, or when introduced by vaccination, being sufficient to propagate itself throughout the system, and there seems to be no provision of nature for its elimination until a crisis is reached. The poisonous principles which propagate some other diseases, when taken into the system do not need to ripen before they are again cast out; the excretory action of the animal economy sometimes removes them as fast as they are received. It is because of this conservative power, this action of the *vis medicatrix naturæ*, that mankind, as well as the lower animals, have been enabled to exist. We are all the time taking poisons into our bodies, and it is one of the offices of the various organs to remove them by the various processes of excretion. The poisonous principle of ordinary intermittent fever, if received only in small quantities, is readily disposed of, and the system retained in a healthy condition, but if the malarial poison be absorbed faster than it can be carried away, there results a series of morbid phenomena characteristic of this periodical disease. And so it is, most probably, with diphtheria; if the air of a sick-room be loaded with the effluvia from the breath and perspiration of a person laboring under a violent case of the disease, one who should remain in the room only a few moments, would be likely to receive enough germs of the disease to cause a manifestation of its presence, and if he were to remain a considerable time there would be danger of a serious attack. On the contrary, if the case were a mild one, or if the sick-room were well ventilated and disinfected, and the visitor were in good health, the danger would be slight. It is these varying circumstances which have caused a difference of opinion between different physicians; but the weight of evidence supports the opinion that D. is both contagious and infectious, and in a late work, Drs. Pepper and Meigs of Philadelphia give this as their conclusion.

Although diphtheria (or putrid fever, a more appropriate name, and comprehensive of all the phases of the disease) is eminently a constitutional affection, it is liable to special local manifestations, the latter sometimes apparently predominating. Now, why does it so often have predominating local characteristics? The following is probably the explanation. The attack is usually brought on by a "cold," and if the system be only slightly contaminated at the time, the symptoms are not likely to be alarming, and will readily yield to prompt treatment, but it should always be borne in mind that the disease is exceedingly stealthy and treacherous, and to be watched like a wolf. Again, the system may be considerably loaded with the germs of the disease, although not to the culminating point. Here, also, causes which produce a "cold" will, besides bringing on the general attack, also give rise to violent local symptoms. But when no exciting causes occur to hasten the attack, and the septic poison is being constantly received, there comes at last a time when a fully developed case of putrid fever will make its appearance, a disease of the gravest character, but which may be recovered from.

One of the conclusions which have been arrived at by the medical profession is that those who live in badly ventilated or drained houses are, with perhaps some exceptions depending on the effects of temperature which are not yet well understood, constantly in a condition which renders them liable to a diphtheritic attack of varying importance. It is true that there are physicians who do not like to pronounce certain cases of sore throat as diphtheritic, unless they have more or less of an alarming character, or appear during an undoubted epidemic, but diphtheria is so treacherous a disease that it is not well to strive to balance arguments at the risk of life, especially when observation has almost surely decided the question on the safe side. It is well known that persons are not as likely to take a "cold" on our Pacific coast or in some of our western territories, as in the Mississippi valley, or between it and the Atlantic ocean. It is therefore probable that organic matter has much to do with the development of "colds;" undoubtedly it has with that of influenza. If we call this organic matter zymotic, then we may assume that with the aid of the vitality of the system it works itself out, or recovery takes place without recourse to medicine. Now, in regard to the septic germs of diphtheria, it is known that they are generally present in the effluvia of cess-pools, sewers, and filthy habitations, perhaps more especially developed or active in the temperate and moist weather of spring and autumn, and mild winters. Therefore, it is reasonable to believe that persons inhabiting badly drained localities, where putrescent effluvia more or less pollutes the air, never have inflammatory affections of the mucous membrane of the mouth or fauces, without having it more or less modified by this circumstance. All persons, therefore, who live in houses where the drain-pipes are not properly trapped, and where there is more or less intrusion of sewer gas through the wash-basins, bath-tubs, etc., will have reason to suspect that when they have febrile symptoms, alternating with chills, but unlike those of fever and ague, and a feeling of weariness, whether accompanied with pain in the throat, or not, there may be diphtheritic complications. The above symptoms are those of milder cases. The attack, when acute, frequently commences with a decided chill, followed by a high fever. The chill and the fever are characteristic, and generally easy to be recognized by the experienced physician. The pulse, however, affords a still stronger indication, and when taken in connection with the chill and the following fever, and the condition of the throat, together with the surrounding sanitary conditions, is quite diagnostic. It is variable, and soft and weak; sometimes quite full, but easily compressible; sometimes not more frequent than in health, but generally ranging from 100 to 140 beats per minute; sometimes reaching 160, and in children going still higher. The cheeks are often of a bright red color, one cheek often much redder than the other, the latter sometimes being quite pale. There is a fluctuation in the circulation, and also, apparently, a fluctuation in the nervous force of the system. It must not be supposed that the throat affection, even when serious, will be indicated by pain, for there is often found considerable mischief, upon inspection, where the patient suspected nothing of the kind. There may be pain only on swallowing; while on the other hand there may be diminution of sensitiveness, especially in grave cases, when also the muscles of deglutition may be so paralyzed as to interfere with swallowing, and in extreme cases there may be paralysis of different parts of the body, generally affecting one side more than the other; but this condition, caused by the great development and accumulation of poisonous matter, may be relieved by the prompt administration of proper remedies. The disease is, indeed, singular in some respects. Although sometimes perfectly unmanageable, and causing death in a few hours, it is at times, even when violent, easily overcome, if attacked with resolution and courage. The paralysis which sometimes occurs at the commencement of the disease must not be confounded with that which often comes on during convalescence after serious attacks. The breath is always more or less fetid, and in severe cases is very offensive. Sometimes the membranous exudation is extensive, spreading over a considerable portion of the fauces, often causing sloughing, especially when efficient remedies are not employed. The exudation may not be confined to the throat or any part of the air passages, but may form on the mucous membrane of the intestines, and has been recognized in the evacuations of the rectum. It may also form on the mucous membrane of the larynx or wind-pipe, or even pass into the bronchial tubes, and when diphtheritic sputa has been thrown upon the mucous membrane of the eyelids, exudations have developed there. Observation has shown that the range of temperature in the axilla is lower than

in other acute diseases. There is usually loss of appetite, with vomiting, and often diarrhea; the latter are unfavorable symptoms. There is more or less delirium in all severe cases, and unless good treatment is speedily adopted the throat is liable to become gangrenous. There is great variableness, no doubt, in the virulence of the poison during different epidemics, and sometimes three fourths of the members of a family will die. The urine, in a majority of cases, at some time during the attack contains albumen, and the symptom is regarded as unfavorable, yet a majority of such cases recover. The neck is often considerably swollen, with considerable inability to move the jaws or to swallow. The tongue and throat are covered with a thickened mucus; the tonsils are generally considerably swollen when the first examination is made, and may have patches of a grayish or yellowish membrane upon them. The membrane, however, is sometimes not seen, either upon the tonsils or other parts of the mouth or throat, till the second day. The tonsils generally increase in size, and sometimes close the entrance to the wind-pipe, and render swallowing very difficult. The color of the parts is also peculiar; indeed, many of the symptoms of D. are peculiarly characteristic, usually making the diagnosis, especially when the history of the person is taken into consideration, easy.

It ought to be more generally known that D. is a disease in which relief must be expected from the use of medicines. It is septic, progressive, and cumulative; and when the system has been fully charged with its germs, it is likely to go to a fatal termination, the functions of the body seemingly participating in furnishing material for the spread of the disorder. The enemy must be repelled by such weapons as are deadly to disease germs. Disinfectants should be freely used, and medicines which keep up the animal strength. A generous diet of easily digested food, such as beef-tea, milk-punch, eggs and wine, boiled rice, and as a beverage, rice-water, with tender beefsteak as soon as the stomach will bear solid food, should be combined with such medicines as quinine and the tincture of chloride of iron. There is great waste of alkaline material in the blood in these cases, and this should be restored by the judicious administration of alkaline carbonates and chlorates. The amount of alcoholic stimulants required is variable; sometimes small quantities only are needed, but frequently they are required to combat the wonderfully depressing influence of the poison, their remedial action being similar to that which they have in cases of bites of poisonous reptiles. It is fortunate that in nearly every case the membranous exudation takes place above the larynx, or in that part of the throat which can be reached by a gargle or a sponge probang. This allows of the application of antiseptics, and no better one can be employed than a solution of carbolic acid, in the proportion of a dram, or a dram and a half, of the pure acid to a quart of water. This should be used as a gargle frequently, every half-hour, hour, or two hours. In young children who cannot gargle, a solution of rather greater strength may be applied with the sponge probang. This will in most cases relieve the local symptoms and cause the disappearance of the exudation in a few days, if the general treatment be judicious. A saturated solution of chlorate of potash may often be employed as a gargle in mild and chronic cases, but will not at all meet the demands of a severe case. What is known as chloride of soda, sold in the shops as Labarraque's disinfecting liquid, when properly diluted forms a good topical application, and before the introduction of carbolic acid, was used with great success, and is still employed by many physicians. The mischievous practice of destroying the exudation, and of course, to some extent, the tissue immediately beneath, with caustic, was in vogue some fifteen or twenty years ago, and the mortality which resulted from this practice was frightful. The application produced a wound in which the disease germs seemed to propagate themselves and enter the system, for the wound, under the circumstances, would not heal or form a protecting plastic membrane such as is developed in the presence of healthy pus. The use of chloride of lime in the sick-room, notwithstanding the denials which have been made of its virtues, has a powerful effect in destroying disease germs, and, as has been shown by experience, will render an apartment occupied by a diphtheritic patient comparatively innocuous, so that he may be nursed assiduously with but little danger to his attendants, especially if they use disinfecting gargles, and give all proper attention to cleanliness.

DIPH'THONG (Gr. having a double sound) means two vowel sounds following one another so closely as to form but one syllable, as in *out*. In this combination the sound is really composed of an *a* as heard in *father*, and a *u* as heard in *put*. Many double vowels in English are not real diphthongs, there being only one sound heard. The spelling of the English language has little or no relation to the pronunciation in this matter. In many syllables written with two vowels, only one sound is heard, as in *bread*. The single vowel letters, again, often have a diphthongal sound; thus, the long sound, as it is called, of *i* is really composed of the sound of *a*, as heard in *father*, and that of *e*, in *me;* and *tune* is pronounced as if written *teun* or rather *tyun*. Such words as *bread, field*, which are now monophthongs, were doubtless at one time real diphthongs, and are still so pronounced in many parts of England.

DIPLACAN'THUS, a genus of fossil ganoid fishes, peculiar to the old red sandstone, in which six species have been found. The body was covered with very small scales, and the tail was heterocercal. There were two dorsal fins, which with each of the other fins were furnished with a strong spine in front, the base of which was simply imbedded in the flesh, as in the dog-fish, and not articulated, as in the siluroids. The head was large, and the mouth wide, and open obliquely.

DIPLOGRAP'SUS, a genus of fossil zoophytes, differing from the graptolite (q.v.) in having a double series of cells. They are found in great abundance in the anthracitic shales of the Silurian measures.

DIPLO'MA (Gr. *diploō*, I double, or fold). This term originated in the ancient custom of writing solemn documents on two tablets of wax, which were doubled, or laid one upon the other (see DIPTYCH), or on writing material which was folded. The Roman emperors were in the habit of giving diplomas to public servants, and to couriers, to enable them to procure the use of the public servants and horses; hence diploma came to signify a royal charter or prince's letters-patent. The term is now mostly applied to instruments given by universities and other learned societies, in proof of the holder having attained a certain degree; or to the licenses held by professional persons to practice their art.

DIPLOM'ACY, the art of managing the intercourse and adjusting the relations of foreign states, by means of ambassadors, envoys extraordinary, consuls, etc. The principles and rules of D. are embodied partly in those international customs and usages which constitute what may be called common, and in those treaties which may be regarded as statute international law. The diplomatic relations of this country are practically under the superintendence of the secretary of state for foreign affairs, but the power of sending ambassadors to, and receiving ambassadors from, foreign states, is an alienable privilege of the crown. It was doubted whether an exception had not been made in the case of Rome, by the statutes passed against papal encroachments; and it was thought expedient to remove such doubt by 11 and 12 Vict. c. 108, which authorizes her majesty to enter into diplomatic relations, provided that no person in holy orders in the church of Rome, or Jesuit, or member of any other religious order, community, or society of that church, bound by monastic or religious vows, shall be received as ambassador at the court of London. Ambassadors are not subject to the municipal laws of the states in which they reside, the theory being that they represent the persons of their respective masters, who cannot be subject to any other laws than those of their own country. If an ambassador offends against the municipal law, or abuses his character, he may be sent home, and accused before his master. Though there was much doubt on the point, this rule seems to extend to crimes against natural law, e.g., to murder, or *mala in se*, as well as to crimes artificially created by the policy of the particular state, *mala prohibita;* and it is now said that the case of Don Pantaleon Sa, the brother and secretary of the Portuguese ambassador, who was executed for an atrocious murder during the protectorate of Cromwell in 1654, was no exception, as he was not "joined with his brother in the same commission." See AMBASSADOR, EMBASSY. The arrangement of international ceremonies belongs to the subject of diplomacy. To treat it in detail would lead us far beyond our limits, and we must content ourselves with remarking a few of the customary and conventional modifications which affect the general principle of international law by which all independent states are held to be equal.

Royal honors are enjoyed by the empires and kingdoms of Europe, including the Swiss confederation, the grand duchies of Germany, and, amongst Catholic states, by the pope; and the same right extends to the United States of America. These, along with other rights of greater importance, include the right of taking precedence of the others in all international ceremonials. Amongst those who enjoy royal honors, the order of precedency, after much discussion, was left by the congress of Vienna on the ancient footing of custom merely. The rule thus fixed is said to be the following: Monarchs enjoying royal honors, but not crowned heads, yield precedence to those who are, whilst they enjoy it over all other monarchs, demi-sovereigns, and rulers of dependent states. This rule leaves the relative rank of the crowned heads and other classes amongst themselves undetermined, and a curious expedient has been found for obviating the necessity of a minuter classification. By what is called the *alternat*, the rank and places of the various powers are changed from time to time in a certain order determined by lot. If there are several parties to a treaty, for example, a corresponding number of copies is made of it, the name of each state being named first in the copy which it preserves, and the others in the order determined by the *alternat*. But the right to alternation has sometimes been a subject of contention. In 1742 it was refused to Prussia by Great Britain; and Hungary and Sardinia had great difficulty in obtaining it at the peace of Aix-la-Chapelle.

The subject of maritime ceremonies will be treated under its respective heads. They consist of salutes either with cannon, or with the flag or pendant, by furling it, lowering it, or pulling it down. There is also a salute with sails, which generally consists in lowering the foretopsail. Maritime ceremonials are usually made the subject of express compact, but, as a general rule, on the open seas, a ship carrying a pendant salutes a ship of a friendly power carrying an admiral, and detached ships generally salute fleets. It is provided by 22 and 23 Vict. c. 5, repealing in so far 6 Anne, c. 7, that pensions granted for diplomatic services, according to the provisions of 2 and 3 Will. IV. c. 116, shall not disqualify the holder from being elected, or sitting, or voting as a member of the house of commons.

DIPLO'MACY (*ante*), the science which deals with the relations and interests of nations in respect to one another. Diplomatic agents are of the following grades:

Ambassadors, ministers penipotentiary, charges d'affaires, envoys, and consuls. In the United States, these agents are appointed by the president, with the advice and consent of the senate. If a vacancy occurs while the senate is not in session, the agent may enter upon his duties upon the appointment of the president, subject, however, to confirmation or rejection by the senate at a future time. In practice, the secretary of state, under the direction of the president, takes charge of the diplomatic relations of the government, giving to the agents their instructions and keeping himself in close correspondence with them. In great emergencies it is not unusual for nations to appoint special commissioners to settle a special difficulty, or to draft a particular treaty. In the United States, the necessity and utility of keeping ministers residing at foreign courts has sometimes been questioned; but the practice is continued in the belief that it is favorable to peace between nations by affording facilities for prompt explanations of disputes as they may arise, and also because it is thought that American citizens traveling or residing in foreign countries often need such protection or advice as only a minister or consul is qualified to give. There can be no doubt that diplomatic intercourse, regularly established and maintained, begets between nations sentiments of mutual respect and forbearance, and tends to keep alive that feeling of universal brotherhood which is the richest and ripest fruit of a Christian civilization. It is the duty of a foreign minister to study the institutions, habits, and even prejudices of the nation to which he is accredited, and to keep his own government advised of every movement affecting its peace and welfare. It is also his duty to convey information to foreigners in respect to the government and people of the nation which he represents, in order to abate or remove national prejudices and awaken fraternal feelings. Of late years, American consuls have done the country a valuable service by gathering information as to the productions, manufactures, and trade of foreign nations, and finding new markets for the products of American industry.

DIPLOMATICS, the science of ancient writings. The term can scarcely be said to have been at any time in general use in this country, and even on the continent it has latterly given way to the more convenient and descriptive term, paleography (q.v.).

DIPLOP'TERUS, a genus of fossil ganoid fishes, four species of which have been discovered in the old red sandstone, and two in the carboniferous series. They have heterocercal tails, with double anal and dorsal fins, opposite each other, but having the dorsal pair a little apart. The head is large and flattened, and the teeth are fewer and larger than in the allied genera. The scales are perforated with small foramina.

DIPPEL'S ANIMAL OIL, called also empyreumatic animal oil, or rectified oil of hartshorn, is prepared by the destructive distillation of bones in close vessels, when bone-black (q.v.) is left in the retort or vessel, and the crude oil distills over into a suitable receiver. When obtained in this manner, it is a thick viscid oil of a brown color, and a very disagreeable odor, but on redistillation it may be obtained limpid and colorless. Air and light affect the pure or rectified oil, and render it colored and somewhat viscid. Its elementary constituents are carbon, hydrogen, nitrogen, and oxygen, and it contains a number of volatile organic bases, such as aniline, picoline, etc. D. A. O. is a powerful medicinal agent, and when swallowed in doses of a few drops, it is antispasmodic, and stimulates the vascular and nervous systems. In large doses, it is a powerful irritant poison.

DIPPER, *Cinclus*, a genus of birds of the thrush family (*merulidæ*), distinguished from the other birds of that family by an almost straight, compressed, sharp-pointed bill, and still more by their manners and habits. They frequent clear pebbly streams and lakes, feeding chiefly on mollusks and on aquatic insects and their larvæ, which they seek even under water, diving with great facility, and moving about for a short time at the bottom of the water. They carry their rather short tail elevated after the manner of wrens, which they also resemble in their "frequent becks" or dipping of the head, accompanied with an upward jerking of the tail. One species is found in Britain, the COMMON D., or WATER OUSEL (*C. aquaticus*), a bird rather smaller than any of the British thrushes, of a generally dark-brown color, with throat and upper part of the breast pure white. It is found throughout the whole of Europe and the n. of Asia, but chiefly in hilly or mountainous districts. It is not gregarious. The D. never fails to attract notice, as it sits upon some stone in the midst of or beside the stream, its white breast rendering it conspicuous as it repeats the movement from which it derives its name. It builds a very curious nest of interwoven moss, domed and with the entrance in the side, usually in some mossy bank close by a stream, and often near or under a cascade. The assertion which has been made, that the D. walks without apparent muscular effort at the bottom of the water, is incorrect; its feet are not well formed for walking, and it moves under water by means of its wings—which are short—not without much muscular effort. The statement also often made, that it eats the spawn of salmon and other fishes, in the belief of which it is much persecuted in Scotland, has never been sufficiently authenticated. Other species of D. are found in Asia and North America. In Scotland, the D. is called the water crow.

DIPPING-NEEDLE. If a magnetic needle be supported so as to be free to move vertically, it does not at most places on the earth's surface rest in a horizontal position, but inclines more or less from it. If the vertical plane in which the needle moves is the magnetic meridian of the place, the angle between the needle and the horizontal line is

called the dip or inclination of the needle. The dip of the magnetic needle at any place can be ascertained with very great exactness by means of the dipping-needle. It consists of a graduated circle fixed vertically in a frame, and moving with it and a vernier on a horizontal graduated circle. This last is supported by a tripod furnished with leveling screws. At the center of the vertical circle, there are two knife-edges of agate, supported by the frame, and parallel to the plane of the circle. The needle rests on these knife-edges by means of two fine polished cylinders of steel, which are placed accurately at the center of the needle, and project at right angles from it: so adjusted, the needle moves with little or no friction. It is so made, moreover, that before being magnetized it remains indifferently in any position; after magnetization, therefore, the dip which it shows is wholly due to the magnetic influence of the earth.

In order to understand how an observation is made with the dipping-needle, we must regard the directing force of the earth's magnetism exerted upon the poles of the needle in any vertical plane in which it may happen to be, as resolved into two forces, one acting at right angles to the plane, and the other acting in the plane. There being a corresponding but opposite force at each pole, we have thus two statical couples acting on the needle—one tending to turn it at right angles to the plane in which it moves, and the other tending to bring it round to a position in the plane such that the needle and the forces of the couple may be in a line. In the dipping-needle, the mode of support completely neutralizes the first of the couples; and the position that the needle takes in any plane is due wholly to the second. When the plane of the needle is at right angles to the magnetic meridian, the forces of this latter couple act vertically, and bring the needle to the same position. This, then, gives us the means of determining the magnetic meridian, for we have only to bring the vertical circle round till the needle stands at 90° to put it in a plane at right angles to that meridian; and then by moving the vernier on the horizontal circle over 90°, we place the upper circle and needle in the plane of the magnetic meridian. The dipping-needle thus serves the purpose of a declination needle (q.v.). In bringing the needle round from the plane at right angles to the magnetic meridian, the dip is less and less, till it becomes least in the plane of that meridian. We might thus also find the magnetic meridian, for it is that plane in which the dip of the needle is least. When the needle is in the plane of the magnetic meridian, the couple which acts in other vertical planes at right angles to them disappears, and the whole force of the terrestrial magnetism acts at each pole of the needle, forming a couple which swings the needle round till it stands in a line with itself. The degree on the circle then pointed to by the needle is the dip at the place of observation. Two readings are necessary, for the reason stated in the DECLINATION NEEDLE. One reading is taken, the needle is then reversed so as to change its supports, and then a second reading is noted, and the mean of the two gives the correct reading. The position of the needle when the dip is read off is manifestly the same that a needle suspended in air, if that were possible, and free to move in any way, would finally assume. In resolving, therefore, the total directive force of the earth as we have done above, we must keep in mind that it always acts parallel to the direction of the dipping-needle.

DIPSA'CEÆ AND DIPSACUS. See TEASEL.

DIPSAS (Gr. a kind of serpent), a genus of non-venomous serpents of the family *colubridæ*, of very elongated form, and with a thick, broad, and obtuse head. They are tree-snakes, inhabitants chiefly of the warm parts of Asia and America. One species only, *D. fallax*, somewhat doubtfully referred to this genus, occurs in the s. of Europe. Some of the species are of great size. A large and beautiful species is found in Java and Sumatra. The form is more attenuated than in others of the genus.

DIPSOMA'NIA, or OINOMA'NIA, from the Greek words *dipsa*, thirst, or *oînos*, wine, and *manía*—terms of modern invention, to denote an irresistible or insane craving for alcoholic stimulants, when occurring in a habitual or confirmed form, and requiring confinement or restraint of the person for its cure. Much discussion has taken place in regard to this and other forms of what is often called moral insanity; the most recent views of physicians, however, tend to show that the drinking insanity, or *furor bibendi*, as it was called by an early writer on the subject, is often associated with other forms of mental derangement, and is very apt to be, in connection with one or more of these forms, hereditarily transmitted, even through several generations; so that the really physical or insane character of the craving for stimulants, at least in some cases, may be regarded as a well-established fact in medicine. For the legal and general questions in connection with this subject, see INSANITY and INTOXICATION.

DIPSOMA'NIA (Gr. *dipsa*, thirst, and *manía*, madness, or eager desire) is a term intended, whether correctly or not, to denote a condition in which certain individuals manifest an irresistible craving for alcoholic drinks. OINOMANIA (Gr. *oînos*, wine), used by German writers; and the English DRINKING INSANITY, are also intended to designate the same state. It is of importance to distinguish dipsomaniacs from ordinarily intemperate and drunken individuals. In our streets and in society, we are only too familiar with the various phases of the habit and vice of drunkenness, and the different grades and circumstances of drinkers, such as the morning dram-drinker; the jolly social drinker; and the individual who, knowingly and intentionally, gives himself up to a debauch. While many thus of their own choice degrade and injure themselves, they are

generally able, for a time at least, to perform tolerably well their usual occupations during business hours. Many hard drinkers can exercise wonderful control over themselves, choosing the time to drink and the time to keep sober; and while sober, can discharge all their family, professional, social, or even religious duties—so far at least as outward appearances go. Some of them may drink continuously, until attacked by what is called *delirium tremens* (q.v.), or fall into the state of *delirium ebriosum* (q.v.), or what has been called *mania a potu;* but when the supplies are stopped, and the necessary treatment is undergone, they are soon able to resume their usual duties, and too soon, in general, their former practices.

There is, however, especially in persons of a nervous and sanguine temperament and constitution—and more readily in women than in men—a condition in which the mere vice is transformed into a disease, the vicious habit into an insane, impulsive propensity, and then the drunkard becomes a dipsomaniac. The alcoholic principle, by habitual abuse, perverts the action, if not the nutrition, of cerebral matter; and the frequent disturbances of the mental functions from fits of intoxication, the loose and irregular habits engendered, and the alternate states of remorse and attempts to drown conscience by more copious libations, all combine to create the dipsomaniac. He loses entire command over his will; has no power to resist the craving for alcoholic stimuli; and is transformed into the involuntary slave of an insane propensity. Physically, the dipsomaniac has a lamentably broken-down aspect; limbs feeble and tremulous; visage pale, leaden-colored, or sodden; and eyes watery and lusterless. But in the manifestations of mind and heart, the change is still more sad. A process of mental deterioration goes on simultaneously with the habit of indulgence; the main aim of life is how to obtain liquor; capacity for business is limited to the means of gratifying the craving; the precepts of morality and religion, the ties of nearest and dearest kin, have no sway over him; indeed, no consideration, human or divine, will interpose any barrier in the way of gratifying the propensity, whenever it is possible. Nor does he now drink with real relish, socially and convivially, but will swallow spirits, away from society and observation, even as it were a drug; and the only satisfaction derived from the act is, that it secures insensibility to the wretched state of mind which prompts the insatiable desire. When this has gone on for some time, although a suspension of the use of stimulants be imposed by the interference of friends, or the occurrence of an attack either of the form of delirium or maniacal excitement mentioned, yet his mind has suffered so materially, that unless control is exercised over him, and continued for a considerable period, he returns immediately like the "dog to his vomit." His moral feelings become more and more perverted, and his intellectual powers weakened. He is thus rendered either facile or wasteful, and incapacitated for the ordinary business of life; or he is irascible, resentful, or mischievous, and torments and annoys those about him, or commits homicide or suicide; or he becomes decidedly insane. Such is acquired dipsomania. But very frequently it is met with as a disease, *ab origine*—a constitutional, and, in the greater proportion of instances, a hereditary affection. When it takes this character, D. resembles other constitutional diseases; and such cases especially illustrate its affinity to insanity. It is well known that gout and rheumatism, or disease of the heart, may be developed from errors in the mode of living of individuals in whose family connections there is no sign of predisposition; while, on the other hand, these diseases may also exist in virtue of a strong hereditary tendency, without any appreciable infringements of the laws of health. And so also D.; for, while frequently resulting from acquired vicious habit, it occurs likewise from an insane hereditary taint, very frequently visited on children by the sins of their parents, especially if the latter have suffered from repeated attacks of delirium tremens, or have been in reality confirmed dipsomaniacs. Indeed, it has even been met with in the offspring of dipsomaniacs during the years of childhood, and that also in the sudden paroxysmal form. But what goes still further to prove its affinity to insanity, is the well-known fact, that in the family of the dipsomaniac, not only several cases of this drink-craving propensity are often met with, but marked instances of mental disorder in other forms. Some interesting examples of this may be found in the *Edinburgh Medical Journal* for April, 1858, by Dr. Thompson of the Perth prisons. When D. thus occurs from constitutional organization, the disease is assuredly of a worse type than when it springs merely out of the vicious habit of drinking. There is generally more eccentricity of habit and deportment, more perversity of mind and disposition, and more untruthfulness and deceit, which is a remarkably uniform feature in this malady. The victim of it is more unscrupulous in the means employed to gratify the ruling desire of existence; and when the disease is fairly developed, and allowed to take its course unrestrainedly, the moral sense becomes utterly perverted, and the intellect annihilated, so that the affected is readily led to the commission of crimes which would not otherwise be perpetrated, or sinks into a state of complete imbecility or hopeless mania. Whether, therefore, the disease exists in its ordinary phases and intensity from voluntary intemperance; or whether it springs out of the propensity, as a consequence of abnormal organization—and these are sufficiently characteristic to present a marked line of distinction from the ordinary vice of intemperance—the pathological and mental phenomena and results are the same—viz., an insatiable craving for alcoholic stimulants, with complete loss of self-respect and self-control in gratifying the desire, despite all obligations due to God and to man. There are generally also some special features in each case, afford-

ing additional evidence of decided mental unsoundness. Some of these are wastefulness and senseless extravagance; ridiculous eccentricity of conduct; gross indecency of behavior, and obscenity and profanity of language; tendency to theft of articles of little or no value—often of one class or kind of things; extreme perverseness and vindictiveness of disposition; and impulsive violence, which leads readily to the commission of homicide or suicide.

These, then, are the features, variously combined in different cases (of which many examples could be easily given), which distinguish instances of D. from ordinary drunkenness, and warrant the opinion that the condition described is a form of mental affection—a disease, like any other insanity. Almost all medical men, we believe, now hold this view, or at least that it should be treated as an insanity; and it has of late been very widely accepted by the general public, at any rate by all, without exception, who have come in contact with instances in their own families or among their friends.

If such, then, is a correct view of the case, it follows that special physical treatment must be adopted before moral and spiritual agencies can be expected to operate with any chance of success; and as the dipsomaniac is incapable of governing his own will, and making any effort to subdue his ruling desire, it is evident that he should be placed under the power of others who have the means of controlling him. From the very nature of the malady, however, it is scarcely to be expected that the inveterate drunkard will voluntarily submit to control, or continue under it for a sufficient length of time to receive lasting benefit; and therefore it seems essential, as in the case of other insanities, that legal power, with proper precautions and restrictions, should be available, to secure the possession of his person, and the protection of his property. It is undoubtedly the duty of a good and wise government to provide for such care, when it is so well known that the consequences of unrestrained action may be so serious to the individual chiefly concerned; when families are so often thereby plunged into deep distress or absolute ruin; and when the amenity of society is so frequently outraged by a display of mischievous eccentricity, or glaring indecency, or by the occurrence of some flagrant crime. "The liberty of the subject" is a precious trust, but the absence of law to meet the case of the insane drunkard, is in reality license for evil, since no precaution is taken to prevent most grievous infringements of the liberties of others. It is certainly an overstrained delicacy in legislation to shirk interference with a class of cases which lead to so much private misery and public expenditure, as the records of our courts of law, prisons, poor-houses, and lunatic asylums can amply attest. But considering the case of the dipsomaniac from another point of view, a facility by law to control, would confer on himself an unspeakable benefit. It would thus afford him his only chance of cure and restoration to society, instead of permitting him to go on to wreck and ruin. Indeed, the neglect of law to provide such a check and remedy, seems inconsistent, unjust, and inhumane, when we consider that while it permits the insensate drunkard to endanger his life, to waste his property, and deprive his family of that which they are justly entitled to expect from his hands during life, or to fall to them at his death, it holds him responsible for any criminal act he may commit. No doubt the law assumes that he drinks voluntarily, and with his eyes open to all the consequences, and that his practices therefore form an aggravation of his guilt; but such is not the case, for he drinks—as has been shown—involuntarily, and without any reflection as to ultimate consequences; and he is manifestly unable to exercise his reason aright, or govern his will. That the existing law of lunacy does not meet the case of insane drinkers, is well known, and much felt. One would imagine that the definition of insanity—"a person so diseased and affected in mind as to render him unfit to be at large, either as regards his own personal safety and conduct, or the safety of the persons and property of others or of the public" (20 and 21 Vict. c. 71, s. 3); and again, "a person of unsound mind" (25 and 26 Vict. c. 54, s. 1)—recognizes a dipsomaniac as a fit object for control. But the ancient dicta of English and Scotch judges, as to the nature of insanity, still appear to adhere to the legal mind; and as medical certifiers now require to state the facts on which they form their opinion, the statement that one or the chief manifestation is excessive intemperance, or an uncontrollable craving for intoxicating liquors, is quite enough to prevent a sheriff—or at least some sheriffs—from granting the wished-for warrant. He declines to interfere unless there is evidence of some furiosity in the case, or the existence of a delusion; and in all probability, were he to do otherwise, and the case be carried into court, a deliverance would be given against the plea of insanity. At any rate, the uncertainty in the administration of law in such cases, and the danger of subjection to annoyance and expense, even did they gain their plea, deter medical men from granting certificates, which, otherwise, they would most unhesitatingly do. In the last lunacy amendment act (29 and 30 Vict. c. 51, s. 15, 1866), as permission is given to the superintendent of any asylum, with assent, in writing, from one of the commissioners in lunacy, to admit as a boarder any person wishing to submit himself to treatment—whose mental condition is not such as to warrant certificates of insanity—it was supposed likely to open a door for the admission of dipsomaniacs. But it has only in a very few instances, and for a very brief period of time, been taken advantage of, under the temporary pressure brought to bear on them by friends, etc. Indeed, there is the same difficulty in getting individuals to go voluntarily into private sanatoria, refuges, and boarding-houses for inebriates—where no legal steps are available—or, when admitted, to detain them sufficiently long so as to effect a cure.

Establishments for inebriates, on a small scale, have existed in this country for many years; and there are at present several excellent ones, for the middle and upper classes, in various parts of the country, particularly in the counties of Argyle, Ross, Inverness, Forfar, and Perth; besides, several medical men, clergymen, and farmers throughout Scotland receive one or two boarders of this class. Into these places, however, only a very few individuals go quite voluntarily; in fact, it is generally under more or less constraint. Straitened circumstances, bodily suffering, the tears and entreaties of relations, threatenings of being cast off altogether, and such-like influences, may succeed perhaps in one out of ten or twelve instances; but abstinence from drink, judicious medical treatment, good diet, pure air, exercise, occupation, and amusement, so improve the physical condition, that ere-long, and before deeper and more radical changes can be effected, or the tone of the moral feelings restored, they become restless, and demand liberty as a right, which they know well cannot be disputed. Out in a few weeks or months, therefore, fully three fourths of those admitted go, or are taken by injudicious or timid friends, and the result may easily be imagined. Years rather than months of control, and gradual trials of liberty on probation, are necessary to effect a permanent cure in any considerable proportion of the more confirmed cases of this malady. Taking into consideration, therefore, these uncertainties, there is evidently not much inducement for parties to invest money in the establishment of a desirable and trustworthy institution. For a good building, in a pleasant and salubrious situation, with some ground attached, must be secured; the furnishings must be comfortable, the cooking good, and considerable opportunities must be provided for within-door and out-door occupation, amusement, and cheeriness. In fact, all the arrangements must be made so as to provide such new and relishable enjoyments as will counteract or take the place of the cravings for alcoholic stimuli, and prevent, as much as possible, discontentment with the situation in which they are placed. Admission to such private boarding-houses is generally at the rate of £100 per annum. The chief stipulations made on entrance are, that no pocket-money be allowed; that no stimulants are to be given, unless under medical direction; and that intimation be made at all hotels, taverns, or spirit-shops in the locality, that no debts will be paid for drink furnished to the boarders. The only public institution in Great Britain for the treatment of inebriates is the Queensberry lodge, Edinburgh, in connection with the house of refuge. It is a handsome building, erected some years ago, and comfortably furnished so as to accommodate 27 female boarders of the better classes, at the rates of from £40 to £100 per annum. Already a considerable number have been admitted; and in several instances apparently with excellent results, notwithstanding the difficulty experienced in the most of cases in detaining boarders a sufficient time.

In several cities of the United States of America, and as far back as 20 years, somewhat similar institutions are in active operation, some of them amply endowed, others partly supported from public funds, although into all the admissions are mostly voluntary. Of these there are now upwards of 12 homes or retreats; and the Boston "Washingtonian home," is pointed to as a model institution. But the institution about which we have heard most is the New York state inebriate asylum, at Binghamton. It is a massive and costly structure, sufficient to accommodate about 200 individuals, amply state endowed and possessing every arrangement and appliance for the treatment of the unfortunate class requiring its aid. Here an average of 40 per cent of the cases admitted are said to have been cured. It is evident, however, from the number of boarders reported as annually undergoing treatment in these various American retreats, that they receive all sorts of drunkards; and we fear that the good accomplished must, in a large proportion of instances, be only partial and temporary. Thus, in the Washingtonian home, which—according to one of its reports—has accommodated an average of about 18 persons daily, and is said to have had from 250 to 300 cases annually under treatment, the necessarily brief average residence of each holds out little hope that much lasting benefit can have resulted in cases at least of such confirmed inebriates as we have described under the name of dipsomaniacs, and for whom legislation is desirable. It is supposed, however, in America, that these state-supported institutions have been economical by keeping inebriates out of the alms-houses, etc., and in restoring about one third of bread-winners to honorable citizenship, and thus preventing them and their families from falling as a burden on the state. In 1870, an "association for the cure of inebriates" was formed, composed of physicians, superintendents, and friends of inebriate asylums, which has ever since been most active in its operations, and done much by meetings, publications of transactions, and otherwise, to help forward the philanthropic movement, and in every particular on the lines of this paper.

The Americans are in advance of us in legislation regarding the care of the person and property of inebriates; for to the magistrate, or rather judge, is committed the care and custody of all insane persons, and of all persons who are wasteful and incapable of conducting their own affairs, in consequence of habitual drunkenness; and he is empowered to provide out of their estates for their safe keeping and maintenance, and for the maintenance of their families and the education of their children. Hence, it might be inferred that legal power might enforce the care and treatment of insane drinkers in lunatic asylums, or in reformatory asylums, such as those at Binghamton or Boston. Yet such powers are not often called into effect, doubtless from the knowledge that such exists, and that the best course is to submit voluntarily and prevent further proceedings.

Freedom of legislation is more natural in a new country, where antiquated precedents and prejudices do not drag the wheels of reform, and where common-sense views of social interests prevail. Accordingly, in southern Australia a great step was taken in the right direction, chiefly through the exertions of Dr. M'Arthy, of Melbourne, who had considered with lively interest the discussions which took place in this country regarding the treatment of dipsomaniacs, after the publication of papers on D. by Dr. Peddie in 1858 and 1860, and a lecture by sir Robert Christison in 1861. In 1867, after a full ventilation of the question, the government carried a measure placing inveterate inebriates in the same category with insane persons, and providing for them in connection with a lunacy amendment act. But this was soon found to be a mistake, and accordingly in 1872 "an act" was passed "to provide for the treatment and cure of inebriates." The government did nothing in the way of grants towards this object; but the Melbourne retreat, founded for upper-class boarders, notwithstanding financial difficulties at first, is now doing good work.

In Scotland, a conviction has long since been felt that some law was absolutely necessary to meet the cure of insane drinkers; and in 1857 and 1861, the commissioners in lunacy gave utterance to most decided views to that effect. Some with them have thought that provisions of this kind should be embodied in a lunacy act. But there is good ground for holding that the case requires special legislation; and that separate asylums, sanatoria, reformatories, or by whatever name inebriate institutions may be called, should be provided and licensed for this class of the unsound in mind. Interference with personal liberty would thus be more in accordance with the delicacies of the case, less painful to the feelings of those chiefly concerned, and more likely to secure the humane and remedial objects contemplated. Besides, the arrangements proposed would greatly relieve ordinary asylums, and apart from this, the malady itself could in many respects be much better treated when separated from other insanities.

Were sufficient facilities afforded, under government sanction, for the control of dipsomaniacs, and their detention until fit for liberation, there is no doubt numerous institutions—and better than those hitherto existing on voluntary enterprise—would spring up in various parts of the country, to accommodate individuals of all grades of society. Institutions so licensed, and endowed with necessary powers, would not only be productive of much public good, but be remunerative. Even supposing it necessary that government should establish three or four inebriate asylums in central situations of the country, these would soon be found to a great extent to be self-supporting, while they would assuredly lessen the burdens of the country otherwise, by the diminution of disease, destitution, and crime. Parochial boards, too, might send their inveterate drunkards into such asylums with more benefit and more economy than they can keep them in the wards of a workhouse.

To remove objections, two points must be attended to. The first is, that careful inspection of the proposed institutions be made by commissioners appointed for the purpose, so as to secure that all necessary humane and remedial arrangements be properly carried out, and no one detained longer than is essential for recovery; and the second is, that they, along with the medical superintendents, should decide when inmates, although still under control, are sufficiently sane to execute any testamentary deeds, or to conduct other business matters, or to perform—under more or less surveillance, of course—any external civil privilege; or when they may be allowed probational leave of absence, as a preliminary step to final liberation.

In 1870, Mr. Dalrymple, M.P., took up the foregoing views warmly, and in the following year introduced his first bill. On the second reading a select committee was appointed to inquire into the whole subject; and a great mass of testimony borne by magistrates, governors of prisons, medical men, superintendents of lunatic asylums, and of inebriate asylums in America, was taken, and has been given at full length in the blue-books.

In the following session, Mr. Dalrymple brought in his second bill, founded on the report of the aforementioned committee, which strongly recommended the adoption of certain legal provisions of a mixed reformatory and punitive character; but the death of Mr. Dalrymple shortly afterwards arrested the further prosecution of any measure on this subject before parliament. However, a subject of so much importance and general interest was not likely to be altogether pushed aside and forgotten; and accordingly it was revived and warmly agitated in 1874–75 by variou branch associations of the British medical associations; and a further impulse given to it by the paper read by Dr. Peddie at its meeting in Aug., 1875, and the discussion which followed. The practical result was the formation in London of a "Society for Promoting Legislation for the Control and Cure of Habitual Drunkards," with lord Shaftesbury as president, and a long list of church dignitaries, members of parliament, and others as vice-presidents and other office-bearers. The society set at once to work to frame a bill on the basis of the select committee's report; and Dr. Cameron, M.P., took charge of it, but too late for the second reading. A new bill was thereafter drawn and introduced in 1879 by lord Shaftesbury in the house of lords and Dr. Cameron in the house of commons, through both of which it had an easy passage. This is not difficult to understand, as its provisions are so mild, and its character so different from that desired by those who had given most attention to the subject, that it was not thought worth any active opposition. The emasculations of the select committee's report, of Mr. Dalrymple's bills, and Dr. Cameron's first bill,

may be at once understood, when it is mentioned that the mental phase of habitual drunkenness is kept in the background; that the existence of retreats is merely sanctioned, but when erected, to be regulated and inspected, and that admission is never to be compulsory, but only permissive, although some power of detention is given. No wonder that the last report of the society mildly says: "The 'Habitual Drunkards' act,' as passed, does not quite come up to the expectation of your committee, but they congratulate all interested in the reformation of the inebriate on the affirmation by parliament of the principles on which the act is based;" and again: "Your committee have every confidence that, provided only adequate opportunity be afforded, many confirmed drunkards will gladly avail themselves of the power of isolation for a time from the many temptations by which they are at present surrounded."

It was fixed that this act should come into force on 1st Jan., 1880, and it is to be hoped that it may prove more wide in its operation and more effective than can at present be fairly anticipated; for the existence of a compulsory clause is essential to the working of the voluntary clause, and would have led to arrangements for reformatories for the habitual drunkards of our police courts and prisons, and not confined the operation of the act simply to the better classes of society.

DIPTERA (Gr. two-winged), an order of insects, which received from Aristotle the name it still bears. Its distinguishing characters are so obvious that it has been acknowledged, with little change of its limits, by almost all naturalists. FLY is a popular name very generally applied to dipterous insects, and often with some distinguishing prefix (as house-fly, flesh-fly, blow-fly, bot-fly, crane-fly, etc.), although it is sometimes used with such prefix to designate insects not belonging to this order (dragon-fly, day-fly, May-fly, etc.). Midges, gnats, and mosquitoes are also dipterous insects. In the number of species which it contains, this is one of the most extensive orders of insects: some of the species are also remarkable for the immense multitudes in which they appear; and although most of them are of small size, and few attract us by brilliant hues, not a few are important on account of the annoyance or mischief which they cause, either in their perfect or in their larva state; whilst many of their larvæ (maggots) are also very useful in consuming putrescent animal matter, which might otherwise prove a source of pestilence.

The D. have only two wings, which are membranous and simply veined. A little behind the wings are two small slender organs called *halteres*, poisers, or balancers, the use of which is not well known. They are usually present even in those exceptional insects of this order in which the wings are not developed. The head of the D. is generally in great part occupied by the large compound eyes, which often contain thousands of facettes; and besides these, three simple or stemmatic eyes (ocelli) are often also present, placed upon the crown of the head. The mouth is formed exclusively for suction, and is usually furnished with a short membranous suctorial proboscis, composed of parts which represent, although so differently modified, the portions of the mouth in coleopterous and other masticating insects, some of the parts, however, often disappearing. The proboscis of many is capable of piercing the skins of animals on the juices of which they feed; others are quite destitute of this power of piercing. Many feed chiefly on saccharine and other vegetable juices. In some genera, the perfect insect seems destitute of a mouth; and the term of life, after the perfect state has been attained, very brief in some, appears to be brief in all. The power which many dipterous insects possess of walking even on very smooth surfaces, in any position, even with the back downwards, familiar to every one in the example of the common house-fly, has not yet received a sufficient explanation. The opinion that their feet are furnished with disks for the formation of a vacuum, has been called in question, but nothing satisfactory has been substituted for it. The terminal rings of the abdomen in the females of many species, form an ovipositor capable of piercing the substances in which the eggs are to be laid, and composed of pieces which may be exserted or retracted into one another like those of a telescope. The eggs are very generally deposited in putrescent animal substances, but those of some kinds in the bodies of living animals, some in vegetable substances; the larvæ of some live in water; the eggs of a few are hatched within their own bodies, and the larvæ of some even remain there till they pass into the pupa state. All the D. undergo a complete metamorphosis. Their larvæ are destitute of true feet, although some of them have organs which serve for the same purpose; some have a distinct head; but others have the head soft and changeable in form, capable of being retracted into the body, and distinguishable only by its position, and by the organs of the mouth. Those which dwell in water or in fluid putrescent matters, have a retractile tail-like prolongation of the body, terminated by a radiated expansion, which communicates with air-tubes, and constitutes part of a very remarkable respiratory system. The larvæ of some D. spin cocoons when about to pass into the pupa state; but in others, the skin of the larva hardens and encases the pupa; the perfect insect making its escape by forcing off with its head the end of its pupa case.

DIPTERA'CEÆ, or DIPTEROCARPA'CEÆ, a natural order of exogenous plants, consisting of beautiful and majestic trees, natives of the East Indies. Some trees of this order, of which about 50 species are known, are highly valuable as timber-trees. Among them is the Sal (q.v.), the most esteemed timber-tree of India. They abound also in balsamic resin, and their resinous products are used for a variety of purposes. See

ANIME, CAMPHOR, COPAL, DAMMAR, VARNISH TREE, and SAL.—*Dipterocarpus*, the genus from which the above order has received its name, contains several species of the noblest trees of India. They abound in the warm parts of the e. coast of the bay of Bengal and the eastern peninsula. The wood is used for house-building, ship-building, etc. *D. turbinatus*, the GURJUN or GOORJUN TREE, the species by which the genus first became known, often attains a height of upwards of 200 ft., and a girth of 15 ft. It has a pale-gray trunk, rising without a branch till it forms at its summit a small symmetrical crown. The leaves are broad, glossy, and beautiful; the flowers in white racemes, but not conspicuous. The wood is hard, close-grained, and durable. A fragrant oil exudes from the trunk, which is extremely valuable for pitch and varnish, and is also used medicinally. It is procured by cutting transverse holes in the trunk, pointing downwards, and lighting fires in them, which causes the oil to flow. The tree is sometimes called the WOOD-OIL TREE. This oil or balsam is also procured from other species of *dipterocarpus*. *D. trinervis* yields a resin which is valuable for plasters, and acts on the mucous membranes like balsam of copaiva. The Javanese smear banana-leaves with this resin, which burn as torches, with a pleasant odor and white light.

DIPTERUS, a genus of fossil ganoid fishes, peculiar to the old red sandstone, in which two species have been found. They derive their name from their most striking characteristic—the double anal and dorsal fins, which are opposite to each other. The head is large and flattened, the teeth subequal, the scales perforated by small foramina, and the tail heterocercal.

DIPTYCH (Gr. *diptycha*), a double writing-tablet, or two writing-tablets, which could be folded together. Herodotus speaks of such a tablet, made of wood and covered with wax. It was in the later Roman time, however, that they were most used, and those which have been preserved belong chiefly to the period when classical was merging into mediæval life. The beautiful carving with which they are often covered on the outside, consequently represents not unfrequently a combination of classical and of Christian subjects. Ivory and metal were sometimes employed in place of wood; but the construction was always the same, the wax with the writing being in the inside. Under the emperors, diptychs were distinguished into consular and ecclesiastical. The former, which were presented by the consuls and other magistrates to their friends, and those officially connected with them, on their entrance on office, were inscribed with their names and bore their portraits. The ecclesiastical diptychs, on the other hand, are decorated with scenes from sacred history, and were preserved in the churches as part of the sacred ornaments. Those that exist are of various sizes, rarely exceeding 8 in. by 4.

DI'PUS. See JERBOA.

DIR'CE, in Greek legend, the personification of a fountain (and stream) at Thebes, from the water of which Hercules derived a part of his strength, and which was usually identified with the fountain of Ares in the legend of Cadmus. Besides the fountain, there was the grove of Dirce, at which sacrifices for the dead and other rites were performed. According to the story, Dirce, the wife of Lycus, king of Thebes, had sorely persecuted Antiope, who at last escaped to Mt. Cithæron, where her twin sons, Amphion and Zethus, were being brought up by a herdsman who was unaware of their parentage. Mother and sons met, but had not recognized each other, till Dirce, who had come to a hill for a Dionysiac ceremony, proposed that Amphion and Zethus should tie Antiope to the horns of a wild bull to be dragged to death. They were about to do so, when the herdsman announced their relationship, and they then tied Dirce to the bull instead. She was dragged over the hill to the fountain into which she was transformed.

DIRECT. See CONSANGUINITY.

DIRECT AND RETROGRADE. In astronomy, the motion of a planet is said to be direct when the planet goes forward by its proper motion in the zodiac according to the succession or order of the signs (i.e., from w. to e.), or when it appears to do so to an observer. On the other hand, it is said to be retrograde when it appears to go the contrary way.

DIRECTOR, one of a number of persons appointed to conduct the affairs of joint-stock undertakings, such as banks, railways, water and gas companies, fire and life assurance companies, and various kinds of manufacturing and trading concerns. The office of a D. is in all cases one of less or more responsibility, sometimes of considerable risk, and according to commercial maxim, ought not to be accepted lightly or for the mere honor which is supposed to be incidental to the position. On this point, unfortunately, there is not a little loose morality and want of due consideration. Men are seen to enter on the office with scarcely a thought of attending to their duty, or of the injury they may inflict by allowing their names to be attached to undertakings in the management of which they cannot be said to take any particular interest. Latterly, so many instances have occurred of the perfunctory performance of the duties of directors, greatly to the damage of those who confided in them, that, perhaps, new and more wholesome views may arise on the subject. As a member of a body incorporated by the legislature, a railway D. is bound to administer the affairs of the company only with the means legitimately put at his disposal, nor can he be expected to incur any personal liability to sustain the general operations. Usually, however, when there is any tem-

porary or peculiar shortcoming in the finances, the directors overdraw to a certain extent the company's bank account on their personal responsibility; in all such cases, and where the outlay has been justifiable, the shareholders rarely decline to authorize measures which will relieve the directors of their obligations. In the case of banks, there are usually two kinds of directors—the ordinary and the extraordinary. The ordinary directors are practically the conductors of the undertaking, while the extraordinary attend only on particular occasions, and are, in fact, little else than ornamental appendages, whose names impart a degree of distinction to the concern. As regards bank as well as railway directors, it is the rule that they must respectively possess a certain amount of stock. It is an understanding that the directors of railways, banks, and assurance companies, should be paid in some way for their services. Being mostly men in business, they cannot be expected to give away their time and take trouble for nothing. Their payment, however, in the shape of an *honorarium*, is generally trifling in comparison to the amount of labor which is to be encountered. At meetings of shareholders, small sums are voted to be set aside for the directors, which sums are for the most part appropriated in the ratio of attendance. The fee of a bank D. is not usually half a guinea at each meeting; though it is as customary for those present to divide amongst them the sum set apart for the occasion, wherefore the regular attenders get most. The insignificance of these fees, even where no stinginess prevails, is employed as an argument why anything like a scrupulous examination into affairs is not reasonably to be expected—an argument seemingly of no great moral or legal force; for it is clear there can be no valid excuse for neglecting a trust which has been voluntarily accepted.

The difficult questions as to the cases in which directors incur liability for the losses sustained by the shareholders whose affairs they have undertaken to manage, have often been raised in courts of law; but, hitherto, no satisfactory solution of them has been found. See JOINT-STOCK COMPANY. Of the statutory provisions as to directors contained in the joint-stock companies acts (consolidated in the act 25 and 26 Vict. c. 89), the chief are these: 1. That the first directors shall be selected, and their number determined, by the subscribers of the original memorandum of association, who shall themselves be deemed directors until other directors are appointed. 2. That his office of director shall be vacated by the acceptance of any other office or place of profit under the company, by bankruptcy or insolvency, or by being concerned in any contract with the company. 3. At the first ordinary meeting after the incorporation of the company, the whole of the directors shall retire from office; and at the first ordinary meeting in every subsequent year, one third of the directors for the time being, or if their number is not a multiple of three, then the number nearest to one third, shall retire from office. In every subsequent year, one third, or other nearest number, who have been longest in office, shall retire. A retiring director shall be re-eligible. 4. The company in a general meeting may increase or diminish the number of directors. 5. Any casual vacancy occurring in the board of directors may be filled up by the directors; but any person so chosen shall retain his office so long only as the vacating director would have retained the same if no vacancy had occurred. The company, in general meeting, may remove any director, and appoint another in his stead. 6. The directors may meet together for the dispatch of business, adjourn, and otherwise regulate their meetings as they think fit, and determine the quorum necessary for the transaction of business. 7. Questions arising are determined by a majority of votes, the chairman having a casting vote in case of equality. 8. A director may at any time summon a meeting of directors. 9. The directors elect their own chairman, and determine the period of his office. In case no chairman has been appointed, or he is absent, the directors shall appoint one of their number to preside for that time only. 10. Directors may delegate their powers to committees of such number as they may judge expedient. 11. The directors must cause minutes to be made in books provided for the purpose. These minutes shall set forth all appointments of officers made by the directors, the names of the directors present at each meeting of directors or of committee, all orders made by meetings or committees, and all resolutions and other proceedings of these bodies. These minutes shall be signed by the chairman, and shall be receivable in evidence of what took place without any further proof. 12. The directors, with the sanction of the company in a general meeting, may declare that a dividend shall be paid to the shareholders in proportion to their shares. No dividend shall be payable except out of the profits arising from the business of the company. 13. If the directors shall declare any dividend when the company is known by them to be insolvent, or any dividend the payment of which would, to their knowledge, render it insolvent, they shall be jointly and severally liable for the debts of the company then existing, and for all that shall be thereafter contracted, so long as they shall respectively remain in office. It is provided that the amount for which they shall be so liable shall not exceed the amount of the dividend declared, and that if any of the directors were absent at the time of making the dividend, or protested in writing, they shall be exempted from liability. Before recommending a dividend, the directors may set aside a reserved fund out of the profits of the company. In companies incorporated for carrying on undertakings of a public nature, such as railways, the appointment, rotation, and powers of directors, are regulated by the statute commonly called "The Companies Clauses Act," 8 Vict. c. 16 (for Scotland, c. 17). Two directors are sufficient to sign a contract. The directors have the management and superintendence of the affairs of the company, and may lawfully

exercise all the powers of the company, except such matters as are specially directed to be transacted by a general meeting of the company. See LIABILITY (LIMITED) ACTS, JOINT-STOCK COMPANIES.

DIRECTORY. On the death of Robespierre, in 1794, a reaction commenced in the convention itself, as well as throughout all France, against the sanguinary excesses of the Terrorists. Ultimately a new constitution—that of the year 3 (1795)—gave birth to a new government, composed of a legislative body divided into two councils—the council of five hundred, whose function was to propose laws; and the council of the ancients, whose function was to pass them. The actual executive power was intrusted to five members chosen from both sections, and who sat at the Luxembourg. Their names were Lépeaux, Letourneur, Rewbel, Barras, and Carnot. These five constituted the famous *Directory*. They assumed authority in a moment of immense peril. France was environed with gigantic adversaries, while distrust, discontent, and the malice of rival factions made her internal administration almost hopeless. The frantic heroism of her soldiers saved her from spoliation by the foreigner; and had all the members of the D. been patriotic and honest, she might have been saved also from spoliation by her own children. But, on the contrary, the home-policy of the D. was deplorable. The demoralization which had begun to characterize officials even in Danton's time, now seized almost every class. Barras, a representative of all the turpitude of the hour, set the example. The majority of the two councils were equally corrupt; and although there were some both in the councils and D. whose virtues and talents were unimpeachable, yet they were too weak to counteract the knavery of their associates. It soon became clear that France could not be reconsolidated by the fag-ends of the revolution. The power and skill requisite for such a herculean work must be sought for elsewhere, among men who had received a nobler discipline than could be obtained in the political squabbles of the metropolis. Such was the thought of the abbé Sièyes. He turned his eyes to the army, where a host of new and brilliant names had appeared—Hoche, Joubert, Brune, Kleber, Desaix, Massena, Moreau, Bernadotte, Augereau, Bonaparte. Sièyes propounded his plan for the overthrow of the D., and the establishment of a consulate, that should be, in reality, a monarchy under republican forms, first of all to Moreau, who was frightened by its audacity; then to Bernadotte, whose excessive caution hindered him from approving of it; then to Augereau, who could not understand it; and finally to Bonaparte, on his return from Egypt. The last admired the project; a conspiracy was rapidly formed; all those functionaries who had been promised places by the D., but had not received them, offered their aid; and by the *coup d'état* of the 18th Brumaire (q.v.), an end was put to a government of weakness, immorality, and intrigue. It was succeeded by the consulate (q.v).

DIRECTORY FOR THE PUBLIC WORSHIP OF GOD, a code of regulations concerning the different parts of public worship, drawn up by the Westminster assembly in 1644, ratified by the English parliament in the same year, and adopted by the general assembly of the church of Scotland and by the Scottish parliament in 1645. It was on express order from both houses of the English parliament, that the Westminster assembly addressed itself to the work of preparing this directory, to supply the place of the Book of Common Prayer, which had been abolished. In Scotland, it was hailed as conducive to "a happy unity and uniformity in religion among the kirks of Christ in these three kingdoms, united under one sovereign," and to "the corroboration of peace and love between the kingdoms." Many of the regulations of the directory are still complied with in all branches of the Presbyterian church in Scotland, but in many things it has been generally departed from; and a disposition prevails in almost all quarters to allow greater freedom and variety in the forms and unessential circumstances of worship; whilst many esteem a departure from the requirement of unnecessary *uniformity* in these things, as tending not a little towards the healing as well as the prevention of divisions, and the establishment of a real *unity*, and even as more consistent with the first principles of Presbyterianism.

DIRECTRIX is a right line perpendicular to the axis of a conic section, in reference to which its nature may be defined. Assume an indefinite straight line as the D. and a point without the D. as the focus. Then, if a line be revolved about the focus, any point moving in the line will generate a curve which will be a conic section when there is a constant ratio between the distance from the point to the focus and the perpendicular distance from the point to the directrix. The curve is an ellipse, a parabola, or an hyperbola, according as the distance from any point of the curve to the focus is less, equal to, or greater than the perpendicular distance from the point to the directrix. The constant ratio referred to is called the determining ratio of the conic.

DIRK is a short dagger which at various times and in various countries has been much used as a weapon of offense. In the royal navy, at the present day, it is worn by officers rather for ornament than for use, belted and buckled to the left side.

DIRK-HARTOG ISLAND, measuring 45 m. by 10, lies off the w. coast of Australia, in lat. 26° s., and long. 113° east. Along with two smaller islands to the n., all the three having their lengths parallel with the mainland, it forms the breast-work of Shark's bay, one of the most commodious inlets on that coast.

DIR'SCHAU, à t. in Prussia, in the government of Dantzic, on the Vistula, a railway junction, 20 m. s.e. of Dantzic; pop. '75, 9,727. There is considerable trade

and industrial activity; but the chief claim of the place to attention is the lattice-work iron bridge over the river, built in 1850–57, 2,726 ft. long, with six spans of 410 ft. each. It affords passage for the railway between Königsberg and Berlin, for two ordinary carriage roads, and two sideways for foot passengers.

DIRT-BEDS, the quarrymen's name, introduced into geology, of several layers which occur in the lower Purbeck beds (q.v.), having the appearance of black dirt. They rest on the fresh-water beds of the lower Purbeck, and consist of one principal layer, from 12 to 18 in. thick, and from two to four thinner layers. The substance is, to a large extent, a dark-brown or blackish earthy lignite, being the remains of an ancient vegetable soil. Through it are dispersed, in considerable abundance, rounded fragments of stones from 3 to 9 in. in diameter. Fossil cycads and zamias are the predominant vegetable remains; they occupy their original upright position, having become fossil on the spots where they grew. The stumps stand erect for a height of from one to three, or even more feet, and at distances from each other similar to what may be observed in a recent forest. Besides these, the dirt-bed contains the silicified stems of coniferous trees, laid prostrate in fragments 3 or 4 ft. in length. The marine oolitic limestone, called Portland stone, was overspread with fluviatile mud, which became the soil on which a forest of cycads and zamias grow, and this was afterwards submerged without any violent agitation, since the layer of black earth has not been abraded, and then was covered with standing fresh water, from which the beds of calcareous mud, now converted into slate, were deposited.

DISABILITY, LEGAL, is either absolute, which wholly disables the person from doing any legal act—e.g., outlawry, excommunication, attainder, alienage—or partial, such as infancy, coverture, lunacy, drunkenness, and the like. It may arise from the act of God, of the law, of the individual himself, or of his ancestor, or the person from whom he inherits.

DISASSIMILATION. See NUTRITION.

DISBANDING, in military matters, is the breaking up of a regiment or corps. When peace is proclaimed after a war, and a reduction of the army becomes necessary, this is effected by disbanding or disembodying; the men are discharged, and the officers are mostly placed on half-pay.

DISBAR, the degradation from the rank of barrister-at-law. This power is in England reposed in the benchers of the four inns of court. As the courts of law require that every barrister, before he is allowed to practice, must have been admitted to that office by one of the inns of court, so they will refuse to hear any one who has been deprived of his rank by the same authority. The power has rarely been exercised, and only when the conduct of the offending party has been grossly irregular. There can be no doubt that the high position held by the bar has been in great measure sustained by the code of honor administered by the societies of the inns of court—a code by which those who are by nature devoid of the feelings of gentlemen are obliged, outwardly at least, to recognize and to observe the demeanor of gentlemen. For some time this wholesome censorship had been exercised with less vigilance than formerly, but a case of disbarring occurred in 1862, and another in 1874.

In Scotland, the power to disbar rests in the faculty of advocates (see ADVOCATES.)

DISCHARGE, from the military service, is by right at the expiration of the period for which attested; or earlier, by indulgence. In the latter case, the grant may be gratuitous, as on reduction of numbers, or when the man is not worth retaining, or paid for by the man discharged. In the last case, the soldier pays a sum of money computed with reference to the unexpired period of service. If a soldier has many years still to serve, the discharge purchase may amount to as much as £20. In the sappers and miners, where the men are all artisans, it may amount to £35; and among this corps such discharges are very frequent, on account of the value placed on the services of these intelligent men by private employers. Soldiers are, under the act of 1870, frequently discharged from service in the regular forces, after three or six years therein, on condition of serving the remainder of their original term in the reserve. Earl Grey, when colonial secretary, introduced the plan of enabling discharged soldiers to settle on a piece of land in the colonies instead of returning home.

Soldiers are occasionally "discharged with ignominy," for some offense that brings dishonor on the corps. In such case, the regiment is assembled, the crime recapitulated, and the sentence read. The buttons, facings, chevrons, medals, and all decorations, are cut from the man's uniform, and he is "drummed out" of the regiment, if a foot-soldier, or by sound of trumpet, if it be a cavalry regiment. Notice of his degradation is afterwards sent in writing from the war-office to his parents or relations.

DISCHARGING, in the royal navy, is the process of placing a ship "out of commission." A regiment of soldiers is permanently in pay, whether engaged in active service or not; but the crew of a ship are paid wages only so long as their names are on the books of a ship "in commission." Naval officers, too, are on full pay only so long as they belong to a particular ship in commission.

DISCIPLES OF CHRIST, a denomination of Baptists, organized 1827, who are often spoken of as Campbellites, but prefer to call themselves THE CHURCH OF CHRIST. In 1808, Thomas Campbell, a minister of the "Seceders," emigrated from Ireland to

the western part of Pennsylvania, and was followed, the next year, by his son Alexander. They both earnestly desired reforms in the Christian church conforming it to apostolic precept and practice. Their first step was to gather a small company of disciples for the special study of the Scriptures, with the pledge that, rejecting all human creeds and confessions of faith, they would strictly conform their practice to the teachings of the divine word. This virtual separation from the Seceders was followed by the gathering of a small congregation in Washington co. Penn., known as the Brush Run church, of which Thomas Campbell was an elder, and by which Alexander was ordained to the ministry. After what they regarded as a thorough investigation of the question of baptism, both father and son, with five other persons, feeling convinced that the Scriptures taught the "*immersion of believers*," were, June 2, 1812, immersed by a Baptist minister. In 1815, having increased to such a degree that they numbered 5 or 6 congregations, they united with the Redstone Baptist association, having first stipulated in writing that no terms of union or communion other that the Holy Scriptures should be required. As many of the Baptist ministers were, from the first, dissatisfied with this union the reformed congregations at length withdrew and joined the Mahoney (Ohio) association, the members of which regarded the new movement with favor and finally entered heartily into it. In 1823, Alexander Campbell commenced the monthly publication of the *Christian Baptist*, by means of which, together with public oral debates on baptism and itinerant preaching over large districts, his views were widely diffused among Baptists. Opposition to them on the part of many at length resulted in ecclesiastical action: the Dover association of Virginia, 1827, leading in what soon became a general withdrawal of Baptist fellowship from all who held the views of Alexander Campbell. The reformers, as they were called, then formed a separate organization, and have since rapidly increased, particularly in Kentucky, Ohio, Indiana, Illinois, Missouri, and Virginia. They have churches, also, in Canada, England, Wales, Ireland, and Australia. They now report about 2,000 ministers, 2,400 churches, and 500,000 members in the United States. Rejecting creeds and confessions of faith, as of human origin, they take the Bible as the sufficient and only authority in matters of faith and practice. Shunning subtle theological speculations, they aim to present Bible truths in Bible terms. This exposed them at first, and in some quarters, to the imputation of holding Unitarian views; but their orthodoxy on this portion of theology is now fully admitted. On the atonement, resurrection, and general judgment they agree with the great body of evangelical Christians. They continue the breaking of bread in commemoration of the Savior's death every first day of the week. They hold that faith and repentance are the divinely appointed pre-requisites for baptism, and that all who do repent and believe may and should be immersed in the name of the Lord Jesus Christ for the remission of sins and reception of the gift of the Holy Spirit. In church polity they are congregational, with three classes of officers: 1. elders, presbyters, or bishops; 2. deacons; 3. evangelists. The last named are the itinerating ministers or missionaries, and are supported by voluntary contributions. Acknowledging their obligation to provide for the wide diffusion of scriptural preaching by well-instructed men, they are zealous in promoting education. They have a university at Lexington, Ky.; and colleges at Bethany, West Va.; Hiram, Ohio; Franklin, Pa.; Indianapolis, Ind.; Eureka, Ill.; and Oskaloosa, Iowa; besides colleges for women and many other schools of high grade.

DISCIPLINE, First Book of, or of Policy, in Scottish ecclesiastical history, an important document, drawn up by John Knox and four other ministers, in 1560. Along with the confession of faith of the same year, it must be held as exhibiting the principles on which the reformed church of Scotland was originally founded. It lays down rules for the election of "pastors or ministers" by the congregation, their examination by "the ministers and elders," etc., also for the election of elders and of deacons; it recognizes the office of superintendent (q.v.) as then established; but it is most largely occupied with things pertaining to ecclesiastical discipline, strictly so called, and the mode of dealing with persons guilty of offenses. The first book of discipline never received the sanction of parliament, but was subscribed by many of the nobles and barons.

DISCIPLINE, Second Book of, or "Heads and Conclusions of the Policy of the Kirk," a document of great importance in the ecclesiastical history of Scotland, adopted by the general assembly in 1578; and, although never ratified by act of parliament, still frequently appealed to as the most perfect and authoritative exhibition of Scottish presbyterianism. The separations which have taken place from the established church in Scotland, have not been on the professed ground of dislike to the constitution exhibited in the second book of discipline, but of anxiety for its perfect maintenance; and this document has recently been adopted as one of the articles of union among Scottish Presbyterian churches in Australia. It was prepared with great care by a committee of the general assembly, in which Andrew Melville took a leading part; and in a time of much conflict between the court and the church, concerning the power of the civil government in things ecclesiastical, church government, and patronage (q.v.). It begins by asserting strongly the powers regarded as essentially inherent in the church, sets forth the distinctions between civil and ecclesiastical government and their mutual relations, and lays down a thoroughly Presbyterian platform of church-government.

DISCIPLINE, in naval and military matters, is a general name for the rules laid down for the proper behavior of the persons employed. The mutiny act, the articles

of war, and general orders issued by the admiralty and the war office, form collectively the code by which discipline is regulated. See ARTICLES OF WAR, MUTINY ACT.

In the army, regimental discipline is chiefly maintained by the adjutant. He sees the regimental orders carried out; superintends the drill and field movements; inspects and tells-off all guards, escorts, and parties; regulates all duty rosters, or rollsters; receives garrison orders; keeps regimental books. The adjutant-general is to the whole army what the adjutant is to a regiment, in reference to discipline. In the navy, the discipline is necessarily very strict.

DISCOB'OLI, according to Cuvier, a family of malacopterous fishes, remarkable for having the ventral fins united to form a sucking disk on the under surface of the body. To this family, also called *cyclopteridæ*, belong the lump-sucker (*cyclopterus lumpus*), the unctuous sucker or sea-owl or cock-paddle *snail*, and or two other British fishes. To this family Cuvier also referred the remora (q.v.), adverting, however, to the different position of the sucking disk, and other important distinctions, on account of which a very different place in the system is now assigned to it. The use of the sucking disk, however, is much the same—that of attaching the animal to fixed substances, so that it may remain and obtain its food, where otherwise it would be swept away by the current. The adhesive power of the sucker, in the larger specimens of the lumpfish, remains after death.

DISCORD, sounds which have no harmonical relation whatever; differing from dissonance (q.v.), which in musical language is applied to sounds that are in grammatically correct relation to each other, though not consonant.

DISCOUNT, the difference between a sum of money due at a future period and its present value; or the deduction made from the amount of a debt that is paid before it is due. It is usually ascertained—in the case of bills of exchange, promissory notes, and the like—by subtracting from the principal amount its interest, calculated from the date of payment until the date when the amount is due; but this, although sanctioned by usage, leads to an excess of charge, the interest being thus advanced to the lender before it has actually accrued. True discount is computed as follows: Suppose that £100 is advanced for one year at, say 5 per cent, the sum repayable at the end of the year in respect of this advance will be £105; therefore, £100 is the present value of £105 due a year hence; and from this conclusion it is easily deduced by proportion, that the value of £100 due a year hence is £95 4*s.* 9¼*d.* Hence the true discount on £100 due in a year at 5 per cent, is £4 15*s.* 2¾*d.* The usual formulas are—for the present value, $\frac{100\,A}{100+nr}$; for the discount, $\frac{Anr}{100+nr}$; where "A" is the principal sum due; "*n*" the time, in years or fractions of a year; and "*r*" the rate per cent, *simple interest being assumed.* For example, let it be required to find the discount on £97 7*s.* 6*d.*, due seven months hence, at 4½ per cent. Here A=£97 7*s.* 6*d.*=97.375, $n=\frac{7}{12}$, $r=4\frac{1}{2}$; $nr=\frac{7}{12}\times\frac{9}{2}=\frac{63}{24}=\frac{21}{8}$. $Anr=97.375\times\frac{21}{8}$.

$$100+nr=100+\tfrac{21}{8}=\tfrac{821}{8}.$$

Hence the discount is $\frac{97.375\times\frac{21}{8}}{\frac{821}{8}}=\frac{97.375\times21}{821}=\frac{204.4875}{821}=2.491=$ £2 9*s.* 10*d.*

But it is easier first to determine the present value, and hence, by subtraction from the amount due, the discount.

An extension of the above formulas is necessary in computations connected with leases, reversions, etc., to be valued on the stricter principle of compound interest, for which see INTEREST.

By discount is likewise understood the depreciation in value of a fixed investment; as when a railway share, on which say £100 has been paid, can be sold for £90 only, the "discount" being thus 10 per cent.

The allowance made to a trader, under the name of discount, for prepayment of a debt, is usually greater than the current rate of interest, as the creditor receiving the money before it becomes due, secures himself against the insolvency of the debtor.

The rates of discount vary according to the demand for money and the nature of the security. The range in Britain is from 3 to 10 per cent, except in the case of doubtful bills or post-obit bonds, when a much higher rate is exacted. Bills at and under three months' currency are usually charged a per cent less than those of a long date. In the colonies higher rates are allowed.

DISCOVERY, BILL OF, a bill in chancery (q.v.) which prays the disclosure by the defendant of some matter pertinent to the cause of the plaintiff. By means of bills of discovery, the equity courts formerly possessed an advantage over the courts of common law in extracting evidence from the parties to a suit, who could not be examined as witnesses in an action at law. But by 14 and 15 Vict. c. 99, 16 and 17 Vict. c. 83, and 17 and 18 Vict. c. 125, parties to an action are competent witnesses, and must give evidence. See the judicature act (1875), ord. xxxi.

DISCOVERY, BILL OF (*ante*), commonly used in aid of the jurisdiction of a court of law to enable the party who prosecutes or defends a suit to obtain a discovery of the facts which are material to such prosecution or defense. The plaintiff must be entitled to the discovery which he seeks, and can have a discovery only of what is necessary for his own title, as of deeds under which he claims, but not to pry into affairs of the

defendant. The bill must show with reasonable certainty a present and vested title and interest in the plaintiff, and what that title and interest are; must state a case which will constitute just ground for a suit or defense at law, and describe deeds and acts with reasonable certainty. A bill of discovery will not lie in aid of a criminal prosecution, a mandamus, or a suit for a penalty.

DISCUSSION, in Scotch law. By the law of Scotland, all cautioners, unless bound jointly and severally with the principal debtor, were formerly, and cautioners bound prior to the passing of the mercantile law amendment act (21st July, 1856) are still, entitled to insist that the creditor shall call on the principal debtor in the first place; or *discuss* him, as it is technically said. Where the principal debtor fails to satisfy the obligation in full, the creditor was bound to give the cautioner the benefit of such portion of it as he did discharge. D. was not merely a demand for payment, but enforcement of it, in so far as the means of the principal debtor admitted of. Cautioners bound subsequently to the date of the mercantile law amendment act (19 and 20 Vict. c. 60, s. 6), can enjoy the right of D. only by express stipulation.

DISEASE, according to its literal construction, a state of *dis-ease*, or absence of the condition of health, in which all the faculties and organs of the body and mind work together harmoniously and without sensible disturbance. In a strictly scientific sense, there may be disease without pain or uneasiness in the ordinary meaning of these words, but hardly without functional disturbance or incapacity of some kind. It is, therefore, only necessary to include in the definition of disease the diminution of functional power, whether attended or not by suffering, and the scientific and practical ideas of the word will closely correspond. It must be admitted that slight structural and functional deviations from the state of health are sometimes unnoticed; but only because they are slight, and because the functions to which they extend are not habitually in use to the full extent. A great deal of unnecessary obscurity is found, especially in continental writers, in discussing the abstract idea of disease, which has been connected with all the most intangible subtleties of the most abstruse and metaphysical philosophy, by regarding it as dependent upon the idea of life and of the vital force. Many authorities have thus generalized disease into a separate active principle, opposed to, and everywhere seeking to destroy, the principle of health; and Paracelsus was hardly more open to objection on the ground of absurdity than many others of his countrymen, when, in his picturesque and at the same time mystical manner, he endowed the vital principle with a kind of personality, and spoke of disease as due to the whims and caprices of a displeased and resentful Archæus, an idea which was still further developed by Van Helmont. It is common to treat of disease as being *functional* or *organic*; i.e., evidenced by changes of function or of structure; but function and structure are so closely allied in fact and in nature, that the more this distinction is examined the more vague and impalpable it becomes; and it can therefore only be kept up as a provisional and conventional arrangement. The classification and arrangement of diseases according to their external characters has been termed nosology (q.v.); while the observation of their more intimate and less superficial relations in connection with their causes and results, is called pathology (q.v.); both of these sciences, of course, being kept in view in the healing art of medicine (q.v.), of the more practical portion of which they form the pillars.

DISEASES, DISTRIBUTION OF. It is generally known that the different regions of the earth are subject to diseases deriving their character from local circumstances and conditions, such as latitude, climate, the chemical quality of the soil, elevation of the land above the sea-level, variation of temperature, water distribution, character of the vegetation, and the peculiar habits of the people. The science of nosography in this aspect, however, did not receive much attention before the beginning of the present century, and is still comparatively undeveloped, though something has been done in the way of discovering and classifying facts. It is known that tropical regions are the home of malarial fevers, cholera, and hepatic diseases. This is due in part to the damp soil and decaying vegetation, particularly in the river valleys. The yellow fever of the Mexican gulf, though often aggravated by other conditions, doubtless originated primarily from this cause. In the more temperate zones, typhus, typhoid, intermittent, and scarlet fevers are found. They are, however, for the most part, not so much endemic as epidemic. In the northern hemisphere, n. of the tropical zone, catarrhal diseases prevail, while in the corresponding zone of the southern hemisphere they are unknown. Intestinal catarrh prevails, however, to a considerable extent in some parts of the intertropical regions. Nosologists are as yet unable to explain why some diseases prevail alike in widely different latitudes; for example, rheumatism in warm and dry as well as in cold and wet regions; and leprosy in Greenland, Norway, and Iceland, as well as in the tropics. In some cases, hilly regions are ravaged by fevers, while in the intervening valleys fevers seldom occur. The cultivation of the soil, sometimes essentially modifies the character of the malarial diseases. The destruction of forests often results in the introduction of diseases unknown before. Indeed, as a general rule, living vegetation tends to preserve health, while decaying vegetation is a prolific source of disease; but the modifications of this law are very little understood. Defective drainage, natural or artificial, is also a common source of disease, especially in cities and thickly settled towns. The personal habits of races and communities in respect to diet and

cleanliness, exert a wide influence upon the public health. Europe, on the whole, possesses the requisite conditions of health in greater perfection than any other quarter of the world. The rates of mortality from diseases of the lungs are greater in northern than in southern latitudes. This is illustrated by the prevalence of consumption in the north-eastern portion of the United States. Fevers are more prevalent in the southern than in the northern states. Malarial fevers are especially fatal in the southern regions of the country. They are infrequent, however, where pine forests abound. Knowledge on this subject, as yet fragmentary, is slowly increasing.

DISEASES OF PLANTS form a subject of study interesting equally in its scientific and its economic or practical relations, but in regard to the most important parts of which much obscurity and uncertainty still exists. Enough, indeed, is known to show that, as might have been expected, an analogy subsists between the kinds of disease to which plants are subject, and those of animals, both in their nature and their causes, yet with wide differences, according to the difference between vegetable and animal life. Plants, like animals, are liable to suffer from unsuitable external circumstances, as of temperature, drought, or moisture, etc.: they are liable, like animals, to suffer from deficiency of food, from excess of it, or from being compelled to subsist on improper kinds of it, or too exclusively on some particular kind. They often suffer much from vegetable parasites, chiefly fungi, and from multitudes of minute animals, which, without eating them up, destroy organs essential to their health, or prey upon their juices. The constitutions of plants are accommodated to particular temperatures, and they neither flourish when the temperature is for any considerable time much above or much below certain limits, very different, however, for different species. Light is of the greatest importance to vegetable life, and a want or deficiency of it speedily produces an unhealthy condition, the proper chemical changes not taking place in the juices of the plant; and this unhealthy condition, sometimes very extensively produced in gloomy seasons, when the deficiency of light is accompanied with excess of moisture both in the air and in the soil, renders plants very liable to the attacks both of vegetable parasites and of minute animal tribes.

Excess of nutriment, causing an extreme rapidity of growth, sometimes produces an unhealthy condition in particular parts of plants, in which a greater amount of tissue is developed in a single season than can be thoroughly matured.—Manures, injudiciously and unsuitably applied, are often productive of disease. Putrescent matter coming in contact with the roots of many plants, is very injurious to them, and causes *canker*.—Contagion, as a cause of disease in plants, if not fully demonstrated, is rendered highly probable by such facts as the memorable prevalence of the potato disease, and the rapid spread of the vine disease (*oïdium*); nor does the existence of particular fungi in the diseased plants materially affect this probability.

With regard to the diseases of plants generally, little has been hitherto found practicable in the way of cure, and prevention is the object chiefly aimed at in all investigations of their nature and causes.

Some of the most important diseases of plants are noticed under particular heads; and some of the most destructive parasitic fungi are described in their proper places in this work.

DISHONOR OF A BILL. When the drawee, or person on whom a bill is drawn, declines to accept it or to pay it, he is said to dishonor it. The act of drawing or of indorsing a bill implies an obligation to pay it in the last instance, and the person in whose favor it is drawn has thus recourse against the drawer and indorsers, should the drawee fail to accept or to pay. In order to preserve this recourse, however, it is indispensable that notice of dishonor shall be given to the drawer and indorsers. No particular form of notice is requisite. The notice must be such as to identify the bill, and to inform the party to whom it is given of the protest, a copy of which ought to accompany it. If the notice is put into the post-office, and properly addressed, it is sufficient; and even verbal notice, if clear, will suffice. In the case of foreign bills, the period within which notice must be given is regulated by the usages and customs of merchants. Any delay which can fairly be ascribed to neglect or omission, and is not justified by the circumstances of the case, will be fatal to the bill-holder's claim for recourse. In inland bills and notes, the rule till lately in Scotland was, that fourteen days after the protest was taken should be allowed. This has been altered by the mercantile law amendment act (19 and 20 Vict. c. 60), which provides (s. 14) that notice of dishonor of inland bills and promissory-notes, in order to entitle the holder to recourse, shall be given "in the same manner and within the same time as is required in the case of foreign bills by the law of Scotland." To both classes of bills, then, the English rule is now applicable, which is, that notice must, in the general case, be sent the next day, where the parties reside in the same place, and by the next post, if they reside at a distance.

DISINFECTANTS are a class of substances which have the power of absorbing or destroying the effluvia or fetid odors evolved from putrescent matter, and the miasmatic matter generated in low, marshy, and ill-drained localities. The principal substances capable of being used for this purpose are chlorine, bleaching-powder, carbolic acid, animal and wood charcoal, chloride of zinc, sesqui-chloride of iron, nitrate of lead,

acetate of lead, and nitrous acid. Chlorine (q.v.), either when used by itself, or in combination with lime, as bleaching-powder, is probably the most powerful disinfecting agent. When liberated into an apartment, it immediately causes the destruction of infectious or other deleterious matters. The mode of its action appears to be principally due to the great affinity of chlorine for the hydrogen of the gaseous compounds evolved from putrefying matter, and in abstracting the hydrogen, the chlorine destroys the organic substance. A simple way of employing chlorine as a disinfecting agent in sick-rooms, and adjacent lobbies and apartments, is to place a thin layer of bleaching-powder upon a plate, from which the carbonic acid of the air will liberate chlorine rapidly enough to be of essential service in keeping down infection, and without causing any inconvenience to the inmates. If a more plentiful supply of chlorine be desired, a little vinegar added to the bleaching-powder will liberate the gas freely. Charcoal is also of great service in removing fetid effluvia. Clothes possessing a disagreeable odor may be deprived of it by being rolled up or placed in a box with charcoal; and a thin layer of the latter strewn over putrefying matter, such as the decomposing carcass of an animal, immediately absorbs the effluvia, and the air above becomes quite sweet. The charcoal acts first by absorbing the odoriferous gases, such as ammonia, hydro-sulphuric acid (sulphuretted hydrogen), etc., and thereafter aids in the oxidation of these into nitric acid, sulphuric acid, and water. As agents capable of being employed in the deodorization and purification of offensive liquids, such as biige-water and sewerage-water, there are chloride of zinc—Burnett's disinfecting liquid (q.v.)—chloride of manganese, perchloride of iron (Ellerman's deodorizing fluid), and nitrate of lead (Ledoyen's disinfecting fluid); but these liquids are not true disinfectants, and are merely serviceable in deodorizing by *fixation*. The employment of fumigating pastilles, burning brown paper, and fumigations with camphor, benzoin, mastic, amber, lavender, and other odoriferous substances, is merely serviceable in cloaking over the offensive, fetid, and hurtful gases, and should never be resorted to unless in conjunction with the use of other agents possessing the properties of true disinfectants. See CARBOLIC ACID; and, for Condy's fluid, the article MANGANESE.

DISINFECTANTS (*ante*). The subject of disinfectants is not yet perfectly understood, and there are many unsettled notions regarding it. There has lately been considerable skepticism in regard to the disinfecting powers of chlorine and carbolic acid, and with apparently good reason. Doubtless too much reliance has been placed upon them, or upon an inefficient mode of using them. The mode of action of chloride of lime, or the chlorine or chlorine compounds liberated therefrom, is probably like that in bleaching. The disease-breeding organism is broken up, and consequently its propagating power destroyed, just as coloring matter is broken up. This explanation does not take into consideration, of course, the theory of bleaching which supposed the abstraction of hydrogen by the chlorine compound and the liberation of oxygen in the condition of ozone. The important fact to bear in mind is that the disinfectant destroys the disease germs. Now, to act in this way, it is necessary to have at least one molecule of the disinfectant in the presence of one molecule of the disease-producing organism, and probably it requires several, perhaps a hundred to one. The question then arises how many molecules of matter or how many organic compound particles are there in a given number of disease germs. No positive answer can be given. It is a mere matter, not of guess-work, but of estimation, and involves the question as to how many molecules of the disinfecting material are required to produce the death or disorganization of the disease germs. After a number of experiments, the question can be, and has been, practically decided. It is found that when an apartment is thoroughly fumigated with chlorine, or the compounds liberated by chloride of lime, that disease germs are destroyed. If, however, chloride of lime has simply been strewed about the premises, even in considerable quantity, it is found often that the place has not been thoroughly disinfected. If carbolic acid is used in too weak a solution it may not sufficiently arrest or destroy the vitality of the growing disease germs. To depend upon the fumes of carbolic acid would be a practical fallacy. The substance must be directly applied, as a rule, to have a full sanitary effect. Perhaps chlorine may act by simply killing the germs. Carbolic acid probably does, and some other substances of less power may act upon some disease germs sufficiently, when they are not present in too great quantity, to prevent development of disease. Heat and cold, when intense enough, are perfect disinfectants. The continued application of dry air heated to 150° or 200° will generally destroy disease germs. It doubtlessly desiccates them, and they die. Moist air must be heated to the boiling point to produce the same effect. A sufficient degree of cold will also effect the purpose; how great, cannot be stated for every instance. We know that diphtheria and scarlet fever, particularly the latter disease, often flourish in severe cold weather. The application of cold, except in a limited and partial manner, is impracticable. The mode of disinfecting any given locality must depend upon circumstances, and often requires much judgment. See CARBOLIC ACID, *ante*.

DISK, in botany, a part intervening in some flowers between the stamens and the pistil. It seems in most cases to represent an inner whorl of stamens variously modified. It is often a mere ring; sometimes it exhibits a whorl of scales or of rudimentary

stamens, or even of petal-like appendages; sometimes it rises into a sort of cup around the pistil; sometimes, as in the rose, it assumes the form of a waxy lining of the tube of the calyx. It is often glandular, and secretes a honey-like fluid. It is one of the parts included under the vague comprehensive term *nectary* by the older botanists.

DISK AND **DISCOB'OLUS.** See QUOIT.

DISLOCA'TION consists in the displacement of one bone from another with which it forms a joint (*put out of joint* being the popular expression). Dislocations are generally the result of sudden accident, but may be the result of disease, or may be congenital. The displacement may be *partial* or *complete;* and surgeons classify their cases into *simple* dislocations, when the skin remains unbroken, and compound, when there is a wound by which the external air may communicate with the joint. Occasionally, in addition to the dislocation, there are fractures of the bones, or lacerations of important blood-vessels in the neighborhood; it is then termed a complicated dislocation. Dislocation is a rare accident in infancy and old age, because in the former the joint-ends of the bones are very flexible, and yield to violence; while the aged skeleton is so rigid that the brittle bones fracture under force that would drive younger and firmer ones out of their sockets. Dislocations are most frequent between the ages of thirty and sixty. Persons with weak muscles, and lax, long ligaments, or those in whom the latter have been softened by inflammation of the joint, are predisposed to dislocation. The joints most frequently displaced are the shoulder and the elbow.

General symptoms of a dislocation.—After a blow, fall, or violent muscular exertion, a limb is found to be immovable at the injured joint, there is great pain, and the shape of the part is changed; but soon swelling ensues, and every distinctive mark about it is obscured. If left alone, or merely treated as an inflamed joint, the swelling gradually subsides; but the immobility continues, the limb is crippled for months or years, when at last nature forms a new socket for the end of the bone, and some amount of useful motion is restored. The proper shape of the part is never restored, but remains an eyesore to the patient, and a disgrace to the surgeon.

The general treatment of dislocations consists in their *reduction*, or pulling the displaced bone back into its place. Its return is opposed by the muscles attached to it, which are stimulated to contraction by the pain of the operation, which requires, of course, a good deal of force to be employed. It is desirable to remove this spasm of the muscles, which is the great obstacle to the reduction of a dislocation; and in former days, bleeding from the arm, emetics, the warm bath, etc., were generally made use of; nowadays, chloroform or ether attains the same ends, and renders the treatment of dislocations much more simple and humane than before the introduction of anæsthetics.

When the surgeon is about to reduce a dislocation requiring any degree of force, he fastens the part of the limb above the displaced bone or the trunk, so as to afford him *counter*-extension; he then pulls on the limb either with his hands, or with a bandage or handkerchief attached to it. The best way of fastening this is to roll a bandage, wetted, to prevent slipping, round the limb, and then taking the thing with which he wishes to extend in both hands, he casts it into two loops, forming what is called a *clove-hitch*, and then slips the double noose up the limb till it rests on the wet bandage previously applied. In old-standing cases, the hands grow weary before the extension has been kept up sufficiently long, so it is well to adapt pulleys to draw upon the clove-hitch, as with them the traction can be regulated as the surgeon desires. Sudden, forcible pulling is useless and hurtful, the object being merely to tire out the muscles which resist the attempts at reduction; when they are exhausted, the bone will generally slip back into its place with an audible snap.

A class of shrewd individuals, called "*bone-setters*," frequently derive profit from some conditions of joints which resemble dislocations. Chronic rheumatic inflammation is occasionally known to fix itself by an accident on some particular joint, especially the shoulder or hip, and may so change the surfaces of the bone-ends that they are spontaneously dislocated; the empiric, naturally antagonistic to the regular practitioner, tells the patient that when he met with the accident the dislocation occurred, but that his doctor overlooked it. Again, many persons who have injured their joints do not submit to having them moved about after the first inflammation has subsided. The bone-setter gives a forcible bend to the limb, which breaks up the adhesions; and because he has done roughly what the doctor would have done equally well gently, the patient praises him, while he blames the one who guided his joint in safety through the first effects of the accident.

Whenever a dislocation occurs, the nearest medical man should be summoned, even should the mere displacement be rectified at once, because no such accident can occur without some tearing of the soft parts, and it will depend on the after-treatment whether the joint will ever become useful again or not. It must also be remembered, that the sooner a dislocation is reduced, the easier is the reduction. Since the introduction of anæsthesia, however, and the subcutaneous division of tissues, many ancient cases may be improved, and many crippled limbs restored to usefulness.

DISLOCATION, or FAULT, a term used in geology to characterize certain displacements common among stratified rocks. The agency that raised these rocks above the waters of the sea, produced in the elevation numerous rents. In their simplest form,

the rents are mere cracks, the parts, though separated, remaining contiguous; sometimes a greater or less fissure intervenes between the disunited portions, and this is filled with materials pressed in from above, or with igneous rocks intruded from below. The beds, however, are not always found at the same level—a displacement as well as a severance often takes place, so that the beds on one side of the fissure or crack are many feet, or many hundreds of feet, above or below the beds on the other side with which they were once continuous. One of the best known faults is that called the "Ninety Fathom Dike" in the Newcastle coal-field. The same beds are 90 fathoms lower on the northern than they are on the southern side. The fissure varies in width from a few feet in some places to more than 20 yards in others; it is filled with sandstone. In the Edinburgh coal-field, the greatest fault is the one known as the "Sheriffhall Slip." It has produced a dislocation of the strata to the extent of 400 or 500 ft., so that the coal which is worked on the s. side of the slip, near the surface, is on the n. side 500 ft. below it. Mr. Milne Home enumerates 120 faults in the Mid-Lothian and East-Lothian coal-fields. He has himself examined 78 of these, and has found that 35 dip to the s., and 43 to the n.; and that while the sum of the down-throws by the faults dipping to the s. is 385 fathoms, those dipping to the n. have depressed the strata 754 fathoms.

Faults in coal-fields are well known, because of their serious interference with the progress of the miner. But though they often cause considerable labor and expense in searching for the continuation of a valuable seam of coal, they have corresponding advantages, since they disclose on the surface the value of the buried minerals, and when filled with solid materials, they form embankments which confine water, and thus save considerable expense in draining the mine.

The amount of dislocation is the measure of a line drawn from one part of the bed, at right angles to its plane, to a line produced from the other separated part of the bed representing its plane. Although no notion can be formed, in meeting with a fault, of the extent of dislocation, yet the direction in which the lost strata are to be sought can be certainly determined, for it has been found to be an invariable law, that the strata are lowest on the overlapping side of the slip. Faults have local names from the miners, all of which have been used by geologists. They are called hitches, dikes, troubles, slips, slides, heaves, and throws.

DISMAL SWAMP, measuring 40 m. from n. to s. by 25 in breadth, lies chiefly in Virginia, but partly in North Carolina. In the center is lake Drummond, covering about 6 sq. miles. Elsewhere the surface is divided between tangled reeds and heavy timber, with a thick undergrowth. This extensive morass has been, at a vast cost, traversed lengthwise by a canal, which connects New Lebanon, in North Carolina, with Norfolk in Virginia.

DISMANTLE is the operation which a ship undergoes when to be laid up in ordinary, or placed out of service. She is unrigged; the rods and most of the ropes are removed; and the upper masts taken down.

DIS'MAS, ST., the name which Catholic tradition has attached to the "good thief." He is represented with a cross beside him.

DISORDERLY HOUSE. For this, see NUISANCE.

DISPART, in gunnery, is a mark set upon the muzzle of a gun, to aid the gunner in obtaining a line of sight truly parallel with the axis of the bore. The dispart, in strictness, is not the mark itself, but a distance or quantity denoted by the mark; and "to dispart" a gun is to determine this distance. It depends mainly on the relation between the diameter of the breech and that of the muzzle.

DISPENSATION, a license granted by the pope for that which is ordinarily prohibited. The nature and limits of the dispensing power have been the subject of much discussion not only in controversy with Protestants, but among Roman Catholics themselves. It is held by the extreme advocates of papal power, that the pope may dispense in any divine law, except the articles of faith; by others, that his dispensing power does not extend to express precepts of the New Testament; some say that his D. is valid only when it proceeds upon just cause; some, that it is not properly a relaxation of the law's obligation, but merely a declaration that in the particular case the law is not applicable. The usage of the church of Rome, however, agrees with the opinions of her theologians in making the pope supreme in releasing from oaths and vows; and a decree of the council of Trent anathematizes all who deny the power of the church to grant dispensations for marriages within the prohibited degrees of the Mosaic law; whilst the multiplied prohibited degrees of the canon law give much occasion for the more frequent exercise of the same power.—Nothing really of the nature of a D. is known in any Protestant church. The only kind of dispensations now in use in England, are those granted by a bishop to a clergyman, to enable him to hold more benefices than one, or to absent himself from his parish. Formerly, the pope's dispensations in England, as elsewhere, prevailed against the law of the land, not in ecclesiastical matters only, but in all that large department of civil affairs which, by an interested fiction, was brought within the scope of ecclesiastical government. This abuse was swept away at the reformation, by 25 Henry VIII. c. 21. The power of the pope was then conferred on the archbishop of Canterbury, in so far as it was not contrary to the law of God. The

granting of special licenses of marriage, and the like, is the only form in which it is ever exercised.

In former times, the crown claimed a dispensing power in civil, similar to that which belonged to the pope in ecclesiastical matters. The power was grossly abused by James II., and was consequently expressly abolished by the bill of rights. The privilege of granting pardons in capital cases is the only form in which the dispensing power of the crown still exists.

DISPERSION. Ordinary white light is heterogeneous in its character, being composed of rays of different refrangibility, and the term D. is used in optics to denote the separation of these rays by refraction. Transparent media of various kinds possess different dispersive powers, or, in other words, different powers of widening the angle between the red and violet rays, when a ray of white light suffers refraction through a prism of given angle at a given angle of incidence. The circumstance called the "irrationality of dispersion," consists in the fact, that when a spectrum is measured after Frauenhofer's manner, it is found that the distance between any of the same two fixed lines of the spectrum has not a constant ratio to the distance between the extreme fixed lines, where different media are used. See SPECTRUM. It may be noticed that the word D. is also sometimes used to denote in optics irregular reflection or the scattering of light on imperfectly polished surfaces. See CATOPTRICS. The amount of light not reflected according to the regular law varies with the nature of the reflecting surface. In the case of light incident at right angles upon a surface of common glass, $\frac{1}{15}$ only is properly reflected. In perpendicular reflection at an ordinary silvered looking-glass, about $\frac{1}{4}$ is lost by this sort of dispersion. A little less than $\frac{1}{4}$ is lost in perpendicular reflection from highly polished speculum metal.

DISPLAYED, in heraldic usage, means *expanded;* as an eagle displayed, or what is vulgarly known as a spread eagle. See EAGLE.

DISPOSITION, in art, differs from *composition,* inasmuch as the former has reference to the arrangement of the parts, the latter to the effect of the whole.

DISPOSITION, in music, a term now used in organ-building, adopted from the German, meaning the arrangement and combination of the stops on the different rows of keys and pedals, with the pitch of each stop, or length of the lowest CC pipe.

DISPOSITION, in the law of Scotland, is a deed of conveyance, applicable either to heritable or movable property, but most frequently used for the purpose of transferring the former from the seller to the buyer. There is another well-known form of the deed, the object of which is to settle a whole succession, both heritable and movable, a will or testament, in Scotland, being used mostly for movable property. This latter deed is commonly known as a disposition and settlement. The following are the clauses usually contained in a disposition for the purpose of conveying heritable property: 1. The *narrative* or *inductive* clause, in which the names of the disponer and disponee are set forth, the cause of granting the deed is stated, and the receipt of the price or consideration is acknowledged, if the conveyance has been for an onerous cause. 2. The *dispositive* clause, in which the maker of the deed "sells and dispones," or "gives, grants, and dispones," if there has been no price paid or consideration given. 3. A clause obliging the disponer to infeft. See INFEFTMENT. 4. A procuratory of resignation. 5. A clause of warrandice (q.v.). 6. An *assignation* to the title-deeds and rents of the subject. 7. An obligation to free the disponee from public burdens due before his term of entry. 8 A clause to the effect that the title-deeds have been delivered to the disponee. 9. A clause of registration. 10. A precept of sasine (q.v.). And lastly, a testing clause (q.v.). Though it is still optional to make use of these clauses, they have been greatly shortened, and in some instances dispensed with by recent acts, which are consolidated by the titles to land (Scotland) act (1868), 31 and 32 Vict. c. 101, and 32 and 33 Vict. c. 116. A disposition for the conveyance of movables is a much simpler document. It often bears reference to an inventory containing a more particular enumeration of the effects conveyed. It grants power to the disponee to take possession of the subjects, and it also contains clauses of warrandice and registration, and a testing clause. The disposition and settlement, again, varies in form according to the nature of the property conveyed, and the arrangements which are made with reference to it. Sometimes it is a direct conveyance; in other cases it conveys the property to trustees, to be held and administered by them for the benefit of other parties. In this latter case, it is known by the name of a trust-disposition and settlement. Where contingencies which cannot be foreseen with certainty are anticipated, where the management is complicated by details, or where the operations under the deed are likely to be protracted, the appointment of trustees (see TRUST) is usually resorted to. In either case, the granter's life-interest in the property is reserved in express terms, and there is also a clause dispensing with delivery. The word "dispone" used to be considered a vital word in all these deeds, but is now no longer essential, though it is still current. A disposition in security, which corresponds to the English mortgage, will be explained under heritable securities.

END OF VOLUME IV.
